Package 'Vdgraph'

August 15, 2014

Type Package

Title This package creates variance dispersion graphs and fraction of design space plots for response surface designs

Version 2.2-1

Date 2014-05-28

Author John Lawson <lawson@byu.edu>

Maintainer John Lawson <lawson@byu.edu>

Description This package calls a modification of the published FORTRAN code for producing variance dispersion graphs. For more details on variance dispersion graphs see ``A Computer Program for Generating Variance Dispersion Graphs'' by G. Vining, Journal of Quality Technology, Vol. 25 No. 1 January 1993.

`Vdgraph-package` *This package creates variance dispersion graphs and fraction of design space plots for response surface designs*

Description

The **Vdgraph** package provides functions for creating Variance Dispersion Graphs and Fraction of Design Space Plots of a standardized response surface design stored in a matrix or a data frame.

The function `Vdgraph(des)` creates the variance dispersion graph of the response surface design stored in the matrix or data frame `des`. The function `FDSPlot(des)` creates the fraction of design space plot of the response surface design stored in the matrix or data frame `des`. Useful response surface designs are also included as matricies in the package. These include the hexagonal design for two factors `Hex2`, the small composite designs for 3 to 6 factors and Roquemore's hybrid designs for 3 to 6 factors. The function Compare2Vdg makes the variance dispersion graphs of two designs on the same scale for comparison.

Details

Package:	Vdgraph
Type:	Package
Version:	1.0-1

`Compare2FDS` *This function compares Fraction of Design Space Plots for two response surface designs.*

Description

This function compares Fraction of Design Space Plots for two response surface designs with the same number of factors over the unit hypercube design space.

Usage

```
Compare2FDS(des1, des2, name1, name2, mod=2)
```

Arguments

`des1`	des1 is a matrix or a data frame containing the first response surface design to be compared in coded or uncoded units. There should be one column for each factor in the design, and one row for each run in the design. The maximum number of rows allowed is 99, and the maximum number of columns is 7.
`des2`	des2 is a matrix or a data frame containing the second response surface design to be compared in coded or uncoded units. There should be one column for each factor in the design, and one row for each run in the design. The maximum number of rows allowed is 99, and the maximum number of columns is 7.
`name1`	name1 is a character string containing a descriptive name for the first design. This descriptive name should be no more than 40 characters in order to fit in the space for a legend. If left out name1 defaults to des1
`name2`	name2 is a character string containing a descriptive name for the second design. This descriptive name should be no more than 40 characters in order to fit in the space for a legend. If left out name2 defaults to des2
`mod`	mod is the model to be represented. 0 = linear model 1 = linear main effects plus linear by linear 2-factor interactions 2 = full quadratic response surface model (default.

Examples

```
data(SCDH5)
data(SCDDL5)
Compare2FDS(SCDH5, SCDDL5, "Hartley SCD-5", "Draper-Lin SCD5", mod=2)
```

`Compare2Vdg` *this function compares Variance Dispersion Graph of two response surface designs with the same number of factors on the same scale*

Description

This function calls the function Vardsgr which uses Vining's (1993) fortran code to get the coordinates of a two variance dispersion graph, and then makes the plot.

Usage

```
Compare2Vdg(des,des2,name1,name2,ncolleg)
```

Arguments

`des`	des is a matrix or a data frame containing the first response surface design to be compared in coded or uncoded units. There should be one column for each factor in the design, and one row for each run in the design. The maximum number of rows allowed is 99, and the maximum number of columns is 7.
`des2`	des2 is a matrix or a data frame containing the second response surface design to be compared in coded or uncoded units. There should be one column for each factor in the design, and one row for each run in the design. The maximum number of rows allowed is 99, and the maximum number of columns is 7.
`name1`	name1 is a character string containing a descriptive name for the first design. This descriptive name should be no more than 40 characters in order to fit in the space for a legend. If left out name1 defaults to des
`name2`	name2 is a character string containing a descriptive name for the second design. This descriptive name should be no more than 40 characters in order to fit in the space for a legend. If left out name2 defaults to des2
`ncolleg`	The number of columns in the legend this can be 1 or 2

Value

vdgpl

`vdgpl`	This is a graph containing the two Variance Dispersion Graphs, one for each design

Note

This function calls the function Vardsgr to get the coordinates for the plot.

f — *Calculate column means of design*

Description

This function calculates means of design.

Usage

```
f(x)
```

Arguments

x	This is a design matrix

Value

mean

mean	This is the mean of the design x

Note

This function is called by the function Vdgraph.

Author(s)

John S. Lawson <lawson@byu.edu>

FDSPlot — *This function makes a Fraction of Design Space Plot of a response surface design.*

Description

This function creates a Fraction of Design Space Plot over the hypercube design space from -1 to 1 on each component.

Usage

```
FDSPlot(des, mod=2)
```

Arguments

`des`	des is a matrix or a data frame containing a response surface design in coded or uncoded units. There should be one column for each factor in the design, and one row for each run in the design. The maximum number of rows allowed is 99, and the maximum number of columns is 7.
`mod`	mod is the model to be represented. 0 = linear model 1 = linear main effects plus linear by linear 2-factor interactions 2 = full quadratic response surface model (default.

mx *Calculate column maximums of design*

Description

This function calculates maximums of design.

Usage

```
mx(x)
```

Arguments

x	This is a design matrix

Value

mean

max	This is the maximum of the design x

Note

This function is called by the function FDSPlot.

`Vardsgr` *Loads compiled fortran in shared file vdg*

Description

This function loads and runs the compiled fortran code vdg. vdg is Vining's 1999 JQT fortran code for producing variance dispersion graphs.

Usage

```
Vardsgr(ndpts, kvar1, kdv1, rdes)
```

Arguments

ndpts	This is the number of runs in the response surface design (maximum=99).
kvar1	This is the number of factors in the design matrix (maximum=6).
kdv1	This is the product of ndpts and kvar1.
rdes	This is the response surface design matrix stored as a vector of the concatenated columns of the design matrix, one column for each factor in the design.

Value

vdgr

vdgr	This is the matrix of coordinates for the variance dispersion graph. It is stored as a vector of concatenated columns. Each column is of length 20, and there are four columns in the matrix. The first column is the radius from the center of the response surface design. The second column is the maximum variance of a predicted value, the third column is the minimum variance of a predicted value, and the fourth column is the average variance of a predicted value.

Note

This function is called by the function Vdgraph.

Vdgraph *this function makes a Variance Dispersion Graph of a response surface design*

Description

This function calls the function Vardsgr which uses Vining's (1993) fortran code to get the coordinates of a variance dispersion graph, and then makes the plot.

Usage

```
Vdgraph(des)
```

Arguments

des	des is a matrix or a data frame containing a response surface design in coded or uncoded units. There should be one column for each factor in the design, and one row for each run in the design. The maximum number of rows allowed is 99, and the maximum number of columns is 7.

Value

vdgpl

vdgpl	This is a graph containing the Variance Dispersion Graph

Note

This function calls the function Vardsgr to get the coordinates for the plot.
