

Package ‘GENLIB’

January 27, 2015

Type Package

Title Genealogical Data Analysis

Version 1.0.2

Date 2014-09-25

Description Genealogical data analysis including descriptive statistics (e.g., kinship and inbreeding coefficients) and gene-dropping simulations.

License GPL (≥ 2)

LazyLoad yes

Depends R ($\geq 3.1.0$), Rcpp ($\geq 0.9.10$)

Imports kinship2, methods, bootstrap, Matrix, lattice, quadprog, foreach, parallel, doParallel

LinkingTo Rcpp

Author Louis Houde [aut],
Jean-Francois Lefebvre [aut],

GenlibR-package *Genealogical Data Analysis*

Description

Genealogical data analysis including descriptive statistics (e.g., kinship and inbreeding coefficients) and gene-dropping simulations.

Details

Package: GenlibR
Type: Package
Version: 1.0
Date: 2012-04-04
License: GPL (>=2)
LazyLoad: yes

Author(s)

Louis Houde, Jean-Francois Lefebvre, Valery Roy-Lagace, Sebastien Lemieux

Classes of basic handling of genealogy data
Classes "GLmultiVector" "GLmultiArray4" "GLmultiMatrix"
"GLmultiNumber"

Description

Objects created to carry information mostly between invisible functions.

Objects from the Class

Objects can be created by calls of the form `new("GLmultiVector", 'matrix', depth = 'integer')`
`new("GLmultiArray4", 'Array', depth = 'integer')`
`new("GLmultiMatrix", 'Array', depth = 'integer')`
`new("GLmultiNumber", 'numeric', depth = 'integer', .Names = 'character')`

Slots

```

GLmultiVector
  Object of class "matrix"
  .Data: Object of class "integer"
    GLmultiArray4, GLmultiMatrix
  .Data: Object of class "array"
  depth: Object of class "integer"
    GLmultiNumber
  .Data: Object of class "numeric" ~~
  depth: Object of class "integer" ~~
  .Names: Object of class "character" ~~

```

Extends

Class `"matrix"`, from data part. Class `"array"`, by class `"matrix"`, distance 2. Class `"structure"`, by class `"matrix"`, distance 3. Class `"vector"`, by class `"matrix"`, distance 4, with explicit coerce.

Methods

```

[<- signature(x = "GLmultiVector", i = "ANY", j = "ANY", value = "ANY"): ...
[ signature(x = "GLmultiVector", i = "ANY", j = "ANY", drop = "ANY"): ...
depth signature(x = "GLmultiVector"): ...
Dim signature(object = "GLmultiVector"): ...

```

Examples

```

showClass("GLmultiVector")
showClass("GLmultiArray4")
showClass("GLmultiMatrix")
showClass("GLmultiNumber")

```

Classes of GLgroupe handling

<i>Classes</i>	"GLmultiPhiGroup"	"GLmultiPhiGroupSingle"
	"GLmultiFGroup"	"GLmultiFGroupSingle"
	"GLCGMatrixGroupSingle"	

Description

Objects used to carry information mostly between invisible functions.

Objects from the Class

Objects can be created by calls of the form

```
new("GLmultiPhiGroup", MatriceCG, groupe = 'GLgroupe', grindice = 'list')
new("GLmultiPhiGroupSingle", MatriceCG, groupe = 'GLgroupe', grindice = 'list')
new("GLmultiFGroup", MatriceCG, groupe = 'GLgroupe', grindice = 'list')
new("GLmultiFGroupSingle", MatriceCG, groupe = 'GLgroupe', grindice = 'list')
new("GLCGMatrixGroupSingle", MatriceCG, groupe = 'GLgroupe', grindice = 'list')
```

Slots

GLCGMatrixGroupSingle, GLmultiFGroupSingle, GLmultiPhiGroupSingle

Object of class "matrix"

.Data: Object of class "GLgroupe"

grindice: Object of class "list" containing the indices of the probands of 'groupe'

GLmultiPhiGroup :

.Data: Object of class "GLmultiMatrix"

groupe: Object of class "GLgroupe"

grindice: Object of class "list" containing the indices of the probands of 'groupe'

GLmultiFGroup :

.Data: Object of class "GLmultiVector"

groupe: Object of class "GLgroupe"

grindice: Object of class "list" containing the indices of the probands of 'groupe'

Extends

Class "**matrix**", from data part. Class "**array**", by class "matrix", distance 2. Class "**structure**", by class "matrix", distance 3. Class "**vector**", by class "matrix", distance 4, with explicit coerce.

Methods

```
[<- signature(x = "GLCGMatrixGroupSingle", i = "ANY", j = "ANY", value = "ANY"):
...
[ signature(x = "GLCGMatrixGroupSingle", i = "ANY", j = "ANY", drop = "ANY"): ...
groupe signature(x = "GLCGMatrixGroupSingle"): ...
```

Examples

```
showClass("GLCGMatrixGroupSingle")
showClass("GLmultiFGroup")
showClass("GLmultiFGroupSingle")
showClass("GLmultiPhiGroupSingle")
showClass("GLmultiPhiGroup")
```

gen.branching *Genealogy subset*

Description

Creates an object of class GLgen from an existing GLgen object by selecting specified individuals.

Usage

```
gen.branching( gen, pro = 0, ancestors = gen.founder(gen), check = 1, bflag = 0)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Default is 0, which will select all individuals without children.
ancestors	Vector of ancestors id numbers to be included. Default includes all founders in the original GLgen object.
check	If check=1 (default), all parameters are validated.
bflag	If set to 0 (default and recommended), probands and founders are filtered to quicken the calculations.

Value

returns a GLgen object

Note

Note that if there are no links between some probands and ancestors, these ids will not be included.

See Also

[gen.genealogy](#) [gen.graph](#) [gen.lineages](#)

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
genJi_part<-gen.branching(genJi,pro=c(2,28))

## Not run: Plots of original genealogy and of the branched version
layout(matrix(1:2,c(1,2),byrow=TRUE))
gen.graph(genJi)
mtext("Original", line=2, cex=1.2)
gen.graph(genJi_part)
mtext("Branched tree\nfor individuals 2 and 28", line=1, cex=1.2)
```

gen.children	<i>Get id numbers of children</i>
--------------	-----------------------------------

Description

Returns the id numbers of the children of specified individuals.

Usage

```
gen.children( gen, individuals, check = "1", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
individuals	Vector of individual id numbers. Required.
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

returns a vector of integer

See Also

[gen.genealogy](#) [gen.pro](#) [gen.founder](#) [gen.sibship](#) [gen.parent](#)

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
gen.children(genJi, individuals=14)

data(genea140)
gen140<-gen.genealogy(genea140)
children51052<-gen.children(gen140, 51052)
gen.graph(gen140, pro=c(children51052))
```

gen.completeness *Completeness*

Description

Returns the completeness of the genealogical data for the specified probands

Usage

```
gen.completeness( gen, pro="0", genNo=-1, type="MEAN", check="1", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Default is 0, which will select all individuals without children.
genNo	Vector of generation numbers at which completeness should be calculated. Default is -1, which calculates completeness at each generation.
type	If type="MEAN" (default), mean completeness over all specified probands is calculated. If type="IND", completeness is calculated for each specified proband.
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

A data frame with each generation at which the completeness is calculated as rows and one column when type is "MEAN". When type is "IND", the number of columns equals the number of probands specified.

References

Cazes P, Cazes MH. (1996) Comment mesurer la profondeur genealogique d'une ascendance? Population (French Ed) 51:117-140.

See Also

[gen.genealogy](#) [gen.rec](#) [gen.occ](#) [gen.implex](#) [gen.entropy](#)

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
gen.completeness(genJi, type="IND")
## Not run: For the 4th generation
gen.completeness(genJi, type="IND", genNo=4)
```

```
data(genea140)
gen140<-gen.genealogy(genea140)
gen.completeness(gen140)
```

gen.completenessVar *Variance of completeness index*

Description

Returns the variance of the completeness index across probands.

Usage

```
gen.completenessVar( gen, pro = "0", genNo = -1, check = "1", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Default is 0, which will select all individuals without children.
genNo	Vector of generation numbers at which completeness should be calculated. Default is -1, which calculates completeness at each generation.
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

A data frame with one column and each generation at which the variance is calculated as rows.

References

Cazes P, Cazes MH. (1996) Comment mesurer la profondeur genealogique d'une ascendance? Population (French Ed) 51:117-140.

See Also

[gen.gc](#)

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
gen.completeness(genJi, type="IND")
gen.completenessVar(genJi)
## Not run: For the 4th generation
gen.completenessVar(genJi, genNo=4)
```

```
data(genea140)
gen140<-gen.genealogy(genea140)
gen.completeness(gen140)
gen.completenessVar(gen140)
```

gen.depth	<i>Genealogy depth</i>
-----------	------------------------

Description

Returns the number of generations in the genealogy from a GLgen object.

Usage

```
gen.depth(gen)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
-----	--

Value

returns a vector of integer

See Also

[gen.genealogy](#) [gen.min](#) [gen.mean](#) [gen.min](#) [gen.entropy](#)

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
gen.depth(genJi)
```

```
data(genea140)
gen140<-gen.genealogy(genea140)
gen.depth(gen140)
```

gen.entropy	<i>Genealogical entropy (expected genealogical depth)</i>
-------------	---

Description

Returns the expected genealogical depth, a measure of genealogical entropy.

Usage

```
gen.entropy( gen, pro = "0", type = "MEAN", check = "1", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Default is 0, which will select all individuals without children.
type	If type="MEAN" (default), mean entropy over all specified probands is calculated. If type="IND", entropy is calculated for each specified proband.
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

A data frame with only one numeric value when type is "MEAN". When type is "IND", the number of rows equals the number of probands specified.

gen.entropy(genJi)
gen.entropy(genJi, type="IND")
```

```
data(genea140)
```

```
gen140<-gen.genealogy(genea140)
gen.entropy(gen140)
gen.entropy(gen140, pro=c(454422, 676521, 677273, 717537, 717634, 717709, 868572))
gen.entropy(gen140, pro=c(454422, 676521, 677273, 717537, 717634, 717709, 868572), type="IND")
```

gen.entropyVar	<i>Variance of entropy index</i>
----------------	----------------------------------

Description

Returns the variance of the entropy index

Usage

```
gen.entropyVar( gen, pro = "0", type = "MEAN", check = "1", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Default is 0, which will select all individuals without children.
type	If type="MEAN" (default), the average of entropy variances (over all probands) is returned. If type="IND", the variance of the entropy is calculated for each specified proband.
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

A data frame with only one numeric value when type is "MEAN". When type is "IND", the number of rows equals the number of probands specified.

genJi<-gen.genealogy(geneaJi)
gen.entropy(genJi, type="IND")
gen.entropyVar(genJi, type="IND")
gen.entropyVar(genJi, type="MEAN")

data(genea140)
gen140<-gen.genealogy(genea140)
gen.entropy(gen140)
gen.entropy(gen140, pro=c(454422, 676521, 677273, 717537, 717634, 717709, 868572))
gen.entropyVar(gen140, pro=c(454422, 676521, 677273, 717537, 717634, 717709, 868572))
gen.entropyVar(gen140, pro=c(454422, 676521, 677273, 717537, 717634, 717709, 868572), type="MEAN")

gen.entropy(gen140, pro=c(454422, 676521, 677273, 717537, 717634, 717709, 868572), type="IND")
gen.entropyVar(gen140, pro=c(454422, 676521, 677273, 717537, 717634, 717709, 868572), type="IND")

```

gen.f	<i>Inbreeding coefficient</i>
-------	-------------------------------

Description

Returns the inbreeding coefficients of the specified probands

Usage

```
gen.f( gen, pro, depthmin= (gen.depth(gen)-1), depthmax= (gen.depth(gen)-1), check = "1")
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included.
depthmin	Minimum genealogical depth to consider in the calculation. Default is the whole genealogy.
depthmax	Maximum genealogical depth to consider in the calculation. Default is the whole genealogy.
check	If check=1 (default), all parameters are validated.

Value

A vector or GLmultiVector object depending on the number of generations treated. GLmultiVector is an array of vectors, one for each depth. Array of size ('depthMax'-'depthMin'), vectors of size 'length(pro)'. A vector of size 'length(pro)' is returned when ('depthMax'-'depthMin') equals 1.

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
f_values<-gen.f(genJi)
f_values
f_allgen<-gen.f(genJi, depthmin=1)
f_allgen<-unclass(f_allgen)

plot(1:7,f_allgen[1,],type="b",xlab="Generation",ylab="Inbreeding values",ylim=c(0,0.25),pch=0)
points(1:7,f_allgen[3,], type="b", lty=12, pch=1)
legend("topright", legend=c("Individual 1", "Individual 29"),lty=c(1,12), pch=c(0,1))

data(genea140)
gen140<-gen.genealogy(genea140)
inbreeding_val<-gen.f(gen140)
boxplot(inbreeding_val, horizontal=TRUE, xlab="Inbreeding values")
```

gen.fCI

Average inbreeding coefficient confidence interval

Description

Returns the confidence interval of the average inbreeding among specified individuals

Usage

```
gen.fCI(vectF, prob=c(0.025,0.05,0.95,0.975), b="5000", print.it="F", check="1")
```

Arguments

vectF A vector of inbreeding coefficients obtained for example with gen.f. Required.

prob Confidence limits probabilities. Default is probs=c(0.025, 0.05, 0.95, 0.975).

b Number of simulations used to calculate the confidence interval. Default is b="5000".

print.it	If print.it="F" (default), progression in the number of simulations performed is not displayed.
check	If check=1 (default), all parameters are validated.

Value

A vector or a GLmultiVector object depending on the type of 'vectF' entered. If 'vectF' is a GLmultiVector, an array of vectors (GLmultiVector), one for each depth, is returned. Array of size ('depthMax'-'depthMin'), vectors of size 'length(probs)'. If 'vectF' is a GLmultiVector, a vector of size 'length(probs)' is returned.

See Also

[gen.f](#)

Examples

```
data(genea140)
gen140<-gen.genealogy(genea140)
gen10 <-gen.branching(gen140, pro=gen.pro(gen140)[c(1:10)])
fval<-gen.f(gen10)
gen.fCI(fval)
```

gen.find.Min.Distance.MRCA

Finds the minimum distances between pairs of individuals given a set of ancestors.

Description

Returns the shortest distances (number of meioses) between pairs of probands given the matrix of MRCAs output by the gen.findMRCA function.

Usage

```
gen.find.Min.Distance.MRCA(genMatrix, individuals="ALL", ancestors="ALL")
```

Arguments

genMatrix	Matrix of most recent common ancestors, MRCAs, obtained with gen.findMRCA. Required.
individuals	Vector of proband id numbers to include. All are included by default.
ancestors	Vector of MRCA id numbers to include. All are included by default.

Value

returns a matrix

See Also

[gen.genealogy](#) [gen.founder](#) [gen.findMRCA](#) [gen.findDistance](#) [gen.findFounders](#)

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
matMRCA<-gen.findMRCA(genJi, individuals=c(1,29), NbProcess = 1)
gen.find.Min.Distance.MRCA(matMRCA)

## Not run: Increasing NbProcess will decrease execution time
data(genea140)
gen140<-gen.genealogy(genea140)
matMRCA<-gen.findMRCA(gen140, individuals=c(409033,408728,408828), NbProcess = 1)
gen.find.Min.Distance.MRCA(matMRCA, individuals=c(409033,408728))
```

<code>gen.findDistance</code>	<i>Minimum genetic distance between two individuals</i>
-------------------------------	---

Description

Returns the minimum distance (number of meioses) between the specified individuals through one specified ancestor.

Usage

```
gen.findDistance(gen, individuals, ancestor)
```

Arguments

<code>gen</code>	An object of class <code>GLgen</code> obtained with <code>gen.genealogy</code> , <code>gen.lineages</code> or <code>gen.branching</code> . Required.
<code>individuals</code>	A vector of individual id numbers between which to calculate the distance. Required.
<code>ancestor</code>	A common ancestor to the specified individuals. Required.

Value

returns a numeric value

See Also

[gen.genealogy](#) [gen.founder](#) [gen.findMRCA](#) [gen.findFounders](#) [gen.find.Min.Distance.MRCA](#)

Examples

```

data(geneaJi)
genJi<-gen.genealogy(geneaJi)
gen.findDistance(genJi, individuals=c(1,29), ancestor=17)
gen.findDistance(genJi, individuals=c(1,29), ancestor=26)

data(genea140)
gen140<-gen.genealogy(genea140)
gen.findDistance(gen140, individuals=c(409033,408728), ancestor=38714)
gen.findDistance(gen140, individuals=c(408728,408828), ancestor=95080)

```

gen.findFounders	<i>Find common founder ancestors</i>
------------------	--------------------------------------

Description

Returns all the ancestors that are founders for specified individuals in the genealogy.

Usage

```
gen.findFounders(gen, individuals, NbProcess=detectCores()-1)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
individuals	Vector of individual id numbers for which to find the founders. Required
NbProcess	Number of processes to use when running this function. Default=detectCores()-1

Value

A vector of integers

Note

Uses slave processes to make the search faster. Those slave processes launch the function gen.getFoundersMPI.

See Also

Examples

```

data(geneaJi)
genJi<-gen.genealogy(geneaJi)
gen.founder(genJi)
gen.findFounders(genJi, individuals=c(1,29), NbProcess = 1)

data(genea140)
gen140<-gen.genealogy(genea140)
gen2<-gen.branching(gen140,pro=c(409033,408728))
## Not run: 615 founders in genealogy of #409033 and #408728
all_founders<-gen.founder(gen2)
length(all_founders)

all_commonFounders<-gen.findFounders(gen140, individuals=c(409033,408728), NbProcess = 1)
length(all_commonFounders) ## Not run: 127 founders common to #409033 and #408728

```

gen.findMRCA	<i>Finding most recent common ancestors, MRCAs</i>
--------------	--

Description

Returns MRCAs of pairs of specified individuals and the distance (number of meioses) between individuals through the MRCAs.

Usage

```
gen.findMRCA(gen, individuals, NbProcess=detectCores()-1)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
individuals	Vector of individual id numbers for which to find the MRCAs. Required
NbProcess	Number of processes to use when running this function. Default=detectCores()-1

Value

returns a matrix

Note

This function uses the parallel programming functions of foreach, snow and doSNOW for launching several processes.

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
gen.findMRCA(genJi, individuals=c(1,29), NbProcess = 1)

## Not run: For a more complex example:
data(genea140)
gen140<-gen.genealogy(genea140)
all_commonFounders<-gen.findFounders(gen140, individuals=c(409033,408728), NbProcess = 1)
## Not run: 127 founders common to #409033 and #408728
length(all_commonFounders)
## Not run: 22 most recent common ancestors for #409033 and #408728
MRCA_2ind<-gen.findMRCA(gen140, individuals=c(409033,408728), NbProcess = 1)
```

gen.founder

Get founder id numbers

Description

Returns the id numbers of the founders. Founders are defined as the individuals without parents in the genealogy (i.e., mother id=0, father id=0).

Usage

```
gen.founder( gen, check = "1", ...)
```

Arguments

gen	An object of class GLgen obtained with <code>gen.genealogy</code> , <code>gen.lineages</code> or <code>gen.branching</code> . Required.
check	If <code>check=1</code> (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

A vector of integer

Examples

```

data(geneaJi)
genJi<-gen.genealogy(geneaJi)
## Not run: There are 6 founders
gen.founder(genJi)

data(genea140)
gen140<-gen.genealogy(genea140)
founder140<-gen.founder(gen140)
## Not run: There are 7399 founders
length(founder140)

```

gen.gc

*Genetic contribution of ancestors***Description**

Returns the genetic contribution of ancestors to the gene pool of specific probands

Usage

```
gen.gc(gen, pro=0, ancestors=0, vctProb=c(0.5,0.5,0.5,0.5), typeCG="IND", check=1)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Default is 0, which will select all individuals without children.
ancestors	Vector of ancestors id numbers to be included. Default is 0, which will select all individuals without parents.
vctProb	Vector of transmission probabilities. Default is vctProb=c(0.5,0.5,0.5,0.5).
typeCG	IF typeCG="IND" (default), the genetic contribution from each ancestor is calculated for each proband. If typeCG="MEAN", the average (over all probands) genetic contributions of each ancestor is returned. If typeCG="PRODUCT", the product (over all probands) of genetic contributions is returned for each ancestor. If typeCG="TOTAL", the sum (over all probands) of genetic contributions is returned for each ancestor. If typeCG="CUMUL", ancestors are ranked in decreasing order of total contribution and cumulative contribution is returned.
check	If check=1 (default), all parameters are validated.

Value

A matrix with rows corresponding to probands and columns corresponding to ancestors when typeCG="IND". For the other typeCG values, rows are ancestors and there is one column containing mean, product, total or cumulative values.

```

gen.genealogy

Create object of class GLgen

Description

Creates an object of class GLgen that contains the ascending genealogies derived from input data in pedigree format

Usage

```
gen.genealogy(ped, check = "1", ...)
```

Arguments

ped A matrix or data frame with the following columns: individual id, father id, mother id, sex. Required. Individual id numbers must be numeric and unique. If an individual does not have a father and/or mother, the father and/or mother id numbers must be set to 0. All non-zero father and mother id numbers must also appear in the individual id column. Sex must be equal to M or 1 for males and F or 2 for females. The sex column is optional for this function but necessary for some other functions using GLgen objects.

check If check=1 (default), all parameters are validated.
 ... Additionnal arguments to be passed to methods.

Value

An object of class GLgen.

## Not run: Print basic information about the genealogy
genJi
```

gen.genout	<i>Create pedigree data</i>
------------	-----------------------------

Description

Creates data frame in pedigree format from an object of class GLgen

Usage

```
gen.genout( gen, sorted = "F", check = "1")
```

Arguments

gen	An object of class GLgen obtained with <code>gen.genealogy</code> , <code>gen.lineages</code> or <code>gen.branching</code> . Required.
sorted	If sorted="F" (default), individual id number are not sorted in output data. Id numbers for parents will be placed before their children ids. If sorted="T", individual id numbers will be sorted.
check	If check=1 (default), all parameters are validated.

Value

returns a data.frame containing the following: **ind father mother sex**

`gen.getAncestorsPAR` *Internal function used by `gen.findMRCA`*

Description

`gen.getAncestorsPAR` is an internal function used by `gen.findMRCA`.

Usage

```
gen.getAncestorsPAR(gen, pro)
```

Arguments

<code>gen</code>	The genealogy to consider.
<code>pro</code>	probands to consider

Value

Vector of the founders identity.

See Also

[gen.findMRCA](#) [gen.grimperPAR](#)

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
gen.findMRCA(genJi, individuals=c(1,29), NbProcess = 1)
```

`gen.getFoundersPAR` *Internal function used by `gen.findFounders`*

Description

`gen.getFoundersPAR` is an internal function used by `gen.findFounders`.

Usage

```
gen.getFoundersPAR(gen, pro)
```

Arguments

<code>gen</code>	The genealogy to consider.
<code>pro</code>	probands to consider

Value

A vector of the founders identity.

See Also

[gen.findFounders](#) [gen.findDistance](#)

Examples

```
data(geneaJi)

gen.founder(genJi, individuals=c(1,29))
gen.findFounders(genJi, individuals=c(1,29), NbProcess = 1)
```

gen.graph

Pedigree graphical tool

Description

Function that plots pedigrees of GLgen objects.

Usage

```
gen.graph( gen, pro=gen.pro(gen), ancestors=gen.founder(gen),
  indVarAffected=gen.genout(gen)$ind, varAffected=gen.genout(gen)$ind, cex="1",
  col="0", symbolsize="1", width="1", packed="F", align="T", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Default is 'gen.pro(gen)', which will select all individuals without children.
ancestors	Vector of ancestors id numbers to be included. Default is 'gen.founder(gen)', which will select all individuals without parents.
indVarAffected	Vector of individuals id numbers used for labeling. Default is 'gen.genout(gen)\$ind', which is all the individuals of the genealogy.
varAffected	Vector of individuals labels. Default is 'gen.genout(gen)\$ind', meaning that the individuals labels are their ids.
cex	Controls text size (same as kinship2::plot.pedigree). Default is 1.
col	Color for each id (same as kinship2::plot.pedigree). Default is 0, which assigns the same color to everyone.
symbolsize	Controls symbolsize (same as kinship2::plot.pedigree). Default is 1.
width	For a packed pedigree, the minimum width allowed in the realignment of pedigrees (same as kinship2::plot.pedigree). Default is 1.
packed	If T, uniform distance between all individuals at a given level (same as kinship2::plot.pedigree). Default is FALSE.
align	Controls the extra effort spent trying to align children underneath parents, but without making the pedigree too wide (same as kinship2::plot.pedigree). Default is TRUE.
...	Other arguments that can be passed to the kinship2::plot.pedigree.

Value

Returns the same invisible list as that returned by kinship2::plot.pedigree, which contains the following: **plist** list containing the information about the pedigree (n, id, pos, fam, spouse) **x** x-axis position **y** y-axis position **boxw** box width **boxh** box height **call** the call made to plot.pedigree() (kinship2 package)

```

<code>gen.grimperPAR</code>	<i>Internal function used by <code>gen.findMRCA</code></i>
-----------------------------	--

Description

`gen.grimperPAR` is an internal function used by `gen.findMRCA`.

Usage

```
gen.grimperPAR(gen, individuals, founder)
```

Arguments

<code>gen</code>	The genealogy to consider.
<code>individuals</code>	probands to consider
<code>founder</code>	the founder by which the distance is calculated

Value

returns a list containing the founder ID and the distance.

See Also

[gen.findMRCA](#) [gen.getAncestorsPAR](#)

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
gen.findMRCA(genJi, individuals=c(1,29), NbProcess = 1)
```

gen.half.founder *Get half-founder id numbers*

Description

Returns the id numbers of the half-founders. Half-founders are defined as the individuals with only one founder parent in the genealogy.

Usage

```
gen.half.founder( gen, check = "1", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

returns a vector of integer

See Also

[gen.genealogy](#) [gen.pro](#) [gen.founder](#) [gen.parent](#)

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
## Not run: There are 2 half-founders
gen.half.founder(genJi)
```

gen.implex *Genealogical implex*

Description

Returns the genealogical implex index (a measure of pedigree collapsing) for the specified probands.

Usage

```
gen.implex( gen, pro = "0", genNo = -1, type = "MEAN", onlyNewAnc = "F", check = "1", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Default is 0, which will select all individuals without children.
genNo	Vector of generation numbers at which the implex should be calculated. Default is -1, which calculates the implex at each generation.
type	If type="MEAN" (default), implex index values are averaged over all specified probands. If type="IND", the implex index is calculated for all specified proband together. If type="ALL", the implex index is calculated for each specified proband.
onlyNewAnc	If onlyNewAnc="F" (default), all ancestors will be considered. If onlyNewAnc="T", only new ancestors will be counted (i.e., an ancestor is not counted again if it has already been counted in another generation).
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

A data frame with each generation at which the completeness is calculated as rows and one column when type is "MEAN". When type is "IND", the number of columns equals the number of probands specified.

gen.implex(genJi, type="IND", genNo=5)
```

```
data(genea140)
gen140<-gen.genealogy(genea140)
gen.implex(gen140)
gen.implex(gen140, pro=c(454422, 676521, 677273, 717537, 717634, 717709, 868572))
gen.implex(gen140, pro=c(454422, 676521, 677273, 717537, 717634, 717709, 868572), type="IND")
```

gen.implexVar	<i>Variance of genealogical implex</i>
---------------	--

Description

Returns the variance of the implex index across probands.

Usage

```
gen.implexVar( gen, pro = "0", onlyNewAnc = "F", genNo = -1, check = "1", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Default is 0, which will select all individuals without children.
onlyNewAnc	If onlyNewAnc="F" (default), all ancestors will be considered. If onlyNewAnc="T", only new ancestors will be counted (i.e., an ancestor is not counted again if it has already been counted in another generation).
genNo	Vector of generation numbers at which the implex should be calculated. Default is -1, which calculates the implex at each generation.
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

A data frame with one column and each generation at which the variance is calculated as rows

```

gen.lineages

Create object of class GLgen for maternal or paternal lineages

Description

Creates an object of class GLgen that contains maternal or paternal lineages selected from input data in pedigree format

Usage

```
gen.lineages(ped, pro = "0", maternal = "T", check = "1", ...)
```

Arguments

ped	A matrix or data frame with the following columns: individual id, father id, mother id, sex. Required. Individual id numbers must be numeric and unique. If an individual does not have a father and/or mother, the father and/or mother id numbers must be set to 0. All non-zero father and mother id numbers must also appear in the individual id column. Sex must be equal to M or 1 for males and F or 2 for females. The sex column is optional for this function but necessary for some other functions using GLgen objects.
pro	Vector of individual id numbers for which lineages should be included. Optional.
maternal	If mat="T" (default), maternal lineages are selected. mat="F" returns paternal lineages.
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

returns a GLgen object

gen.graph(genJi_FaLi)
mtext("Paternal\nlineages", line=1)

```

gen.max	<i>Maximum number of generations</i>
---------	--------------------------------------

Description

Returns the maximum number of generations between all probands and the individuals specified. Probands are defined as the individuals without children in the genealogy.

Usage

```
gen.max( gen, individuals, check = "1")
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
individuals	A vector of ids specifying the individuals to include in the calculation. Required.
check	If check=1 (default), all parameters are validated.

Value

returns a vector of integer

See Also

gen.max(genJi,c(17,26))
```

```
data(genea140)
gen140<-gen.genealogy(genea140)
gen.min(gen140,c(18311,18430))
gen.mean(gen140,c(18311,18430))
gen.max(gen140,c(18311,18430))
```

gen.mean

Mean number of generations

Description

Returns the average number of generations between all probands and the individuals specified. Probands are defined as the individuals without children in the genealogy.

Usage

```
gen.mean( gen, individuals, check = "1")
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
individuals	A vector of ids specifying the individuals to include in the calculation. Required.
check	If check=1 (default), all parameters are validated.

Value

returns a numeric value

```

```
data(genea140)
gen140<-gen.genealogy(genea140)
gen.min(gen140,c(18311,18430))
gen.mean(gen140,c(18311,18430))
gen.max(gen140,c(18311,18430))
```

gen.min	<i>Minimum number of generations</i>
---------	--------------------------------------

Description

Returns the minimum number of generations between all probands and the individuals specified. Probands are defined as the individuals without children in the genealogy.

Usage

```
gen.min( gen, individuals, check = "1")
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
individuals	A vector of ids specifying the individuals to include in the calculation. Required.
check	If check=1 (default), all parameters are validated.

Value

returns a vector of integer

```

```
data(genea140)
gen140<-gen.genealogy(genea140)
gen.min(gen140,c(18311,18430))
gen.mean(gen140,c(18311,18430))
gen.max(gen140,c(18311,18430))
```

<code>gen.nochildren</code>	<i>Number of children</i>
-----------------------------	---------------------------

Description

Returns the number of children for specified individuals

Usage

```
gen.nochildren( gen, individuals, check = "1")
```

Arguments

<code>gen</code>	An object of class <code>GLgen</code> obtained with <code>gen.genealogy</code> , <code>gen.lineages</code> or <code>gen.branching</code> . Required.
<code>individuals</code>	A vector of ids of the individuals on each of whom the number of children is to be returned. Required.
<code>check</code>	If <code>check=1</code> (default), all parameters are validated.

Value

A vector containing the number of children for each individual specified.

See Also

[gen.genealogy](#) [gen.nowomen](#) [gen.noind](#) [gen.nomen](#) [gen.children](#)

Examples

```
data(geneaJi)

gen.nochildren(genJi,individuals=c(1,12,14,20))
```

```
data(genea140)
gen140<-gen.genealogy(genea140)
children51052<-gen.children(gen140,51052)
gen.nochildren(gen140,51052)
gen.graph(gen140, pro=children51052)
```

gen.noind	<i>Number of individuals</i>
-----------	------------------------------

Description

Returns the number of individuals included in the genealogy

Usage

```
gen.noind( gen, check = "1")
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
check	If check=1 (default), all parameters are validated.

Value

returns a vector of integer

See Also

```

gen.nomen	<i>Number of men</i>
-----------	----------------------

Description

Returns the number of men included in the genealogy

Usage

```
gen.nomen( gen, check = "1")
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
check	If check=1 (default), all parameters are validated.

Value

returns a vector of integer

See Also

[gen.genealogy](#) [gen.nowomen](#) [gen.nochildren](#) [gen.noind](#)

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
gen.nomen(genJi)
```

gen.nowomen	<i>Number of women</i>
-------------	------------------------

Description

Returns the number of women included in the genealogy

Usage

```
gen.nowomen( gen, check = "1")
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
check	If check=1 (default), all parameters are validated.

Value

returns a vector of integer

See Also

[gen.genealogy](#) [gen.nomen](#) [gen.nochildren](#) [gen.noind](#)

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
gen.nowomen(genJi)
```

gen.occ

Ancestor occurrences

Description

Returns the number of times that the specified ancestors are present in the genealogies of the specified probands.

Usage

```
gen.occ( gen, pro = "0", ancestors = "0", typeOcc = "IND", check = "1", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Default is 0, which will select all individuals without children.
ancestors	Vector of ancestors id numbers to be included. Default is 0, which will select all individuals without parents.
typeOcc	If typeOcc="IND" (default), the number of occurrences for each proband will be returned. If typeOcc="TOTAL", the sum of all occurrences over all probands will be returned.
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

A matrix with number of lines equal to the number of ancestors included and the number of columns equal to the number of probands included if typeOcc="BRUT" or only one column if typeOcc="TOTAL"

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
## Not run: Number of occurrences of ancestors in the specified proband's genealogy
gen.occ(genJi, pro=c(1,29), ancestors=c(3,6,10,12,14,16,18,20,26,28))

data(genea140)
gen140<-gen.genealogy(genea140)
gen.occ(gen140, pro=c(454422,676521,677273,717537,717634,717709,868572),
        ancestors=c(18305,18528,31114,18325))
```

gen.parent

Get id numbers of parents

Description

Returns the id numbers of the parents of specified individuals.

Usage

```
gen.parent( gen, individuals, output = "FaMo", check = "1", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
individuals	Vector of individual id numbers. Required.
output	If output="FaMo" (default) then both mothers and fathers are included. "Mo" outputs mothers only and "Fa", fathers only.
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

returns a list containing the following: **Fathers Mothers**

See Also

[gen.genealogy](#) [gen.pro](#) [gen.founder](#) [gen.children](#) [gen.sibship](#)

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
gen.parent(genJi, individuals=c(3,21,29))
```

gen.phi	<i>Kinship coefficient</i>
---------	----------------------------

Description

Returns the kinship coefficients between pairs of individuals

Usage

```
gen.phi(gen, pro, depthmin=(gen.depth(gen)-1), depthmax=(gen.depth(gen)-1), MT=F,
        check=1)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Required.
depthmin	Minimum genealogical depth to consider in the calculation. Default is the whole genealogy.
depthmax	Maximum genealogical depth to consider in the calculation. Default is the whole genealogy.
MT	Allows parallel computing when set to TRUE. Default is MT=F.
check	If check=1 (default), all parameters are validated.

Value

A matrix or a GLmultiMatrix object depending on the number of generations treated. GLmultiMatrix is an array of matrices, one for each depth. Array of size ('depthMax'-'depthMin') and matrices of size 'length(pro)' * 'length(pro)'. The matrix object, also of size 'length(pro)' * 'length(pro)', is returned when ('depthMax'-'depthMin') equals 1.

legend("topright", legend=c("Individuals 1 and 2", "Individuals 2 and 29"),lty=c(1,12), pch=c(0,1))

```

gen.phiCI

Average kinship confidence interval

Description

Returns the confidence interval of the average kinship among pairs of specified individuals

Usage

```
gen.phiCI(phiMatrix, prob=c(0.025,0.05,0.95,0.975), b=5000, print.it=F, check=1)
```

Arguments

phiMatrix	A square matrix of kinship coefficients obtained for example with gen.phi, or an array of square matrices (GLmultiMatrix object) of kinship coefficients obtained with gen.phi. Required.
prob	Confidence limits probabilities. Default is probs=c(0.025, 0.05, 0.95, 0.975).
b	Number of simulations used to calculate the confidence interval. Default is b="5000".
print.it	If print.it="F" (default), progression in the number of simulations performed is not displayed.
check	If check=1 (default), all parameters are validated.

Value

A vector or a GLmultiVector object depending on the type of 'phiMatrix' entered. If 'phiMatrix' is a GLmultiMatrix, an array of vectors (GLmultiVector), one for each depth, is returned. Array of size ('depthMax'-'depthMin'), vectors of size 'length(probs)'. If 'phiMatrix' is a matrix, a vector of size 'length(probs)' is returned.

gen.phiCI(phiMat)
```

gen.phiMean

Average kinship

Description

Returns the average kinship among pairs of specified individuals

Usage

```
gen.phiMean( phiMatrix, check = "1")
```

Arguments

phiMatrix	A square matrix of kinship coefficients obtained for example with gen.phi. Required.
check	If check=1 (default), all parameters are validated.

Value

returns a numeric value

gen.phiMean(phi6subjects)
```

gen.phiOver	<i>Kinship above threshold</i>
-------------	--------------------------------

Description

Returns the pairs of individuals with kinship coefficient values greater than specified threshold

Usage

```
gen.phiOver( phiMatrix, threshold)
```

Arguments

phiMatrix	A square matrix of kinship coefficients obtained for example with gen.phi. Required.
threshold	Threshold of kinship values to return.

Value

A data frame containing the probands and their kinship.

```

```
gen.phiOver(phi9subj,0.025)
```

gen.pro	<i>Get proband id numbers</i>
---------	-------------------------------

Description

Returns the id numbers of the probands. Probands are defined as the individuals without children in the genealogy.

Usage

```
gen.pro( gen, check = "1", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

returns a vector of integer

```

```
data(genea140)
gen140<-gen.genealogy(genea140)
gen.pro(gen140)
## Not run: There are 140 proposants
```

gen.rec *Ancestors coverage*

Description

Returns the number of specified probands genealogically related to specified ancestors (i.e., ancestor occurs in the proband's genealogy).

Usage

```
gen.rec( gen, pro = "0", ancestors = "0", check = "1", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Default is 0, which will select all individuals without children.
ancestors	Vector of ancestors id numbers to be included. Default is 0, which will select all individuals without parents.
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

A matrix with number of lines equal to the number of ancestors specified and one column.

Note

If an ancestor is also a proband, he/she will be counted in his/her coverage.

See Also

## Not run: Number of probands which are descendants of an ancestor
gen.rec(genJi)
```

```
data(genea140)
gen140<-gen.genealogy(genea140)
gen.rec(gen140, ancestors=c(18305, 18528, 31114, 18325))
```

gen.sibship *Get id numbers of siblings*

Description

Returns the id numbers of the siblings of specified individuals.

Usage

```
gen.sibship( gen, individuals, halfSibling = "T", check = "1", ...)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
individuals	Vector of individual id numbers. Required.
halfSibling	If halfSibling="T" (default) then ids of halfsiblings are also returned. halfSibling="F" returns only full sibling ids.
check	If check=1 (default), all parameters are validated.
...	Additional arguments to be passed to methods.

Value

returns a vector of integer

gen140<-gen.genealogy(genea140)
sibs<-gen.sibship(gen140,individuals=10174, halfSibling=FALSE)
gen.graph(gen140, pro=c(10174,sibs))
```

gen.simuProb *Gene dropping simulations - Probabilities*

Description

Returns the probabilities that specified probands inherit disease alleles from ancestors.

Usage

```
gen.simuProb(gen, pro, statePro, ancestors, stateAncestors, simulNo=5000,
             probRecomb=c(0,0), probSurvival=1.0)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Required.
statePro	Required vector indicating, for each proband in pro, the probability to be calculated: 0 = no disease allele is transmitted 1 = 1 disease allele is transmitted 2 = 2 disease alleles are transmitted
ancestors	Vector of ancestors id numbers to be included. Required.
stateAncestors	Required vector indicating, for each ancestor in ancestors, the genotype state: 0 = no disease allele present 1 = 1 disease allele present 2 = 2 disease alleles present
simulNo	Number of simulations to perform. Default is 5000.
probRecomb	Recombination probabilities for males and females. Default is no recombination.
probSurvival	Survival probability for homozygotes. Default is 1.

Value

A list containing the following: the joint probability of specified statePro for all probands, the probability of specified statePro for each proband, the probability that, 0, 1, ..., and all probands inherit the specified number of disease alleles.

See Also

Examples

```
data(geneaJi)
genJi<-gen.genealogy(geneaJi)
## Not run: Probability that subjects 1 and 29 get 1 and 2 alleles from ancestors 20 and 25,
## Not run: that have themselves 2 and 1.
gen.simuProb(genJi, pro=c(1,29), statePro=c(1,2), ancestors=c(20,25), stateAncestors=c(2,1),
```

```

        simulNo=10000)
## Not run: Probability that subjects 1 and 29 get 1 segment from ancestors 25,
## Not run: knowing the segment has a male
## Not run: recombination rate of 0.02 and a female recombination rate of 0.04.
gen.simuProb(genJi, pro=c(1,29), statePro=c(1,1), ancestors=c(25), stateAncestors=c(1),
             simulNo=10000, probRecomb = c(0.02, 0.04))
## Not run: Probability that subjects 1 and 29 get 1 and 2 alleles from ancestors 20 and 25,
## Not run: that have themselves 2 and 1 and knowing that homozygous people have a survival rate
## Not run: of 0.50.
gen.simuProb(genJi, pro=c(1,29), statePro=c(1,2), ancestors=c(20,25), stateAncestors=c(2,1),
             simulNo=10000, probSurvival=0.5)

```

gen.simuSample

Gene dropping simulations - Sample

Description

Returns the number of alleles transmitted to specified probands from ancestors

Usage

```
gen.simuSample(gen, pro, ancestors, stateAncestors, simulNo = 5000)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Required.
ancestors	Vector of ancestors id numbers to be included. Required.
stateAncestors	Required vector indicating, for each ancestor in ancestors, the genotype state: 0 = no disease allele present 1 = 1 disease allele present 2 = 2 disease alleles present
simulNo	Number of simulations to perform. Default is 5000.

Value

A matrix with number of columns equal to the number of simulations and number of rows equal to the number of probands.

## Not run: Number of alleles received by simulation
table(colSums(simu_5000))
## Not run: Number of alleles received by each propositant
table(simu_5000[1,],simu_5000[2,])

```

gen.simuSampleFreq *Gene dropping simulations - Frequencies*

Description

Returns the number of alleles transmitted to specified probands from ancestors

Usage

```
gen.simuSampleFreq( gen, pro, ancestors, stateAncestors, simulNo = "5000")
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Required.
ancestors	Vector of ancestors id numbers to be included. Required.
stateAncestors	Required vector indicating, for each ancestor in ancestors, the genotype state: 0 = no disease allele present 1 = 1 disease allele present 2 = 2 disease alleles present
simulNo	Number of simulations to perform. Default is 5000.

Value

A data frame containing for each row (one row per proband): **Alleles.transmitted.0 Alleles.transmitted.1 Alleles.transmitted.2**

See Also

```

gen.simuSet

Gene dropping simulations with specified transmission probabilities

Description

Returns the number of alleles transmitted to specified probands from ancestors considering specified transmission probabilities.

Usage

```
gen.simuSet(gen, pro, ancestors, stateAncestors,
            probMatrix=matrix(c(
                c(1,0.5,0,0.5,0.25,0,0,0,0,1,1,1,1,0.75,0.5,1,0.5,0),
                c(1,0.5,0,0.5,0.25,0,0,0,0,1,1,1,1,0.75,0.5,1,0.5,0)),
                nrow=3, ncol=12),
            simulNo = 5000)
```

Arguments

gen	An object of class GLgen obtained with gen.genealogy, gen.lineages or gen.branching. Required.
pro	Vector of proband id numbers to be included. Required.
ancestors	Vector of ancestors id numbers to be included. Required.
stateAncestors	Required vector indicating, for each ancestor in ancestors, the genotype state: 0 = no disease allele present 1 = 1 disease allele present 2 = 2 disease alleles present
probMatrix	Matrix of transmission probabilities of 0, 1, or 2 disease alleles. Default is: [1,] [2,] [3,] [4,] [5,] [6,] [7,] [8,] [9,] [10,] [11,] [12,] [1,] 1.0 0.50 0 1 1.00 1.0 1.0 0.50 0 1 1.00 1.0 [2,] 0.5 0.25 0 1 0.75 0.5 0.5 0.25 0 1 0.75 0.5 [3,] 0.0 0.00 0 1 0.50 0.0 0.0 0.00 0 1 0.50 0.0 where rows are genotype states (0,1,2) for the father and columns are states for the mother (in blocks of 3). 1st block (col

1-3) are the probabilities of transmitting 0 allele to a son. 2nd block (col 4-6) are the probabilities of transmitting 1 allele to a son. 3rd block (col 7-9) are the probabilities of transmitting 0 allele to a daughter. 4th block (col 10-12) are the probabilities of transmitting 1 allele to a daughter.

simulNo Number of simulations to perform. Default is 5000.

Value

A matrix with number of columns equal to the number of simulations and number of rows equal to the number of probands.

genea140	<i>Genealogical information for 140 individuals from the Quebec Reference Sample</i>
----------	--

Description

A genealogical corpus made of 41523 individuals from the province of Quebec, Canada. A total of 140 individuals have been sampled in seven sub-populations, listed in pop140, and their genealogies were reconstructed as far back as possible using the BALSAC population register and the Early Quebec Population Register.

Usage

genea140

Format

A data frame with 41523 observations on 11 variables. [,1] ind: An individual's ID number [,2] father: This individual's father ID number [,3] mother: This individual's mother ID number [,4] sex: Individual's sex coded 1/2 for male/female

Source

Balsac

References

geneaJi	<i>Highly inbred pedigree</i>
---------	-------------------------------

Description

A modified version of a pedigree of two Jicaque Indians studied by Chapman & Jacquard (1971).

Usage

geneaJi

Format

A data frame with 29 observations on 4 variables. [, 1] ind An individual's ID number [, 2] father This individual's father ID number [, 3] mother This individual's mother ID number [, 4] sex Individual's sex coded 1/2 for male/female

GLgen-class

Class "GLgen"

Description

Object containing a genealogy.

Objects from the Class

Objects can be created by calls of the form `gen.genealogy('data.frame')`.

Extends

Class "[GLgroupe](#)", directly.

Methods

initialize signature(.Data="integer",Date="character"): ...

depth signature(x = "GLgen") Gives the depth of the genealogy.

length signature(x = "GLgen") Gives the number of individuals in the genealogy.

Examples

```
showClass("GLgen")
```

GLgroupe-class

Class "GLgroupe"

Description

Object representing a set of proband in different groups.
Each element of this list is a group named with the proband number.

Objects from the Class

Objects can be created by calls of the form `new("GLgroupe", 'list')`.

Extends

Class "GLgen", directly.

Methods

initialize signature(.Data=list): ...

[signature(object = "GLgroupe",ANY,ANY,ANY):...

Examples

```
showClass("GLgroupe")
```

GLmultiList-class	<i>Class "GLmultiList"</i>
-------------------	----------------------------

Description

Objects created to carry information mostly between invisible functions.

Objects from the Class

Objects can be created by calls of the form `new("GLmultiList", 'Array')`.

Slots

.Data: Object of class "list" ~~

liste: Object of class "list" ~~

Extends

Class "list", from data part. Class "vector", by class "list", distance 2.

Methods

No methods defined with class "GLmultiList" in the signature.

Examples

```
showClass("GLmultiList")
```

pop140

Population of origin of the 140 Quebec samples

Description

The 140 individuals from the genealogical corpus from Quebec were sampled from 7 different populations from 5 regions; Quebec City, Montreal, Saguenay, North Shore, Gaspesia. In Gaspesia we find 3 different populations: French-Canadians, Acadians and Loyalists.

Usage

pop140

Format

, 1 ind: An individual's ID number

[, 2] pop: This individual's population
