Package ‘ggplot2’

March 17, 2015

Type Package

Title An Implementation of the Grammar of Graphics

Version 1.0.1

Description An implementation of the grammar of graphics in R. It combines the advantages of both base and lattice graphics: conditioning and shared axes are handled automatically, and you can still build up a plot step by step from multiple data sources. It also implements a sophisticated multidimensional conditioning system and a consistent interface to map data to aesthetic attributes. See http://ggplot2.org for more information, documentation and examples.

Depends R (>= 2.14), stats, methods

Imports plyr (>= 1.7.1), digest, grid, gtable (>= 0.1.1), reshape2, scales (>= 0.2.3), proto, MASS

Suggests quantreg, Hmisc, mapproj, maps, hexbin, maptools, multcomp, nlme, testthat, knitr, mgcv

VignetteBuilder knitr

Enhances sp

### Description

This operator allows you to add objects to a ggplot or theme object.

### Usage

```r
## S3 method for class 'gg'
e1 + e2

e1 %+% e2

e1 %replace% e2
```
Arguments

- **e1**: An object of class `ggplot` or `theme`
- **e2**: A component to add to `e1`

Details

If the first object is an object of class `ggplot`, you can add the following types of objects, and it will return a modified `ggplot` object.

- **data.frame**: replace current data.frame (must use `%+%`)
- **uneval**: replace current aesthetics
- **layer**: add new layer
- **theme**: update plot theme
- **scale**: replace current scale
- **coord**: override current coordinate system
- **facet**: override current coordinate faceting

If the first object is an object of class `theme`, you can add another theme object. This will return a modified theme object.

For theme objects, the `+` operator and the `%+%replace%` can be used to modify elements in themes. The `+` operator completely replaces elements with elements from `e2`. In contrast, the `%+%replace%` operator does not replace the entire element; it only updates element properties which are present (not NULL) in the second object.

See Also

`theme`

Examples

### Adding objects to a `ggplot` object

```r
p <- qplot(wt, mpg, colour = hp, data = mtcars)

p + coord_cartesian(ylim = c(0, 40))
p + scale_colour_continuous(breaks = c(100, 300))
p + guides(colour = "colourbar")
```

# Use a different data frame

```r
m <- mtcars[1:10, ]
p %+% m
```

### Adding objects to a `theme` object

# Compare these results of adding theme objects to other theme objects

```r
add_el <- theme_grey() + theme(text = element_text(family = "Times"))
rep_el <- theme_grey() %+%replace% theme(text = element_text(family = "Times"))
```

```
add_el$text
rep_el$text
```
**add_theme**

*Modify properties of an element in a theme object*

**Description**

Modify properties of an element in a theme object

**Usage**

```r
add_theme(t1, t2, t2name)
```

**Arguments**

- `t1`: A theme object
- `t2`: A theme object that is to be added to `t1`
- `t2name`: A name of the `t2` object. This is used for printing informative error messages.

**See Also**

`gg`

---

**aes**

*Generate aesthetic mappings that describe how variables in the data are mapped to visual properties (aesthetics) of geoms.*

**Description**

`aes` creates a list of unevaluated expressions. This function also performs partial name matching, converts color to `colour`, and old style R names to ggplot names (e.g. `pch` to `shape`, `cex` to `size`)

**Usage**

```r
aes(x, y, ...
```

**Arguments**

- `x, y, ...`: List of name value pairs giving aesthetics to map.

**See Also**

See `aes_colour_fill_alpha, aes_group_order, aes_linetype_size_shape` and `aes_position` for more specific examples with different aesthetics.

Other aesthetic generators: `aes_q, aes_string`

**Examples**

```r
aes(x = mpg, y = wt)
aes(x = mpg ^ 2, y = wt / cyl)
```
aes_all

**Description**

Given a character vector, create a set of identity mappings

**Usage**

```r
aes_all(vars)
```

**Arguments**

- `vars` vector of variable names

**Examples**

```r
aes_all(names(mtcars))
aes_all(c(“x”, “y”, “col”, "pch"))
```

aes_auto

**Automatic aesthetic mapping**

**Description**

Automatic aesthetic mapping

**Usage**

```r
aes_auto(data = NULL, ...)
```

**Arguments**

- `data` data.frame or names of variables
- `...` aesthetics that need to be explicitly mapped.

**Examples**

```r
df <- data.frame(x = 1, y = 1, colour = 1, label = 1, pch = 1)
aes_auto(df)
aes_auto(names(df))

df <- data.frame(xp = 1, y = 1, colour = 1, txt = 1, foo = 1)
aes_auto(df, x = xp, label = txt)
aes_auto(names(df), x = xp, label = txt)

df <- data.frame(foo = 1:3)
aes_auto(df, x = xp, y = yp)
aes_auto(df)
```
Description

This page demonstrates the usage of a sub-group of aesthetics; colour, fill and alpha.

Examples

```r
# Bar chart example
c <- ggplot(mtcars, aes(factor(cyl)))
# Default plotting
c + geom_bar()
# To change the interior colouring use fill aesthetic
c + geom_bar(fill = "red")
# Compare with the colour aesthetic which changes just the bar outline

c + geom_bar(colour = "red")
# Combining both, you can see the changes more clearly

#c + geom_bar(fill = "white", colour = "red")

# The aesthetic fill also takes different colouring scales
# Setting fill equal to a factor variable uses a discrete colour scale

k <- ggplot(mtcars, aes(factor(cyl), fill = factor(vs)))
k + geom_bar()

# Fill aesthetic can also be used with a continuous variable
m <- ggplot(movies, aes(x = rating))
m + geom_histogram()

m + geom_histogram(aes(fill = ..count..))

# Some geoms don't use both aesthetics (i.e. geom_point or geom_line)

b <- ggplot(economics, aes(x = date, y = unemploy))
b + geom_line()
b + geom_line(colour = "green")
b + geom_point()
b + geom_point(colour = "red")

# For large datasets with overplotting the alpha
# Aesthetic will make the points more transparent

df <- data.frame(x = rnorm(5000), y = rnorm(5000))
h <- ggplot(df, aes(x,y))
h + geom_point()
h + geom_point(alpha = 0.5)
h + geom_point(alpha = 1/10)

# If a geom uses both fill and colour, alpha will only modify the fill colour

c + geom_bar(fill = "dark grey", colour = "black")
c + geom_bar(fill = "dark grey", colour = "black", alpha = 1/3)
```
# Alpha can also be used to add shading
j <- b + geom_line()

j

yrng <- range(economics$unemploy)

j <- j + geom_rect(aes(NULL, NULL, xmin = start, xmax = end, fill = party),
ymmin = yrng[1], ymax = yrng[2], data = presidential)

j

library(scales) # to access the alpha function

j + scale_fill_manual(values = alpha(c("blue", "red"), .3))
ec_scaled <- data.frame(  
  date = economics$date,  
  colwise(rescale@1)(economics[, -(1:2)])  
)  
ecm <- melt(ec_scaled, id = "date")  
f <- ggplot(ecm, aes(date, value))  
f + geom_line(aes(linetype = variable))  

# Using facets  
k <- ggplot(diamonds, aes(carat, ..density..)) + geom_histogram(binwidth = 0.2)  
k + facet_grid(. ~ cut)  

# There are three common cases where the default is not enough, and we  
# will consider each one below. In the following examples, we will use a simple  
# longitudinal dataset, Oxboys, from the nlme package. It records the heights  
# (height) and centered ages (age) of 26 boys (Subject), measured on nine  
# occasions (Occasion).  

# Multiple groups with one aesthetic  
library(nlme)  
h <- ggplot(Oxboys, aes(age, height))  
# A single line tries to connect all the observations  
h + geom_line()  
# The group aesthetic maps a different line for each subject  
h + geom_line(aes(group = Subject))  

# Different groups on different layers  
h <- h + geom_line(aes(group = Subject))  
# Using the group aesthetic with both geom_line() and geom_smooth()  
# groups the data the same way for both layers  
h + geom_smooth(aes(group = Subject), method = "lm", se = FALSE)  
# Changing the group aesthetic for the smoother layer  
# fits a single line of best fit across all boys  
h + geom_smooth(aes(group = 1), size = 2, method = "lm", se = FALSE)  

# Overriding the default grouping  
# The plot has a discrete scale but you want to draw lines that connect across  
# groups. This is the strategy used in interaction plots, profile plots, and parallel  
# coordinate plots, among others. For example, we draw boxplots of height at  
# each measurement occasion  
boysbox <- ggplot(Oxboys, aes(Occasion, height))  
boysbox + geom_boxplot()  
# There is no need to specify the group aesthetic here; the default grouping  
# works because occasion is a discrete variable. To overlay individual trajectories  
# we again need to override the default grouping for that layer with aes(group = Subject)  
boysbox <- boysbox + geom_boxplot()  
boysbox + geom_line(aes(group = Subject), colour = "blue")  

# Use the order aesthetic to change stacking order of bar charts  
w <- ggplot(diamonds, aes(clarity, fill = cut))  
w + geom_bar()  
w + geom_bar(aes(order = desc(cut)))  

# Can also be used to change plot order of scatter plots
Description
This page demonstrates the usage of a sub-group of aesthetics: linetype, size and shape.

Examples

```r
d <- ggplot(diamonds, aes(carat, price, colour = cut))
d + geom_point()
d + geom_point(aes(order = sample(seq_along(carat))))
```

```r
aes_linetype_size_shape

Differentiation related aesthetics: linetype, size, shape

# Data
df <- data.frame(x = 1:10, y = 1:10)
f <- ggplot(df, aes(x = x, y = y))
f + geom_line(linetype = 2)
f + geom_line(linetype = "dotdash")
```

```r
# An example with hex strings, the string "33" specifies three units on followed
# by three off and "3333" specifies three units on followed by three off followed
# by one on and finally three off.
f + geom_line(linetype = "3333")
```

```r
# Mapping line type from a variable
library(plyr)
library(reshape2)
rescale01 <- function(x) (x - min(x)) / diff(range(x))
ec_scaled <- data.frame(
  date = economics$date,
  colwise(rescale01)(economics[,-c(1:2)])
)
ecm <- melt(ec_scaled, id = "date")
qplot(date, value, data = ecm, geom = "line", linetype = variable)
```

```r
# Size examples
# Should be specified with a numerical value (in millimetres),
# or from a variable source
p <- ggplot(mtcars, aes(wt, mpg))
p + geom_point(size = 4)
p + geom_point(aes(size = qsec))
p + geom_point(size = 2.5) + geom_hline(yintercept = 25, size = 3.5)
```

```r
# Shape examples
# Shape takes four types of values: an integer in [0, 25],
```
# a single character-- which uses that character as the plotting symbol,
# a NA to draw nothing
p + geom_point()
p + geom_point(shape = 5)
p + geom_point(shape = "k", size = 3)
p + geom_point(shape = ".")
p + geom_point(shape = NA)

# Shape can also be mapped from a variable
p + geom_point(aes(shape = factor(cyl)))

# A look at all 25 symbols
df2 <- data.frame(x = 1:5, y = 1:25, z = 1:25)
s <- ggplot(df2, aes(x = x, y = y))
s + geom_point(aes(shape = z), size = 4) + scale_shape_identity()
# While all symbols have a foreground colour, symbols 19-25 also take a
# background colour (fill)
s + geom_point(aes(shape = z), size = 4, colour = "Red") +
  scale_shape_identity()
s + geom_point(aes(shape = z), size = 4, colour = "Red", fill = "Black") +
  scale_shape_identity()

---

### aes_position

**Position related aesthetics:** x, y, xmin, xmax, ymin, ymax, xend, yend

**Description**

This page demonstrates the usage of a sub-group of aesthetics; x, y, xmin, xmax, ymin, ymax, xend, and yend.

**Examples**

# Generate data: means and standard errors of means for prices
# for each type of cut
dmod <- lm(price ~ cut, data = diamonds)
cuts <- data.frame(cut = unique(diamonds$cut), predict(dmod, data.frame(cut =
unique(diamonds$cut)), se = TRUE)[c("fit", "se.fit")])
se <- ggplot(cuts, aes(x = cut, y = fit, ymin = fit - se.fit,
  ymax = fit + se.fit, colour = cut))
se + geom_pointrange()

# Boxplot with precomputed statistics
# generate sample data
library(plyr)
abc <- adply(matrix(rnorm(100), ncol = 5), 2, quantile, c(0,.25,.5,.75,1))
b <- ggplot(abc, aes(x = X1, ymin = "0x", lower = "25x",
  middle = "50x", upper = "75x", ymax = "100x"))
b + geom_boxplot(stat = "identity")
# Using `annotate`

```r
p <- ggplot(mtcars, aes(wt, mpg)) + geom_point()
p + annotate("rect", xmin = 2, xmax = 3.5, ymin = 2, ymax = 25,
               fill = "dark grey", alpha = .5)
```

# Geom_segment examples

```r
library(grid)
p + geom_segment(aes(x = 2, y = 15, xend = 2, yend = 25),
                 arrow = arrow(length = unit(0.5, "cm")))
p + geom_segment(aes(x = 2, y = 15, xend = 3, yend = 15),
                 arrow = arrow(length = unit(0.5, "cm")))
p + geom_segment(aes(x = 5, y = 30, xend = 3.5, yend = 25),
                 arrow = arrow(length = unit(0.5, "cm")))
```

# You can also use `geom_segment` to recreate plot(type = "h"):

```r
counts <- as.data.frame(table(x = rpois(100, 5)))
counts$x <- as.numeric(as.character(counts$x))
with(counts, plot(x, Freq, type = "h", lwd = 10))
```

```r
qplot(x, Freq, data = counts, geom = "segment", yend = 0, xend = x,
      size = I(10))
```

---

**aes_string**

*Generate aesthetic mappings from a string/quoted objects*

**Description**

Aesthetic mappings describe how variables in the data are mapped to visual properties (aesthetics) of geoms. `aes` uses non-standard evaluation to capture the variable names. These two variants use regular evaluation, which is easier to use inside functions.

**Usage**

```r
aes_string(x = NULL, y = NULL, ...)
aes_q(x = NULL, y = NULL, ...)
```

**Arguments**

- `x,y,...` List of name value pairs

**Details**

`aes_string` and `aes_q` are particularly useful when writing functions that create plots because you can use strings or quoted names/calls to define the aesthetic mappings, rather than having to use `substitute` to generate a call to `aes()`.
See Also

aes

Other aesthetic generators: aes

Examples

# Three ways of generating the same aesthetics
aes(mpg, wt, col = cyl, fill = NULL)
aes_string("mpg", "wt", col = "cyl", fill = NULL)
aes_q(quote(mpg), quote(wt), col = quote(cyl), fill = NULL)

aes(col = cyl, fill = NULL)
aes_string(col = "cyl", fill = NULL)
aes_q(col = quote(cyl), fill = NULL)

---

### annotate

Create an annotation layer.

#### Description

This function adds geoms to a plot. Unlike typical a geom function, the properties of the geoms are not mapped from variables of a data frame, but are instead in as vectors. This is useful for adding small annotations (such as text labels) or if you have your data in vectors, and for some reason don’t want to put them in a data frame.

#### Usage

```r
annotate(geom, x = NULL, y = NULL, xmin = NULL, xmax = NULL,
         ymin = NULL, ymax = NULL, ...)
```

#### Arguments

- **geom** name of geom to use for annotation
- **x, y, xmin, ymin, xmax, ymax** positioning aesthetics - you must specify at least one of these.
- **...** other aesthetics. These are not scaled so you can do (e.g.) `colour = "red"` to get a red point.

#### Details

Note that all position aesthetics are scaled (i.e. they will expand the limits of the plot so they are visible), but all other aesthetics are set. This means that layers created with this function will never affect the legend.
Examples

```r
p <- ggplot(mtcars, aes(x = wt, y = mpg)) + geom_point()
p + annotate("text", x = 4, y = 25, label = "Some text")
p + annotate("text", x = 2:5, y = 25, label = "Some text")
p + annotate("rect", xmin = 3, xmax = 4.2, ymin = 12, ymax = 21, alpha = .2)
p + annotate("segment", x = 2.5, xend = 4, y = 15, yend = 25, colour = "blue")
p + annotate("pointrange", x = 3.5, y = 20, ymin = 12, ymax = 28, colour = "red", size = 1.5)

p + annotate("text", x = 2:3, y = 20:21, label = c("my label", "label 2"))
```

Description

This is a special geom intended for use as static annotations that are the same in every panel. These annotations will not affect scales (i.e. the x and y axes will not grow to cover the range of the grob, and the grob will not be modified by any ggplot settings or mappings).

Usage

```r
annotation_custom(grob, xmin = -Inf, xmax = Inf, ymin = -Inf, ymax = Inf)
```

Arguments

- `grob` grob to display
- `xmin,xmax` x location (in data coordinates) giving horizontal location of raster
- `ymin,ymax` y location (in data coordinates) giving vertical location of raster

Details

Most useful for adding tables, inset plots, and other grid-based decorations.

Note

`annotation_custom` expects the grob to fill the entire viewport defined by `xmin`, `xmax`, `ymin`, `ymax`. Grobs with a different (absolute) size will be center-justified in that region. Inf values can be used to fill the full plot panel (see examples).
Examples

```r
# Dummy plot
base <- qplot(1:10, 1:10, geom = "blank") + theme_bw()
# Adding a table
## Not run:
if (require(gridExtra)) {
  base + annotation_custom(grob = tableGrob(head(iris[,1:3]),
                                       xmin = 3, xmax = 6, ymin = 2, ymax = 8))
  # full panel
  base + annotation_custom(grob = roundrectGrob(),
                           xmin = -Inf, xmax = Inf, ymin = -Inf, ymax = Inf)
}
## End(Not run)
# Inset plot
g <- ggplotGrob(qplot(1, 1) +
               theme(plot.background = element_rect(colour = "black")))
base +
       annotation_custom(grob = g, xmin = 1, xmax = 10, ymin = 0, ymax = 10)
```

---

**annotation_logticks**  
Annotation: log tick marks

Description

This annotation adds log tick marks with diminishing spacing. These tick marks probably make sense only for base 10.

Usage

```r
annotation_logticks(base = 10, sides = "bl", scaled = TRUE,
                     short = unit(0.1, "cm"),
                     mid = unit(0.2, "cm"),
                     long = unit(0.3, "cm"),
                     colour = "black",
                     size = 0.5, linetype = 1, alpha = 1, color = NULL,
                     ...)
```

Arguments

- **base**: the base of the log (default 10)
- **sides**: a string that controls which sides of the plot the log ticks appear on. It can be set to a string containing any of "trbl", for top, right, bottom, and left.
- **scaled**: is the data already log-scaled? This should be TRUE (default) when the data is already transformed with `log10()` or when using `scale_y_log10`. It should be FALSE when using `coord_trans(y = "log10")`.
- **short**: a unit object specifying the length of the short tick marks
- **mid**: a unit object specifying the length of the middle tick marks. In base 10, these are the "5" ticks.
annotation_logticks

long  a unit object specifying the length of the long tick marks. In base 10, these are the "1" (or "10") ticks.
colour  Colour of the tick marks.
size  Thickness of tick marks, in mm.
linetype  Linetype of tick marks (solid, dashed, etc.)
alpha  The transparency of the tick marks.
color  An alias for colour.
...  Other parameters passed on to the layer

See Also

scale_y_continuous, scale_y_log10 for log scale transformations.
coord_trans for log coordinate transformations.

Examples

# Make a log-log plot (without log ticks)
library(MASS)
library(scales)
a <- ggplot(Animals, aes(x = body, y = brain)) + geom_point() +
  scale_x_log10(breaks = trans_breaks("log10", function(x) 10^x),
                labels = trans_format("log10", math_format(10^.x))) +
  scale_y_log10(breaks = trans_breaks("log10", function(x) 10^x),
                labels = trans_format("log10", math_format(10^.x))) +
  theme_bw()
a + annotation_logticks()  # Default: log ticks on bottom and left
a + annotation_logticks(sides = "lr")  # Log ticks for y, on left and right
a + annotation_logticks(sides = "trbl")  # All four sides

# Hide the minor grid lines because they don't align with the ticks
a + annotation_logticks(sides = "trbl") + theme(panel.grid.minor = element_blank())

# Another way to get the same results as 'a' above: log-transform the data before
b <- ggplot(Animals, aes(x = log10(body), y = log10(brain))) + geom_point() +
  scale_x_continuous(name = "body", labels = math_format(10^.x)) +
  scale_y_continuous(name = "brain", labels = math_format(10^.x)) +
  theme_bw()+ theme(panel.grid.minor = element_blank())
b + annotation_logticks()

# This shows log(x) on the axes
d <- ggplot(Animals, aes(x = log10(body), y = log10(brain))) + geom_point() +
  theme_bw()
d + annotation_logticks()
# Using a coordinate transform requires scaled = FALSE

t <- ggplot(Animals, aes(x = body, y = brain)) + geom_point() +
    coord_trans(xtrans = "log10", ytrans = "log10") + theme_bw()

  t + annotation_logticks(scaled = FALSE)

# Change the length of the ticks

library(grid)
a + annotation_logticks(short = unit(.5,"mm"), mid = unit(3,"mm"), long = unit(4,"mm"))

---

**annotation_map**  
Annotation: maps.

---

### Description

Annotation: maps.

### Usage

`annotation_map(map, ...)`

### Arguments

- **map**
  - data frame representing a map. Most map objects can be converted into the right format by using `fortify`
- **...**
  - other arguments used to modify aesthetics

### Examples

```r
library(maps)
usamap <- map_data("state")

seal.sub <- subset(seals, long > -130 & lat < 45 & lat > 40)
ggplot(seal.sub, aes(x = long, y = lat)) +
   annotation_map(usamap, fill = "NA", colour = "grey50") +
   geom_segment(aes(xend = long + delta_long, yend = lat + delta_lat))

seal2 <- transform(seal.sub, 
  latr = cut(lat, 2),
  longr = cut(long, 2))

ggplot(seal2, aes(x = long, y = lat)) +
   annotation_map(usamap, fill = "NA", colour = "grey50") +
   geom_segment(aes(xend = long + delta_long, yend = lat + delta_lat)) +
   facet_grid(latr ~ longr, scales = "free", space = "free")
```
**annotation_raster**

**Annotation:** High-performance rectangular tiling.

**Description**

This is a special version of `geom_raster` optimised for static annotations that are the same in every panel. These annotations will not affect scales (i.e. the x and y axes will not grow to cover the range of the raster, and the raster must already have its own colours).

**Usage**

```
annotation_raster(raster, xmin, xmax, ymin, ymax, interpolate = FALSE)
```

**Arguments**

- `raster`  
  raster object to display

- `xmin, xmax`  
  x location (in data coordinates) giving horizontal location of raster

- `ymin, ymax`  
  y location (in data coordinates) giving vertical location of raster

- `interpolate`  
  If TRUE interpolate linearly, if FALSE (the default) don’t interpolate.

**Details**

Most useful for adding bitmap images.

**Examples**

```r
# Generate data
rainbow <- matrix(hcl(seq(0, 360, length = 50 * 50), 80, 70), nrow = 50)
qplot(mpg, wt, data = mtcars) +
  annotation_raster(rainbow, 15, 20, 3, 4)
# To fill up whole plot
qplot(mpg, wt, data = mtcars) +
  annotation_raster(rainbow, -Inf, Inf, -Inf, Inf) +
  geom_point()

rainbow2 <- matrix(hcl(seq(0, 360, length = 10), 80, 70), nrow = 1)
qplot(mpg, wt, data = mtcars) +
  annotation_raster(rainbow2, -Inf, Inf, -Inf, Inf) +
  geom_point()

rainbow2 <- matrix(hcl(seq(0, 360, length = 10), 80, 70), nrow = 1)
qplot(mpg, wt, data = mtcars) +
  annotation_raster(rainbow2, -Inf, Inf, -Inf, Inf, interpolate = TRUE) +
  geom_point()
```
autoclip  

Create a complete ggplot appropriate to a particular data type

Description

autoplot uses ggplot2 to draw a particular plot for an object of a particular class in a single command. This defines the S3 generic that other classes and packages can extend.

Usage

autoplot(object, ...)

Arguments

object  
an object, whose class will determine the behaviour of autoplot

...  
other arguments passed to specific methods

Value

a ggplot object

See Also

ggplot and fortify

borders

Create a layer of map borders.

Description

Create a layer of map borders.

Usage

borders(database = "world", regions = ".", fill = NA, colour = "grey50", ...)

Arguments

database  
map data, see map for details

regions  
map region

fill  
fill colour

colour  
border colour

...  
other arguments passed onto geom_polygon
**Examples**

```r
if (require("maps")) {

  ia <- map_data("county", "iowa")
  mid_range <- function(x) mean(range(x))
  library(plyr)
  seats <- ddply(ia, .(subregion), colwise(mid_range, .(lat, long)))
  ggplot(ia, aes(long, lat)) +
    geom_polygon(aes(group = group), fill = NA, colour = "grey60") +
    geom_text(aes(label = subregion), data = seats, size = 2, angle = 45)

data(us.cities)
capitals <- subset(us.cities, capital == 2)
  ggplot(capitals, aes(long, lat)) +
    borders("state") +
    geom_point(aes(size = pop)) +
    scale_size_area()
}
```

calc_element  

*Calculate the element properties, by inheriting properties from its parents*

**Description**

Calculate the element properties, by inheriting properties from its parents

**Usage**

`calc_element(element, theme, verbose = FALSE)`

**Arguments**

- `element` The name of the theme element to calculate
- `theme` A theme object (like theme_grey())
- `verbose` If TRUE, print out which elements this one inherits from

**Examples**

```r
t <- theme_grey()
calc_element('text', t)

# Compare the "raw" element definition to the element with calculated inheritance
t$axis.text.x
calc_element('axis.text.x', t, verbose = TRUE)

# This reports that axis.text.x inherits from axis.text, # which inherits from text. You can view each of them with:
```
coord_cartesian

Cartesian coordinates.

Description

The Cartesian coordinate system is the most familiar, and common, type of coordinate system. Setting limits on the coordinate system will zoom the plot (like you’re looking at it with a magnifying glass), and will not change the underlying data like setting limits on a scale will.

Usage

coord_cartesian(xlim = NULL, ylim = NULL, wise = NULL)

Arguments

xlim limits for the x axis
ylim limits for the y axis
wise deprecated in 0.9.1

Examples

# There are two ways of zooming the plot display: with scales or
# with coordinate systems. They work in two rather different ways.

(p <- qplot(disp, wt, data=mtcars) + geom_smooth())

# Setting the limits on a scale will throw away all data that's not
# inside these limits. This is equivalent to plotting a subset of
# the original data
p + scale_x_continuous(limits = c(325, 500))

# Setting the limits on the coordinate system performs a visual zoom
# the data is unchanged, and we just view a small portion of the original
# plot. See how the axis labels are the same as the original data, and
# the smooth continue past the points visible on this plot.
p + coord_cartesian(xlim = c(325, 500))

# You can see the same thing with this 2d histogram
(d <- ggplot(diamonds, aes(carat, price)) +
  stat_bin2d(bins = 25, colour="grey50"))

# When zooming the scale, the we get 25 new bins that are the same
# size on the plot, but represent smaller regions of the data space
d + scale_x_continuous(limits = c(0, 2))
coord_fixed

# When zooming the coordinate system, we see a subset of original 50 bins,
# displayed bigger
d + coord_cartesian(xlim = c(0, 2))

coord_fixed

Cartesian coordinates with fixed relationship between x and y scales.

Description

A fixed scale coordinate system forces a specified ratio between the physical representation of data units on the axes. The ratio represents the number of units on the y-axis equivalent to one unit on the x-axis. The default, ratio = 1, ensures that one unit on the x-axis is the same length as one unit on the y-axis. Ratios higher than one make units on the y axis longer than units on the x-axis, and vice versa. This is similar to eqscplot, but it works for all types of graphics.

Usage

coord_fixed(ratio = 1, xlim = NULL, ylim = NULL, wise = NULL)

Arguments

ratio aspect ratio, expressed as y / x
xlim limits for the x axis
ylim limits for the y axis
wise deprecated in 0.9.1

Examples

# ensures that the ranges of axes are equal to the specified ratio by
# adjusting the plot aspect ratio

qplot(mpg, wt, data = mtcars) + coord_fixed(ratio = 1)
qplot(mpg, wt, data = mtcars) + coord_fixed(ratio = 5)
qplot(mpg, wt, data = mtcars) + coord_fixed(ratio = 1/5)

# Resize the plot to see that the specified aspect ratio is maintained
coord_flip  

Flipped cartesian coordinates.

Description

Flipped cartesian coordinates so that horizontal becomes vertical, and vertical, horizontal. This is primarily useful for converting geoms and statistics which display y conditional on x, to x conditional on y.

Usage

coord_flip(...)

Arguments

... Other arguments passed onto coord_cartesian

Examples

# Very useful for creating boxplots, and other interval
# geoms in the horizontal instead of vertical position.
qplot(cut, price, data=diamonds, geom="boxplot")
last_plot() + coord_flip()

qplot(cut, data=diamonds, geom="bar")
last_plot() + coord_flip()

h <- qplot(carat, data=diamonds, geom="histogram")
h
h + coord_flip()
h + coord_flip() + scale_x_reverse()

# You can also use it to flip lines and area plots:
qplot(1:5, (1:5)^2, geom="area")
last_plot() + coord_flip()

coord_map  

Map projections.

Description

This coordinate system provides the full range of map projections available in the mapproj package.
coord_map

Usage

coord_map(projection = "mercator", ..., orientation = NULL, xlim = NULL, ylim = NULL)

Arguments

projection       projection to use, see mapproject for list
...              other arguments passed on to mapproject
orientation      projection orientation, which defaults to c(90, 0, mean(range(x))). This
                 is not optimal for many projections, so you will have to supply your own. See
                 mapproject for more information.
xlim             manually specific x limits (in degrees of longitude)
ylim             manually specific y limits (in degrees of latitude)

Details

This is still experimental, and if you have any advice to offer regarding a better (or more correct)
way to do this, please let me know

Examples

if (require("maps")) {
  # Create a lat-long dataframe from the maps package
  nz <- map_data("nz")
  nzmap <- ggplot(nz, aes(x=long, y=lat, group=group)) +
          geom_polygon(fill="white", colour="black")

  # Use cartesian coordinates
  nzmap
  # With default mercator projection
  nzmap + coord_map()
  # Other projections
  nzmap + coord_map("cylindrical")
  nzmap + coord_map("azimuthal", orientation=c(-36.92,174.6,0))

  states <- map_data("state")
  usamap <- ggplot(states, aes(x=long, y=lat, group=group)) +
           geom_polygon(fill="white", colour="black")

  # Use cartesian coordinates
  usamap
  # With mercator projection
  usamap + coord_map()
  # See mapproject for coordinate systems and their parameters
  usamap + coord_map("gilbert")
  usamap + coord_map("lagrange")

  # For most projections, you'll need to set the orientation yourself
  # as the automatic selection done by mapproject is not available to
  # ggplot
coord_polar

Polar coordinates.

Description

The polar coordinate system is most commonly used for pie charts, which are a stacked bar chart in polar coordinates.

Usage

coord_polar(theta = "x", start = 0, direction = 1)

Arguments

theta variable to map angle to (x or y)
start offset of starting point from 12 o’clock in radians
direction 1, clockwise; -1, anticlockwise

Examples

# NOTE: Use these plots with caution - polar coordinates has
# major perceptual problems. The main point of these examples is
# to demonstrate how these common plots can be described in the
# grammar. Use with EXTREME caution.

# A coxcomb plot = bar chart + polar coordinates
cxc <- ggplot(mtcars, aes(x = factor(cyl))) +
  geom_bar(width = 1, colour = "black")
coord_quickmap

Cartesian coordinates with an aspect ratio approximating Mercator projection.

Description

The representation of a portion of the earth, which is approximately spherical, onto a flat 2D plane requires a projection. This is what coord_map does. These projections account for the fact that the actual length (in km) of one degree of longitude varies between the equator and the pole. Near the equator, the ratio between the lengths of one degree of latitude and one degree of longitude is approximately 1. Near the pole, it is tends towards infinity because the length of one degree of longitude tends towards 0. For regions that span only a few degrees and are not too close to the poles, setting the aspect ratio of the plot to the appropriate lat/lon ratio approximates the usual mercator projection. This is what coord_quickmap does. With coord_map all elements of the graphic have to be projected which is not the case here. So coord_quickmap has the advantage
of being much faster, in particular for complex plots such as those using with `geom_tile`, at the expense of correctedness in the projection.

Usage

```r
coord_quickmap(xlim = NULL, ylim = NULL)
```

Arguments

- `xlim`: limits for the x axis
- `ylim`: limits for the y axis

Examples

```r
# ensures that the ranges of axes are equal to the specified ratio by
# adjusting the plot aspect ratio

if (require("maps")) {
  # Create a lat-long dataframe from the maps package
  nz <- map_data("nz")
  # Prepare a plot of the map
  nzmap <- ggplot(nz, aes(x = long, y = lat, group = group)) +
    geom_polygon(fill = "white", colour = "black")

  # Plot it in cartesian coordinates
  nzmap
  # With correct mercator projection
  nzmap + coord_map()
  # With the aspect ratio approximation
  nzmap + coord_quickmap()
}

# Resize the plot to see that the specified aspect ratio is maintained
```

---

**coord_trans**

*Transformed cartesian coordinate system.*

Description

`coord_trans` is different to scale transformations in that it occurs after statistical transformation and will affect the visual appearance of geoms - there is no guarantee that straight lines will continue to be straight.

Usage

```r
coord_trans(xtrans = "identity", ytrans = "identity", limx = NULL,
  limy = NULL)
```
Arguments

xtrans, ytrans  transformers for x and y axes
limx, limy  limits for x and y axes. (Named so for backward compatibility)

Details

All current transformations only work with continuous values - see trans_new for list of transformations, and instructions on how to create your own.

Examples

# See ?geom_boxplot for other examples

# Three ways of doing transforming in ggplot:
# * by transforming the data
qplot(log10(carat), log10(price), data=diamonds)
# * by transforming the scales
qplot(carat, price, data=diamonds, log="xy")
qplot(carat, price, data=diamonds) + scale_x_log10() + scale_y_log10()
# * by transforming the coordinate system:
qplot(carat, price, data=diamonds) + coord_trans(x = "log10", y = "log10")

# The difference between transforming the scales and
# transforming the coordinate system is that scale
# transformation occurs BEFORE statistics, and coordinate
# transformation afterwards. Coordinate transformation also
# changes the shape of geoms:

d <- subset(diamonds, carat > 0.5)
qplot(carat, price, data = d, log="xy") +
  geom_smooth(method="lm")
qplot(carat, price, data = d) +
  geom_smooth(method="lm") +
  coord_trans(x = "log10", y = "log10")

# Here I used a subset of diamonds so that the smoothed line didn't
# drop below zero, which obviously causes problems on the log-transformed
# scale

# With a combination of scale and coordinate transformation, it's
# possible to do back-transformations:
library(scales)
qplot(carat, price, data=diamonds, log="xy") +
  geom_smooth(method="lm") +
  coord_trans(x = exp_trans(10), y = exp_trans(10))
# cf.
qplot(carat, price, data=diamonds) + geom_smooth(method = "lm")

# Also works with discrete scales
df <- data.frame(a = abs(rnorm(26)), letters)
cut_number

Cut numeric vector into intervals containing equal number of points.

Usage

cut_number(x, n = NULL, ...)
diamonds

Arguments

x         numeric vector
n         number of intervals to create
...       other arguments passed on to cut

See Also

cut_interval

Examples

table(cut_number(runif(1000), n = 10))

---

diamonds

Description

A dataset containing the prices and other attributes of almost 54,000 diamonds. The variables are as follows:

Usage

data(diamonds)

Format

A data frame with 53940 rows and 10 variables

Details

- price. price in US dollars ($326–$18,823)
- carat. weight of the diamond (0.2–5.01)
- cut. quality of the cut (Fair, Good, Very Good, Premium, Ideal)
- colour. diamond colour, from J (worst) to D (best)
- clarity. a measurement of how clear the diamond is (I1 (worst), SI1, SI2, VS1, VS2, VVS1, VVS2, IF (best))
- x. length in mm (0–10.74)
- y. width in mm (0–58.9)
- z. depth in mm (0–31.8)
- depth. total depth percentage = z / mean(x, y) = 2 * z / (x + y) (43–79)
- table. width of top of diamond relative to widest point (43–95)
economics

**US economic time series.**

**Description**

This dataset was produced from US economic time series data available from [http://research.stlouisfed.org/fred2](http://research.stlouisfed.org/fred2).

**Usage**

data(economics)

**Format**

A data frame with 478 rows and 6 variables

**Details**

- **date.** Month of data collection
- **psavert.** Personal savings rate, [http://research.stlouisfed.org/fred2/series/PSAVER](http://research.stlouisfed.org/fred2/series/PSAVER)
- **pce.** Personal consumption expenditures, in billions of dollars, [http://research.stlouisfed.org/fred2/series/PCE](http://research.stlouisfed.org/fred2/series/PCE)
- **unemploy.** Number of unemployed in thousands, [http://research.stlouisfed.org/fred2/series/UNEMPLOY](http://research.stlouisfed.org/fred2/series/UNEMPLOY)
- **uempmed.** Median duration of unemployment, in week, [http://research.stlouisfed.org/fred2/series/UEMPMED](http://research.stlouisfed.org/fred2/series/UEMPMED)
- **pop.** Total population, in thousands, [http://research.stlouisfed.org/fred2/series/POP](http://research.stlouisfed.org/fred2/series/POP)

**Description**

Theme element: blank. This theme element draws nothing, and assigns no space

**Usage**

element_blank()
**element_line**

Theme element: line.

**Description**

Theme element: line.

**Usage**

```r
element_line(colour = NULL, size = NULL, linetype = NULL,
             lineend = NULL, color = NULL)
```

**Arguments**

- `colour`: line colour
- `size`: line size
- `linetype`: line type
- `lineend`: line end
- `color`: an alias for `colour`

**element_rect**

Theme element: rectangle.

**Description**

Most often used for backgrounds and borders.

**Usage**

```r
element_rect(fill = NULL, colour = NULL, size = NULL, linetype = NULL,
             color = NULL)
```

**Arguments**

- `fill`: fill colour
- `colour`: border colour
- `size`: border size
- `linetype`: border linetype
- `color`: an alias for `colour`
element_text

Theme element: text.

Description
Theme element: text.

Usage

`element_text(family = NULL, face = NULL, colour = NULL, size = NULL, hjust = NULL, vjust = NULL, angle = NULL, lineheight = NULL, color = NULL)`

Arguments

- `family`: font family
- `face`: font face ("plain", "italic", "bold", "bold.italic")
- `colour`: text colour
- `size`: text size (in pts)
- `hjust`: horizontal justification (in [0, 1])
- `vjust`: vertical justification (in [0, 1])
- `angle`: angle (in [0, 360])
- `lineheight`: line height
- `color`: an alias for `colour`

expand_limits

Expand the plot limits with data.

Description

panels or all plots. This function is a thin wrapper around `geom_blank` that makes it easy to add such values.

Usage

`expand_limits(...)`

Arguments

... named list of aesthetics specifying the value (or values) that should be included in each scale.
Examples

```r
p <- qplot(mpg, wt, data = mtcars)
p + expand_limits(x = 0)
p + expand_limits(y = c(1, 9))
p + expand_limits(x = 0, y = 0)

qplot(mpg, wt, data = mtcars, colour = cyl) +
  expand_limits(colour = seq(2, 10, by = 2))
qplot(mpg, wt, data = mtcars, colour = factor(cyl)) +
  expand_limits(colour = factor(seq(2, 10, by = 2)))
```

facet_grid

Lay out panels in a grid.

Description

Lay out panels in a grid.

Usage

```r
facet_grid(facets, margins = FALSE, scales = "fixed", space = "fixed",
shrink = TRUE, labeller = "label_value", as.table = TRUE, drop = TRUE)
```

Arguments

- **facets**
  - A formula with the rows (of the tabular display) on the LHS and the columns (of the tabular display) on the RHS; the dot in the formula is used to indicate there should be no faceting on this dimension (either row or column). The formula can also be provided as a string instead of a classical formula object.

- **margins**
  - Either a logical value or a character vector. Margins are additional facets which contain all the data for each of the possible values of the faceting variables. If FALSE, no additional facets are included (the default). If TRUE, margins are included for all faceting variables. If specified as a character vector, it is the names of variables for which margins are to be created.

- **scales**
  - Are scales shared across all facets (the default, "fixed"), or do they vary across rows ("free_x"), columns ("free_y"), or both rows and columns ("free")

- **space**
  - If "fixed", the default, all panels have the same size. If "free_y" their height will be proportional to the length of the y scale; if "free_x" their width will be proportional to the length of the x scale; or if "free" both height and width will vary. This setting has no effect unless the appropriate scales also vary.

- **shrink**
  - If TRUE, will shrink scales to fit output of statistics, not raw data. If FALSE, will be range of raw data before statistical summary.

- **labeller**
  - A function that takes two arguments (variable and value) and returns a string suitable for display in the facet strip. See label_value for more details and pointers to other options.
as.table  If TRUE, the default, the facets are laid out like a table with highest values at the bottom-right. If FALSE, the facets are laid out like a plot with the highest value at the top-right.

drop  If TRUE, the default, all factor levels not used in the data will automatically be dropped. If FALSE, all factor levels will be shown, regardless of whether or not they appear in the data.

Examples

```r
p <- ggplot(mtcars, aes(mpg, wt)) + geom_point()
# With one variable
p + facet_grid(. ~ cyl)
p + facet_grid(cyl ~ .)

# With two variables
p + facet_grid(vs ~ am)
p + facet_grid(am ~ vs)
p + facet_grid(vs ~ am, margins=TRUE)

# To change plot order of facet grid,
# change the order of variable levels with factor()
set.seed(6809)
diamonds <- diamonds[sample(nrow(diamonds), 1000), ]
diamonds$cut <- factor(diamonds$cut,
  levels = c("Ideal", "Very Good", "Fair", "Good", "Premium"))

# Repeat first example with new order
p <- ggplot(diamonds, aes(carat, ..density..)) +
  geom_histogram(binwidth = 1)
p + facet_grid(. ~ cut)

qplot(mpg, wt, data=mtcars, facets = . ~ vs + am)
qplot(mpg, wt, data=mtcars, facets = vs + am ~ .)

# You can also use strings, which makes it a little easier
# when writing functions that generate faceting specifications
# p + facet_grid("cut ~ ")

# see also ?plotmatrix for the scatterplot matrix

# If there isn't any data for a given combination, that panel
# will be empty
qplot(mpg, wt, data=mtcars) + facet_grid(cyl ~ vs)
p <- qplot(mpg, wt, data=mtcars, facets = vs ~ cyl)

df <- data.frame(mpg = 22, wt = 3)
p + geom_point(data = df, colour="red", size = 2)
df2 <- data.frame(mpg = c(19, 22), wt = c(2,4), vs = c(0, 1))
```
p + geom_point(data = df2, colour="red", size = 2)

df3 <- data.frame(mpg = c(19, 22), wt = c(2,4), vs = c(1, 1))
p + geom_point(data = df3, colour="red", size = 2)

# You can also choose whether the scales should be constant
# across all panels (the default), or whether they should be allowed
# to vary
mt <- ggplot(mtcars, aes(mpg, wt, colour = factor(cyl))) + geom_point()

mt + facet_grid(. ~ cyl, scales = "free")
# If scales and space are free, then the mapping between position
# and values in the data will be the same across all panels
mt + facet_grid(. ~ cyl, scales = "free", space = "free")

mt + facet_grid(vs ~ am, scales = "free")
mt + facet_grid(vs ~ am, scales = "free_x")
mt + facet_grid(vs ~ am, scales = "free_y")
mt + facet_grid(vs ~ am, scales = "free", space="free")
mt + facet_grid(vs ~ am, scales = "free", space="free_x")
mt + facet_grid(vs ~ am, scales = "free", space="free_y")

# You may need to set your own breaks for consistent display:
mt + facet_grid(. ~ cyl, scales = "free_x", space="free") +
  scale_x_continuous(breaks = seq(10, 36, by = 2))
# Adding scale limits override free scales:
last_plot() + xlim(10, 15)

# Free scales are particularly useful for categorical variables
qplot(cty, model, data=mpg) +
  facet_grid(manufacturer ~ ., scales = "free", space = "free")
# particularly when you reorder factor levels
mpg <- within(mpg, {
  model <- reorder(model, cty)
  manufacturer <- reorder(manufacturer, cty)
})
last_plot() %+% mpg + theme(strip.text.y = element_text())

# Use as.table to to control direction of horizontal facets, TRUE by default
h <- ggplot(mtcars, aes(x = mpg, y = wt)) + geom_point()

h + facet_grid(cyl ~ vs)
h + facet_grid(cyl ~ vs, as.table = FALSE)

# Use labeller to control facet labels, label_value is default
h + facet_grid(cyl ~ vs, labeller = label_both)
# Using label_parsed, see ?plotmath for more options
mtcars$cyl2 <- factor(mtcars$cyl, labels = c("alpha", "beta", "sqrt(x, y)"))
k <- qplot(wt, mpg, data = mtcars)
k + facet_grid(. ~ cyl2)
k + facet_grid(. ~ cyl2, labeller = label_parsed)
# For label_bquote the label value is x.
p <- qplot(wt, mpg, data = mtcars)
facet_null

Facet specification: a single panel.

Description

Facet specification: a single panel.

Usage

facet_null(shrink = TRUE)

Arguments

shrink

If TRUE, will shrink scales to fit output of statistics, not raw data. If FALSE, will be range of raw data before statistical summary.

Examples

# facet_null is the default facetting specification if you
# don't override it with facet_grid or facet_wrap
ggplot(mtcars, aes(mpg, wt)) + geom_point()
qplot(mpg, wt, data = mtcars)
**facet_wrap**

Wrap a 1d ribbon of panels into 2d.

### Description

Wrap a 1d ribbon of panels into 2d.

### Usage

```r
facet_wrap(facets, nrow = NULL, ncol = NULL, scales = "fixed",
          shrink = TRUE, as.table = TRUE, drop = TRUE)
```

### Arguments

- **facets**: formula specifying variables to facet by
- **nrow**: number of rows
- **ncol**: number of columns
- **scales**: should scales be fixed ("fixed", the default), free ("free"), or free in one dimension ("free_x", "free_y")
- **shrink**: If TRUE, will shrink scales to fit output of statistics, not raw data. If FALSE, will be range of raw data before statistical summary.
- **as.table**: If TRUE, the default, the facets are laid out like a table with highest values at the bottom-right. If FALSE, the facets are laid out like a plot with the highest value at the top-right.
- **drop**: If TRUE, the default, all factor levels not used in the data will automatically be dropped. If FALSE, all factor levels will be shown, regardless of whether or not they appear in the data.

### Examples

```r
d <- ggplot(diamonds, aes(carat, price, fill = ..density..)) +
xlim(0, 2) + stat_binhex(na.rm = TRUE) + theme(aspect.ratio = 1)
d + facet_wrap(~ color)
d + facet_wrap(~ color, ncol = 1)
d + facet_wrap(~ color, ncol = 4)
d + facet_wrap(~ color, nrow = 1)
d + facet_wrap(~ color, nrow = 3)

# Using multiple variables continues to wrap the long ribbon of
# plots into 2d - the ribbon just gets longer
# d + facet_wrap(~ color + cut)

# To change plot order of facet wrap,
# change the order of variable levels with factor()
diamonds$color <- factor(diamonds$color, levels = c("G", "J", "D", "E", "I", "F", "H"))
# Repeat first example with new order
```
d <- ggplot(diamonds, aes(carat, price, fill = ..density..)) +
xlim(0, 2) + stat_binhex(na.rm = TRUE) + theme(aspect.ratio = 1)
d + facet_wrap(~ color)

# You can choose to keep the scales constant across all panels
# or vary the x scale, the y scale or both:
p <- qplot(price, data = diamonds, geom = "histogram", binwidth = 1000)
p + facet_wrap(~ color)
p + facet_wrap(~ color, scales = "free_y")

p <- qplot(displ, hwy, data = mpg)
p + facet_wrap(~ cyl)
p + facet_wrap(~ cyl, scales = "free")

# Use as.table to to control direction of horizontal facets, TRUE by default
p + facet_wrap(~ cyl, as.table = FALSE)

# Add data that does not contain all levels of the faceting variables
cyl6 <- subset(mpg, cyl == 6)
p + geom_point(data = cyl6, colour = "red", size = 1) +
    facet_wrap(~ cyl)
p + geom_point(data = transform(cyl6, cyl = 7), colour = "red") +
    facet_wrap(~ cyl)
p + geom_point(data = transform(cyl6, cyl = NULL), colour = "red") +
    facet_wrap(~ cyl)

---

**fortify**

Fortify a model with data.

---

**Description**

Method to convert a generic R object into a data frame useful for plotting. Takes its name from the idea of fortifying the original data with model fit statistics, and vice versa.

**Usage**

`fortify(model, data, ...)`

**Arguments**

- `model` model or other R object to convert to data frame
- `data` original dataset, if needed
- `...` other arguments passed to methods

**See Also**

`fortify.lm`
fortify-multcomp

Description

Fortify methods for objects produced by \texttt{multcomp}

Usage

- ## S3 method for class 'glht'
  \texttt{fortify(model, data, ...)}

- ## S3 method for class 'confint.glht'
  \texttt{fortify(model, data, ...)}

- ## S3 method for class 'summary.glht'
  \texttt{fortify(model, data, ...)}

- ## S3 method for class 'cld'
  \texttt{fortify(model, data, ...)}

Arguments

- \texttt{model} an object of class \texttt{glht}, \texttt{confint.glht}, \texttt{summary.glht} or \texttt{cld}
- \texttt{data,...} other arguments to the generic ignored in this method.

Examples

```r
if (require("multcomp")) {
  amod <- aov(breaks ~ wool + tension, data = warpbreaks)
  wht <- glht(amod, linfct = mcp(tension = "Tukey"))

  fortify(wht)
  ggplot(wht, aes(lhs, estimate)) + geom_point()

  CI <- confint(wht)
  fortify(CI)
  ggplot(CI, aes(lhs, estimate, ymin = lwr, ymax = upr)) +
       geom_linerange() +
       geom_point()

  fortify(summary(wht))
  ggplot(mapping = aes(lhs, estimate)) +
       geom_linerange(aes(ymin = lwr, ymax = upr), data = CI) +
       geom_point(aes(size = p), data = summary(wht)) +
       scale_size(trans = "reverse")

  cld <- cld(wht)
  fortify(cld)
}
```
Supplement the data fitted to a linear model with model fit statistics.

Description

If you have missing values in your model data, you may need to refit the model with `na.action = na.exclude`.

Usage

```r
## S3 method for class 'lm'
fortify(model, data = model$model, ...)
```

Arguments

- `model`: linear model
- `data`: data set, defaults to data used to fit model
- `...`: not used by this method

Value

The original data with extra columns:

- `.hat`: Diagonal of the hat matrix
- `.sigma`: Estimate of residual standard deviation when corresponding observation is dropped from model
- `.cooksD`: Cook's distance, `cooks.distance`
- `.fitted`: Fitted values of model
- `.resid`: Residuals
- `.stdresid`: Standardised residuals

Examples

```r
mod <- lm(mpg ~ wt, data = mtcars)
head(fortify(mod))
head(fortify(mod, mtcars))

plot(mod, which = 1)
qplot(.fitted, .resid, data = mod) +
  geom_hline(yintercept = 0) +
  geom_smooth(se = FALSE)
qplot(.fitted, .stdresid, data = mod) +
  geom_hline(yintercept = 0) +
  geom_smooth(se = FALSE)
qplot(.fitted, .stdresid, data = fortify(mod, mtcars),
  colour = factor(cyl))
qplot(mpg, .stdresid, data = fortify(mod, mtcars), colour = factor(cyl))
```
fortify.map

Fortify method for map objects.

Description

This function turns a map into a data frame that can more easily be plotted with ggplot2.

Usage

```r
## S3 method for class 'map'
fortify(model, data, ...)
```

Arguments

- `model` map object
- `data` not used by this method
- `...` not used by this method

See Also

`map_data` and `borders`
Examples

```r
if (require("maps")) {
  ca <- map("county", "ca", plot = FALSE, fill = TRUE)
  head(fortify(ca))
  qplot(long, lat, data = ca, geom = "polygon", group = group)

  tx <- map("county", "texas", plot = FALSE, fill = TRUE)
  head(fortify(tx))
  qplot(long, lat, data = tx, geom = "polygon", group = group,
        colour = I("white"))
}
```

---

### fortify.sp

Fortify method for classes from the sp package.

---

**Description**

To figure out the correct variable name for region, inspect `as.data.frame(model)`.

**Usage**

```r
## S3 method for class 'SpatialPolygonsDataFrame'
fortify(model, data, region = NULL, ...)

## S3 method for class 'SpatialPolygons'
fortify(model, data, ...)

## S3 method for class 'Polygons'
fortify(model, data, ...)

## S3 method for class 'Polygon'
fortify(model, data, ...)

## S3 method for class 'SpatialLinesDataFrame'
fortify(model, data, ...)

## S3 method for class 'Lines'
fortify(model, data, ...)

## S3 method for class 'Line'
fortify(model, data, ...)
```

**Arguments**

- **model**: SpatialPolygonsDataFrame to convert into a dataframe.
- **data**: not used by this method
- **region**: name of variable used to split up regions
- **...**: not used by this method
Examples
if (require("maptools")) {
  sids <- system.file("shapes/sids.shp", package="maptools")
  ncl <- readShapePoly(sids,
    proj4string = CRS("+proj=longlat +datum=NAD27"))
  ncl_df <- fortify(ncl)
}

geom_abline

Line specified by slope and intercept.

Description
The abline geom adds a line with specified slope and intercept to the plot.

Usage
gem_abline(mapping = NULL, data = NULL, stat = "abline",
  position = "identity", show_guide = FALSE, ...)

Arguments
  mapping  The aesthetic mapping, usually constructed with \texttt{aes} or \texttt{aes_string}. Only
            needs to be set at the layer level if you are overriding the plot defaults.
  data     A layer specific dataset - only needed if you want to override the plot defaults.
  stat     The statistical transformation to use on the data for this layer.
  position The position adjustment to use for overlapping points on this layer
  show_guide should a legend be drawn? (defaults to FALSE)
  ...       other arguments passed on to \texttt{layer}. This can include aesthetics whose values
            you want to set, not map. See \texttt{layer} for more details.

Details
With its siblings geom_hline and geom_vline, it’s useful for annotating plots. You can supply the
parameters for geom_abline, intercept and slope, in two ways: either explicitly as fixed values, or
in a data frame. If you specify the fixed values (geom_abline(intercept=0, slope=1)) then the
line will be the same in all panels. If the intercept and slope are stored in the data, then they can
vary from panel to panel. See the examples for more ideas.

Aesthetics
geom_abline understands the following aesthetics (required aesthetics are in bold):
  • alpha
  • colour
  • linetype
  • size
See Also

stat_smooth to add lines derived from the data, geom_hline for horizontal lines, geom_vline for vertical lines geom_segment

Examples

```r
p <- qplot(wt, mpg, data = mtcars)

# Fixed slopes and intercepts
p + geom_abline() # Can't see it - outside the range of the data
p + geom_abline(intercept = 20)

# Calculate slope and intercept of line of best fit
coef(lm(mpg ~ wt, data = mtcars))
p + geom_abline(intercept = 37, slope = -5)
p + geom_abline(intercept = 10, colour = "red", size = 2)

# See ?stat_smooth for fitting smooth models to data
p + stat_smooth(method="lm", se=FALSE)

# Slopes and intercepts as data
p <- ggplot(mtcars, aes(x = wt, y=mpg), . ~ cyl) + geom_point()
df <- data.frame(a=rnorm(10, 25), b=rnorm(10, 0))
p + geom_abline(aes(intercept=a, slope=b), data=df)

# Slopes and intercepts from linear model
library(plyr)
coefs <- ddply(mtcars, .(cyl), function(df) {
  m <- lm(mpg ~ wt, data=df)
data.frame(a = coef(m)[1], b = coef(m)[2])
})
str(coefs)
p + geom_abline(data=coefs, aes(intercept=a, slope=b))

# It's actually a bit easier to do this with stat_smooth
p + geom_smooth(aes(group=cyl), method="lm")
p + geom_smooth(aes(group=cyl), method="lm", fullrange=TRUE)

# With coordinate transforms
p + geom_abline(intercept = 37, slope = -5) + coord_flip()
p + geom_abline(intercept = 37, slope = -5) + coord_polar()
```

geom_area

Area plot.

Description

An area plot is the continuous analog of a stacked bar chart (see geom_bar), and can be used to show how composition of the whole varies over the range of x. Choosing the order in which different
components is stacked is very important, as it becomes increasing hard to see the individual pattern
as you move up the stack.

Usage

```r
geom_area(mapping = NULL, data = NULL, stat = "identity",
  position = "stack", na.rm = FALSE, ...)
```

Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**: The statistical transformation to use on the data for this layer.
- **position**: The position adjustment to use for overlapping points on this layer
- **na.rm**: If `FALSE` (the default), removes missing values with a warning. If `TRUE` silently removes missing values.
- **...**: other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Details

An area plot is a special case of `geom_ribbon`, where the minimum of the range is fixed to 0, and the position adjustment defaults to `position_stacked`.

Examples

```r
# see geom_ribbon
```

---

**geom_bar**  
*Bars, rectangles with bases on x-axis*

Description

The bar geom is used to produce 1d area plots: bar charts for categorical x, and histograms for continuous y. `stat_bin` explains the details of these summaries in more detail. In particular, you can use the weight aesthetic to create weighted histograms and barcharts where the height of the bar no longer represent a count of observations, but a sum over some other variable. See the examples for a practical example.

Usage

```r
geom_bar(mapping = NULL, data = NULL, stat = "bin", position = "stack",
  ...)```
Arguments

mapping The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
stat The statistical transformation to use on the data for this layer.
position The position adjustment to use for overlapping points on this layer
... other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Details

The heights of the bars commonly represent one of two things: either a count of cases in each group, or the values in a column of the data frame. By default, `geom_bar` uses `stat="bin"`. This makes the height of each bar equal to the number of cases in each group, and it is incompatible with mapping values to the `y` aesthetic. If you want the heights of the bars to represent values in the data, use `stat="identity"` and map a value to the `y` aesthetic.

By default, multiple x’s occurring in the same place will be stacked a top one another by position_stack. If you want them to be dodged from side-to-side, see `position_dodge`. Finally, `position_fill` shows relative propotions at each x by stacking the bars and then stretching or squashing to the same height.

Sometimes, bar charts are used not as a distributional summary, but instead of a dotplot. Generally, it’s preferable to use a dotplot (see `geom_point`) as it has a better data-ink ratio. However, if you do want to create this type of plot, you can set y to the value you have calculated, and use `stat='identity'`

A bar chart maps the height of the bar to a variable, and so the base of the bar must always been shown to produce a valid visual comparison. Naomi Robbins has a nice article on this topic. This is the reason it doesn’t make sense to use a log-scaled y axis with a bar chart

Aesthetics

gem_bar understands the following aesthetics (required aesthetics are in bold):

- x
- alpha
- colour
- fill
- linetype
- size
- weight

See Also

`stat_bin` for more details of the binning algorithm, `position_dodge` for creating side-by-side barcharts, `position_stack` for more info on stacking,
Examples

```r
# Generate data
c <- ggplot(mtcars, aes(factor(cyl)))

# By default, uses stat="bin", which gives the count in each category
c + geom_bar()
c + geom_bar(width=.5)
c + geom_bar() + coord_flip()
c + geom_bar(fill="white", colour="darkgreen")

# Use qplot
qplot(factor(cyl), data=mtcars, geom="bar")
qplot(factor(cyl), data=mtcars, geom="bar", fill=factor(cyl))

# When the data contains y values in a column, use stat="identity"
library(plyr)
# Calculate the mean mpg for each level of cyl
mm <- ddply(mtcars, "cyl", summarise, mmpg = mean(mpg))
ggplot(mm, aes(x = factor(cyl), y = mmpg)) + geom_bar(stat = "identity")

# Stacked bar charts
qplot(factor(cyl), data=mtcars, geom="bar", fill=factor(vs))
qplot(factor(cyl), data=mtcars, geom="bar", fill=factor(gear))

# Stacked bar charts are easy in ggplot2, but not effective visually,
# particularly when there are many different things being stacked
ggplot(diamonds, aes(clarity, fill=cut)) + geom_bar()

# Faceting is a good alternative:
ggplot(diamonds, aes(clarity)) + geom_bar() + facet_wrap(~ cut)
# If the x axis is ordered, using a line instead of bars is another
# possibility:
ggplot(diamonds, aes(clarity)) + geom_freqpoly(aes(group = cut, colour = cut))

# Dodged bar charts
ggplot(diamonds, aes(clarity, fill=cut)) + geom_bar(position="dodge")
# compare with
ggplot(diamonds, aes(cut, fill=cut)) + geom_bar() + facet_grid(~ clarity)

# But again, probably better to use frequency polygons instead:
ggplot(diamonds, aes(clarity, colour=cut)) + geom_freqpoly(aes(group = cut))

# Often we don't want the height of the bar to represent the
# count of observations, but the sum of some other variable.
# For example, the following plot shows the number of diamonds
# of each colour
```
qplot(color, data=diamonds, geom="bar")
# If, however, we want to see the total number of carats in each colour
# we need to weight by the carat variable
qplot(color, data=diamonds, geom="bar", weight=carat, ylab="carat")

# A bar chart used to display means
meanprice <- tapply(diamonds$price, diamonds$cut, mean)
cut <- factor(levels(diamonds$cut), levels = levels(diamonds$cut))
qplot(cut, meanprice)
qplot(cut, meanprice, geom="bar", stat="identity")
qplot(cut, meanprice, geom="bar", stat="identity", fill = I("grey50"))

# Another stacked bar chart example
k <- ggplot(mpg, aes(manufacturer, fill=class))
k + geom_bar()
# Use scales to change aesthetics defaults
k + geom_bar() + scale_fill_brewer()
k + geom_bar() + scale_fill_grey()

# To change plot order of class variable
# use factor() to change order of levels
mpg$class <- factor(mpg$class, levels = c("midsize", "minivan", 
"suv", "compact", "2seater", "subcompact", "pickup"))
m <- ggplot(mpg, aes(manufacturer, fill=class))
m + geom_bar()

---

**geom_bin2d**

*Add heatmap of 2d bin counts.*

### Description

Add heatmap of 2d bin counts.

### Usage

```r
ggplot(data, ...) + geom_bin2d(mapping = NULL, data = NULL, stat = "bin2d", 
    position = "identity", ...)
```

### Arguments

- **mapping**
  The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only
  needs to be set at the layer level if you are overriding the plot defaults.
- **data**
  A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**
  The statistical transformation to use on the data for this layer.
- **position**
  The position adjustment to use for overlapping points on this layer
- **...**
  other arguments passed on to `layer`. This can include aesthetics whose values
  you want to set, not map. See `layer` for more details.
Aesthetics

geom_bin2d understands the following aesthetics (required aesthetics are in bold):

- xmax
- xmin
- ymax
- ymin
- alpha
- colour
- fill
- linetype
- size
- weight

Examples

d <- ggplot(diamonds, aes(x = x, y = y)) + xlim(4,10) + ylim(4,10)
d + geom_bin2d()
d + geom_bin2d(binwidth = c(0.1, 0.1))

# See ?stat_bin2d for more examples

---

**geom_blank**

*Blank, draws nothing.*

Description

The blank geom draws nothing, but can be a useful way of ensuring common scales between different plots.

Usage

```
geom_blank(mapping = NULL, data = NULL, stat = "identity",
        position = "identity", ...)  
```

Arguments

- **mapping**
  - The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**
  - A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**
  - The statistical transformation to use on the data for this layer.
- **position**
  - The position adjustment to use for overlapping points on this layer.
- **...**
  - other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.
Examples

qplot(length, rating, data = movies, geom = "blank")
# Nothing to see here!

# Take the following scatter plot
a <- ggplot(mtcars, aes(x = wt, y = mpg), . - cyl) + geom_point()
# Add to that some lines with geom_abline()
df <- data.frame(a = rnorm(10, 25), b = rnorm(10, 0))
a + geom_abline(aes(intercept = a, slope = b), data = df)
# Suppose you then wanted to remove the geom_point layer
# If you just remove geom_point, you will get an error
b <- ggplot(mtcars, aes(x = wt, y = mpg))
## Not run: b + geom_abline(aes(intercept = a, slope = b), data = df)
# Switching to geom_blank() gets the desired plot
c <- ggplot(mtcars, aes(x = wt, y = mpg)) + geom_blank()
c + geom_abline(aes(intercept = a, slope = b), data = df)

geom_boxplot

Box and whiskers plot.

Description

The upper and lower "hinges" correspond to the first and third quartiles (the 25th and 75th percentiles). This differs slightly from the method used by the boxplot function, and may be apparent with small samples. See boxplot.stats for more information on how hinge positions are calculated for boxplot.

Usage

geom_boxplot(mapping = NULL, data = NULL, stat = "boxplot",
position = "dodge", outlier.colour = NULL, outlier.shape = NULL,
outlier.size = NULL, notch = FALSE, notchwidth = 0.5,
varwidth = FALSE, ...)

Arguments

mapping The aesthetic mapping, usually constructed with aes or aes_string. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
stat The statistical transformation to use on the data for this layer.
position The position adjustment to use for overlapping points on this layer
outlier.colour colour for outlying points. Uses the default from geom_point().
outlier.shape shape of outlying points. Uses the default from geom_point().
outlier.size size of outlying points. Uses the default from geom_point().
geom_boxplot

notch: if FALSE (default) make a standard box plot. If TRUE, make a notched box plot. Notches are used to compare groups; if the notches of two boxes do not overlap, this is strong evidence that the medians differ.

notchwidth: for a notched box plot, width of the notch relative to the body (default 0.5)

varwidth: if FALSE (default) make a standard box plot. If TRUE, boxes are drawn with widths proportional to the square-roots of the number of observations in the groups (possibly weighted, using the weight aesthetic).

... other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.

Details

The upper whisker extends from the hinge to the highest value that is within 1.5 * IQR of the hinge, where IQR is the inter-quartile range, or distance between the first and third quartiles. The lower whisker extends from the hinge to the lowest value within 1.5 * IQR of the hinge. Data beyond the end of the whiskers are outliers and plotted as points (as specified by Tukey).

In a notched box plot, the notches extend 1.58 * IQR / sqrt(n). This gives a roughly 95 See McGill et al. (1978) for more details.

Aesthetics

geom_boxplot understands the following aesthetics (required aesthetics are in bold):

- lower
- middle
- upper
- x
- ymax
- ymin
- alpha
- colour
- fill
- linetype
- shape
- size
- weight

---

**geom_contour**

Display contours of a 3d surface in 2d.

**Description**

Display contours of a 3d surface in 2d.

**Usage**

```r
ggplot(mtcars, aes(factor(cyl), mpg)) + geom_boxplot(stat = "identity", lineend = "butt", linejoin = "round", linemitre = 1, na.rm = FALSE, ...)
```

**Arguments**

- **mapping**
  The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.

- **data**
  A layer specific dataset - only needed if you want to override the plot defaults.

- **stat**
  The statistical transformation to use on the data for this layer.

- **position**
  The position adjustment to use for overlapping points on this layer

- **lineend**
  Line end style (round, butt, square)

- **linejoin**
  Line join style (round, mitre, bevel)

- **linemitre**
  Line mitre limit (number greater than 1)

- **na.rm**
  If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.

- **...**
  other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.
Aesthetics

`geom_contour` understands the following aesthetics (required aesthetics are in bold):

- x
- y
- alpha
- colour
- linetype
- size
- weight

See Also

- **`geom_density2d`**: 2d density contours

Examples

```r
# See stat_contour for examples
```

---

`geom_crossbar`  
*Hollow bar with middle indicated by horizontal line.*

Description

Hollow bar with middle indicated by horizontal line.

Usage

```r
geom_crossbar(mapping = NULL, data = NULL, stat = "identity",
position = "identity", fatten = 2, ...)
```

Arguments

- **mapping**  
The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**  
A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**  
The statistical transformation to use on the data for this layer.
- **position**  
The position adjustment to use for overlapping points on this layer
- **fatten**  
a multiplicate factor to fatten middle bar by
- **...**  
other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.
Aesthetics

**geom_crossbar** understands the following aesthetics (required aesthetics are in bold):

- x
- y
- ymax
- ymin
- alpha
- colour
- fill
- linetype
- size

See Also

**geom_errorbar** for error bars, **geom_pointrange** and **geom_linerange** for other ways of showing mean + error, **stat_summary** to compute errors from the data, **geom_smooth** for the continuous analog.

Examples

```r
# See geom_linerange for examples
```

---

**geom_density**

Display a smooth density estimate.

Description

A smooth density estimate calculated by **stat_density**.

Usage

```
geom_density(mapping = NULL, data = NULL, stat = "density",
position = "identity", na.rm = FALSE, ...)
```

Arguments

- **mapping**
  The aesthetic mapping, usually constructed with **aes** or **aes_string**. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**
  A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**
  The statistical transformation to use on the data for this layer.
- **position**
  The position adjustment to use for overlapping points on this layer
- **na.rm**
  If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
- **...**
  other arguments passed on to **layer**. This can include aesthetics whose values you want to set, not map. See **layer** for more details.
Aesthetics

geom_density understands the following aesthetics (required aesthetics are in bold):

- x
- y
- alpha
- colour
- fill
- linetype
- size
- weight

See Also

geom_histogram for the histogram and stat_density for examples.

Examples

# See stat_density for examples

-----
geom_density2d  Contours from a 2d density estimate.
-----

Description

Perform a 2D kernel density estimation using kde2d and display the results with contours.

Usage

geom_density2d(mapping = NULL, data = NULL, stat = "density2d",
position = "identity", lineend = "butt", linejoin = "round",
linemitre = 1, na.rm = FALSE, ...)

Arguments

mapping  The aesthetic mapping, usually constructed with aes or aes_string. Only needs to be set at the layer level if you are overriding the plot defaults.
data  A layer specific dataset - only needed if you want to override the plot defaults.
stat  The statistical transformation to use on the data for this layer.
position  The position adjustment to use for overlapping points on this layer
lineend  Line end style (round, butt, square)
linejoin  Line join style (round, mitre, bevel)
linemitre  Line mitre limit (number greater than 1)
In a dot plot, the width of a dot corresponds to the bin width (or maximum width, depending on the binning algorithm), and dots are stacked, with each dot representing one observation.

Usage

```
geom_dotplot(mapping = NULL, data = NULL, stat = "bindot",
position = "identity", na.rm = FALSE, binwidth = NULL, binaxis = "x",
method = "dotdensity", binpositions = "bygroup", stackdir = "up",
stackratio = 1, dotsize = 1, stackgroups = FALSE, ...)
```
Arguments

mapping  The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
data  A layer specific dataset - only needed if you want to override the plot defaults.
stat  The statistical transformation to use on the data for this layer.
position  The position adjustment to use for overlapping points on this layer.
na.rm  If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
binwidth  When method is "dotdensity", this specifies maximum bin width. When method is "histodot", this specifies bin width. Defaults to 1/30 of the range of the data.
binaxis  which axis to bin along "x" (default) or "y".
method  "dotdensity" (default) for dot-density binning, or "histodot" for fixed bin widths (like `stat_bin`).
binpositions  When method is "dotdensity", "bygroup" (default) determines positions of the bins for each group separately. "all" determines positions of the bins with all the data taken together; this is used for aligning dot stacks across multiple groups.
stackdir  which direction to stack the dots. "up" (default), "down", "center", "centerw-hole" (centered, but with dots aligned)
stackratio  how close to stack the dots. Default is 1, where dots just just touch. Use smaller values for closer, overlapping dots.
dotsize  The diameter of the dots relative to `binwidth`, default 1.
stackgroups  should dots be stacked across groups? This has the effect that `position = "stack"` should have, but can’t (because this geom has some odd properties).
...  other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Details

With dot-density binning, the bin positions are determined by the data and `binwidth`, which is the maximum width of each bin. See Wilkinson (1999) for details on the dot-density binning algorithm.

With histodot binning, the bins have fixed positions and fixed widths, much like a histogram.

When binning along the x axis and stacking along the y axis, the numbers on y axis are not meaningful, due to technical limitations of `ggplot2`. You can hide the y axis, as in one of the examples, or manually scale it to match the number of dots.

Aesthetics

gem_dotplot understands the following aesthetics (required aesthetics are in bold):

- x
- y
- alpha
- colour
- fill
geom_dotplot

References

Examples

```r
ggplot(mtcars, aes(x = mpg)) + geom_dotplot()
```

ggplot(mtcars, aes(x = mpg, fill = factor(cyl))) + geom_dotplot(stackgroups = TRUE, binwidth = 1, method = "histodot")
```
ggplot(mtcars, aes(x = 1, y = mpg, fill = factor(cyl))) +
  geom_dotplot(binaxis = "y", stackgroups = TRUE, binwidth = 1, method = "histodot")

# Use qplot instead
qplot(mpg, data = mtcars, geom = "dotplot")

---

**geom_errorbar**  
*Error bars.*

**Description**

Error bars.

**Usage**

```r
geom_errorbar(mapping = NULL, data = NULL, stat = "identity",
               position = "identity", ...)
```

**Arguments**

- `mapping`  
  The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.

- `data`  
  A layer specific dataset - only needed if you want to override the plot defaults.

- `stat`  
  The statistical transformation to use on the data for this layer.

- `position`  
  The position adjustment to use for overlapping points on this layer

- `...`  
  other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

**Aesthetics**

`geom_errorbar` understands the following aesthetics (required aesthetics are in bold):

- `x`
- `ymax`
- `ymin`
- `alpha`
- `colour`
- `linetype`
- `size`
- `width`
**See Also**

- **geom_pointrange**: range indicated by straight line, with point in the middle
- **geom_linerange**: range indicated by straight line
- **geom_crossbar**: hollow bar with middle indicated by horizontal line
- **stat_summary**: examples of these guys in use, **geom_smooth** for continuous analog

**Examples**

```r
# Create a simple example dataset
df <- data.frame(
  trt = factor(c(1, 1, 2, 2)),
  resp = c(1, 5, 3, 4),
  group = factor(c(1, 2, 1, 2)),
  se = c(0.1, 0.3, 0.3, 0.2)
)
df2 <- df[c(1,3),]

# Define the top and bottom of the errorbars
limits <- aes(ymax = resp + se, ymin=resp - se)

p <- ggplot(df, aes(fill=group, y=resp, x=trt)) + geom_bar(position="dodge", stat="identity")

# Because the bars and errorbars have different widths
# we need to specify how wide the objects we are dodging are
p <- ggplot(df2, aes(fill=group, y=resp, x=trt)) + geom_bar(position="dodge") + geom_errorbar(limits, position=dodge, width=0.25)

p <- ggplot(df, aes(colour=group, y=resp, x=trt)) + geom_point() + geom_errorbar(limits, width=0.2) + geom_pointrange(limits) + geom_crossbar(limits, width=0.2)

# If we want to draw lines, we need to manually set the
# groups which define the lines - here the groups in the
# original dataframe
p + geom_line(aes(group=group)) + geom_errorbar(limits, width=0.2)
```

---

**geom_errorbarh**: Horizontal error bars

**Description**

Horizontal error bars
Usage

geom_errorbarh(mapping = NULL, data = NULL, stat = "identity",
    position = "identity", ...)

Arguments

mapping The aesthetic mapping, usually constructed with \texttt{aes} or \texttt{aes_string}. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
stat The statistical transformation to use on the data for this layer.
position The position adjustment to use for overlapping points on this layer
... other arguments passed on to \texttt{layer}. This can include aesthetics whose values you want to set, not map. See \texttt{layer} for more details.

Aesthetics

\texttt{geom_errorbarh} understands the following aesthetics (required aesthetics are in bold):

- \texttt{x}
- \texttt{xmax}
- \texttt{xmin}
- \texttt{y}
- \texttt{alpha}
- \texttt{colour}
- \texttt{height}
- \texttt{linetype}
- \texttt{size}

See Also

\texttt{geom_errorbar}: vertical error bars

Examples

df <- data.frame(
    trt = factor(c(1, 1, 2, 2)),
    resp = c(1, 5, 3, 4),
    group = factor(c(1, 2, 1, 2)),
    se = c(0.1, 0.3, 0.3, 0.2)
)

# Define the top and bottom of the errorbars
p <- ggplot(df, aes(resp, trt, colour = group))
p + geom_point() +
    geom_errorbarh(aes(xmax = resp + se, xmin = resp - se))
p + geom_point() +
    geom_errorbarh(aes(xmax = resp + se, xmin = resp - se, height = .2))
geom_freqpoly

Frequency polygon.

Description
Frequency polygon.

Usage
geom_freqpoly(mapping = NULL, data = NULL, stat = "bin",
position = "identity", ...)

Arguments
- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**: The statistical transformation to use on the data for this layer.
- **position**: The position adjustment to use for overlapping points on this layer
- **...**: other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Aesthetics
`geom_freqpoly` understands the following aesthetics (required aesthetics are in bold):

- alpha
- colour
- linetype
- size

See Also
`geom_histogram`: histograms

Examples
```r
qplot(carat, data = diamonds, geom = "freqpoly")
qplot(carat, data = diamonds, geom = "freqpoly", binwidth = 0.1)
qplot(carat, data = diamonds, geom = "freqpoly", binwidth = 0.01)
qplot(price, data = diamonds, geom = "freqpoly", binwidth = 1000)
qplot(price, data = diamonds, geom = "freqpoly", binwidth = 1000, colour = color)
qplot(price, ..density.., data = diamonds, geom = "freqpoly",
      binwidth = 1000, colour = color)
```
**Description**

Hexagon binning.

**Usage**

```
geom_hex(mapping = NULL, data = NULL, stat = "binhex",
position = "identity", ...)
```

**Arguments**

- **mapping**
  The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.

- **data**
  A layer specific dataset - only needed if you want to override the plot defaults.

- **stat**
  The statistical transformation to use on the data for this layer.

- **position**
  The position adjustment to use for overlapping points on this layer

- **...**
  Other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

**Aesthetics**

`geom_hex` understands the following aesthetics (required aesthetics are in bold):

- x
- y
- alpha
- colour
- fill
- size

**Examples**

```
# See ?stat_binhex for examples
```
Description

`geom_histogram` is an alias for `geom_bar` plus `stat_bin` so you will need to look at the documentation for those objects to get more information about the parameters.

Usage

```r
geom_histogram(mapping = NULL, data = NULL, stat = "bin",
    position = "stack", ...)
```

Arguments

- `mapping` The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- `data` A layer specific dataset - only needed if you want to override the plot defaults.
- `stat` The statistical transformation to use on the data for this layer.
- `position` The position adjustment to use for overlapping points on this layer
- `...` other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Details

By default, `stat_bin` uses 30 bins - this is not a good default, but the idea is to get you experimenting with different binwidths. You may need to look at a few to uncover the full story behind your data.

Aesthetics

`geom_histogram` understands the following aesthetics (required aesthetics are in bold):

- `x`
- `alpha`
- `colour`
- `fill`
- `linetype`
- `size`
- `weight`
Examples

set.seed(5689)
movies <- movies[sample(nrow(movies), 1000),]

# Simple examples
qplot(rating, data=movies, geom="histogram")
qplot(rating, data=movies, weight=votes, geom="histogram")
qplot(rating, data=movies, weight=votes, geom="histogram", binwidth=1)
qplot(rating, data=movies, weight=votes, geom="histogram", binwidth=0.1)

# More complex
m <- ggplot(movies, aes(x=rating))
m + geom_histogram()
m + geom_histogram(aes(y = ..density..)) + geom_density()
m + geom_histogram(binwidth = 1)
m + geom_histogram(binwidth = 0.5)
m + geom_histogram(binwidth = 0.1)

# Add aesthetic mappings
m + geom_histogram(aes(weight = votes))
m + geom_histogram(aes(y = ..count..))
m + geom_histogram(aes(fill = ..count..))

# Change scales
m + geom_histogram(aes(fill = ..count..)) +
  scale_fill_gradient("Count", low = "green", high = "red")

# Often we don't want the height of the bar to represent the
# count of observations, but the sum of some other variable.
# For example, the following plot shows the number of movies
# in each rating.
qplot(rating, data=movies, geom="bar", binwidth = 0.1)
# If, however, we want to see the number of votes cast in each
# category, we need to weight by the votes variable
qplot(rating, data=movies, geom="bar", binwidth = 0.1,
  weight=votes, ylab = "votes")

m <- ggplot(movies, aes(x = votes))
# For transformed scales, binwidth applies to the transformed data.
# The bins have constant width on the transformed scale.
m + geom_histogram() + scale_x_log10()
m + geom_histogram(binwidth = 1) + scale_x_log10()
m + geom_histogram() + scale_x_sqrt()
m + geom_histogram(binwidth = 10) + scale_x_sqrt()

# For transformed coordinate systems, the binwidth applies to the
# raw data. The bins have constant width on the original scale.

# Using log scales does not work here, because the first
# bar is anchored at zero, and so when transformed becomes negative
# infinity. This is not a problem when transforming the scales, because
# no observations have 0 ratings.
```r
m + geom_histogram(origin = 0) + coord_trans(x = "log10")
```
# Use origin = 0, to make sure we don't take sqrt of negative values
```r
m + geom_histogram(origin = 0) + coord_trans(x = "sqrt")
m + geom_histogram(origin = 0, binwidth = 1000) + coord_trans(x = "sqrt")
```
# You can also transform the y axis. Remember that the base of the bars has value 0, so log transformations are not appropriate
```r
m <- ggplot(movies, aes(x = rating))
m + geom_histogram(binwidth = 0.5) + scale_y_sqrt()
m + geom_histogram(binwidth = 0.5) + scale_y_reverse()
```
# Set aesthetics to fixed value
```r
m + geom_histogram(colour = "darkgreen", fill = "white", binwidth = 0.5)
```
# Use facets
```r
m <- m + geom_histogram(binwidth = 0.5)
m + facet_grid(Action ~ Comedy)
```
# Often more useful to use density on the y axis when facetting
```r
m <- m + aes(y = ..density..)
m + facet_grid(Action ~ Comedy)
m + facet_wrap(~ mpaa)
```
# Multiple histograms on the same graph
# see ?position, ?position_fill, etc for more details.
```r
set.seed(6298)
diamonds_small <- diamonds[sample(nrow(diamonds), 1000), ]
ggplot(diamonds_small, aes(x=price)) + geom_bar()
hist_cut <- ggplot(diamonds_small, aes(x=price, fill=cut))
hist_cut + geom_bar() # defaults to stacking
hist_cut + geom_bar(position="fill")
hist_cut + geom_bar(position="dodge")
```
# This is easy in ggplot2, but not visually effective. It's better
# to use a frequency polygon or density plot. Like this:
```r
ggplot(diamonds_small, aes(price, ..density.., colour = cut)) +
  geom_freqpoly(binwidth = 1000)
```
# Or this:
```r
ggplot(diamonds_small, aes(price, colour = cut)) +
  geom_density()
```
# Or if you want to be fancy, maybe even this:
```r
ggplot(diamonds_small, aes(price, fill = cut)) +
  geom_density(alpha = 0.2)
```
# Which looks better when the distributions are more distinct
```r
ggplot(diamonds_small, aes(depth, fill = cut)) +
  geom_density(alpha = 0.2) + xlim(55, 70)
```
rmmovies

---

**geom_hline**

Horizontal line.
Description

This geom allows you to annotate the plot with horizontal lines (see `geom_vline` and `geom_abline` for other types of lines).

Usage

```r
geom_hline(mapping = NULL, data = NULL, stat = "hline",
   position = "identity", show_guide = FALSE, ...)
```

Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**: The statistical transformation to use on the data for this layer.
- **position**: The position adjustment to use for overlapping points on this layer.
- **show_guide**: Should a legend be drawn? (defaults to `FALSE`)
- **...**: Other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Details

There are two ways to use it. You can either specify the intercept of the line in the call to the geom, in which case the line will be in the same position in every panel. Alternatively, you can supply a different intercept for each panel using a data.frame. See the examples for the differences.

Aesthetics

`geom_hline` understands the following aesthetics (required aesthetics are in bold):

- `alpha`
- `colour`
- `linetype`
- `size`

See Also

`geom_vline` for vertical lines, `geom_abline` for lines defined by a slope and intercept, `geom_segment` for a more general approach.

Examples

```r
p <- ggplot(mtcars, aes(x = wt, y=mpg)) + geom_point()

p + geom_hline(aes(yintercept=mpg))
p + geom_hline(yintercept=20)
p + geom_hline(yintercept=seq(10, 30, by=5))
```
geom_jitter

Points, jittered to reduce overplotting.

Description

The jitter geom is a convenient default for geom_point with position = 'jitter'. See position_jitter to see how to adjust amount of jittering.

Usage

geom_jitter(mapping = NULL, data = NULL, stat = "identity",
position = "jitter", na.rm = FALSE, ...)

Arguments

mapping The aesthetic mapping, usually constructed with aes or aes_string. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
stat The statistical transformation to use on the data for this layer.
position The position adjustment to use for overlapping points on this layer
na.rm If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
...
other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.

Aesthetics

geom_jitter understands the following aesthetics (required aesthetics are in bold):

• x
• y
• alpha
• colour
• fill
• shape
• size

See Also

geom_point for regular, unjittered points, geom_boxplot for another way of looking at the conditional distribution of a variable, position_jitter for examples of using jittering with other geoms

Examples

p <- ggplot(mpg, aes(displ, hwy))
p + geom_point()
p + geom_point(position = "jitter")

# Add aesthetic mappings
p + geom_jitter(aes(colour = cyl))

# Vary parameters
p + geom_jitter(position = position_jitter(width = .5))
p + geom_jitter(position = position_jitter(height = .5))

# Use qplot instead
qplot(displ, hwy, data = mpg, geom = "jitter")
qplot(class, hwy, data = mpg, geom = "jitter")
qplot(class, hwy, data = mpg, geom = c("boxplot", "jitter"))
qplot(class, hwy, data = mpg, geom = c("jitter", "boxplot"))

---

**geom_line**

*Connect observations, ordered by x value.*

**Description**

Connect observations, ordered by x value.

**Usage**

geom_line(mapping = NULL, data = NULL, stat = "identity",
position = "identity", ...)

**Arguments**

- **mapping**
  The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**
  A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**
  The statistical transformation to use on the data for this layer.
- **position**
  The position adjustment to use for overlapping points on this layer
- **...**
  other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.
Aesthetics

geom_line understands the following aesthetics (required aesthetics are in bold):

• x
• y
• alpha
• colour
• linetype
• size

See Also

gem_path: connect observations in data order, geom_segment: draw line segments, geom.ribbon: fill between line and x-axis

Examples

# Summarise number of movie ratings by year of movie
mry <- do.call(rbind, by(movies, round(movies$rating), function(df) {
  nums <- tapply(df$length, df$year, length)
  data.frame(rating=round(df$rating[1]), year = as.numeric(names(nums)), number=as.vector(nums))
}))

p <- ggplot(mry, aes(x=year, y=number, group=rating))
p + geom_line()

# Add aesthetic mappings
p + geom_line(aes(size = rating))
p + geom_line(aes(colour = rating))

# Change scale
p + geom_line(aes(colour = rating)) + scale_colour_gradient(low="red")
p + geom_line(aes(size = rating)) + scale_size(range = c(0.1, 3))

# Set aesthetics to fixed value
p + geom_line(colour = "red", size = 1)

# Use qplot instead
qplot(year, number, data=mry, group=rating, geom="line")

# Using a time series
qplot(date, pop, data=economics, geom="line")
qplot(date, pop, data=economics, geom="line", log="y")
qplot(date, pop, data=subset(economics, date > as.Date("2006-1-1")), geom="line")
qplot(date, pop, data=economics, size=unemploy/pop, geom="line")

# Use the arrow parameter to add an arrow to the line
# See ?grid::arrow for more details
c <- ggplot(economics, aes(x = date, y = pop))
# Arrow defaults to "last"
library(grid)
c + geom_line(arrow = arrow())
c + geom_line(arrow = arrow(angle = 15, ends = "both", type = "closed"))

# See scale_date for examples of plotting multiple times series on
# a single graph

# A simple pcp example

y2005 <- runif(300, 20, 120)
y2010 <- y2005 * runif(300, -1.05, 1.5)
group <- rep(LETTERS[1:3], each = 100)

df <- data.frame(id = seq_along(group), group, y2005, y2010)
library(reshape2) # for melt
dfm <- melt(df, id.var = c("id", "group"))
ggplot(dfm, aes(variable, value, group = id, colour = group)) +
geom_path(alpha = 0.5)

geom_linerange

An interval represented by a vertical line.

Description
An interval represented by a vertical line.

Usage

geom_linerange(mapping = NULL, data = NULL, stat = "identity",
               position = "identity", ...)

Arguments

mapping The aesthetic mapping, usually constructed with aes or aes_string. Only
         needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
stat The statistical transformation to use on the data for this layer.
position The position adjustment to use for overlapping points on this layer
...
     other arguments passed on to layer. This can include aesthetics whose values
     you want to set, not map. See layer for more details.

Aesthetics

gem_linerange understands the following aesthetics (required aesthetics are in bold):

• x
• ymax
geom_map

- ymin
- alpha
- colour
- linetype
- size

See Also

gem_errorbar: error bars; geom_pointrange: range indicated by straight line, with point in the middle; geom_crossbar: hollow bar with middle indicated by horizontal line; stat_summary: examples of these guys in use; geom_smooth: for continuous analog

Examples

```r
# Generate data: means and standard errors of means for prices
# for each type of cut
dmod <- lm(price ~ cut, data=diamonds)
cuts <- data.frame(cut = unique(diamonds$cut),
    predict(dmod, data.frame(cut = unique(diamonds$cut)), se=TRUE)[c("fit","se.fit")])
qplot(cut, fit, data=cut)
# With a bar chart, we are comparing lengths, so the y-axis is
# automatically extended to include 0
qplot(cut, fit, data=cut, geom="bar")

# Display estimates and standard errors in various ways
se <- ggplot(cuts, aes(cut, fit,
    ymin = fit - se.fit, ymax=fit + se.fit, colour = cut))
se + geom_linerange()
se + geom_pointrange()
se + geom_errorbar(width = 0.5)
se + geom_crossbar(width = 0.5)

# Use coord_flip to flip the x and y axes
se + geom_linerange() + coord_flip()
```

geom_map

Polgons from a reference map.

Description

Does not affect position scales.

Usage

```r
geom_map(mapping = NULL, data = NULL, map, stat = "identity", ...)
```
Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.

- **data**: A layer specific dataset - only needed if you want to override the plot defaults.

- **map**: Data frame that contains the map coordinates. This will typically be created using `fortify` on a spatial object. It must contain columns `x` or `long`, `y` or `lat`, and `region` or `id`.

- **stat**: The statistical transformation to use on the data for this layer.

  ...  

- **other arguments passed on to layer**: This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Aesthetics

`geom_map` understands the following aesthetics (required aesthetics are in bold):

- **map_id**
- **alpha**
- **colour**
- **fill**
- **linetype**
- **size**

Examples

```r
# When using geom_polygon, you will typically need two data frames: 
# one contains the coordinates of each polygon (positions), and the 
# other the values associated with each polygon (values). An id 
# variable links the two together

ids <- factor(c("1.1", "2.1", "1.2", "2.2", "1.3", "2.3"))

values <- data.frame(
  id = ids,
  value = c(3, 3.1, 3.1, 3.2, 3.15, 3.5)
)

ggplot(values) + geom_map(aes(map_id = id), map = positions) + 
  expand_limits(positions)
```

```r
ggplot(values, aes(fill = value)) + 
  geom_map(aes(map_id = id), map = positions) +
```
geom_path

Connect observations in original order

Description

Connect observations in original order

Usage

geom_path(mapping = NULL, data = NULL, stat = "identity",
    position = "identity", lineend = "butt", linejoin = "round",
    linemitre = 1, na.rm = FALSE, arrow = NULL, ...)

Arguments

mapping The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
stat The statistical transformation to use on the data for this layer.
position The position adjustment to use for overlapping points on this layer
lineend Line end style (round, butt, square)
linejoin Line join style (round, mitre, bevel)
linemitre Line mitre limit (number greater than 1)
na.rm If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
Arrow specification, as created by `?grid::arrow` and other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

### Aesthetics

`geom_path` understands the following aesthetics (required aesthetics are in bold):

- x
- y
- alpha
- colour
- linetype
- size

### See Also

- `geom_line`: Functional (ordered) lines; `geom_polygon`: Filled paths (polygons); `geom_segment`: Line segments

### Examples

```r
# Generate data
library(plyr)
myear <- ddply(movies, .(year), colwise(mean, .(length, rating))
p <- ggplot(myear, aes(length, rating))
p + geom_path()

# Add aesthetic mappings
p + geom_path(aes(size = year))
p + geom_path(aes(colour = year))

# Change scale
p + geom_path(aes(size = year)) + scale_size(range = c(1, 3))

# Set aesthetics to fixed value
p + geom_path(colour = "green")

# Control line join parameters
df <- data.frame(x = 1:3, y = c(4, 1, 9))
base <- ggplot(df, aes(x, y))
base + geom_path(size = 10)
base + geom_path(size = 10, lineend = "round")
base + geom_path(size = 10, linejoin = "mitre", lineend = "butt")

# Use qplot instead
qplot(length, rating, data=myear, geom="path")

# Using economic data:
```
# How is unemployment and personal savings rate related?
qplot(unemploy/pop, psavert, data=economics)
qplot(unemploy/pop, psavert, data=economics, geom="path")
qplot(unemploy/pop, psavert, data=economics, geom="path", size=as.numeric(date))

# How is rate of unemployment and length of unemployment?
qplot(unemploy/pop, uempmed, data=economics)
qplot(unemploy/pop, uempmed, data=economics, geom="path")
  geom_point(data=head(economics, 1), colour="red") +
  geom_point(data=tail(economics, 1), colour="blue")
qplot(unemploy/pop, uempmed, data=economics, geom="path")
  geom_text(data=head(economics, 1), label="1967", colour="blue") +
  geom_text(data=tail(economics, 1), label="2007", colour="blue")

# geom_path removes missing values on the ends of a line.
# use na.rm = T to suppress the warning message
df <- data.frame(
  x = 1:5,
  y1 = c(1, 2, 3, 4, NA),
  y2 = c(NA, 2, 3, 4, 5),
  y3 = c(1, 2, NA, 4, 5),
  y4 = c(1, 2, 3, 4, 5))
qplot(x, y1, data = df, geom = c("point","line"))
qplot(x, y2, data = df, geom = c("point","line"))
qplot(x, y3, data = df, geom = c("point","line"))
qplot(x, y4, data = df, geom = c("point","line"))

# Setting line type vs colour/size
# Line type needs to be applied to a line as a whole, so it can
# not be used with colour or size that vary across a line
x <- seq(0.01, .99, length=100)
df <- data.frame(x = rep(x, 2), y = c(qlogis(x), 2 * qlogis(x)), group = rep(c("a","b"), each=100))
p <- ggplot(df, aes(x=x, y=y, group=group))

# Should work
p + geom_line(linetype = 2)
p + geom_line(aes(colour = group), linetype = 2)
p + geom_line(aes(colour = x))

# Should fail
should_stop(p + geom_line(aes(colour = x), linetype=2))

# Use the arrow parameter to add an arrow to the line
# See ?grid::arrow for more details
library(grid)
c <- ggplot(economics, aes(x = date, y = pop))
# Arrow defaults to "last"
c + geom_path(arrow = arrow())
c + geom_path(arrow = arrow(angle = 15, ends = "both", length = unit(0.6, "inches")))
The point geom is used to create scatterplots.

Usage

```r
geom_point(mapping = NULL, data = NULL, stat = "identity",
            position = "identity", na.rm = FALSE, ...)
```

Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**: The statistical transformation to use on the data for this layer.
- **position**: The position adjustment to use for overlapping points on this layer.
- **na.rm**: If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
- **...**: other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Details

The scatterplot is useful for displaying the relationship between two continuous variables, although it can also be used with one continuous and one categorical variable, or two categorical variables. See `geom_jitter` for possibilities.

The bubblechart is a scatterplot with a third variable mapped to the size of points. There are no special names for scatterplots where another variable is mapped to point shape or colour, however.

The biggest potential problem with a scatterplot is overplotting: whenever you have more than a few points, points may be plotted on top of one another. This can severely distort the visual appearance of the plot. There is no one solution to this problem, but there are some techniques that can help. You can add additional information with `stat_smooth`, `stat_quantile` or `stat_density2d`. If you have few unique x values, `geom_boxplot` may also be useful. Alternatively, you can summarise the number of points at each location and display that in some way, using `stat_sum`. Another technique is to use transparent points, `geom_point(alpha = 0.05).

Aesthetics

`geom_point` understands the following aesthetics (required aesthetics are in bold):

- **x**
- **y**
geom_point

- alpha
- colour
- fill
- shape
- size

See Also

scale_size to see scale area of points, instead of radius, geom_jitter to jitter points to reduce (mild) overplotting

Examples

```r
p <- ggplot(mtcars, aes(wt, mpg))
p + geom_point()

# Add aesthetic mappings
p + geom_point(aes(colour = qsec))
p + geom_point(aes(alpha = qsec))
p + geom_point(aes(colour = factor(cyl)))
p + geom_point(aes(shape = factor(cyl))))
p + geom_point(aes(size = qsec))

# Change scales
p + geom_point(aes(colour = cyl)) + scale_colour_gradient(low = "blue")
p + geom_point(aes(size = qsec)) + scale_size_area()
p + geom_point(aes(shape = factor(cyl))) + scale_shape(solid = FALSE)

# Set aesthetics to fixed value
p + geom_point(colour = "red", size = 3)
qplot(wt, mpg, data = mtcars, colour = I("red"), size = I(3))

# Varying alpha is useful for large datasets
d <- ggplot(diamonds, aes(carat, price))
d + geom_point(alpha = 1/10)
d + geom_point(alpha = 1/20)
d + geom_point(alpha = 1/100)

# You can create interesting shapes by layering multiple points of
# different sizes
p <- ggplot(mtcars, aes(mpg, wt))
p + geom_point(colour="grey50", size = 4) + geom_point(aes(colour = cyl))
p + aes(shape = factor(cyl)) +
    geom_point(aes(colour = factor(cyl)), size = 4) +
    geom_point(colour="grey90", size = 1.5)
p + geom_point(colour="black", size = 4.5) +
    geom_point(colour="pink", size = 4) +
    geom_point(aes(shape = factor(cyl)))

# These extra layers don’t usually appear in the legend, but we can
# force their inclusion
p + geom_point(colour="black", size = 4.5, show_guide = TRUE) +
  geom_point(colour="pink", size = 4, show_guide = TRUE) +
  geom_point(aes(shape = factor(cyl))))

# Transparent points:
qplot(mpg, wt, data = mtcars, size = I(5), alpha = I(0.2))

# geom_point warns when missing values have been dropped from the data set
# and not plotted, you can turn this off by setting na.rm = TRUE
mtcars2 <- transform(mtcars, mpg = ifelse(runif(32) < 0.2, NA, mpg))
qplot(wt, mpg, data = mtcars2)
qplot(wt, mpg, data = mtcars2, na.rm = TRUE)

# Use qplot instead
qplot(wt, mpg, data = mtcars)
qplot(wt, mpg, data = mtcars, colour = factor(cyl))
qplot(wt, mpg, data = mtcars, colour = I("red"))

---

**geom_pointrange**

An interval represented by a vertical line, with a point in the middle.

**Description**

An interval represented by a vertical line, with a point in the middle.

**Usage**

```r
geom_pointrange(mapping = NULL, data = NULL, stat = "identity",
    position = "identity", ...)
```

**Arguments**

- `mapping` The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- `data` A layer specific dataset - only needed if you want to override the plot defaults.
- `stat` The statistical transformation to use on the data for this layer.
- `position` The position adjustment to use for overlapping points on this layer
- `...` other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

**Aesthetics**

`geom_pointrange` understands the following aesthetics (required aesthetics are in bold):

- `x`
geom_polygon

- y
- ymax
- ymin
- alpha
- colour
- fill
- linetype
- shape
- size

See Also

gem_errorbar for error bars, geom_linerange for range indicated by straight line, + examples, geom_crossbar for hollow bar with middle indicated by horizontal line, stat_summary for examples of these guys in use, geom_smooth for continuous analog

Examples

# See geom_linerange for examples

gem_polygon

Polygon, a filled path.

Description

Polygon, a filled path.

Usage

gem_polygon(mapping = NULL, data = NULL, stat = "identity",
position = "identity", ...)

Arguments

mapping The aesthetic mapping, usually constructed with aes or aes_string. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
stat The statistical transformation to use on the data for this layer.
position The position adjustment to use for overlapping points on this layer
...
other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.
Aesthetics

gem_polygon understands the following aesthetics (required aesthetics are in bold):

- x
- y
- alpha
- colour
- fill
- linetype
- size

See Also

gem_path for an unfilled polygon, gem_ribbon for a polygon anchored on the x-axis

Examples

# When using gem_polygon, you will typically need two data frames:
# one contains the coordinates of each polygon (positions), and the
# other the values associated with each polygon (values). An id
# variable links the two together

ids <- factor(c("1.1", "2.1", "1.2", "2.2", "1.3", "2.3"))

values <- data.frame(
  id = ids,
  value = c(3, 3.1, 3.1, 3.2, 3.15, 3.5)
)

positions <- data.frame(
  id = rep(ids, each = 4),
  x = c(2, 1, 1.1, 2.2, 1, 0, 0.3, 1.1, 2.2, 1.1, 1.2, 2.5, 1.1, 0.3,
        0.5, 1.2, 2.5, 1.2, 1.3, 2.7, 1.2, 0.5, 0.6, 1.3),
  y = c(-0.5, 0, 1, 0.5, 0, 0.5, 1, 0.5, 1, 0.5, 1, 2.1, 1.7, 1, 1.5,
        2.2, 2.1, 1.7, 2.1, 3.2, 2.8, 2.1, 2.2, 3.3, 3.2)
)

# Currently we need to manually merge the two together
datapoly <- merge(values, positions, by=c("id"))

(p <- ggplot(datapoly, aes(x=x, y=y)) + geom_polygon(aes(fill=value, group=id)))

# Which seems like a lot of work, but then it's easy to add on
# other features in this coordinate system, e.g.:

stream <- data.frame(
  x = cumsum(runif(50, max = 0.1)),
  y = cumsum(runif(50, max = 0.1))
)
Add quantile lines from a quantile regression.

Description
This can be used as a continuous analogue of a geom_boxplot.

Usage
geom_quantile(mapping = NULL, data = NULL, stat = "quantile",
position = "identity", lineend = "butt", linejoin = "round",
linemitre = 1, na.rm = FALSE, ...)

Arguments
- mapping: The aesthetic mapping, usually constructed with \texttt{aes} or \texttt{aes_string}. Only needs to be set at the layer level if you are overriding the plot defaults.
- data: A layer specific dataset - only needed if you want to override the plot defaults.
- stat: The statistical transformation to use on the data for this layer.
- position: The position adjustment to use for overlapping points on this layer.
- lineend: Line end style (round, butt, square).
- linejoin: Line join style (round, mitre, bevel).
- linemitre: Line mitre limit (number greater than 1).
- na.rm: If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
- ...: Other arguments passed on to \texttt{layer}. This can include aesthetics whose values you want to set, not map. See \texttt{layer} for more details.

Aesthetics
geom_quantile understands the following aesthetics (required aesthetics are in bold):
- \texttt{x}
- \texttt{y}
- \texttt{alpha}
- \texttt{colour}
- \texttt{linetype}
- \texttt{size}
- \texttt{weight}
geom_raster

See Also

See stat_quantile for examples.

Examples

# See stat_quantile for examples

---

geom_raster  

*High-performance rectangular tiling.*

Description

This is a special case of geom_tile where all tiles are the same size. It is implemented highly efficiently using the internal rasterGrob function.

Usage

```r
geom_raster(mapping = NULL, data = NULL, stat = "identity",
position = "identity", hjust = 0.5, vjust = 0.5, interpolate = FALSE,
...)
```

Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**: The statistical transformation to use on the data for this layer.
- **position**: The position adjustment to use for overlapping points on this layer.
- **hjust, vjust**: horizontal and vertical justification of the grob. Each justification value should be a number between 0 and 1. Defaults to 0.5 for both, centering each pixel over its data location.
- **interpolate**: If TRUE interpolate linearly, if FALSE (the default) don’t interpolate.
- **...**: other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Details

By default, geom_raster add a vertical and horizontal padding. The size of padding depends on the resolution of data. If you want to manually set the padding (e.g. want zero-padding), you can change the behavior by setting `hpad` and `vpad`. 
Aesthetics

`geom_raster` understands the following aesthetics (required aesthetics are in bold):

- x
- y
- alpha
- fill

Examples

```r
# Generate data
pp <- function(n, r=4) {
  x <- seq(-r*pi, r*pi, len=n)
  df <- expand.grid(x=x, y=x)
  df$r <- sqrt(df$x^2 + df$y^2)
  df$z <- cos(df$r^2)*exp(-df$r/6)
  df
}
qplot(x, y, data = pp(20), fill = z, geom = "raster")
# Interpolation worsens the appearance of this plot, but can help when
# rendering images.
qplot(x, y, data = pp(20), fill = z, geom = "raster", interpolate = TRUE)

# For the special cases where it is applicable, geom_raster is much
# faster than geom_tile:
pp200 <- pp(200)
base <- ggplot(pp200, aes(x, y, fill = z))
benchplot(base + geom_raster())
benchplot(base + geom_tile())

# justification
df <- expand.grid(x = 0:5, y = 0:5)
df$z <- runif(nrow(df))
# default is compatible with geom_tile()
ggplot(df, aes(x, y, fill = z)) + geom_raster()
# zero padding
ggplot(df, aes(x, y, fill = z)) + geom_raster(hjust = 0, vjust = 0)
```

---

**geom_rect**

2d rectangles.

**Description**

2d rectangles.
Usage

```r
geom_rect(mapping = NULL, data = NULL, stat = "identity",
         position = "identity", ...)
```

Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**: The statistical transformation to use on the data for this layer.
- **position**: The position adjustment to use for overlapping points on this layer
- **...**: other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Aesthetics

- `xmax`
- `xmin`
- `ymax`
- `ymin`
- `alpha`
- `colour`
- `fill`
- `linetype`
- `size`

Examples

```r
df <- data.frame(
  x = sample(10, 20, replace = TRUE),
  y = sample(10, 20, replace = TRUE)
)
ggplot(df, aes(xmin = x, xmax = x + 1, ymin = y, ymax = y + 2)) +
geom_rect()
```
**geom_ribbon**

*Ribbons, y range with continuous x values.*

**Description**

Ribbons, y range with continuous x values.

**Usage**

```r
geom_ribbon(mapping = NULL, data = NULL, stat = "identity",
    position = "identity", na.rm = FALSE, ...)
```

**Arguments**

- `mapping` The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- `data` A layer specific dataset - only needed if you want to override the plot defaults.
- `stat` The statistical transformation to use on the data for this layer.
- `position` The position adjustment to use for overlapping points on this layer
- `na.rm` If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
- `...` other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

**Aesthetics**

`geom_ribbon` understands the following aesthetics (required aesthetics are in bold):

- **x**
- **ymax**
- **ymin**
- **alpha**
- **colour**
- **fill**
- **linetype**
- **size**

**See Also**

- `geom_bar` for discrete intervals (bars), `geom_linerange` for discrete intervals (lines), `geom_polygon` for general polygons
Examples

# Generate data
huron <- data.frame(year = 1875:1972, level = as.vector(LakeHuron))
library(plyr) # to access round_any
huron$decade <- round_any(huron$year, 10, floor)

h <- ggplot(huron, aes(x=year))

h + geom_ribbon(aes(ymin=0, ymax=level))
h + geom_area(aes(y = level))

# Add aesthetic mappings
h + geom_ribbon(aes(ymin=level-1, ymax=level+1))
h + geom_ribbon(aes(ymin=level-1, ymax=level+1)) + geom_line(aes(y=level))

# Take out some values in the middle for an example of NA handling
huron[huron$year > 1900 & huron$year < 1910, "level"] <- NA
h <- ggplot(huron, aes(x=year))
h + geom_ribbon(aes(ymin=level-1, ymax=level+1)) + geom_line(aes(y=level))

# Another data set, with multiple y's for each x
m <- ggplot(movies, aes(y=votes, x=year))
(m <- m + geom_point())

# The default summary isn't that useful
m + stat_summary(geom="ribbon", fun.ymin="min", fun.ymax="max")
m + stat_summary(geom="ribbon", fun.data="median_hilow")

# Use qplot instead
qplot(year, level, data=huron, geom=c("area", "line"))

geom_rug

description
Marginal rug plots.

Usage

geom_rug(mapping = NULL, data = NULL, stat = "identity",
position = "identity", sides = "bl", ...)

Arguments

mapping The aesthetic mapping, usually constructed with aes or aes_string. Only
needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
stat The statistical transformation to use on the data for this layer.
position The position adjustment to use for overlapping points on this layer
sides A string that controls which sides of the plot the rugs appear on. It can be set to a string containing any of "trbl", for top, right, bottom, and left.
... other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.

Aesthetics

geom_rug understands the following aesthetics (required aesthetics are in bold):

• alpha
• colour
• linetype
• size

Examples

p <- ggplot(mtcars, aes(x=wt, y=mpg))
p + geom_point()
p + geom_point() + geom_rug()  # Rug on bottom only
p + geom_point() + geom_rug(sides="b")  # Rug on bottom only
p + geom_point() + geom_rug(sides="trbl")  # All four sides
p + geom_point() + geom_rug(position='jitter')

geom_segment

Single line segments.

Description

Single line segments.

Usage

geom_segment(mapping = NULL, data = NULL, stat = "identity",
  position = "identity", arrow = NULL, lineend = "butt", na.rm = FALSE,
  ...)
Arguments

mapping The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.

data A layer specific dataset - only needed if you want to override the plot defaults.

stat The statistical transformation to use on the data for this layer.

position The position adjustment to use for overlapping points on this layer

arrow specification for arrow heads, as created by `arrow()`

lineend Line end style (round, butt, square)

na.rm If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.

... other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Aesthetics

gem segment understands the following aesthetics (required aesthetics are in bold):

- `x`
- `xend`
- `y`
- `yend`
- `alpha`
- `colour`
- `linetype`
- `size`

See Also

gem_path and gem_line for multi-segment lines and paths.

Examples

library(grid) # needed for arrow function
p <- ggplot(seals, aes(x = long, y = lat))
(p <- p + geom_segment(aes(xend = long + delta_long, yend = lat + delta_lat),
    arrow = arrow(length = unit(0.1,"cm"))))

if (require("maps")) {

xlim <- range(seals$long)
ylim <- range(seals$lat)
usamap <- data.frame(map("world", xlim = xlim, ylim = ylim, plot = FALSE)[c("x","y")])
usamap <- rbind(usamap, NA, data.frame(map("state", xlim = xlim, ylim = ylim, plot = FALSE)[c("x","y")]))
names(usamap) <- c("long", "lat")
p + geom_path(data = usamap) + scale_x_continuous(limits = xlim)
}

# You can also use geom_segment to recreate plot(type = "h"):
counts <- as.data.frame(table(x = rpois(100,5)))
counts$x <- as.numeric(as.character(counts$x))
with(counts, plot(x, Freq, type = "h", lwd = 10))

ggplot(x, Freq, data = counts, geom = "segment",
yend = 0, xend = x, size = 1(10))

# Adding line segments
library(grid) # needed for arrow function
b <- ggplot(mtcars, aes(wt, mpg)) + geom_point()
b + geom_segment(aes(x = 2, y = 15, xend = 2, yend = 25))
b + geom_segment(aes(x = 2, y = 15, xend = 3, yend = 15))
b + geom_segment(aes(x = 5, y = 30, xend = 3.5, yend = 25),
arrow = arrow(length = unit(0.5, "cm")))

---

**geom_smooth**

Add a smoothed conditional mean.

**Description**

Add a smoothed conditional mean.

**Usage**

geom_smooth(mapping = NULL, data = NULL, stat = "smooth",
position = "identity", ...)

**Arguments**

- **mapping**
  The aesthetic mapping, usually constructed with aes or aes_string. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**
  A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**
  The statistical transformation to use on the data for this layer.
- **position**
  The position adjustment to use for overlapping points on this layer
- **...**
  other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.

**Aesthetics**

geom_smooth understands the following aesthetics (required aesthetics are in bold):

- **x**
- **y**
• alpha
• colour
• fill
• linetype
• size
• weight

See Also

The default stat for this geom is stat_smooth see that documentation for more options to control the underlying statistical transformation.

Examples

# See stat_smooth for examples of using built in model fitting
# if you need some more flexible, this example shows you how to
# plot the fits from any model of your choosing
qplot(wt, mpg, data=mtcars, colour=factor(cyl))

model <- lm(mpg ~ wt + factor(cyl), data=mtcars)
grid <- with(mtcars, expand.grid(
  wt = seq(min(wt), max(wt), length = 20),
  cyl = levels(factor(cyl))
))
grid$mpg <- stats::predict(model, newdata=grid)
qplot(wt, mpg, data=mtcars, colour=factor(cyl)) + geom_line(data=grid)

# or with standard errors
err <- stats::predict(model, newdata=grid, se = TRUE)
grid$ucl <- err$fit + 1.96 * err$se.fit
grid$lcl <- err$fit - 1.96 * err$se.fit
qplot(wt, mpg, data=mtcars, colour=factor(cyl)) +
  geom_smooth(aes(ymin = lcl, ymax = ucl), data=grid, stat="identity")

geom_step

Connect observations by stairs.

Description

Connect observations by stairs.

Usage

geom_step(mapping = NULL, data = NULL, stat = "identity",
  position = "identity", direction = "hv", ...)
Arguments

mapping  The aesthetic mapping, usually constructed with aes or aes_string. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
stat  The statistical transformation to use on the data for this layer.
position  The position adjustment to use for overlapping points on this layer
direction  direction of stairs: 'vh' for vertical then horizontal, or 'hv' for horizontal then vertical
...  other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.

Aesthetics

text x

geom_step understands the following aesthetics (required aesthetics are in bold):

• alpha
• colour
• linetype
• size

Examples

# Simple quantiles/ECDF from examples(plot)
x <- sort(rnorm(47))
qplot(seq_along(x), x, geom="step")

# Steps go horizontally, then vertically (default)
qplot(seq_along(x), x, geom="step", direction = "hv")
plot(x, type = "s")

# Steps go vertically, then horizontally
qplot(seq_along(x), x, geom="step", direction = "vh")
plot(x, type = "S")

# Also works with other aesthetics
df <- data.frame(
  x = sort(rnorm(50)),
  trt = sample(c("a", "b"), 50, rep = TRUE)
)
qplot(seq_along(x), x, data = df, geom="step", colour = trt)
Description

Textual annotations.

Usage

```r
geom_text(mapping = NULL, data = NULL, stat = "identity",
          position = "identity", parse = FALSE, ...)
```

Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**: The statistical transformation to use on the data for this layer.
- **position**: The position adjustment to use for overlapping points on this layer.
- **parse**: If TRUE, the labels will be parsed into expressions and displayed as described in `?plotmath`.
- **...**: other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Aesthetics

`geom_text` understands the following aesthetics (required aesthetics are in bold):

- **label**
- **x**
- **y**
- **alpha**
- **angle**
- **colour**
- **family**
- **fontface**
- **hjust**
- **lineheight**
- **size**
- **vjust**
Examples

```r
p <- ggplot(mtcars, aes(x=wt, y=mpg, label=rownames(mtcars)))

p + geom_text()
# Change size of the label
p + geom_text(size=10)
p <- p + geom_point()

# Set aesthetics to fixed value
p + geom_text()
p + geom_point() + geom_text(hjust=0, vjust=0)
p + geom_point() + geom_text(angle = 45)

# Add aesthetic mappings
p + geom_text(aes(colour=factor(cyl)))
p + geom_text(aes(colour=factor(cyl))) + scale_colour_discrete(l=40)

p + geom_text(aes(size=wt))
p + geom_text(aes(size=wt)) + scale_size(range=c(3,6))

# You can display expressions by setting parse = TRUE. The
details of the display are described in ?plotmath, but note that
geom_text uses strings, not expressions.
p + geom_text(aes(label = paste(wt, "^\(^\)\ c y l\ ^{\)\ sep = "])),
parse = TRUE)

# Add an annotation not from a variable source
c <- ggplot(mtcars, aes(wt, mpg)) + geom_point()
c + geom_text(data = NULL, x = 5, y = 30, label = "plot mpg vs. wt")
# Or, you can use annotate
c + annotate("text", label = "plot mpg vs. wt", x = 2, y = 15, size = 8, colour = "red")

# Use qplot instead
qplot(wt, mpg, data = mtcars, label = rownames(mtcars),
     geom=c("point", "text"))
qplot(wt, mpg, data = mtcars, label = rownames(mtcars), size = wt) +
     geom_text(colour = "red")

# You can specify family, fontface and lineheight
p <- ggplot(mtcars, aes(x=wt, y=mpg, label=rownames(mtcars)))
p + geom_text(fontface=3)
p + geom_text(aes(fontface=am+1))
p + geom_text(aes(family=c("serif", "mono")[[am+1]]))
```

**geom_tile**

Tile plane with rectangles.
Description

Similar to `levelplot` and `image`.

Usage

    geom_tile(mapping = NULL, data = NULL, stat = "identity",
              position = "identity", ...)

Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**: The statistical transformation to use on the data for this layer.
- **position**: The position adjustment to use for overlapping points on this layer
- **...**: other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Aesthetics

`geom_tile` understands the following aesthetics (required aesthetics are in bold):

- x
- y
- alpha
- colour
- fill
- linetype
- size

Examples

```
# Generate data
pp <- function(n,r=4) {
  x <- seq(-r*pi, r*pi, len=n)
  df <- expand.grid(x=x, y=x)
  df$r <- sqrt(df$x^2 + df$y^2)
  df$z <- cos(df$r^2)*exp(-df$r/6)
  df
}
p <- ggplot(pp(20), aes(x=x,y=y))
p + geom_tile() #pretty useless!
```

```
# Add aesthetic mappings
p + geom_tile(aes(fill=z))
```
# Change scale
p + geom_tile(aes(fill=z)) + scale_fill_gradient(low="green", high="red")

# Use qplot instead
qplot(x, y, data=pp(20), geom="tile", fill=z)
qplot(x, y, data=pp(100), geom="tile", fill=z)

# Missing values
p <- ggplot(pp(20)[sample(20*20, size=200),], aes(x=x,y=y,fill=z))
p + geom_tile()

# Input that works with image
image(t(volcano)[ncol(volcano):1,])
library(reshape2) # for melt
ggplot(melt(volcano), aes(x=Var1, y=Var2, fill=value)) + geom_tile()

# inspired by the image-density plots of Ken Knoblauch
cars <- ggplot(mtcars, aes(y=factor(cyl), x=mpg))
cars + geom_point()
cars + stat_bin(aes(fill=..count..), geom="tile", binwidth=3, position="identity")
cars + stat_bin(aes(fill=..density..), geom="tile", binwidth=3, position="identity")
cars + stat_density(aes(fill=..density..), geom="tile", position="identity")
cars + stat_density(aes(fill=..count..), geom="tile", position="identity")

# Another example with with unequal tile sizes
x.cell.boundary <- c(0, 4, 6, 8, 10, 14)
example <- data.frame(
  x = rep(c(2, 5, 7, 9, 12), 2),
  y = factor(rep(c(1,2), each=5)),
  z = rep(1:5, each=2),
  w = rep(diff(x.cell.boundary), 2)
)
qplot(x, y, fill=z, data=example, geom="tile")
qplot(x, y, fill=z, data=example, geom="tile", width=w)
qplot(x, y, fill=factor(z), data=example, geom="tile", width=w)

# You can manually set the colour of the tiles using
# scale_manual
col <- c("darkblue", "blue", "green", "orange", "red")
qplot(x, y, fill=col[z], data=example, geom="tile", width=w, group=1) +
  scale_fill_identity(labels=letters[1:5], breaks=col)

---

**geom_violin**

**Violin plot.**
Description

Violin plot.

Usage

geom_violin(mapping = NULL, data = NULL, stat = "ydensity",
position = "dodge", trim = TRUE, scale = "area", ...)  

Arguments

mapping       The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
data          A layer specific dataset - only needed if you want to override the plot defaults.
stat           The statistical transformation to use on the data for this layer.
position       The position adjustment to use for overlapping points on this layer
trim           If TRUE (default), trim the tails of the violins to the range of the data. If FALSE, don't trim the tails.
scale          if "area" (default), all violins have the same area (before trimming the tails). If "count", areas are scaled proportionally to the number of observations. If "width", all violins have the same maximum width.
...            other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Aesthetics

`geom_violin` understands the following aesthetics (required aesthetics are in bold):

• x
• y
• alpha
• colour
• fill
• linetype
• size
• weight

Examples

```r
p <- ggplot(mtcars, aes(factor(cyl), mpg))
p + geom_violin()
qplot(factor(cyl), mpg, data = mtcars, geom = "violin")
p + geom_violin() + geom_jitter(height = 0)
p + geom_violin() + coord_flip()
```
geom_vline

qplot(factor(cyl), mpg, data = mtcars, geom = "violin") +
  coord_flip()

  # Scale maximum width proportional to sample size:
  p + geom_violin(scale = "count")

  # Scale maximum width to 1 for all violins:
  p + geom_violin(scale = "width")

  # Default is to trim violins to the range of the data. To disable:
  p + geom_violin(trim = FALSE)

  # Use a smaller bandwidth for closer density fit (default is 1).
  p + geom_violin(adjust = .5)

  # Add aesthetic mappings
  # Note that violins are automatically dodged when any aesthetic is
  # a factor
  p + geom_violin(aes(fill = cyl))
  p + geom_violin(aes(fill = factor(cyl)))
  p + geom_violin(aes(fill = factor(vs)))
  p + geom_violin(aes(fill = factor(am)))

  # Set aesthetics to fixed value
  p + geom_violin(fill = "grey80", colour = "#3366FF")
  qplot(factor(cyl), mpg, data = mtcars, geom = "violin",
        colour = I("#3366FF"))

  # Scales vs. coordinate transforms -------
  # Scale transformations occur before the density statistics are computed.
  # Coordinate transformations occur afterwards. Observe the effect on the
  # number of outliers.
  library(plyr) # to access round_any
  m <- ggplot(movies, aes(y = votes, x = rating,
                         group = round_any(rating, 0.5)))
  m + geom_violin()
  m + geom_violin() + scale_y_log10()
  m + geom_violin() + coord_trans(y = "log10")
  m + geom_violin() + scale_y_log10() + coord_trans(y = "log10")

  # Violin plots with continuous x:
  # Use the group aesthetic to group observations in violins
  qplot(year, budget, data = movies, geom = "violin")
  qplot(year, budget, data = movies, geom = "violin",
        group = round_any(year, 10, floor))

  geom_vline  Line, vertical.
Description

This geom allows you to annotate the plot with vertical lines (see `geom_hline` and `geom_abline` for other types of lines).

Usage

```r
geom_vline(mapping = NULL, data = NULL, stat = "vline",
    position = "identity", show_guide = FALSE, ...)
```

Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**: The statistical transformation to use on the data for this layer.
- **position**: The position adjustment to use for overlapping points on this layer.
- **show_guide**: should a legend be drawn? (defaults to `false`)...
- **...**: other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Details

There are two ways to use it. You can either specify the intercept of the line in the call to the geom, in which case the line will be in the same position in every panel. Alternatively, you can supply a different intercept for each panel using a data.frame. See the examples for the differences.

Aesthetics

`geom_vline` understands the following aesthetics (required aesthetics are in bold):

- **alpha**
- **colour**
- **linetype**
- **size**

See Also

- `geom_hline` for horizontal lines, `geom_abline` for lines defined by a slope and intercept, `geom_segment` for a more general approach

Examples

```r
# Fixed lines
p <- ggplot(mtcars, aes(x = wt, y = mpg)) + geom_point()
p + geom_vline(xintercept = 5)
p + geom_vline(xintercept = 1:5)
p + geom_vline(xintercept = 1:5, colour="green", linetype = "longdash")
```
p + geom_vline(aes(xintercept = wt))

# With coordinate transforms
p + geom_vline(aes(xintercept = wt)) + coord_equal()
p + geom_vline(aes(xintercept = wt)) + coord_flip()
p + geom_vline(aes(xintercept = wt)) + coord_polar()

p2 <- p + aes(colour = factor(cyl))
p2 + geom_vline(xintercept = 15)

# To display different lines in different facets, you need to
# create a data frame.
p <- qplot(mpg, wt, data=mtcars, facets = vs ~ am)
vline.data <- data.frame(z = c(15, 20, 25, 30), vs = c(0, 0, 1, 1), am = c(0, 1, 0, 1))
p + geom_vline(aes(xintercept = z), vline.data)

---

### ggplot.data.frame

Create a new ggplot plot from a data frame

#### Description

Create a new ggplot plot from a data frame

#### Usage

```r
## S3 method for class 'data.frame'
ggplot(data, mapping = aes(), ..., 
environment = globalenv())
```

#### Arguments

- `data` default data frame for plot
- `mapping` default list of aesthetic mappings (these can be colour, size, shape, line type – see individual geom functions for more details)
- `...` ignored
- `environment` in which evaluation of aesthetics should occur

#### See Also

[http://had.co.nz/ggplot2](http://had.co.nz/ggplot2)
**Description**

`ggsave` is a convenient function for saving a plot. It defaults to saving the last plot that you displayed, and for a default size uses the size of the current graphics device. It also guesses the type of graphics device from the extension. This means the only argument you need to supply is the filename.

**Usage**

```r
ggsave(filename = default_name(plot), plot = last_plot(),
 device = default_device(filename), path = NULL, scale = 1,
 width = par("din")[1], height = par("din")[2], units = c("in", "cm",
 "mm"), dpi = 300, limitsize = TRUE, ...)
```

**Arguments**

- `filename` file name/filename of plot
- `plot` plot to save, defaults to last plot displayed
- `device` device to use, automatically extract from file name extension
- `path` path to save plot to (if you just want to set path and not filename)
- `scale` scaling factor
- `width` width (defaults to the width of current plotting window)
- `height` height (defaults to the height of current plotting window)
- `units` units for width and height when either one is explicitly specified (in, cm, or mm)
- `dpi` dpi to use for raster graphics
- `limitsize` when TRUE (the default), `ggsave` will not save images larger than 50x50 inches, to prevent the common error of specifying dimensions in pixels.
  
- `...` other arguments passed to graphics device

**Details**

`ggsave` currently recognises the extensions eps/ps, tex (pictex), pdf, jpeg, tiff, png, bmp, svg and wmf (windows only).

**Examples**

```r
## Not run:
ratings <- qplot(rating, data=movies, geom="histogram")
qplot(length, data=movies, geom="histogram")
ggsave("length-hist.pdf")
ggsave("length-hist.png")
ggsave("ratings.pdf", ratings)
ggsave("ratings.pdf", ratings, width=4, height=4)
```
## ggplot2 themes

### Description

Themes set the general aspect of the plot such as the colour of the background, gridlines, the size and colour of fonts.

### Usage

```r
theme_gray(base_size = 12, base_family = "")
theme_gray(base_size = 12, base_family = "")
theme_bw(base_size = 12, base_family = "")
theme_linedraw(base_size = 12, base_family = "")
theme_light(base_size = 12, base_family = "")
theme_minimal(base_size = 12, base_family = "")
theme_classic(base_size = 12, base_family = ")
```

### Arguments

- `base_size`: base font size
- `base_family`: base font family

### Details

- **theme_gray**: The signature ggplot2 theme with a grey background and white gridlines, designed to put the data forward yet make comparisons easy.
- **theme_bw**: The classic dark-on-light ggplot2 theme. May work better for presentations displayed with a projector.
- **theme_linedraw**: A theme with only black lines of various widths on white backgrounds, reminiscent of a line drawings. Serves a purpose similar to theme_bw. Note that this theme has some very thin lines (« 1 pt) which some journals may refuse.
- **theme_light**: A theme similar to theme_linedraw but with light grey lines and axes, to direct more attention towards the data.
- **theme_minimal**: A minimalistic theme with no background annotations.
- **theme_classic**: A classic-looking theme, with x and y axis lines and no gridlines.
Examples

```r
p <- ggplot(mtcars) + geom_point(aes(x = wt, y = mpg,
       colour=factor(gear))) + facet_wrap(~am)

p
p + theme_gray()
p + theme_bw()
p + theme_linedraw()
p + theme_light()
p + theme_minimal()
p + theme_classic()
```

---

**guides**

*Set guides for each scale.*

---

Description

Guides for each scale can be set in call of `scale_*` with argument `guide`, or in `guides`.

Usage

```r
guides(...)```

Arguments

... List of scale guide pairs

Value

A list containing the mapping between scale and guide.

See Also

Other guides: `guide_colorbar`, `guide_colourbar`; `guide_legend`

Examples

```r
# ggplot object

dat <- data.frame(x = 1:5, y = 1:5, p = 1:5, q = factor(1:5),
                   r = factor(1:5))
p <- ggplot(dat, aes(x, y, colour = p, size = q, shape = r)) + geom_point()

# without guide specification
p

# Show colorbar guide for colour.
# All these examples below have a same effect.
```
guide_colourbar

\begin{verbatim}
p + guides(colour = "colorbar", size = "legend", shape = "legend")
p + guides(colour = guide_colorbar(), size = guide_legend(),
shape = guide_legend())
p +
  scale_colour_continuous(guide = "colorbar") +
  scale_size_discrete(guide = "legend") +
  scale_shape(guide = "legend")

# Guides are integrated where possible
p + guides(colour = guide_legend("title"), size = guide_legend("title"),
shape = guide_legend("title"))
# same as
g <- guide_legend("title")
p + guides(colour = g, size = g, shape = g)
p + theme(legend.position = "bottom")

# position of guides
p + theme(legend.position = "bottom", legend.box = "horizontal")

# Set order for multiple guides
qplot(data = mpg, x = displ, y = cty, size = hwy, colour = cyl, shape = drv) +
guides(colour = guide_colourbar(order = 1),
       alpha = guide_legend(order = 2),
       size = guide_legend(order = 3))
\end{verbatim}

---

guide_colourbar  

**Continuous colour bar guide.**

---

**Description**

Colour bar guide shows continuous color scales mapped onto values. Colour bar is available with `scale_fill` and `scale_colour`. For more information, see the inspiration for this function: Mat-
lab's `colorbar` function.

**Usage**

guide_colourbar(title = waiver(), title.position = NULL,
title.theme = NULL, title.hjust = NULL, title.vjust = NULL,
label = TRUE, label.position = NULL, label.theme = NULL,
label.hjust = NULL, label.vjust = NULL, barwidth = NULL,
barheight = NULL, nbin = 20, raster = TRUE, ticks = TRUE,
draw.ulim = TRUE, draw.llim = TRUE, direction = NULL,
default.unit = "line", reverse = FALSE, order = 0, ...)

guide_colorbar(title = waiver(), title.position = NULL,
title.theme = NULL, title.hjust = NULL, title.vjust = NULL,
label = TRUE, label.position = NULL, label.theme = NULL,
label.hjust = NULL, label.vjust = NULL, barwidth = NULL,
barheight = NULL, nbin = 20, raster = TRUE, ticks = TRUE,
draw.ulim = TRUE, draw.llim = TRUE, direction = NULL,
default.unit = "line", reverse = FALSE, order = 0, ...)

Arguments

- **title**: A character string or expression indicating a title of guide. If NULL, the title is not shown. By default (waiver), the name of the scale object or the name specified in labs is used for the title.

- **title.position**: A character string indicating the position of a title. One of "top" (default for a vertical guide), "bottom", "left" (default for a horizontal guide), or "right."

- **title.theme**: A theme object for rendering the title text. Usually the object of element_text is expected. By default, the theme is specified by legend.title in theme or theme.

- **title.hjust**: A number specifying horizontal justification of the title text.

- **title.vjust**: A number specifying vertical justification of the title text.

- **label**: logical. If TRUE then the labels are drawn. If FALSE then the labels are invisible.

- **label.position**: A character string indicating the position of a label. One of "top", "bottom" (default for horizontal guide), "left", or "right" (default for vertical guide).

- **label.theme**: A theme object for rendering the label text. Usually the object of element_text is expected. By default, the theme is specified by legend.text in theme or theme.

- **label.hjust**: A numeric specifying horizontal justification of the label text.

- **label.vjust**: A numeric specifying vertical justification of the label text.

- **barwidth**: A numeric or a unit object specifying the width of the colorbar. Default value is legend.key.width or legend.key.size in theme or theme.

- **barheight**: A numeric or a unit object specifying the height of the colorbar. Default value is legend.key.height or legend.key.size in theme or theme.

- **nbin**: A numeric specifying the number of bins for drawing colorbar. A smoother colorbar for a larger value.

- **raster**: A logical. If TRUE then the colorbar is rendered as a raster object. If FALSE then the colorbar is rendered as a set of rectangles. Note that not all graphics devices are capable of rendering raster image.

- **ticks**: A logical specifying if tick marks on colorbar should be visible.

- **draw.ulim**: A logical specifying if the upper limit tick marks should be visible.

- **draw.llim**: A logical specifying if the lower limit tick marks should be visible.

- **direction**: A character string indicating the direction of the guide. One of "horizontal" or "vertical."
**guide_colourbar**

- `default.unit`: A character string indicating unit for `barwidth`
- `reverse`: logical. If `TRUE` the colorbar is reversed. By default, the highest value is on the top and the lowest value is on the bottom.
- `order`: positive integer less that 99 that specify the order of this guide in the multiple guides. If 0 (default), the order is determined by a secret algorithm.
- `...`: ignored.

**Details**

Guides can be specified in each scale or in `guides`. `guide="legend"` in scale is syntax sugar for `guide=guide_legend()` - but the second form allows you to specify more options. As for how to specify the guide for each scales, see `guides`.

**Value**

A guide object

**See Also**

Other guides: `guide_legend`; `guides`.

**Examples**

```r
library(reshape2) # for melt
df <- melt(outer(1:4, 1:4), varnames = c("X1", "X2"))

p1 <- ggplot(df, aes(X1, X2)) + geom_tile(aes(fill = value))
p2 <- p1 + geom_point(aes(size = value))

# Basic form
p1 + scale_fill_continuous(guide = "colorbar")
p1 + scale_fill_continuous(guide = guide_colorbar())
p1 + guides(fill = guide_colorbar())

# Control styles

# bar size
p1 + guides(fill = guide_colorbar(barwidth = 0.5, barheight = 10))

# no label
p1 + guides(fill = guide_colorbar(label = FALSE))

# no tick marks
p1 + guides(fill = guide_colorbar(ticks = FALSE))

# label position
p1 + guides(fill = guide_colorbar(label.position = "left"))

# label theme
p1 + guides(fill = guide_colorbar(label.theme = element_text(colour = "blue", angle = 0)))
```
# small number of bins
p1 + guides(fill = guide_colorbar(nbin = 3))

# large number of bins
p1 + guides(fill = guide_colorbar(nbin = 100))

# make top- and bottom-most ticks invisible
p1 + scale_fill_continuous(limits = c(0, 20), breaks = c(0, 5, 10, 15, 20),
                          guide = guide_colorbar(nbin = 100, draw.ulim = FALSE, draw.llim = FALSE))

# guides can be controlled independently
p2 +
scale_fill_continuous(guide = "colorbar") +
scale_size(guide = "legend")
p2 + guides(fill = "colorbar", size = "legend")

p2 +
scale_fill_continuous(guide = guide_colorbar(direction = "horizontal")) +
scale_size(guide = guide_legend(direction = "vertical"))

---

**guide_legend**  

*Legend guide.*

**Description**

Legend type guide shows key (i.e., geoms) mapped onto values. Legend guides for various scales are integrated if possible.

**Usage**

```r
guide_legend(title = waiver(), title.position = NULL, title.theme = NULL, title.hjust = NULL, title.vjust = NULL, label = TRUE, label.position = NULL, label.theme = NULL, label.hjust = NULL, label.vjust = NULL, keywidth = NULL, keyheight = NULL, direction = NULL, default.unit = "line", override.aes = list(), nrow = NULL, ncol = NULL, byrow = FALSE, reverse = FALSE, order = 0, ...)
```

**Arguments**

- **title**: A character string or expression indicating a title of guide. If NULL, the title is not shown. By default (`waiver`), the name of the scale object or the name specified in `labs` is used for the title.

- **title.position**: A character string indicating the position of a title. One of "top" (default for a vertical guide), "bottom", "left" (default for a horizontal guide), or "right."

- **title.theme**: A theme object for rendering the title text. Usually the object of `element_text` is expected. By default, the theme is specified by `legend.title` in `theme` or `theme`.

- **...**: Additional arguments that are passed on to `ggplot2::guide_colorbar` and `ggplot2::guide_legend` if they are not specified otherwise.
Guide legend

Title

- **title.hjust**: A number specifying horizontal justification of the title text.
- **title.vjust**: A number specifying vertical justification of the title text.
- **label**: logical. If TRUE then the labels are drawn. If FALSE then the labels are invisible.
- **label.position**: A character string indicating the position of a label. One of "top", "bottom" (default for horizontal guide), "left", or "right" (default for vertical guide).
- **label.theme**: A theme object for rendering the label text. Usually the object of `element_text` is expected. By default, the theme is specified by `legend.text` in `theme` or `theme`.
- **label.hjust**: A numeric specifying horizontal justification of the label text.
- **label.vjust**: A numeric specifying vertical justification of the label text.

Key width and height

- **keywidth**: A numeric or a unit object specifying the width of the legend key. Default value is `legend.key.width` or `legend.key.size` in `theme` or `theme`.
- **keyheight**: A numeric or a unit object specifying the height of the legend key. Default value is `legend.key.height` or `legend.key.size` in `theme` or `theme`.

Direction

- **direction**: A character string indicating the direction of the guide. One of "horizontal" or "vertical."

Default unit

- **default.unit**: A character string indicating unit for `keywidth` and `keyheight`.

Override aes

- **override.aes**: A list specifying aesthetic parameters of legend key. See details and examples.

Number of rows and columns

- **nrow**: The desired number of rows of legends.
- **ncol**: The desired number of column of legends.
- **byrow**: logical. If FALSE (the default) the legend-matrix is filled by columns, otherwise the legend-matrix is filled by rows.
- **reverse**: logical. If TRUE the order of legends is reversed.
- **order**: positive integer less that 99 that specify the order of this guide in the multiple guides. If 0 (default), the order is determined by a secret algorithm.

Details

Guides can be specified in each scale or in `guides`. `guide="legend"` in scale is syntactic sugar for `guide=guide_legend()`. As for how to specify the guide for each scales in more detail, see `guides`.

Value

A guide object

See Also

Other guides: `guide_colorbar`, `guide_colourbar`; `guides`
Examples

```r
library(reshape2) # for melt
df <- melt(outer(1:4, 1:4), varnames = c("X1", "X2"))

p1 <- ggplot(df, aes(X1, X2)) + geom_tile(aes(fill = value))
p2 <- p1 + geom_point(aes(size = value))

# Basic form
p1 + scale_fill_continuous(guide = "legend")
p1 + scale_fill_continuous(guide = guide_legend())

# Guide title
p1 + scale_fill_continuous(guide = guide_legend(title = "V")) # title text
p1 + scale_fill_continuous(name = "V") # same
p1 + scale_fill_continuous(guide = guide_legend(title = NULL)) # no title

# Control styles

# key size
p1 + guides(fill = guide_legend(keywidth = 3, keyheight = 1))

# title position
p1 + guides(fill = guide_legend(title = "LEFT", title.position = "left"))

# title text styles via element_text
p1 + guides(fill = guide_legend(
  title.theme = element_text(size=15, face="italic", colour = "red", angle = 45)))

# label position
p1 + guides(fill = guide_legend(label.position = "bottom"))

# label styles
p1 + scale_fill_continuous(breaks = c(5, 10, 15),
  labels = paste("long", c(5, 10, 15)),
  guide = guide_legend(direction = "horizontal", title.position = "top",
  label.position="bottom", label.hjust = 0.5, label.vjust = 0.5,
  label.theme = element_text(angle = 90)))

# Set aesthetic of legend key

# very low alpha value make it difficult to see legend key
p3 <- qplot(carat, price, data = diamonds, colour = color,
  alpha = 1/(100))
p3

# override.aes overwrites the alpha
p3 + guides(colour = guide_legend(override.aes = list(alpha = 1)))

# multiple row/col legends
p <- qplot(1:20, 1:20, colour = letters[1:20])
```
hmisc

Wrap up a selection of summary functions from Hmisc to make it easy to use with `stat_summary`.

Description
See the Hmisc documentation for details of their options.

Usage

```r
mean_cl_boot(x, ...)
mean_cl_normal(x, ...)
mean_sdl(x, ...)
median_hilow(x, ...)
```

Arguments

- `x` a numeric vector
- `...` other arguments passed on to the respective Hmisc function.

See Also

- `smean.cl.boot`, `smean.cl.normal`, `smean.sdl`, `smedian.hilow`

---

is.ggplot

Reports whether `x` is a ggplot object

Description
Reports whether `x` is a ggplot object

Usage

```r
is.ggplot(x)
```
is.theme

Arguments

x An object to test

Description

Reports whether x is a theme object

Usage

is.theme(x)

Arguments

x An object to test

is.rel

Reports whether x is a rel object

Description

Reports whether x is a rel object

Usage

is.rel(x)

Arguments

x An object to test
labeller

Generic labeller function for facets

Description

One-step function for providing methods or named character vectors for displaying labels in facets.

Usage

labeller(..., keep.as.numeric = FALSE)

Arguments

... Named arguments of the form variable=values, where values could be a vector or method.
keep.as.numeric logical, default TRUE. When FALSE, converts numeric values supplied as margins to the facet to characters.

Details

The provided methods are checked for number of arguments. If the provided method takes less than two (e.g. capitalize), the method is passed values. Else (e.g. label_both), it is passed variable and values (in that order). If you want to be certain, use e.g. an anonymous function. If errors are returned such as “argument ".." is missing, with no default” or “unused argument (variable)”, matching the method’s arguments does not work as expected; make a wrapper function.

Value

Function to supply to facet_grid for the argument labeller.

Examples

pl <- ggplot(mpg, aes(cty, hwy)) + geom_point()
pl + facet_grid(cyl ~ class, labeller=label_both)
pl + facet_grid(cyl ~ class, labeller=labeller(cyl=label_both))

ggplot(mtcars, aes(x = mpg, y = wt)) + geom_point() +
   facet_grid(vs + am ~ gear, margins=TRUE,
               labeller=labeller(vs=label_both, am=label_both))

capitalize <- function(string) {
  substr(string, 1, 1) <- toupper(substr(string, 1, 1))
  string
}
conservation_status <- c('cd'='Conservation Dependent',
                         'en'='Endangered',
                         'lc'='Least concern',
                         ....}
'nt'='Near Threatened',
'vu'='Vulnerable',
'domesticated'='Domesticated')

p2 <- ggplot(msleep, aes(x=sleep_total, y=awake)) + geom_point()
p2 + facet_grid(vore ~ conservation, labeller = labeller(vore = capitalize))

p2 + facet_grid(vore ~ conservation,
              labeller=labeller(vore = capitalize, conservation = conservation_status ))

# We could of course have renamed the levels;
# then we can apply another nifty function
msleep$conservation2 <- plyr::revalue(msleep$conservation, conservation_status)

p2 %>% msleep +
      facet_grid(vore ~ conservation2, labeller = labeller(vore = capitalize))
p2 %>% msleep +
      facet_grid(vore ~ conservation2, labeller = labeller(conservation2 =
        label_wrap_gen(10)))

table_both  

---
label_both  

### Description

Label facets with value and variable.

### Usage

label_both(variable, value)

### Arguments

- **variable**: variable name passed in by facetter
- **value**: variable value passed in by facetter

### See Also

Other facet labellers: label_bquote; label_parsed; label_value

### Examples

p <- qplot(wt, mpg, data = mtcars)
p + facet_grid(. ~ cyl)
p + facet_grid(. ~ cyl, labeller = label_both)
**label_bquote**  

Label facet with 'bquoted' expressions

**Description**

See `bquote` for details on the syntax of the argument. The label value is `x`.

**Usage**

```
label_bquote(expr = beta*(x))
```

**Arguments**

- `expr`  
  labelling expression to use

**See Also**

`plotmath`

Other facet labellers: `label_both`; `label_parsed`; `label_value`

**Examples**

```
p <- qplot(wt, mpg, data = mtcars)
p + facet_grid(. ~ vs, labeller = label_bquote(alpha ~ (x)))
p + facet_grid(. ~ vs, labeller = label_bquote(.(x) ~ (x)))
```

---

**label_parsed**  

Label facets with parsed label.

**Description**

Label facets with parsed label.

**Usage**

```
label_parsed(variable, value)
```

**Arguments**

- `variable`  
  variable name passed in by facetter
- `value`  
  variable value passed in by facetter

**See Also**

`plotmath`

Other facet labellers: `label_both`; `label_bquote`; `label_value`
Examples

mtcars$cyl2 <- factor(mtcars$cyl, labels = c("alpha", "beta", "gamma"))
qplot(wt, mpg, data = mtcars) + facet_grid(~ cyl2)
qplot(wt, mpg, data = mtcars) + facet_grid(~ cyl2, labeller = label_parsed)

label_value

**Label facets with their value. This is the default labelling scheme.**

Description

Label facets with their value. This is the default labelling scheme.

Usage

label_value(variable, value)

Arguments

- variable: variable name passed in by facetter
- value: variable value passed in by facetter

See Also

Other facet labellers: label_both; label_bquote; label_parsed

Examples

p <- qplot(wt, mpg, data = mtcars)
p + facet_grid(~ cyl)
p + facet_grid(~ cyl, labeller = label_value)

label_wrap_gen

**Label facets with a word wrapped label.**

Description

Uses `strwrap` for line wrapping.

Usage

label_wrap_gen(width = 25)

Arguments

- width: integer, target column width for output.
labs

Change axis labels and legend titles

Description

Change axis labels and legend titles

Usage

labs(...)

xlab(label)

ylab(label)

ggtitle(label)

Arguments

...

a list of new names in the form aesthetic = "new name"

label

The text for the axis or plot title.

Examples

p <- qplot(mpg, wt, data = mtcars)
p + labs(title = "New plot title")
p + labs(x = "New x label")
p + xlab("New x label")
p + ylab("New y label")
p + ggtitle("New plot title")

# This should work independently of other functions that modify the
the scale names
p + ylab("New y label") + ylim(2, 4)
p + ylim(2, 4) + ylab("New y label")

# The labs function also modifies legend labels
p <- qplot(mpg, wt, data = mtcars, colour = cyl)
p + labs(colour = "Cylinders")

# Can also pass in a list, if that is more convenient
p + labs(list(title = "Title", x = "X", y = "Y"))

See Also

.labeller
last_plot

Retrieve the last plot to be modified or created.

Description

Retrieve the last plot to be modified or created.

Usage

last_plot()

See Also

ggsave

map_data

Create a data frame of map data.

Description

Create a data frame of map data.

Usage

map_data(map, region = ".", exact = FALSE, ...)

Arguments

map name of map provided by the maps package. These include county, france, italy, nz, state, usa, world, world2.
region name of subregions to include. Defaults to . which includes all subregion. See documentation for map for more details.
exact should the region be treated as a regular expression (FALSE) or as a fixed string (TRUE).
... all other arguments passed on to map

Examples

if (require("maps")) {
  states <- map_data("state")
  arrests <- USArrests
  names(arrests) <- tolower(names(arrests))
  arrests$region <- tolower(rownames(USArrests))
  choro <- merge(states, arrests, sort = FALSE, by = "region")}
mean_se

Calculate mean and standard errors on either side.

Description

Calculate mean and standard errors on either side.

Usage

mean_se(x, mult = 1)

Arguments

x
numeric vector

mult
number of multiples of standard error

See Also

for use with stat_summary

midwest

Midwest demographics.

Description

Demographic information of midwest counties

Usage

data(midwest)

Format

A data frame with 437 rows and 28 variables
Details

The variables are as follows:

- PID
- county
- state
- area
- poptotal. Total population
- popdensity. Population density
- popwhite. Number of whites.
- popblack. Number of blacks.
- popamerindian. Number of American Indians.
- popasian. Number of Asians.
- popother. Number of other races.
- percwhite. Percent white.
- perclblack. Percent black.
- percamerindan. Percent American Indian.
- percasian. Percent Asian.
- percother. Percent other races.
- popadults. Number of adults.
- perchsd.
- percollege. Percent college educated.
- percpprof. Percent profession.
- poppovertyknown.
- percpovertyknown
- percbelowpoverty
- percchildbelowpovert
- percadultpoverty
- percelderlypoverty
- inmetro. In a metro area.
- category'}
Description

Usage

data(movies)

Format

A data frame with 28819 rows and 24 variables

Details

Movies were selected for inclusion if they had a known length and had been rated by at least one imdb user. The data set contains the following fields:

- title. Title of the movie.
- year. Year of release.
- budget. Total budget (if known) in US dollars
- length. Length in minutes.
- rating. Average IMDB user rating.
- votes. Number of IMDB users who rated this movie.
- r1-10. Multiplying by ten gives percentile (to nearest 10%) of users who rated this movie a 1.
- mpaa. MPAA rating.
- action, animation, comedy, drama, documentary, romance, short. Binary variables representing if movie was classified as belonging to that genre.

References

http://had.co.nz/data/movies/
**mpg**

*Fuel economy data from 1999 and 2008 for 38 popular models of car*

**Description**

This dataset contains a subset of the fuel economy data that the EPA makes available on [http://fueleconomy.gov](http://fueleconomy.gov). It contains only models which had a new release every year between 1999 and 2008 - this was used as a proxy for the popularity of the car.

**Usage**

```r
data(mpg)
```

**Format**

A data frame with 234 rows and 11 variables

**Details**

- manufacturer.
- model.
- displ. engine displacement, in litres
- year.
- cyl. number of cylinders
- trans. type of transmission
- drv. f = front-wheel drive, r = rear wheel drive, 4 = 4wd
- cty. city miles per gallon
- hwy. highway miles per gallon
- fl.
- class.

**msleep**

*An updated and expanded version of the mammals sleep dataset.*

**Description**

This is an updated and expanded version of the mammals sleep dataset. Updated sleep times and weights were taken from V. M. Savage and G. B. West. A quantitative, theoretical framework for understanding mammalian sleep. Proceedings of the National Academy of Sciences, 104 (3):1051-1056, 2007.
Usage

data(msleep)

Format

A data frame with 83 rows and 11 variables

Details

Additional variables order, conservation status and vore were added from wikipedia.

- name. common name
- genus.
- vore. carnivore, omnivore or herbivore?
- order.
- conservation. the conservation status of the animal
- sleep\_total. total amount of sleep, in hours
- sleep\_rem. rem sleep, in hours
- sleep\_cycle. length of sleep cycle, in hours
- awake. amount of time spent awake, in hours
- brainwt. brain weight in kilograms
- bodywt. body weight in kilograms

---

opts

Build a theme (or partial theme) from theme elements

Description

opts is deprecated. See the theme function.

Usage

opts(…)

Arguments

... Arguments to be passed on to the theme function.
position_dodge

Adjust position by dodging overlaps to the side.

Description

Adjust position by dodging overlaps to the side.

Usage

position_dodge(width = NULL, height = NULL)

Arguments

width
Manually specify width (does not affect all position adjustments)

height
Manually specify height (does not affect all position adjustments)

See Also

Other position adjustments: position_fill; position_identity; position_jitterdodge; position_jitter; position_stack

Examples

ggplot(mtcars, aes(x=factor(cyl), fill=factor(vs))) +
  geom_bar(position="dodge")
ggplot(diamonds, aes(x=price, fill=cut)) + geom_bar(position="dodge")
# see ?geom_boxplot and ?geom_bar for more examples

# Dodging things with different widths is tricky
df <- data.frame(x=c("a","a","b","b"), y=1:4, g = rep(1:2, 2))
p <- qplot(x, y, data=df, group=g, position="dodge", geom="bar",
  stat="identity")
p + geom_linerange(aes(ymin = y-1, ymax = y+1), position="dodge")
# You need to explicitly specify the width for dodging
p + geom_linerange(aes(ymin = y-1, ymax = y+1),
  position = position_dodge(width = 0.9))

# Similarly with error bars:
p + geom_errorbar(aes(ymin = y-1, ymax = y+1), width = 0.2,
  position="dodge")
p + geom_errorbar(aes(ymin = y-1, ymax = y+1, width = 0.2),
  position = position_dodge(width = 0.9))
position_fill

Stack overlapping objects on top of one another, and standardise to have equal height.

Description

Stack overlapping objects on top of one another, and standardise to have equal height.

Usage

position_fill(width = NULL, height = NULL)

Arguments

width     Manually specify width (does not affect all position adjustments)
height    Manually specify height (does not affect all position adjustments)

See Also

See `geom_bar` and `geom_area` for more examples.

Other position adjustments: `position_dodge`; `position_identity`; `position_jitterdodge`; `position_jitter`; `position_stack`

Examples

```r
# See ?geom_bar and ?geom_area for more examples
ggplot(mtcars, aes(x=factor(cyl), fill=factor(vs))) + geom_bar(position="fill")

cde <- geom_histogram(position="fill", binwidth = 500)
ggplot(diamonds, aes(x=price)) + cde
ggplot(diamonds, aes(x=price, fill=cut)) + cde
ggplot(diamonds, aes(x=price, fill=clarity)) + cde
ggplot(diamonds, aes(x=price, fill=color)) + cde
```

position_identity

Don’t adjust position

Description

Don’t adjust position
position_jitter

Usage

position_identity(width = NULL, height = NULL)

Arguments

width          Manually specify width (does not affect all position adjustments)
height         Manually specify height (does not affect all position adjustments)

See Also

Other position adjustments: position_dodge; position_fill; position_jitterdodge; position_jitter; position_stack

position_jitter  Jitter points to avoid overplotting.

Description

Jitter points to avoid overplotting.

Usage

position_jitter(width = NULL, height = NULL)

Arguments

width              degree of jitter in x direction. Defaults to 40% of the resolution of the data.
height             degree of jitter in y direction. Defaults to 40% of the resolution of the data

See Also

Other position adjustments: position_dodge; position_fill; position_identity; position_jitterdodge; position_stack

Examples

qplot(am, vs, data = mtcars)

# Default amount of jittering will generally be too much for
# small datasets:
qplot(am, vs, data = mtcars, position = "jitter")
# Control the amount as follows
qplot(am, vs, data = mtcars, position = position_jitter(w = 0.1, h = 0.1))

# With ggplot
ggplot(mtcars, aes(x = am, y = vs)) + geom_point(position = "jitter")
ggplot(mtcars, aes(x = am, y = vs)) + geom_point(position = position_jitter(w = 0.1, h = 0.1))
position_jitterdodge

# The default works better for large datasets, where it will
# take up as much space as a boxplot or a bar
qplot(class, hwy, data = mpg, geom = c("boxplot", "jitter"))

position_jitterdodge  Adjust position by simultaneously dodging and jittering

Description

This is primarily used for aligning points generated through geom_point() with dodged boxplots
(e.g., a geom_boxplot() with a fill aesthetic supplied).

Usage

position_jitterdodge(jitter.width = NULL, jitter.height = NULL,
dodge.width = NULL)

Arguments

jitter.width  degree of jitter in x direction. Defaults to 40% of the resolution of the data.
jitter.height  degree of jitter in y direction. Defaults to 0.
dodge.width  the amount to dodge in the x direction. Defaults to 0.75, the default position_dodge() width.

See Also

Other position adjustments: position_dodge; position_fill; position_identity; position_jitter;
position_stack

Examples

dsub <- diamonds[ sample(nrow(diamonds), 1000), ]
ggplot(dsub, aes(x = cut, y = carat, fill = clarity)) +
  geom_boxplot(outlier.size = 0) +
  geom_point(pch = 21, position = position_jitterdodge())
position_stack

Stack overlapping objects on top of one another.

Description

Stack overlapping objects on top of one another.

Usage

position_stack(width = NULL, height = NULL)

Arguments

- **width**: Manually specify width (does not affect all position adjustments)
- **height**: Manually specify height (does not affect all position adjustments)

See Also

Other position adjustments: position_dodge; position_fill; position_identity; position_jitterdodge; position_jitter

Examples

```r
# Stacking is the default behaviour for most area plots:
ggplot(mtcars, aes(factor(cyl), fill = factor(vs))) + geom_bar()

# To change stacking order, use factor() to change order of levels
mtcars$vs <- factor(mtcars$vs, levels = c(1,0))
ggplot(mtcars, aes(factor(cyl), fill = factor(vs))) + geom_bar()

ggplot(diamonds, aes(price)) + geom_histogram(binwidth=500)
ggplot(diamonds, aes(price, fill = cut)) + geom_histogram(binwidth=500)

# Stacking is also useful for time series
data.set <- data.frame(
  Time = c(rep(1, 4), rep(2, 4), rep(3, 4), rep(4, 4)),
  Type = rep(c('a', 'b', 'c', 'd'), 4),
  Value = rpois(16, 10)
)
qplot(Time, Value, data = data.set, fill = Type, geom = "area")

# If you want to stack lines, you need to say so:
qplot(Time, Value, data = data.set, colour = Type, geom = "line")
qplot(Time, Value, data = data.set, colour = Type, geom = "line", position = "stack")

# But realise that this makes it **much** harder to compare individual trends
```
prensidential

Terms of 10 presidents from Eisenhower to Bush W.

Description

The names of each president, the start and end date of their term, and their party of 10 US presidents from Eisenhower to Bush W.

Usage

data(presidential)

Format

A data frame with 10 rows and 4 variables

print.ggplo

Draw plot on current graphics device.

Description

Draw plot on current graphics device.

Usage

## S3 method for class 'ggplot'
print(x, newpage = is.null(vp), vp = NULL, ...)

## S3 method for class 'ggplot'
plot(x, newpage = is.null(vp), vp = NULL, ...)

Arguments

x plot to display
newpage draw new (empty) page first?
vp viewport to draw plot in
... other arguments not used by this method
Description

qplot is the basic plotting function in the ggplot2 package, designed to be familiar if you’re used to `plot` from the base package. It is a convenient wrapper for creating a number of different types of plots using a consistent calling scheme. See `http://had.co.nz/ggplot2/book/qplot.pdf` for the chapter in the ggplot2 book which describes the usage of qplot in detail.

Usage

```r
qplot(x, y = NULL, ..., data, facets = NULL, margins = FALSE,
      geom = "auto", stat = list(NULL), position = list(NULL), xlim = c(NA,
      NA), ylim = c(NA, NA), log = "", main = NULL,
      xlab = deparse(substitute(x)), ylab = deparse(substitute(y)), asp = NA)
```

Arguments

- `x` x values
- `y` y values
- `...` other aesthetics passed for each layer
- `data` data frame to use (optional). If not specified, will create one, extracting vectors from the current environment.
- `facets` faceting formula to use. Picks `facet_wrap` or `facet_grid` depending on whether the formula is one sided or two-sided
- `margins` whether or not margins will be displayed
- `geom` character vector specifying geom to use. Defaults to "point" if x and y are specified, and "histogram" if only x is specified.
- `stat` character vector specifying statistics to use
- `position` character vector giving position adjustment to use
- `xlim` limits for x axis
- `ylim` limits for y axis
- `log` which variables to log transform ("x", "y", or "xy")
- `main` character vector or expression for plot title
- `xlab` character vector or expression for x axis label
- `ylab` character vector or expression for y axis label
- `asp` the y/x aspect ratio
Examples

```r
# Use data from data.frame
qplot(mpg, wt, data=mtcars)
qplot(mpg, wt, data=mtcars, colour=cyl)
qplot(mpg, wt, data=mtcars, size=cyl)
qplot(mpg, wt, data=mtcars, facets=vs ~ am)

# It will use data from local environment
hp <- mtcars$hp
wt <- mtcars$wt
cyl <- mtcars$cyl
vs <- mtcars$vs
am <- mtcars$am
qplot(hp, wt)
qplot(hp, wt, colour=cyl)
qplot(hp, wt, size=cyl)
qplot(hp, wt, facets=vs ~ am)

qplot(1:10, rnorm(10), colour = runif(10))
qplot(1:10, letters[1:10])
mod <- lm(mpg ~ wt, data=mtcars)
qplot(resid(mod), fitted(mod))
qplot(resid(mod), fitted(mod), facets = . ~ vs)

f <- function() {
  a <- 1:10
  b <- a ^ 2
  qplot(a, b)
}

f()

# qplot will attempt to guess what geom you want depending on the input
# both x and y supplied = scatterplot
qplot(mpg, wt, data = mtcars)
# just x supplied = histogram
qplot(mpg, data = mtcars)
# just y supplied = scatterplot, with x = seq_along(y)
qplot(y = mpg, data = mtcars)

# Use different geoms
qplot(mpg, wt, data = mtcars, geom="path")
qplot(factor(cyl), wt, data = mtcars, geom=c("boxplot", "jitter"))
qplot(mpg, data = mtcars, geom = "dotplot")
```

---

**Relative sizing for theme elements**
**Description**

Relative sizing for theme elements

**Usage**

\[ \text{rel}(x) \]

**Arguments**

- \( x \): A number representing the relative size

**Examples**

\[
\text{qplot}(1:3, 1:3) + \text{theme}(\text{axis.title.x} = \text{element_text(size = \text{rel}(2.5)))}
\]

---

**resolution**

Compute the "resolution" of a data vector.

**Description**

The resolution is the smallest non-zero distance between adjacent values. If there is only one unique value, then the resolution is defined to be one.

**Usage**

\[ \text{resolution}(x, \text{zero} = \text{TRUE}) \]

**Arguments**

- \( x \): numeric vector
- \( \text{zero} \): should a zero value be automatically included in the computation of resolution

**Details**

If \( x \) is an integer vector, then it is assumed to represent a discrete variable, and the resolution is 1.

**Examples**

\[
\text{resolution}(1:10) \\
\text{resolution}((1:10) - 0.5) \\
\text{resolution}((1:10) - 0.5, \text{FALSE}) \\
\text{resolution}(c(1, 2, 10, 20, 50)) \\
\text{resolution}(\text{as.integer}(c(1, 10, 20, 50))) \quad \# \text{Returns 1}
\]
**scale_alpha**

*Alpha scales.*

**Description**

`scale_alpha` is an alias for `scale_alpha_continuous` since that is the most common use of alpha, and it saves a bit of typing.

**Usage**

```r
scale_alpha(..., range = c(0.1, 1))
scale_alpha_continuous(..., range = c(0.1, 1))
scale_alpha_discrete(..., range = c(0.1, 1))
```

**Arguments**

- `...` Other arguments passed on to `continuous_scale` or `discrete_scale` as appropriate, to control name, limits, breaks, labels and so forth.
- `range` range of output alpha values. Should lie between 0 and 1.

**Examples**

```r
(p <- qplot(mpg, cyl, data = mtcars, alpha = cyl))
p + scale_alpha("cylinders")
p + scale_alpha("number\nof\ncylinders")
p + scale_alpha(range = c(0.4, 0.8))
(p <- qplot(mpg, cyl, data=mtcars, alpha = factor(cyl)))
p + scale_alpha_discrete(range = c(0.4, 0.8))
```

---

**scale_area**

*Scale area instead of radius (for size).*

**Description**

`scale_area` is deprecated and will be removed in a future version of ggplot2. Use `scale_size_area` instead. Note that the default behavior of `scale_size_area` is slightly different: by default, it makes the area proportional to the numeric value.

**Usage**

```r
scale_area(..., range = c(1, 6))
```
Arguments

... Other arguments passed on to \texttt{continuous_scale} to control name, limits, breaks, labels and so forth.

\texttt{range} Range of output sizes. Should be greater than 0.

\begin{verbatim}

scale_colour_brewer \texttt{Sequential, diverging and qualitative colour scales from colorbrewer.org}

\end{verbatim}

Description

ColorBrewer provides sequential, diverging and qualitative colour schemes which are particularly suited and tested to display discrete values (levels of a factor) on a map. ggplot2 can use those colours in discrete scales. It also allows to smoothly interpolate 6 colours from any palette to a continuous scale (6 colours per palette gives nice gradients; more results in more saturated colours which do not look as good). However, the original colour schemes (particularly the qualitative ones) were not intended for this and the perceptual result is left to the appreciation of the user.

Usage

scale_colour_brewer(..., type = "seq", palette = 1)
scale_fill_brewer(..., type = "seq", palette = 1)
scale_colour_distiller(..., type = "seq", palette = 1, values = NULL, space = "Lab", na.value = "grey50")
scale_fill_distiller(..., type = "seq", palette = 1, values = NULL, space = "Lab", na.value = "grey50")
scale_color_brewer(..., type = "seq", palette = 1)
scale_color_distiller(..., type = "seq", palette = 1, values = NULL, space = "Lab", na.value = "grey50")

Arguments

... Other arguments passed on to \texttt{discrete_scale} to control name, limits, breaks, labels and so forth.

type One of seq (sequential), div (diverging) or qual (qualitative)
palette If a string, will use that named palette. If a number, will index into the list of palettes of appropriate type
values if colours should not be evenly positioned along the gradient this vector gives the position (between 0 and 1) for each colour in the \texttt{colours} vector. See \texttt{rescale} for a convenience function to map an arbitrary range to between 0 and 1.
scale_colour_brewer

space    colour space in which to calculate gradient. "Lab" usually best unless gradient
goes through white.
na.value Colour to use for missing values

Details

See http://colorbrewer2.org for more information.

Examples

dsamp <- diamonds[sample(nrow(diamonds), 1000), ]
(d <- qplot(carat, price, data = dsamp, colour = clarity))

# Change scale label
d + scale_colour_brewer()
d + scale_colour_brewer("clarity")
d + scale_colour_brewer(expression(clarity[beta]))

# Select brewer palette to use, see ?scales::brewer_pal for more details
d + scale_colour_brewer(type = "seq")
d + scale_colour_brewer(type = "seq", palette = 3)

(d + scale_colour_brewer(palette = "Blues")
d + scale_colour_brewer(palette = "Set1")

# scale_fill_brewer works just the same as
# scale_colour_brewer but for fill colours
ggplot(diamonds, aes(x = price, fill = cut)) +
  geom_histogram(position = "dodge", binwidth = 1000) +
  scale_fill_brewer()

# Generate map data
library(reshape2) # for melt
volcano3d <- melt(volcano)
names(volcano3d) <- c("x", "y", "z")

# Basic plot
v <- ggplot() + geom_tile(aes(x = x, y = y, fill = z), data = volcano3d)
v + scale_fill_distiller()
v + scale_fill_distiller(palette = 2)
v + scale_fill_distiller(type = "div")
v + scale_fill_distiller(palette = "Spectral")
scale_colour_gradient

Smooth gradient between two colours

Description

Default colours are generated with munsell and mns1(c("2.5PB 2/4", "2.5PB 7/10"). Generally, for continuous colour scales you want to keep hue constant, but vary chroma and luminance. The munsell package makes this easy to do using the Munsell colour system.

Usage

scale_colour_gradient(..., low = "#132B43", high = "#56B1F7", space = "Lab", na.value = "grey50", guide = "colourbar")

scale_fill_gradient(..., low = "#132B43", high = "#56B1F7", space = "Lab", na.value = "grey50", guide = "colourbar")

scale_colour_continuous(..., low = "#132B43", high = "#56B1F7", space = "Lab", na.value = "grey50", guide = "colourbar")

scale_fill_continuous(..., low = "#132B43", high = "#56B1F7", space = "Lab", na.value = "grey50", guide = "colourbar")

scale_color_continuous(..., low = "#132B43", high = "#56B1F7", space = "Lab", na.value = "grey50", guide = "colourbar")

scale_color_gradient(..., low = "#132B43", high = "#56B1F7", space = "Lab", na.value = "grey50", guide = "colourbar")

Arguments

... Other arguments passed on to discrete_scale to control name, limits, breaks, labels and so forth.
low colour for low end of gradient.
high colour for high end of gradient.
space colour space in which to calculate gradient. "Lab" usually best unless gradient goes through white.
na.value Colour to use for missing values
guide Type of legend. Use "colourbar" for continuous colour bar, or "legend" for discrete colour legend.

`seq_gradient_pal` for details on underlying palette

Other colour scales: `scale_color_brewer`, `scale_color_distiller`, `scale_colour_brewer`, `scale_colour_distiller`, `scale_fill_brewer`, `scale_fill_distiller`; `scale_color_discrete`, `scale_color_hue`, `scale_colour_discrete`, `scale_colour_hue`, `scale_fill_discrete`, `scale_fill_hue`; `scale_color_gradient`, `scale_colour_gradient`, `scale_fill_gradient`; `scale_color_gradientn`, `scale_colour_gradientn`, `scale_fill_gradientn`; `scale_color_grey`, `scale_colour_grey`, `scale_fill_grey`

Examples

```r
# It's hard to see, but look for the bright yellow dot
# in the bottom right hand corner
dsub <- subset(diamonds, x > 5 & x < 6 & y > 5 & y < 6)
(d <- qplot(x, y, data=dsub, colour=z))
# That one point throws our entire scale off. We could
# remove it, or manually tweak the limits of the scale

# Tweak scale limits. Any points outside these limits will not be
# plotted, and will not affect the calculation of statistics, etc
d + scale_colour_gradient(limits=c(3, 10))
d + scale_colour_gradient(limits=c(3, 4))
# Setting the limits manually is also useful when producing
# multiple plots that need to be comparable

# Alternatively we could try transforming the scale:
d + scale_colour_gradient(trans = "log")
d + scale_colour_gradient(trans = "sqrt")

# Other more trivial manipulations, including changing the name
# of the scale and the colours.

d + scale_colour_gradient("Depth")
d + scale_colour_gradient(expression(Depth[mm]))

d + scale_colour_gradient(limits=c(3, 4), low="red")
d + scale_colour_gradient(limits=c(3, 4), low="red", high="white")
# Much slower
d + scale_colour_gradient(limits=c(3, 4), low="red", high="white", space="Lab")
d + scale_colour_gradient(limits=c(3, 4), space="Lab")

# scale_fill_continuous works similarly, but for fill colours
(h <- qplot(x - y, data=dsub, geom="histogram", binwidth=0.01, fill=..count..))
h + scale_fill_continuous(low="black", high="pink", limits=c(0,3100))

# Colour of missing values is controlled with na.value:
miss <- sample(c(NA, 1:5), nrow(mtcars), rep = TRUE)
qplot(mpg, wt, data = mtcars, colour = miss)
qplot(mpg, wt, data = mtcars, colour = miss) +
  scale_colour_gradient(na.value = "black")
```
scaleColourGradient2

Diverging colour gradient

Description

Diverging colour gradient

Usage

scale_colour_gradient2(..., low = muted("red"), mid = "white",
                        high = muted("blue"), midpoint = 0, space = "rgb",
                        na.value = "grey50", guide = "colourbar")

scale_fill_gradient2(..., low = muted("red"), mid = "white",
                        high = muted("blue"), midpoint = 0, space = "rgb",
                        na.value = "grey50", guide = "colourbar")

scale_color_gradient2(..., low = muted("red"), mid = "white",
                        high = muted("blue"), midpoint = 0, space = "rgb",
                        na.value = "grey50", guide = "colourbar")

Arguments

... Other arguments passed on to discrete_scale to control name, limits, breaks,
    labels and so forth.
low colour for low end of gradient.
mid colour for mid point
high colour for high end of gradient.
midpoint The midpoint (in data value) of the diverging scale. Defaults to 0.
space colour space in which to calculate gradient. "Lab" usually best unless gradient
goes through white.
na.value Colour to use for missing values
guide Type of legend. Use "colourbar" for continuous colour bar, or "legend" for
    discrete colour legend.

(d + scale_colour_gradient2(low=muted("red"), high=muted("blue")))

(d + scale_colour_gradient2(space="Lab"))
# Using the Lab colour space also improves perceptual properties
# at the price of slightly slower operation

(d + scale_colour_gradient2(high=muted("green")))
# About 5% of males are red-green colour blind, so it's a good
# idea to avoid that combination

(d + scale_colour_gradient2(mid=muted("green"), high="white", low="white"))
# or use a non zero mid point
(d <- qplot(carat, price, data=diamonds, colour=price/carat))
(d + scale_colour_gradient2(midpoint=mean(diamonds$price / diamonds$carat)))

# Fill gradients work much the same way
p <- qplot(letters[1:5], 1:5, fill= c(-3, 3, 5, 2, -2), geom = "bar",
stat = "identity")
p + scale_fill_gradient2("fill")
# Note how positive and negative values of the same magnitude
# have similar intensity

scale_colour_gradientn
Smooth colour gradient between n colours

Description
Smooth colour gradient between n colours
Usage

scale_colour_gradientn(..., colours, values = NULL, space = "Lab",
na.value = "grey50", guide = "colourbar")

scale_fill_gradientn(..., colours, values = NULL, space = "Lab",
na.value = "grey50", guide = "colourbar")

scale_color_gradientn(..., colours, values = NULL, space = "Lab",
na.value = "grey50", guide = "colourbar")

Arguments

... Other arguments passed on to discrete_scale to control name, limits, breaks,
labels and so forth.
colours vector of colours
values if colours should not be evenly positioned along the gradient this vector gives the
position (between 0 and 1) for each colour in the colours vector. See rescale
for a convience function to map an arbitrary range to between 0 and 1.
space colour space in which to calculate gradient. "Lab" usually best unless gradient
goes through white.
na.value Colour to use for missing values
guide Type of legend. Use "colourbar" for continuous colour bar, or "legend" for
discrete colour legend.

    values <- seq(-max_val, max_val, length = 11)

    d + scale_colour_gradientn(colours = topo.colors(10),
                                values = values, rescaler = function(x, ...) x, oob = identity)
    d + scale_colour_gradientn(colours = terrain.colors(10),
                                values = values, rescaler = function(x, ...) x, oob = identity)

scale_colour_grey  Sequential grey colour scale.

Description

Based on gray.colors

Usage

    scale_colour_grey(..., start = 0.2, end = 0.8, na.value = "red")

    scale_fill_grey(..., start = 0.2, end = 0.8, na.value = "grey50")

    scale_color_grey(..., start = 0.2, end = 0.8, na.value = "red")

Arguments

    ... Other arguments passed on to discrete_scale to control name, limits, breaks,
         labels and so forth.
    start gray value at low end of palette
    end   gray value at high end of palette
    na.value Colour to use for missing values

scale_color_gradient, scale_colour_continuous, scale_colour_gradient, scale_fill_continuous,
scale_fill_gradient, scale_color_discrete, scale_color_hue, scale_colour_discrete,
scale_color_hue, scale_fill_discrete, scale_fill_hue, scale_color_gradient2, scale_colour_gradient2,
scale_fill_gradient2, scale_color_gradientn, scale_colour_gradientn, scale_fill_gradientn
Examples

```r
p <- qplot(mpg, wt, data=mtcars, colour=factor(cyl))
p + scale_colour_grey()
p + scale_colour_grey(end = 0)

# You may want to turn off the pale grey background with this scale
p + scale_colour_grey() + theme_bw()

# Colour of missing values is controlled with na.value:
miss <- factor(sample(c(NA, 1:5), nrow(mtcars), rep = TRUE))
qplot(mpg, wt, data = mtcars, colour = miss) + scale_colour_grey()
quplot(mpg, wt, data = mtcars, colour = miss) +
  scale_colour_grey(na.value = "green")
```

scale_colour_hue

**Qualitative colour scale with evenly spaced hues.**

Description

Qualitative colour scale with evenly spaced hues.

Usage

```r
scale_colour_hue(..., h = c(0, 360) + 15, c = 100, l = 65, h.start = 0,
direction = 1, na.value = "grey50")
scale_fill_hue(..., h = c(0, 360) + 15, c = 100, l = 65, h.start = 0,
direction = 1, na.value = "grey50")
scale_colour_discrete(..., h = c(0, 360) + 15, c = 100, l = 65,
h.start = 0, direction = 1, na.value = "grey50")
scale_fill_discrete(..., h = c(0, 360) + 15, c = 100, l = 65,
h.start = 0, direction = 1, na.value = "grey50")
scale_color_discrete(..., h = c(0, 360) + 15, c = 100, l = 65,
h.start = 0, direction = 1, na.value = "grey50")
scale_color_hue(..., h = c(0, 360) + 15, c = 100, l = 65, h.start = 0,
direction = 1, na.value = "grey50")
```

Arguments

- `...` Other arguments passed on to `discrete_scale` to control name, limits, breaks, labels and so forth.
- `h` range of hues to use, in [0, 360]
- `c` chroma (intensity of colour), maximum value varies depending on
scale_colour_hue

1  luminance (lightness), in [0, 100]

h.start  hue to start at
direction  direction to travel around the colour wheel, 1 = clockwise, -1 = counter-clockwise

na.value  Colour to use for missing values

scale_fill_gradient; scale_color_gradient2, scale_colour_gradient2, scale_fill_gradient2;
scale_color_gradientn, scale_colour_gradientn, scale_fill_gradientn; scale_color_grey,
scale_colour_grey, scale_fill_grey

Examples

dsamp <- diamonds[sample(nrow(diamonds), 1000),]
(d <- qplot(carat, price, data=dsamp, colour=clarity))

# Change scale label
d + scale_colour_hue()
d + scale_colour_hue("clarity")
d + scale_colour_hue(expression(clarity[beta]))

# Adjust luminosity and chroma
d + scale_colour_hue(l=40, c=30)
d + scale_colour_hue(l=70, c=30)
d + scale_colour_hue(l=70, c=150)
d + scale_colour_hue(l=80, c=150)

# Change range of hues used
d + scale_colour_hue(h=c(0, 90))
d + scale_colour_hue(h=c(90, 180))
d + scale_colour_hue(h=c(180, 270))
d + scale_colour_hue(h=c(270, 360))

# Vary opacity
# (only works with pdf, quartz and cairo devices)
d <- ggplot(dsamp, aes(carat, price, colour = clarity))
d + geom_point(alpha = 0.9)
d + geom_point(alpha = 0.5)
d + geom_point(alpha = 0.2)

# Colour of missing values is controlled with na.value:
miss <- factor(sample(c(NA, 1:5), nrow(mtcars), rep = TRUE))
qplot(mpg, wt, data = mtcars, colour = miss)
qplot(mpg, wt, data = mtcars, colour = miss) +
  scale_colour_hue(na.value = "black")
scale_identity  Use values without scaling.

Description
Use values without scaling.

Usage
scale_colour_identity(..., guide = "none")
scale_fill_identity(..., guide = "none")
scale_shape_identity(..., guide = "none")
scale_linetype_identity(..., guide = "none")
scale_alpha_identity(..., guide = "none")
scale_size_identity(..., guide = "none")
scale_color_identity(..., guide = "none")

Arguments
... Other arguments passed on to discrete_scale or continuous_scale
guide Guide to use for this scale - defaults to "none".

Examples
colour <- c("red", "green", "blue", "yellow")
qplot(1:4, 1:4, fill = colour, geom = "tile")
qplot(1:4, 1:4, fill = colour, geom = "tile") + scale_fill_identity()

# To get a legend guide, specify guide = "legend"
qplot(1:4, 1:4, fill = colour, geom = "tile") +
  scale_fill_identity(guide = "legend")
# But you'll typically also need to supply breaks and labels:
qplot(1:4, 1:4, fill = colour, geom = "tile") +
  scale_fill_identity("trt", labels = letters[1:4], breaks = colour,
                     guide = "legend")

# cyl scaled to appropriate size
qplot(mpg, wt, data = mtcars, size = cyl)

# cyl used as point size
qplot(mpg, wt, data = mtcars, size = cyl) + scale_size_identity()
scale_linetype  

Scale for line patterns.

Description

Default line types based on a set supplied by Richard Pearson, University of Manchester. Line types can not be mapped to continuous values.

Usage

scale_linetype(..., na.value = "blank")

scale_linetype_continuous(...) 

scale_linetype_discrete(..., na.value = "blank")

Arguments

...  

common discrete scale parameters: name, breaks, labels, na.value, limits and guide. See discrete_scale for more details

na.value  

The linetype to use for NA values.

Examples

library(reshape2) # for melt
library(plyr) # for dplyr
ecm <- melt(economics, id = "date")
rescale01 <- function(x) (x - min(x)) / diff(range(x))
ecm <- dplyr::ddply(ecm, "variable", transform, value = rescale01(value))

qplot(date, value, data=ecm, geom="line", group=variable)
qplot(date, value, data=ecm, geom="line", linetype=variable)
qplot(date, value, data=ecm, geom="line", colour=variable)

# See scale_manual for more flexibility

scale_manual  

Create your own discrete scale.

Description

Create your own discrete scale.
Usage

scale_colour_manual(..., values)
scale_fill_manual(..., values)
scale_size_manual(..., values)
scale_shape_manual(..., values)
scale_linetype_manual(..., values)
scale_alpha_manual(..., values)
scale_color_manual(..., values)

Arguments

... common discrete scale parameters: name, breaks, labels, na.value, limits and guide. See discrete_scale for more details
values a set of aesthetic values to map data values to. If this is a named vector, then the values will be matched based on the names. If unnamed, values will be matched in order (usually alphabetical) with the limits of the scale. Any data values that don’t match will be given na.value.

Examples

p <- qplot(mpg, wt, data = mtcars, colour = factor(cyl))

p + scale_colour_manual(values = c("red", "blue", "green"))
p + scale_colour_manual(
  values = c("8" = "red", "4" = "blue", "6" = "green"))
# With rgb hex values
p + scale_colour_manual(values = c("#FF0000", "#0000FF", "#00FF00"))

# As with other scales you can use breaks to control the appearance
# of the legend
cols <- c("8" = "red", "4" = "blue", "6" = "darkgreen", "10" = "orange")
p + scale_colour_manual(values = cols)
p + scale_colour_manual(values = cols, breaks = c("4", "6", "8"))
p + scale_colour_manual(values = cols, breaks = c("8", "6", "4"),
  labels = c("four", "six", "eight"))

# And limits to control the possible values of the scale
p + scale_colour_manual(values = cols, limits = c("4", "8"))
p + scale_colour_manual(values = cols, limits = c("4", "6", "8", "10"))

# Notice that the values are matched with limits, and not breaks
p + scale_colour_manual(limits = c(6, 8, 4), breaks = c(8, 4, 6),
values = c("grey50", "grey80", "black")

Description
A continuous variable can not be mapped to shape.

Usage
scale_shape(..., solid = TRUE)
scale_shape_discrete(..., solid = TRUE)
scale_shape_continuous(...)

Arguments
... common discrete scale parameters: name, breaks, labels, na.value, limits and guide. See discrete_scale for more details
solid Are the shapes solid, TRUE, or hollow FALSE?

Examples
dsmall <- diamonds[ sample(nrow(diamonds), 100), ]

(d <- qplot(carat, price, data=dsmall, shape=cut))
d + scale_shape(solid = TRUE) # the default
d + scale_shape(solid = FALSE)
d + scale_shape(name="Cut of diamond")
d + scale_shape(name="Cut of\ndiamond")

# To change order of levels, change order of
# underlying factor
levels(dsmall$cut) <- c("Fair", "Good", "Very Good", "Premium", "Ideal")

# Need to recreate plot to pick up new data
qplot(price, carat, data=dsmall, shape=cut)

# Or for short:
d %>% dsmall
scale_size

Size scale.

Description

Size scale.

Usage

scale_size_continuous(..., range = c(1, 6))
scale_size(..., range = c(1, 6))
scale_size_discrete(..., range = c(1, 6))

Arguments

... common continuous scale parameters: name, breaks, labels, na.value, limits
and trans. See continuous_scale for more details
range a numeric vector of length 2 that specifies the minimum and maximum size of
the plotting symbol after transformation.

Examples

(p <- qplot(mpg, cyl, data=mtcars, size=cyl))
p + scale_size("cylinders")
p + scale_size("number\n\nof\n\ncylinders")

p + scale_size(range = c(0, 10))
p + scale_size(range = c(1, 2))

# Map area, instead of width/radius
# Perceptually, this is a little better
p + scale_size_area()
p + scale_size_area(max_size = 25)

# Also works with factors, but not a terribly good
# idea, unless your factor is ordered, as in this example
qplot(mpg, cyl, data=mtcars, size=factor(cyl))

# To control the size mapping for discrete variable, use
# scale_size_manual:
last_plot() + scale_size_manual(values=c(2,4,6))
scale_size_area

Scale area instead of radius, for size.

Description

When `scale_size_area` is used, the default behavior is to scale the area of points to be proportional to the value.

Usage

```r
scale_size_area(..., max_size = 6)
```

Arguments

- `...`: Other arguments passed on to `continuous_scale` to control name, limits, breaks, labels and so forth.
- `max_size`: Size of largest points.

Details

Note that this controls the size scale, so it will also control the thickness of lines. Line thickness will be proportional to the square root of the value, which is probably undesirable in most cases.

scale_x_continuous

Continuous position scales (x & y).

Description

Continuous position scales (x & y).

Usage

```r
scale_x_continuous(..., expand = waiver())
scale_y_continuous(..., expand = waiver())
scale_x_log10(...)
scale_y_log10(...)
scale_x_reverse(...)
scale_y_reverse(...)
scale_x_sqrt(...)
scale_y_sqrt(...)
```
**Arguments**

... common continuous scale parameters: name, breaks, labels, na.value, limits and trans. See `continuous_scale` for more details

`expand` a numeric vector of length two giving multiplicative and additive expansion constants. These constants ensure that the data is placed some distance away from the axes.

**See Also**

Other position scales: `scale_x_datetime`, `scale_y_datetime`; `scale_x_date`, `scale_y_date`; `scale_x_discrete`, `scale_y_discrete`

**Examples**

```r
(m <- qplot(rating, votes, data=subset(movies, votes > 1000),
    na.rm = TRUE))

# Manipulating the default position scales lets you:

# * change the axis labels
m + scale_y_continuous("number of votes")
```

```
m + scale_y_continuous(expression(votes*alpha))
```

# * modify the axis limits
```
m + scale_y_continuous(limits=c(0, 5000))
m + scale_y_continuous(limits=c(1000, 10000))
m + scale_x_continuous(limits=c(7, 8))
```

# you can also use the short hand functions xlim and ylim
```
m + ylim(0, 5000)
m + ylim(1000, 10000)
m + xlim(7, 8)
```

# * choose where the ticks appear
```
m + scale_x_continuous(breaks=1:10)
m + scale_x_continuous(breaks=c(1,3,7,9))
```

# * manually label the ticks
```
m + scale_x_continuous(breaks=c(2,5,8), labels=c("two", "five", "eight"))
m + scale_x_continuous(breaks=c(2,5,8), labels=c("horrible", "ok", "awesome"))
m + scale_x_continuous(breaks=c(2,5,8), labels=expression(Alpha, Beta, Omega))
```

# There are a few built in transformation that you can use:
```
m + scale_y_log10()
m + scale_y_sqrt()
m + scale_y_reverse()
```

# You can also create your own and supply them to the trans argument.
```
# See ?scale::trans_new
```

# You can control the formatting of the labels with the formatter
Some common formats are built into the scales package:

```r
# argument. Some common formats are built into the scales package:
x <- rnorm(10) * 100000
y <- seq(0, 1, length = 10)
p <- ggplot(x, y)
library(scales)
p + scale_y_continuous(labels = percent)
p + scale_y_continuous(labels = dollar)
p + scale_x_continuous(labels = comma)

# qplot allows you to do some of this with a little less typing:
# * axis limits
qplot(rating, votes, data = movies, ylim = c(1e4, 5e4))
# * axis labels
qplot(rating, votes, data = movies, xlab = "My x axis", ylab = "My y axis")
# * log scaling
qplot(rating, votes, data = movies, log = "xy")
```

## scale_x_date

**Position scale, date**

### Description

Position scale, date

### Usage

```r
scale_x_date(..., expand = waiver(), breaks = pretty_breaks(),
  minor_breaks = waiver())
```

```r
cscale_y_date(..., expand = waiver(), breaks = pretty_breaks(),
  minor_breaks = waiver())
```

### Arguments

- `...`: common continuous scale parameters: name, breaks, labels, na.value, limits and trans. See `continuous_scale` for more details
- `expand`: a numeric vector of length two giving multiplicative and additive expansion constants. These constants ensure that the data is placed some distance away from the axes.
- `breaks`: A vector of breaks, a function that given the scale limits returns a vector of breaks, or a character vector, specifying the width between breaks. For more information about the first two, see `continuous_scale`, for more information about the last, see `date_breaks`.
- `minor_breaks`: Either NULL for no minor breaks, `waiver()` for the default breaks (one minor break between each major break), a numeric vector of positions, or a function that given the limits returns a vector of minor breaks.
See Also

Other position scales: \texttt{scale_x_continuous}, \texttt{scale_x_log10}, \texttt{scale_x_reverse}, \texttt{scale_x_sqrt}, \texttt{scale_y_continuous}, \texttt{scale_y_log10}, \texttt{scale_y_reverse}, \texttt{scale_y_sqrt}; \texttt{scale_x_datetime}, \texttt{scale_y_datetime}; \texttt{scale_x_discrete}, \texttt{scale_y_discrete}

Examples

# We'll start by creating some nonsense data with dates
df <- data.frame(
  date = seq(Sys.Date(), len=100, by="1 day")[sample(100, 50)],
  price = runif(50)
)
df <- df[order(df$date), ]
dt <- qplot(date, price, data=df, geom="line") + theme(aspect.ratio = 1/4)

# We can control the format of the labels, and the frequency of
# the major and minor tickmarks. See \texttt{?format.Date} and \texttt{?seq.Date}
# for more details.
library(scales) # to access breaks/formatting functions
dt + scale_x_date()
dt + scale_x_date(labels = date_format("%m/%d"))
dt + scale_x_date(labels = date_format("%W"))
dt + scale_x_date(labels = date_format("%w"), breaks = date_breaks("month"))

dt + scale_x_date(breaks = date_breaks("months"),
  labels = date_format("%b"))
dt + scale_x_date(breaks = date_breaks("4 weeks"),
  labels = date_format("%d-%b"))

# We can use character string for breaks.
# See \texttt{\link{by}} argument in \texttt{\link{seq.Date}}.
dt + scale_x_date(breaks = "2 weeks")
dt + scale_x_date(breaks = "1 month", minor_breaks = "1 week")

# The date scale will attempt to pick sensible defaults for
# major and minor tick marks
qplot(date, price, data=df[1:10,], geom="line")
qplot(date, price, data=df[1:4,], geom="line")

df <- data.frame(
  date = seq(Sys.Date(), len=1000, by="1 day"),
  price = runif(500)
)
qplot(date, price, data=df, geom="line")

# A real example using economic time series data
qplot(date, psavert, data=economics)
qplot(date, psavert, data=economics, geom="path")

end <- max(economics$date)
last_plot() + scale_x_date(limits = c(as.Date("2000-1-1"), end))
last_plot() + scale_x_date(limits = c(as.Date("2005-1-1"), end))
last_plot() + scale_x_date(limits = c(as.Date("2006-1-1"), end))

# If we want to display multiple series, one for each variable
# it's easiest to first change the data from a "wide" to a "long"
# format:
library(reshape2) # for melt
em = melt(economics, id = "date")

# Then we can group and facet by the new "variable" variable
qplot(date, value, data = em, geom = "line", group = variable)
qplot(date, value, data = em, geom = "line", group = variable) +
  facet_grid(variable ~., scale = "free_y")

scale_x_datetime

Position scale, date

description
Position scale, date

usage
scale_x_datetime(..., expand = waiver(), breaks = pretty_breaks(),
  minor_breaks = waiver())
scale_y_datetime(..., expand = waiver(), breaks = pretty_breaks(),
  minor_breaks = waiver())

arguments
...
  common continuous scale parameters: name, breaks, labels, na.value, limits
  and trans. see continuous_scale for more details
expand
  a numeric vector of length two giving multiplicative and additive expansion
  constants. these constants ensure that the data is placed some distance away
  from the axes.
breaks
  a vector of breaks, a function that given the scale limits returns a vector of
  breaks, or a character vector, specifying the width between breaks. for more
  information about the first two, see continuous_scale, for more information
  about the last, see date_breaks.
minor_breaks
  either NULL for no minor breaks, waiver() for the default breaks (one minor
  break between each major break), a numeric vector of positions, or a function
  that given the limits returns a vector of minor breaks.

see also
Other position scales: scale_x_continuous, scale_x_log10, scale_x_reverse, scale_x_sqrt,
scale_y_continuous, scale_y_log10, scale_y_reverse, scale_y_sqrt; scale_x_date, scale_y_date;
scale_x_discrete, scale_y_discrete
Examples

```r
start <- ISOdate(2001, 1, 1, tz = "")
df <- data.frame(
  day30 = start + round(runif(100, max = 30 * 86400)),
  day7 = start + round(runif(100, max = 7 * 86400)),
  day = start + round(runif(100, max = 86400)),
  hour10 = start + round(runif(100, max = 10 * 3600)),
  hour5 = start + round(runif(100, max = 5 * 3600)),
  hour = start + round(runif(100, max = 3600)),
  min10 = start + round(runif(100, max = 10 * 60)),
  min5 = start + round(runif(100, max = 5 * 60)),
  min = start + round(runif(100, max = 60)),
  sec10 = start + round(runif(100, max = 10)),
  y = runif(100)
)
```

# Automatic scale selection

```r
qplot(sec10, y, data = df)
qplot(min, y, data = df)
qplot(min5, y, data = df)
qplot(min10, y, data = df)
qplot(hour, y, data = df)
qplot(hour5, y, data = df)
qplot(hour10, y, data = df)
qplot(day, y, data = df)
qplot(day30, y, data = df)
```

# Manual scale selection

```r
qplot(day30, y, data = df)
library(scales) # to access breaks/formatting functions
last_plot() + scale_x_datetime(breaks = date_breaks("2 weeks"))
last_plot() + scale_x_datetime(breaks = date_breaks("10 days"))
library(scales) # to access breaks/formatting functions
last_plot() + scale_x_datetime(breaks = date_breaks("10 days"),
labels = date_format("%d/%m"))
last_plot() + scale_x_datetime(breaks = date_breaks("1 day"),
  minor_breaks = date_breaks("2 hour"))
```

---

**scale_x_discrete**

*Discrete position.*

**Description**

You can use continuous positions even with a discrete position scale - this allows you (e.g.) to place labels between bars in a bar chart. Continuous positions are numeric values starting at one for the first level, and increasing by one for each level (i.e. the labels are placed at integer positions). This is what allows jittering to work.
**scale_x_discrete**

**Usage**

```r
scale_x_discrete(..., expand = waiver())
```

```r
cscale_y_discrete(..., expand = waiver())
```

**Arguments**

...  
common discrete scale parameters: name, breaks, labels, na.value, limits and guide. See `discrete_scale` for more details

expand  
a numeric vector of length two giving multiplicative and additive expansion constants. These constants ensure that the data is placed some distance away from the axes.

**See Also**

Other position scales: `scale_x_continuous`, `scale_x_log10`, `scale_x_reverse`, `scale_x_sqrt`, `scale_y_continuous`, `scale_y_log10`, `scale_y_reverse`, `scale_y_sqrt`; `scale_x_datetime`, `scale_y_datetime`; `scale_x_date`, `scale_y_date`

**Examples**

```r
qplot(cut, data=diamonds, stat="bin")
qplot(cut, data=diamonds, geom="bar")

# The discrete position scale is added automatically whenever you
# have a discrete position.
(d <- qplot(cut, clarity, data=subset(diamonds, carat > 1), geom="jitter"))

d + scale_x_discrete("Cut")
d + scale_x_discrete("Cut", labels = c("Fair" = "F", "Good" = "G", "Very Good" = "VG", "Perfect" = "P", "Ideal" = "I"))

d + scale_y_discrete("Clarity")
d + scale_x_discrete("Cut") + scale_y_discrete("Clarity")

# Use limits to adjust the which levels (and in what order)
# are displayed
d + scale_x_discrete(limits=c("Fair","Ideal"))

# you can also use the short hand functions xlim and ylim
d + xlim("Fair","Ideal", "Good")
d + ylim("I1", "IF")

# See ?reorder to reorder based on the values of another variable
qplot(manufacturer, cty, data=mpg)
qplot(reorder(manufacturer, cty), cty, data=mpg)
qplot(reorder(manufacturer, displ), cty, data=mpg)

# Use abbreviate as a formatter to reduce long names
```r
def stat_bin(mapping = NULL, data = NULL, geom = "bar", position = "stack", width = 0.9, drop = FALSE, right = FALSE, binwidth = NULL, origin = NULL, breaks = NULL, ...)```

**seals**

*Vector field of seal movements.*

**Description**

**Usage**

```r
data(seals)
```

**Format**

A data frame with 1155 rows and 4 variables

**References**

[http://www.stat.berkeley.edu/~brill/Papers/jspifinal.pdf](http://www.stat.berkeley.edu/~brill/Papers/jspifinal.pdf)
Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **geom**: The geometric object to use display the data.
- **position**: The position adjustment to use for overlapping points on this layer.
- **width**: Width of bars when used with categorical data.
- **drop**: If TRUE, remove all bins with zero counts.
- **right**: If TRUE, right-closed, left-open, if FALSE, the default, right-open, left-closed.
- **binwidth**: Bin width to use. Defaults to 1/30 of the range of the data.
- **origin**: Origin of first bin.
- **breaks**: Actual breaks to use. Overrides bin width and origin.
- **...**: other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Value

New data frame with additional columns:

- **count**: number of points in bin
- **density**: density of points in bin, scaled to integrate to 1
- **ncount**: count, scaled to maximum of 1
- **ndensity**: density, scaled to maximum of 1

Aesthetics

`stat_bin` understands the following aesthetics (required aesthetics are in bold):

- **x**
- **y**

Examples

```r
simple <- data.frame(x = rep(1:10, each = 2))
bases <- ggplot(simple, aes(x))
# By default, right = FALSE intervals are of the form [a, b)
bases + stat_bin(binwidth = 1, drop = FALSE, right = FALSE, col = "black")
# If right = TRUE, and intervals are of the form (a, b]
bases + stat_bin(binwidth = 1, drop = FALSE, right = TRUE, col = "black")

m <- ggplot(movies, aes(x=rating))
m + stat_bin()
m + stat_bin(binwidth=0.1)
m + stat_bin(breaks=seq(4.6, by=0.1))
# See geom_histogram for more histogram examples
```
# To create a unit area histogram, use `aes(y = ..density..)`
(linehist <- m + stat_bin(aes(y = ..density..), binwidth=0.1,
    geom="line", position="identity"))
linehist + stat_density(colour="blue", fill=NA)

# Also works with categorical variables
ggplot(movies, aes(x=mpaa)) + stat_bin()
qplot(mpaa, data=movies, stat="bin")

stat_bin2d Count number of observation in rectangular bins.

**Description**

Count number of observation in rectangular bins.

**Usage**

`stat_bin2d(mapping = NULL, data = NULL, geom = NULL,
    position = "identity", bins = 30, drop = TRUE, ...)`

**Arguments**

- **mapping**
  The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**
  A layer specific dataset - only needed if you want to override the plot defaults.
- **geom**
  The geometric object to use display the data
- **position**
  The position adjustment to use for overlapping points on this layer
- **bins**
  numeric vector giving number of bins in both vertical and horizontal directions. Set to 30 by default.
- **drop**
  if TRUE removes all cells with 0 counts.
- **...**
  other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

**Aesthetics**

`stat_bin2d` understands the following aesthetics (required aesthetics are in bold):

- **x**
- **y**
- **fill**

**See Also**

`stat_binhex` for hexagonal binning
Examples

```r
d <- ggplot(diamonds, aes(carat, price))
d + stat_bin2d()

d + geom_bin2d()

# You can control the size of the bins by specifying the number of
# bins in each direction:
d + stat_bin2d(bins = 10)
d + stat_bin2d(bins = 30)

# Or by specifying the width of the bins
d + stat_bin2d(binwidth = c(1, 1000))
d + stat_bin2d(binwidth = c(.1, 500))

# Or with a list of breaks
x <- seq(min(diamonds$carat), max(diamonds$carat), by = 0.1)
y <- seq(min(diamonds$price), max(diamonds$price), length = 50)
d + stat_bin2d(breaks = list(x = x, y = y))

# With qplot
qplot(x, y, data = diamonds, geom = "bin2d",
      xlim = c(4, 10), ylim = c(4, 10))
qplot(x, y, data = diamonds, geom = "bin2d", binwidth = c(0.1, 0.1),
      xlim = c(4, 10), ylim = c(4, 10))
```

stat_bindot | Bin data for dot plot.

Description

Missing values are currently silently dropped. If weights are used, they must be integer values.

Usage

```r
stat_bindot(mapping = NULL, data = NULL, geom = "dotplot",
            position = "identity", binwidth = NULL, origin = NULL, width = 0.9,
            binaxis = "x", method = "dotdensity", binpositions = "bygroup",
            drop = FALSE, right = TRUE, na.rm = FALSE, ...)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mapping</td>
<td>The aesthetic mapping, usually constructed with <code>aes</code> or <code>aes_string</code>. Only needs to be set at the layer level if you are overriding the plot defaults.</td>
</tr>
<tr>
<td>data</td>
<td>A layer specific dataset - only needed if you want to override the plot defaults.</td>
</tr>
<tr>
<td>geom</td>
<td>The geometric specific object to use display the data</td>
</tr>
<tr>
<td>position</td>
<td>The position adjustment to use for overlapping points on this layer</td>
</tr>
</tbody>
</table>
binwidth  When method is "dotdensity", this specifies maximum bin width. When method is "histodot", this specifies bin width. Defaults to 1/30 of the range of the data
origin  When method is "histodot", origin of first bin
width  When binaxis is "y", the spacing of the dot stacks for dodging.
binaxis  The axis to bin along, "x" (default) or "y"
method  "dotdensity" (default) for dot-density binning, or "histodot" for fixed bin widths (like stat_bin)
binpositions  When method is "dotdensity", "bygroup" (default) determines positions of the bins for each group separately. "all" determines positions of the bins with all the data taken together; this is used for aligning dot stacks across multiple groups.
drop  If TRUE, remove all bins with zero counts
right  When method is "histodot", should intervals be closed on the right (a, b], or not [a, b)
na.rm  If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
...  other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.

Value

New data frame with additional columns:

- `x` center of each bin, if binaxis is "x"
- `y` center of each bin, if binaxis is "y"
- `binwidth` max width of each bin if method is "dotdensity"; width of each bin if method is "histodot"
- `count` number of points in bin
- `ncount` count, scaled to maximum of 1
- `density` density of points in bin, scaled to integrate to 1, if method is "histodot"
- `ndensity` density, scaled to maximum of 1, if method is "histodot"

Aesthetics

stat_bindot understands the following aesthetics (required aesthetics are in bold):

- `x`
- `y`

See Also

See geom_dotplot for examples.

Examples

# See geom_dotplot for examples
**stat_binhex**  
Bin 2d plane into hexagons.

**Description**  
Bin 2d plane into hexagons.

**Usage**  
```r
stat_binhex(mapping = NULL, data = NULL, geom = "hex",
            position = "identity", bins = 30, na.rm = FALSE, ...)
```

**Arguments**
- **mapping**  
The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**  
A layer specific dataset - only needed if you want to override the plot defaults.
- **geom**  
The geometric object to use display the data
- **position**  
The position adjustment to use for overlapping points on this layer
- **bins**  
numeric vector specifying number of bins in both x and y directions. Set to 30 by default.
- **na.rm**  
If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
- **...**  
other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

**Aesthetics**
- **stat_binhex** understands the following aesthetics (required aesthetics are in bold):
  - x
  - y
  - fill

**See Also**
- `stat_bin2d` for rectangular binning

**Examples**
```r
d <- ggplot(diamonds, aes(carat, price))
d + stat_binhex()
d + geom_hex()
```

# You can control the size of the bins by specifying the number of
# bins in each direction:
d + stat_binhex(bins = 10)
d + stat_binhex(bins = 30)

# Or by specifying the width of the bins
d + stat_binhex(binwidth = c(1, 1000))
d + stat_binhex(binwidth = c(.1, 500))

# With qplot
qplot(x, y, data = diamonds, geom = "hex", xlim = c(4, 10), ylim = c(4, 10))
qplot(x, y, data = diamonds, geom = "hex", xlim = c(4, 10), ylim = c(4, 10),
      binwidth = c(0.1, 0.1))

stat_boxplot

Calculate components of box and whisker plot.

Description
Calculate components of box and whisker plot.

Usage
stat_boxplot(mapping = NULL, data = NULL, geom = "boxplot",
              position = "dodge", na.rm = FALSE, coef = 1.5, ...)

Arguments

mapping The aesthetic mapping, usually constructed with aes or aes_string. Only
          needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
geom The geometric object to use display the data
position The position adjustment to use for overlapping points on this layer
na.rm If FALSE (the default), removes missing values with a warning. If TRUE silently
        removes missing values.coef length of the whiskers as multiple of IQR. Defaults to 1.5
... other arguments passed on to layer. This can include aesthetics whose values
      you want to set, not map. See layer for more details.

Value
A data frame with additional columns:

width width of boxplot
ymin lower whisker = smallest observation greater than or equal to lower hinge - 1.5
      * IQR
stat_contour

lower lower hinge, 25% quantile
notchlower lower edge of notch = median - 1.58 * IQR / sqrt(n)
middle median, 50% quantile
notchupper upper edge of notch = median + 1.58 * IQR / sqrt(n)
upper upper hinge, 75% quantile
ymax upper whisker = largest observation less than or equal to upper hinge + 1.5 * IQR

Aesthetics

stat_boxplot understands the following aesthetics (required aesthetics are in bold):

• x
• y

See Also

See geom_boxplot for examples.

Examples

# See geom_boxplot for examples

stat_contour Calculate contours of 3d data.

Description

Calculate contours of 3d data.

Usage

stat_contour(mapping = NULL, data = NULL, geom = "path",
position = "identity", na.rm = FALSE, ...)

Arguments

mapping The aesthetic mapping, usually constructed with aes or aes_string. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
geom The geometric object to use display the data
position The position adjustment to use for overlapping points on this layer
na.rm If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
... other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.
Value

A data frame with additional column:

level height of contour

Aesthetics

`stat_contour` understands the following aesthetics (required aesthetics are in bold):

- x
- y
- z
- order

Examples

```r
# Generate data
library(reshape2) # for melt
volcano3d <- melt(volcano)
names(volcano3d) <- c("x", "y", "z")

# Basic plot
v <- ggplot(volcano3d, aes(x, y, z = z))
v + stat_contour()

# Setting bins creates evenly spaced contours in the range of the data
v + stat_contour(bins = 2)
v + stat_contour(bins = 10)

# Setting binwidth does the same thing, parameterised by the distance
# between contours
v + stat_contour(binwidth = 2)
v + stat_contour(binwidth = 5)
v + stat_contour(binwidth = 10)
v + stat_contour(binwidth = 2, size = 0.5, colour = "grey50") +
  stat_contour(binwidth = 10, size = 1)

# Add aesthetic mappings
v + stat_contour(aes(size = ..level..))
v + stat_contour(aes(colour = ..level..))

# Change scale
v + stat_contour(aes(colour = ..level..), size = 2) +
  scale_colour_gradient(low = "brown", high = "white")

# Set aesthetics to fixed value
v + stat_contour(colour = "red")
v + stat_contour(size = 2, linetype = 4)

# Try different geoms
```
stat_density

v + stat_contour(geom="polygon", aes(fill=..level..))
v + geom_tile(aes(fill = z)) + stat_contour()

# Use qplot instead
qplot(x, y, z = z, data = volcano3d, geom = "contour")
qplot(x, y, z = z, data = volcano3d, stat = "contour", geom = "path")

stat_density       1d kernel density estimate.

Description

1d kernel density estimate.

Usage

stat_density(mapping = NULL, data = NULL, geom = "area",
               position = "stack", adjust = 1, kernel = "gaussian", trim = FALSE,
               na.rm = FALSE, ...)

Arguments

mapping The aesthetic mapping, usually constructed with aes or aes_string. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
geom The geometric object to use display the data
position The position adjustment to use for overlapping points on this layer
adjust see density for details
kernel kernel used for density estimation, see density for details
trim if TRUE, the default, densities are trimmed to the actual range of the data. If FALSE, they are extended by the default 3 bandwidths (as specified by the cut parameter to density)
na.rm If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
... other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.

Value

data.frame with additional columns:
density density estimate
count density * number of points - useful for stacked density plots
scaled density estimate, scaled to maximum of 1
Aesthetics

stat_density understands the following aesthetics (required aesthetics are in bold):

- x
- fill
- y

See Also

stat_bin for the histogram

Examples

```r
m <- ggplot(movies, aes(x = rating))
m + geom_density()

# Adjust parameters
m + geom_density(kernel = "rectangular")
m + geom_density(kernel = "biweight")
m + geom_density(kernel = "epanechnikov")
m + geom_density(adjust=1/5) # Very rough
m + geom_density(adjust=5) # Very smooth

# Adjust aesthetics
m + geom_density(aes(fill=factor(Drama)), size=2)
# Scale so peaks have same height:
m + geom_density(aes(fill=factor(Drama), y = ..scaled..), size=2)

m + geom_density(colour="darkgreen", size=2)
m + geom_density(colour="darkgreen", size=2, fill=NA)
m + geom_density(colour="darkgreen", size=2, fill="green")

# Change scales
(m <- ggplot(movies, aes(x=votes)) + geom_density(trim = TRUE))
m + scale_x_log10()
m + coord_trans(x="log10")
m + scale_x_log10() + coord_trans(x="log10")

# Also useful with
m + stat_bin()

# Make a volcano plot
ggplot(diamonds, aes(x = price)) +
  stat_density(aes(ymax = ..density.., ymin = ..density..),
               fill = "grey50", colour = "grey50",
               geom = "ribbon", position = "identity") +
  facet_grid(. ~ cut) +
  coord_flip()

# Stacked density plots
stat_density2d 171

# If you want to create a stacked density plot, you need to use
# the 'count' (density * n) variable instead of the default density density

# Loses marginal densities
qplot(rating, ..density.., data=movies, geom="density", fill=mpaa, position="stack")
# Preserves marginal densities
qplot(rating, ..count.., data=movies, geom="density", fill=mpaa, position="stack")

# You can use position="fill" to produce a conditional density estimate
qplot(rating, ..count.., data=movies, geom="density", fill=mpaa, position="fill")

# Need to be careful with weighted data
m <- ggplot(movies, aes(x=rating, weight=votes))
m + geom_histogram(aes(y = ..count..)) + geom_density(fill=NA)

m <- ggplot(movies, aes(x=rating, weight=votes/sum(votes)))
m + geom_histogram(aes(y=..density..)) + geom_density(fill=NA, colour="black")

library(plyr) # to access round_any
movies$decade <- round_any(movies$year, 10)
m <- ggplot(movies, aes(x=rating, colour=decade, group=decade))
m + geom_density(fill=NA)
m + geom_density(fill=NA) + aes(y = ..count..)

# Use qplot instead
qplot(length, data=movies, geom="density", weight=rating)
qplot(length, data=movies, geom="density", weight=rating/sum(rating))

stat_density2d 2d density estimation.

Description

2d density estimation.

Usage

stat_density2d(mapping = NULL, data = NULL, geom = "density2d",
    position = "identity", na.rm = FALSE, contour = TRUE, n = 100, ...)

Arguments

mapping The aesthetic mapping, usually constructed with aes or aes_string. Only
needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
geom The geometric object to use display the data
position The position adjustment to use for overlapping points on this layer
stat_density2d

na.rm  If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.

contour  If TRUE, contour the results of the 2d density estimation

n  number of grid points in each direction

...  other arguments passed on to kde2d

Value

A data frame in the same format as stat_contour

Aesthetics

stat_density2d understands the following aesthetics (required aesthetics are in bold):

• x
• y
• colour
• size

Examples

library("MASS")
data(geyser, "MASS")
m <- ggplot(geyser, aes(x = duration, y = waiting)) + geom_point() + xlim(0.5, 6) + ylim(40, 110)
m + geom_density2d()

dens <- kde2d(geyser$duration, geyser$waiting, n = 50,
lims = c(0.5, 6, 40, 110))
densdf <- data.frame(expand.grid(duration = dens$x, waiting = dens$y),
z = as.vector(dens$z))
m + geom_contour(aes(z=z), data=densdf)

m + geom_density2d() + scale_y_log10()
m + geom_density2d() + coord_trans(y="log10")
m + stat_density2d(aes(fill = ..level..), geom="polygon")

qplot(duration, waiting, data=geyser, geom=c("point","density2d")) +
xlim(0.5, 6) + ylim(40, 110)

# If you map an aesthetic to a categorical variable, you will get a
# set of contours for each value of that variable
set.seed(4393)
dsmall <- diamonds[sample(nrow(diamonds), 1000), ]
qplot(x, y, data = dsmall, geom = "density2d", colour = cut)
qplot(x, y, data = dsmall, geom = "density2d", linetype = cut)
qplot(carat, price, data = dsmall, geom = "density2d", colour = cut)
```r
# If we turn contouring off, we can use geometries like tiles:
d + stat_density2d(geom="tile", aes(fill = ..density..), contour = FALSE)
last_plot() + scale_fill_gradient(limits=c(1e-5,8e-4))

# Or points:
d + stat_density2d(geom="point", aes(size = ..density..), contour = FALSE)
```

---

**stat_ecdf**  
**Empirical Cumulative Density Function**

**Description**  
Empirical Cumulative Density Function

**Usage**  

```r
stat_ecdf(mapping = NULL, data = NULL, geom = "step",
          position = "identity", n = NULL, ...)  
```

**Arguments**

- `mapping`  
The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- `data`  
A layer specific dataset - only needed if you want to override the plot defaults.
- `geom`  
The geometric object to use display the data
- `position`  
The position adjustment to use for overlapping points on this layer
- `n`  
if NULL, do not interpolate. If not NULL, this is the number of points to interpolate with.
- `...`  
other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

**Value**

A `data.frame` with additional columns:

- `x`  
x in data
- `y`  
cumulative density corresponding x
Examples

```r
qplot(rnorm(1000), stat = "ecdf", geom = "step")

df <- data.frame(x = c(rnorm(100, 0, 3), rnorm(100, 0, 10)),
                 g = gl(2, 100))

ggplot(df, aes(x, colour = g)) + stat_ecdf()
```

---

**stat_ellipse**

**Plot data ellipses.**

**Description**

Plot data ellipses.

**Usage**

```r
stat_ellipse(mapping = NULL, data = NULL, geom = "path",
             position = "identity", type = "t", level = 0.95, segments = 51,
             na.rm = FALSE, ...)  
```

**Arguments**

- **mapping**
  The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.

- **data**
  A layer specific dataset - only needed if you want to override the plot defaults.

- **geom**
  The geometric object to use display the data

- **position**
  The position adjustment to use for overlapping points on this layer

- **type**
  The type of ellipse. The default "t" assumes a multivariate t-distribution, and "norm" assumes a multivariate normal distribution. "euclid" draws a circle with the radius equal to level, representing the euclidian distance from the center. This ellipse probably won’t appear circular unless `coord_fixed()` is applied.

- **level**
  The confidence level at which to draw an ellipse (default is 0.95), or, if type="euclid", the radius of the circle to be drawn.

- **segments**
  The number of segments to be used in drawing the ellipse.

- **na.rm**
  If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.

- **...**
  other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.
Details

The method for calculating the ellipses has been modified from car::ellipse (Fox and Weisberg, 2011)

References

Examples

```r
ggplot(faithful, aes(waiting, eruptions))+
  geom_point()+
  stat_ellipse()

ggplot(faithful, aes(waiting, eruptions, color = eruptions > 3))+
  geom_point()+
  stat_ellipse()

ggplot(faithful, aes(waiting, eruptions, color = eruptions > 3))+
  geom_point()+
  stat_ellipse(type = "norm", linetype = 2)+
  stat_ellipse(type = "t")

ggplot(faithful, aes(waiting, eruptions, color = eruptions > 3))+
  geom_point()+
  stat_ellipse(type = "norm", linetype = 2)+
  stat_ellipse(type = "euclid", level = 3)+
  coord_fixed()

ggplot(faithful, aes(waiting, eruptions, color = eruptions > 3))+
  stat_ellipse(geom = "polygon")
```

Description

Superimpose a function.

Usage

```r
stat_function(mapping = NULL, data = NULL, geom = "path",
              position = "identity", fun, n = 101, args = list(), ...)
```
Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **geom**: The geometric object to use display the data.
- **position**: The position adjustment to use for overlapping points on this layer.
- **fun**: function to use.
- **n**: number of points to interpolate along.
- **args**: list of additional arguments to pass to `fun`.
- **...**: other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Value

A data.frame with additional columns:

- **x**: x's along a grid.
- **y**: value of function evaluated at corresponding x.

Aesthetics

`stat_function` understands the following aesthetics (required aesthetics are in bold):

- **y**

Examples

```r
x <- rnorm(100)
b <- qplot(x, geom = "density")
b + stat_function(fun = dnorm, colour = "red")
b + stat_function(fun = dnorm, colour = "red", arg = list(mean = 3))

# Plot functions without data
# Examples adapted from Kohske Takahashi

# Specify range of x-axis
qplot(c(0, 2), stat = "function", fun = exp, geom = "line")
ggplot(data.frame(x = c(0, 2)), aes(x)) + stat_function(fun = exp)
# Plot a normal curve
qplot(data.frame(x = c(-5, 5), aes(x))) + stat_function(fun = dnorm)
# With qplot
qplot(c(-5, 5), stat = "function", fun = dnorm, geom = "line")
# Or
qplot(c(-5, 5), geom = "blank") + stat_function(fun = dnorm)
# To specify a different mean or sd, use the args parameter to supply new values
ggplot(data.frame(x = c(-5, 5)), aes(x)) +
  stat_function(fun = dnorm, args = list(mean = 2, sd = .5))
```
# Two functions on the same plot
f <- ggplot(data.frame(x = c(0, 10)), aes(x))
f + stat_function(fun = sin, colour = "red") +
  stat_function(fun = cos, colour = "blue")

# Using a custom function
test <- function(x) (x ^ 2 + x + 20)
f + stat_function(fun = test)

stat_identity

Identity statistic.

Description

Identity statistic.

Usage

stat_identity(mapping = NULL, data = NULL, geom = "point",
              position = "identity", width = NULL, height = NULL, ...)

Arguments

mapping The aesthetic mapping, usually constructed with \texttt{aes} or \texttt{aes_string}. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
geom The geometric object to use display the data
position The position adjustment to use for overlapping points on this layer
width The width of the tiles.
height The height of the tiles.
... other arguments passed on to \texttt{layer}. This can include aesthetics whose values you want to set, not map. See \texttt{layer} for more details.

Aesthetics

\texttt{stat_identity} understands the following aesthetics (required aesthetics are in bold):

```
```

Examples

# Doesn't do anything, so hard to come up a useful example
stat_qq

Calculation for quantile-quantile plot.

Description

Calculation for quantile-quantile plot.

Usage

stat_qq(mapping = NULL, data = NULL, geom = "point",
position = "identity", distribution = qnorm, dparams = list(),
na.rm = FALSE, ...)

Arguments

mapping The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only
needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
geom The geometric object to use display the data
position The position adjustment to use for overlapping points on this layer
distribution Distribution function to use, if x not specified
dparams Parameters for distribution function
na.rm If FALSE (the default), removes missing values with a warning. If TRUE silently
removes missing values.
... Other arguments passed to distribution function

Value

a data.frame with additional columns:

sample sample quantiles
theoretical theoretical quantiles

Aesthetics

stat_qq understands the following aesthetics (required aesthetics are in bold):

• sample
• x
• y
Examples

# From ?qqplot
y <- rt(200, df = 5)
qplot(sample = y, stat="qq")

# qplot is smart enough to use stat_qq if you use sample
qplot(sample = y)
qplot(sample = precip)

# Using to explore the distribution of a variable
qplot(sample = mpg, data = mtcars)
qplot(sample = mpg, data = mtcars, colour = factor(cyl))

stat_quantile

Continuous quantiles.

Description

Continuous quantiles.

Usage

stat_quantile(mapping = NULL, data = NULL, geom = "quantile",
position = "identity", quantiles = c(0.25, 0.5, 0.75), formula = NULL,
method = "rq", na.rm = FALSE, ...)

Arguments

mapping  The aesthetic mapping, usually constructed with aes or aes_string. Only needs to be set at the layer level if you are overriding the plot defaults.
data    A layer specific dataset - only needed if you want to override the plot defaults.
geom    The geometric object to use display the data
position    The position adjustment to use for overlapping points on this layer
quantiles    conditional quantiles of y to calculate and display
formula
method
na.rm
... Value
Aesthetics
Examples
Description

Aids the eye in seeing patterns in the presence of overplotting.

Usage

```r
stat_smooth(mapping = NULL, data = NULL, geom = "smooth",
            position = "identity", method = "auto", formula = y ~ x, se = TRUE,
            n = 80, fullrange = FALSE, level = 0.95, na.rm = FALSE, ...)
```

Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **geom**: The geometric object to use display the data
- **position**: The position adjustment to use for overlapping points on this layer
- **method**: smoothing method (function) to use, eg. lm, glm, gam, loess, rlm. For datasets with n < 1000 default is `loess`. For datasets with 1000 or more observations defaults to gam, see `gam` for more details.
- **formula**: formula to use in smoothing function, eg. `y ~ x`, `y ~ poly(x, 2)`, `y ~ log(x)`
- **se**: display confidence interval around smooth? (TRUE by default, see level to control
- **n**: number of points to evaluate smoother at
- **fullrange**: should the fit span the full range of the plot, or just the data
- **level**: level of confidence interval to use (0.95 by default)
- **na.rm**: If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
- **...**: other arguments are passed to smoothing function

Details

Calculation is performed by the (currently undocumented) `predictdf` generic function and its methods. For most methods the confidence bounds are computed using the `predict` method - the exceptions are `loess` which uses a t-based approximation, and for `glm` where the normal confidence interval is constructed on the link scale, and then back-transformed to the response scale.
Value

a data.frame with additional columns

- **y** predicted value
- **ymin** lower pointwise confidence interval around the mean
- **ymax** upper pointwise confidence interval around the mean
- **se** standard error

Aesthetics

stat_smooth understands the following aesthetics (required aesthetics are in bold):

- **x**
- **y**

See Also

qplot(Age, data=kyphosis, facets = . ~ Kyphosis, binwidth = 10)
qplot(Age, Kyphosis, data=kyphosis, position="jitter")
qplot(Age, Kyphosis, data=kyphosis, position=position_jitter(height=0.1))

qplot(Age, as.numeric(Kyphosis) - 1, data = kyphosis) +
  stat_smooth(method="glm", family="binomial")
qplot(Age, as.numeric(Kyphosis) - 1, data=kyphosis) +
  stat_smooth(method="glm", family="binomial", formula = y ~ ns(x, 2))

## End (Not run)

stat_spoke  
Convert angle and radius to xend and yend.

Description

Convert angle and radius to xend and yend.

Usage

stat_spoke(mapping = NULL, data = NULL, geom = "segment",
position = "identity", ...)

Arguments

mapping  The aesthetic mapping, usually constructed with aes or aes_string. Only needs to be set at the layer level if you are overriding the plot defaults.
data        A layer specific dataset - only needed if you want to override the plot defaults.
The geometric object to use display the data

position

The position adjustment to use for overlapping points on this layer

... other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.

Value

da.frame with additional columns

xend x position of end of line segment

yend y position of end of line segment

Aesthetics

stat_spoke understands the following aesthetics (required aesthetics are in bold):

• angle
• radius
• x
• y
• xend
• yend

Examples

df <- expand.grid(x = 1:10, y=1:10)
df$angle <- runif(100, 0, 2*pi)
df$speed <- runif(100, 0, 0.5)

qplot(x, y, data=df) + stat_spoke(aes(angle=angle), radius = 0.5)
last_plot() + scale_y_reverse()

qplot(x, y, data=df) + stat_spoke(aes(angle=angle, radius=speed))

stat_sum  

\textit{Sum unique values. Useful for overplotting on scatterplots.}

Description

Sum unique values. Useful for overplotting on scatterplots.

Usage

\texttt{stat\_sum(mapping = NULL, data = NULL, geom = \textquoteleft point\textquoteright, position = \textquoteleft identity\textquoteright, ...)}
Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.

- **data**: A layer specific dataset - only needed if you want to override the plot defaults.

- **geom**: The geometric object to use display the data

- **position**: The position adjustment to use for overlapping points on this layer

- **...**: other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Value

- **a data.frame** with additional columns
  - **n**: number of observations at position
  - **prop**: percent of points in that panel at that position

Aesthetics

- `stat_sum` understands the following aesthetics (required aesthetics are in bold):
  - **x**
  - **y**
  - **size**

See Also

- `ggfluctuation` for a fluctuation diagram,

Examples

```r
  d <- ggplot(diamonds, aes(x = cut, y = clarity))
  # By default, all categorical variables in the plot form grouping
  # variables, and the default behavior in stat_sum is to show the
  # proportion. Specifying stat_sum with no group identifier leads to
  # a plot which is not meaningful:
  d + stat_sum()
  # To correct this problem and achieve a more desirable plot, we need
  # to specify which group the proportion is to be calculated over.
  # There are several ways to do this:

  # by overall proportion
  d + stat_sum(aes(group = 1))
  d + stat_sum(aes(group = 1)) + scale_size(range = c(3, 10))
  d + stat_sum(aes(group = 1)) + scale_size_area(max_size = 10)

  # by cut
  d + stat_sum(aes(group = cut))
  d + stat_sum(aes(group = cut, colour = cut))
```
# by clarity
d + stat_sum(aes(group = clarity))
d + stat_sum(aes(group = clarity, colour = cut))

# Instead of proportions, can also use sums
d + stat_sum(aes(size = ..n..))

# Can also weight by another variable
d + stat_sum(aes(group = 1, weight = price))
d + stat_sum(aes(group = 1, weight = price, size = ..n..))

# Or using qplot
qplot(cut, clarity, data = diamonds)
qplot(cut, clarity, data = diamonds, stat = "sum", group = 1)

stat_summary

Summarise y values at every unique x.

Description

stat_summary allows for tremendous flexibilty in the specification of summary functions. The summary function can either supply individual summary functions for each of y, ymin and ymax (with fun.y, fun.ymax, fun.ymin), or return a data frame containing any number of aesthetics with with fun.data. All summary functions are called with a single vector of values, x.

Usage

stat_summary(mapping = NULL, data = NULL, geom = "pointrange",
position = "identity", ...)

Arguments

mapping The aesthetic mapping, usually constructed with aes or aes_string. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
geom The geometric object to use display the data
position The position adjustment to use for overlapping points on this layer
...
other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.

Details

A simple vector function is easiest to work with as you can return a single number, but is somewhat less flexible. If your summary function operates on a data.frame it should return a data frame with variables that the geom can use.
**Value**

A data frame with additional columns:

- `fun.data`: Complete summary function. Should take data frame as input and return data frame as output.
- `fun.ymin`: ymin summary function (should take numeric vector and return single number).
- `fun.y`: y summary function (should take numeric vector and return single number).
- `fun.ymax`: ymax summary function (should take numeric vector and return single number).

**Aesthetics**

`stat_summary` understands the following aesthetics (required aesthetics are in bold):

- `x`
- `y`

**See Also**

`geom_errorbar`, `geom_pointrange`, `geom_linerange`, `geom_crossbar` for geoms to display summarised data.

**Examples**

```r
# Basic operation on a small dataset
d <- qplot(cyl, mpg, data=mtcars)
d + stat_summary(fun.data = "mean_cl_boot", colour = "red")

p <- qplot(cyl, mpg, data = mtcars, stat="summary", fun.y = "mean")
p
# Don't use ylim to zoom into a summary plot - this throws the
data away
p + ylim(c(15, 30))
# Instead use coord_cartesian
p + coord_cartesian(ylim = c(15, 30))

# You can supply individual functions to summarise the value at
# each x:
stat_sum_single <- function(fun, geom="point", ...) {
  stat_summary(fun.y=fun, colour="red", geom=geom, size = 3, ...)
}
d + stat_sum_single(mean)
d + stat_sum_single(mean, geom="line")
d + stat_sum_single(median)
d + stat_sum_single(sd)

d + stat_summary(fun.y = mean, fun.ymin = min, fun.ymax = max,
    colour = "red")
```
d + aes(colour = factor(vs)) + stat_summary(fun.y = mean, geom="line")

# Alternatively, you can supply a function that operates on a data.frame.
# A set of useful summary functions is provided from the Hmisc package:

stat_sum_df <- function(fun, geom="crossbar", ...) {
  stat_summary(fun.data=fun, colour="red", geom=geom, width=0.2, ...)
}

# The crossbar geom needs grouping to be specified when used with
# a continuous x axis.
d + stat_sum_df("mean_cl_boot", mapping = aes(group = cyl))
d + stat_sum_df("mean_sdl", mapping = aes(group = cyl))
d + stat_sum_df("mean_sdl", mult = 1, mapping = aes(group = cyl))
d + stat_sum_df("median_hilow", mapping = aes(group = cyl))

# There are lots of different geoms you can use to display the summaries

d + stat_sum_df("mean_cl_normal", mapping = aes(group = cyl))
d + stat_sum_df("mean_cl_normal", geom = "errorbar")
d + stat_sum_df("mean_cl_normal", geom = "pointrange")
d + stat_sum_df("mean_cl_normal", geom = "smooth")

# Summaries are more useful with a bigger data set:
mpg2 <- subset(mpg, cyl != 5L)
m <- ggplot(mpg2, aes(x=cyl, y=hwy)) +
  geom_point() +
  stat_summary(fun.data = "mean_sdl", geom = "linerange",
               colour = "red", size = 2, mult = 1) +
  xlab("cyl")

# An example with highly skewed distributions:
set.seed(596)
mov <- movies[sample(nrow(movies), 10000),]
m2 <- ggplot(mov, aes(x= factor(round(rating)), y=votes)) + geom_point()
m2 <- m2 + stat_summary(fun.data = "mean_cl_boot", geom = "crossbar",
                         colour = "red", width = 0.3) + xlab("rating")

# Notice how the overplotting skews off visual perception of the mean
# supplementing the raw data with summary statistics is very important

# Next, we'll look at votes on a log scale.

# Transforming the scale means the data are transformed
# first, after which statistics are computed:
m2 + scale_y_log10()

# Transforming the coordinate system occurs after the
# statistic has been computed. This means we're calculating the summary on the raw data
# and stretching the geoms onto the log scale. Compare the widths of the
# standard errors.
m2 + coord_trans(y="log10")
Apply function for 2D rectangular bins.

Description

Apply function for 2D rectangular bins.

Usage

stat_summary2d(mapping = NULL, data = NULL, geom = NULL,
    position = "identity", bins = 30, drop = TRUE, fun = mean, ...)

Arguments

mapping The aesthetic mapping, usually constructed with aes or aes_string. Only
    needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
geom The geometric object to use display the data
position The position adjustment to use for overlapping points on this layer
bins see stat_bin2d
drop drop if the output of fun is NA.
fun function for summary.
... parameters passed to fun

Aesthetics

stat_summary2d understands the following aesthetics (required aesthetics are in bold):

- x
- y
- z
- fill

stat_summary2d is 2D version of stat_summary. The data are devided by x and y. z in each cell
is passed to arbitral summary function.

stat_summary2d requires the following aesthetics:

- x: horizontal position
- y: vertical position
- z: value passed to the summary function

See Also

stat_summary_hex for hexagonal summarization. stat_bin2d for the binning options.
**Examples**

```r
d <- ggplot(diamonds, aes(carat, depth, z = price))
d + stat_summary2d()

# Specifying function
d + stat_summary2d(fun = function(x) sum(x^2))
d + stat_summary2d(fun = var)
```

---

**stat_summary_hex**  
*Apply function for 2D hexagonal bins.*

**Description**

Apply function for 2D hexagonal bins.

**Usage**

```r
stat_summary_hex(mapping = NULL, data = NULL, geom = "hex",
                  position = "identity", bins = 30, drop = TRUE, fun = mean, ...)
```

**Arguments**

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **geom**: The geometric object to use display the data
- **position**: The position adjustment to use for overlapping points on this layer
- **bins**: see `stat_binhex`
- **drop**: drop if the output of `fun` is NA.
- **fun**: function for summary.
- **...**: parameters passed to `fun`

**Aesthetics**

`stat_summary_hex` understands the following aesthetics (required aesthetics are in bold):

- **x**
- **y**
- **z**
- **fill**
**stat_unique**

`stat_summary2d` is hexagonal version of `stat_summary`. The data are divided by `x` and `y`. `z` in each cell is passed to arbitral summary function.

`stat_summary_hex` requires the following aesthetics:

- `x`: horizontal position
- `y`: vertical position
- `z`: value passed to the summary function

**See Also**

`stat_summary2d` for rectangular summarization. `stat_bin2d` for the hexagon-ing options.

**Examples**

```r
d <- ggplot(diamonds, aes(carat, depth, z = price))
d + stat_summary_hex()

# Specifying function
 d + stat_summary_hex(fun = function(x) sum(x^2))
d + stat_summary_hex(fun = var, na.rm = TRUE)
```

---

**stat_unique**

*Remove duplicates.*

**Description**

Remove duplicates.

**Usage**

```r
stat_unique(mapping = NULL, data = NULL, geom = "point",
            position = "identity", ...)
```

**Arguments**

- `mapping`: The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- `data`: A layer specific dataset - only needed if you want to override the plot defaults.
- `geom`: The geometric object to use display the data
- `position`: The position adjustment to use for overlapping points on this layer
- `...`: other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

**Aesthetics**

`stat_unique` understands the following aesthetics (required aesthetics are in bold):

- `.`
Examples

```r
ggplot(mtcars, aes(vs, am)) + geom_point(alpha = 0.1)
ggplot(mtcars, aes(vs, am)) + geom_point(alpha = 0.1, stat="unique")
```

---

**stat_ydensity**

*1d kernel density estimate along y axis, for violin plot.*

**Description**

1d kernel density estimate along y axis, for violin plot.

**Usage**

```r
stat_ydensity(mapping = NULL, data = NULL, geom = "violin",
position = "dodge", adjust = 1, kernel = "gaussian", trim = TRUE,
scale = "area", na.rm = FALSE, ...)
```

**Arguments**

- **mapping** The aesthetic mapping, usually constructed with `aes` or `aes_string`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data** A layer specific dataset - only needed if you want to override the plot defaults.
- **geom** The geometric object to use display the data
- **position** The position adjustment to use for overlapping points on this layer
- **adjust** see `density` for details
- **kernel** kernel used for density estimation, see `density` for details
- **trim** If TRUE (default), trim the tails of the violins to the range of the data. If FALSE, don’t trim the tails.
- **scale** if "area" (default), all violins have the same area (before trimming the tails). If "count", areas are scaled proportionally to the number of observations. If "width", all violins have the same maximum width.
- **na.rm** If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
- **...** other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

**Value**

A data frame with additional columns:

- **density** density estimate
- **scaled** density estimate, scaled to maximum of 1
- **count** density * number of points - probably useless for violin plots
Aesthetics

stat_ydensity understands the following aesthetics (required aesthetics are in bold):

• x
• y

See Also

geom_violin for examples, and stat_density for examples with data along the x axis.

Examples

# See geom_violin for examples
# Also see stat_density for similar examples with data along x axis

theme

Description

Use this function to modify theme settings.

Usage

theme(..., complete = FALSE)

Arguments

... a list of element name, element pairings that modify the existing theme.
complete set this to TRUE if this is a complete theme, such as the one returned by theme_grey(). Complete themes behave differently when added to a ggplot object.

Details

Theme elements can inherit properties from other theme elements. For example, axis.title.x inherits from axis.title, which in turn inherits from text. All text elements inherit directly or indirectly from text; all lines inherit from line, and all rectangular objects inherit from rect.

For more examples of modifying properties using inheritance, see +.gg and %+replace%.

To see a graphical representation of the inheritance tree, see the last example below.

Theme elements

The individual theme elements are:
line all line elements (element_line)
rect all rectangular elements (element_rect)
text all text elements (element_text)
title all title elements: plot, axes, legends (element_text; inherits from text)
axis.title label of axes (element_text; inherits from text)
axis.title.x x axis label (element_text; inherits from axis.title)
axis.title.y y axis label (element_text; inherits from axis.title)
avis.text tick labels along axes (element_text; inherits from text)
avis.text.x x axis tick labels (element_text; inherits from axis.text)
avis.text.y y axis tick labels (element_text; inherits from axis.text)
axis.ticks tick marks along axes (element_line; inherits from line)
axis.ticks.x x axis tick marks (element_line; inherits from axis.ticks)
axis.ticks.y y axis tick marks (element_line; inherits from axis.ticks)
axis.ticks.length length of tick marks (unit)
axis.ticks.margin space between tick mark and tick label (unit)
axis.line lines along axes (element_line; inherits from line)
axis.line.x line along x axis (element_line; inherits from axis.line)
axis.line.y line along y axis (element_line; inherits from axis.line)
legend.background background of legend (element_rect; inherits from rect)
legend.margin extra space added around legend (unit)
legend.key background underneath legend keys (element_rect; inherits from rect)
legend.key.size size of legend keys (unit; inherits from legend.key.size)
legend.key.height key background height (unit; inherits from legend.key.size)
legend.key.width key background width (unit; inherits from legend.key.size)
legend.text legend item labels (element_text; inherits from text)
legend.text.align alignment of legend labels (number from 0 (left) to 1 (right))
legend.title title of legend (element_text; inherits from title)
legend.title.align alignment of legend title (number from 0 (left) to 1 (right))
legend.position the position of legends ("none", "left", "right", "bottom", "top", or two-element numeric vector)
legend.direction layout of items in legends ("horizontal" or "vertical")
legend.justification anchor point for positioning legend inside plot ("center" or two-element numeric vector)
legend.box arrangement of multiple legends ("horizontal" or "vertical")
legend.box.justification justification of each legend within the overall bounding box, when there are multiple legends ("top", "both", or "none")
panel.background background of plotting area, drawn underneath plot (element_rect; inherits from rect)
panel.border border around plotting area, drawn on top of plot so that it covers tick marks and grid lines. This should
panel.margin margin around facet panels (unit)
panel.margin.x horizontal margin around facet panels (unit; inherits from panel.margin)
panel.margin.y vertical margin around facet panels (unit; inherits from panel.margin)
panel.grid grid lines (element_line; inherits from line)
panel.grid.major major grid lines (element_line; inherits from panel.grid)
panel.grid.minor minor grid lines (element_line; inherits from panel.grid)
panel.grid.major.x vertical major grid lines (element_line; inherits from panel.grid.major)
panel.grid.major.y horizontal major grid lines (element_line; inherits from panel.grid.major)
panel.grid.minor.x vertical minor grid lines (element_line; inherits from panel.grid.minor)
panel.grid.minor.y horizontal minor grid lines (element_line; inherits from panel.grid.minor)
plot.background background of the entire plot (element_rect; inherits from rect)
plot.title plot title (text appearance) (element_text; inherits from title)
plot.margin margin around entire plot (unit with the sizes of the top, right, bottom, and left margins)
strip.background background of facet labels (element_rect; inherits from rect)
strip.text facet labels (element_text; inherits from text)
strip.text.x facet labels along horizontal direction (element_text; inherits from strip.text)
strip.text.y facet labels along vertical direction (element_text; inherits from strip.text)

Examples

```r
p <- qplot(mpg, wt, data = mtcars)
p
p + theme(panel.background = element_rect(colour = "pink"))
p + theme_bw()

# Scatter plot of gas mileage by vehicle weight
p <- ggplot(mtcars, aes(x = wt, y = mpg)) + geom_point()
# Calculate slope and intercept of line of best fit
coef(lm(mpg ~ wt, data = mtcars))
p + geom_abline(intercept = 37, slope = -5)
# Calculate correlation coefficient
with(mtcars, cor(wt, mpg, use = "everything", method = "pearson"))
# Annotate the plot
p + geom_abline(intercept = 37, slope = -5) +
  geom_text(data = data.frame(), aes(4.5, 30, label = "Pearson-R = -.87"))

# Change the axis labels
# Original plot
p
p + xlab("Vehicle Weight") + ylab("Miles per Gallon")
# Or
p + labs(x = "Vehicle Weight", y = "Miles per Gallon")

# Change title appearance
p <- p + labs(title = "Vehicle Weight-Gas Mileage Relationship")
# Set title to twice the base font size
p + theme(plot.title = element_text(size = rel(2)))
p + theme(plot.title = element_text(size = rel(2), colour = "blue"))

# Changing plot look with themes
```
DF <- data.frame(x = rnorm(400))
m <- ggplot(DF, aes(x = x)) + geom_histogram()
# Default is theme_grey()
m
# Compare with
m + theme_bw()

# Manipulate Axis Attributes
library(grid) # for unit

## End(Not run)
**Description**

The `theme_xx` functions have been deprecated. They are replaced with the `element_xx` functions.

**Usage**

```r
theme_blank(...)  
theme_rect(...)  
theme_line(...)  
theme_segment(...)  
theme_text(...)  
```

**Arguments**

`...`  
Arguments to be passed to the appropriate `element_xx` function.

---

**theme_update**

*Get, set and update themes.*

**Description**

Use `theme_update` to modify a small number of elements of the current theme or use `theme_set` to completely override it.

**Usage**

```r
theme_update(...)  
theme_get()  
theme_set(new)  
```

**Arguments**

`...`  
named list of theme settings

`new`  
new theme (a list of theme elements)

**See Also**

`%+replace%` and `.gg`
Examples

```r
qplot(mpg, wt, data = mtcars)
old <- theme_set(theme_bw())
qplot(mpg, wt, data = mtcars)
theme_set(old)
qplot(mpg, wt, data = mtcars)

old <- theme_update(panel.background = element_rect(colour = "pink"))
qplot(mpg, wt, data = mtcars)
theme_set(old)
theme_set()

qplot(mpg, wt, data=mtcars, colour=mpg) +
  theme(legend.position=c(0.95, 0.95), legend.justification = c(1, 1))
last_plot() +
  theme(legend.background = element_rect(fill = "white", colour = "white", size = 3))
```

---

**Description**

There are two types of graphics functions in base graphics, those that draw complete graphics and those that add to existing graphics.

**Details**

qplot() has been designed to mimic plot(), and can do the job of all other high-level plotting commands. There are only two graph types from base graphics that cannot be replicated with ggplot2: filled.contour() and persp()

**Examples**

```r
# High-level plotting commands

x <- runif(10)
y <- 1:10
plot(x, y); dotchart(x, y)
qplot(x, y)

plot(x, y, type = "l")
qplot(x, y, geom = "line")

plot(x, y, type = "s")
qplot(x, y, geom = "step")

plot(x, y, type = "b")
```
qplot(x, y, geom = c("point", "line"))

boxplot(x, y)
qplot(x, y, geom = "boxplot")

hist(x)
qplot(x, geom = "histogram")

# cdplot(factor(x), y)
# qplot(x, fill = y, geom = "density", position = "fill")

# coplot(y ~ x | a ~ b)
# qplot(x, y, facets = a ~ b)

# Many of the geoms are parameterised differently than base graphics. For
# example, hist() is parameterised in terms of the number of bins, while
# geom_histogram() is parameterised in terms of the width of each bin.
hist(x, bins = 10)
qplot(x, geom = "histogram", binwidth = .1)

# qplot() often requires data in a slightly different format to the base
# graphics functions. For example, the bar geom works with untabulated data,
# not tabulated data like barplot(); the tile and contour geoms expect data
# in a data frame, not a matrix like image() and contour().
barplot(table(x))
qplot(x, geom = "bar")

barplot(x)
qplot(seq_along(x), x, geom = "bar", stat = "identity")

# image(x)
# qplot(X1, X2, data = melt(x), geom = "tile", fill = value)

# contour(x)
# qplot(X1, X2, data = melt(x), geom = "contour", fill = value)

# Generally, the base graphics functions work with individual vectors, not
# data frames like ggplot2. qplot() will try to construct a data frame if one
# is not specified, but it is not always possible. If you get strange errors,
# you may need to create the data frame yourself.
df <- data.frame(x = x, y = y)
with(df, plot(x, y))
qplot(x, y, data = df)

# By default, qplot() maps values to aesthetics with a scale. To override
# this behaviour and set aesthetics, overriding the defaults, you need to use I().
plot(x, y, col = "red", cex = 1)
qplot(x, y, colour = I("red"), size = I(1))

# Low-level drawing

# The low-level drawing functions which add to an existing plot are equivalent
# to adding a new layer in ggplot2.
# Base function  
  ggplot2 layer
# curve()  
geom_curve()
# hline()  
geom_hline()
# lines()  
geom_line()
# points()  
geom_point()
# polygon()  
geom_polygon()
# rect()  
geom_rect()
# rug()  
geom_rug()
# segments()  
geom_segment()
# text()  
geom_text()
# vline()  
geom_vline()
# abline(lm(y ~ x))  
geom_smooth(method = "lm")
# lines(density(x))  
geom_density()
# lines(loess(x, y))  
geom_smooth()

plot(x, y)
lines(x, y)

qplot(x, y) + geom_line()

# Or, building up piece-meal
qplot(x, y)
last_plot() + geom_line()

# Legends, axes and grid lines

# In ggplot2, the appearance of legends and axes is controlled by the scales.
# Axes are produced by the x and y scales, while all other scales produce legends.
# See ?theme for help changing the appearance of axes and legends.
# The appearance of grid lines is controlled by the grid.major and grid.minor
# theme options, and their position by the breaks of the x and y scales.

# Colour palettes

# Instead of global colour palettes, ggplot2 has scales for individual plots. Much
# of the time you can rely on the default colour scale (which has somewhat better
# perceptual properties), but if you want to reuse an existing colour palette, you
# can use scale_colour_manual(). You will need to make sure that the colour
# is a factor for this to work.

palette(rainbow(5))
plot(1:5, 1:5, col = 1:5, pch = 19, cex = 4)

qplot(1:5, 1:5, col = factor(1:5), size = I(4))
last_plot() + scale_colour_manual(values = rainbow(5))

# In ggplot2, you can also use palettes with continuous values,
# with intermediate values being linearly interpolated.

qplot(0:100, 0:100, col = 0:100, size = I(4)) +
  scale_colour_gradientn(colours = rainbow(7))
last_plot() + scale_colour_gradientn(colours = terrain.colors(7))
# Graphical parameters

# The majority of par settings have some analogue within the theme system, or
# in the defaults of the geoms and scales. The appearance plot border drawn
# by box() can be controlled in a similar way by the panel.background and
# plot.background theme elements. Instead of using title(), the plot title is
# set with the title option. See ?theme for more theme elements.
last_plot() + labs(title = "My Plot Title")

---

## translate_qplot GGplot

### Translating between qplot and ggplot

#### Description

Within ggplot2, there are two basic methods to create plots, with qplot() and ggplot(). qplot() is
designed primarily for interactive use: it makes a number of assumptions that speed most cases, but
when designing multilayered plots with different data sources it can get in the way. This section
describes what those defaults are, and how they map to the fuller ggplot() syntax.

#### Examples

# By default, qplot() assumes that you want a scatterplot,
# i.e., you want to use geom_point()
# qplot(x, y, data = data)
# ggplot(data, aes(x, y)) + geom_point()

# Using Aesthetics

# If you map additional aesthetics, these will be added to the defaults. With
# qplot() there is no way to use different aesthetic mappings (or data) in
# different layers
# qplot(x, y, data = data, shape = shape, colour = colour)
# ggplot(data, aes(x, y, shape = shape, colour = colour)) + geom_point()

# # Aesthetic parameters in qplot() always try to map the aesthetic to a
# # variable. If the argument is not a variable but a value, effectively a new column
# # is added to the original dataset with that value. To set an aesthetic to a
# # value and override the default appearance, you surround the value with I() in
# # qplot(), or pass it as a parameter to the layer.
# qplot(x, y, data = data, colour = I("red"))
# ggplot(data, aes(x, y)) + geom_point(colour = "red")

# Changing the geom parameter changes the geom added to the plot
# qplot(x, y, data = data, geom = "line")
# ggplot(data, aes(x, y)) + geom_line()

# Not all geoms require both x and y, e.g., geom_bar() and geom_histogram().
translate_qplot_gpl

Translating between qplot and Graphics Production Library (GPL)

Description

The Grammar of Graphics uses two specifications. A concise format is used to caption figures, and a more detailed xml format stored on disk.
Examples

# The following example of the concise format is adapted from Figure 1.5,

# DATA: source("demographics")
# DATA: longitude, latitude = map(source("World"))
# TRANS: bd = max(birth - death, 0)
# COORD: project.mercator()
# ELEMENT: point(position(lon * lat), size(bd), color(color.red))
# ELEMENT: polygon(position(longitude * latitude))

# This is relatively simple to adapt to the syntax of ggplot2:

# ggplot() is used to specify the default data and default aesthetic mappings.
# Data is provided as standard R data.frames existing in the global environment;
# it does not need to be explicitly loaded. We also use a slightly
# different world dataset, with columns lat and long. This lets us use the
# same aesthetic mappings for both datasets. Layers can override the default
# data and aesthetic mappings provided by the plot.

# We replace TRANS with an explicit transformation by R code.

# ELEMENTs are replaced with layers, which explicitly specify the data
# source. Each geom has a default statistic which is used to transform the
# data prior to plotting. For the geoms in this example, the default statistic
# is the identity function. Fixed aesthetics (the colour red in this example)
# are supplied as additional arguments to the layer, rather than as special
# constants.

# The SCALE component has been omitted from this example (so that the
# defaults are used). In both the ggplot2 and GoG examples, scales are
# defined by default. In ggplot you can override the defaults by adding a
# scale object, e.g., scale colour or scale size.

# COORD uses a slightly different format. In general, most of the components
# specifications in ggplot are slightly different to those in GoG, in order to
# be more familiar to R users.

# Each component is added together with + to create the final plot.

# Resulting ggplot2 code:
# demographics <- transform(demographics, bd = pmax(birth - death, 0))
# p <- ggplot(demographic, aes(lon, lat))
# p <- p + geom_polygon(data = world)
# p <- p + geom_point(aes(size = bd), colour = "red")
# p <- p + coord_map(projection = "mercator")
# print(p)
translate_qplot_lattice

Translating between qplot and lattice

Description

The major difference between lattice and ggplot2 is that lattice uses a formula based interface. ggplot2 does not because the formula does not generalise well to more complicated situations.

Examples

```r
# Not run:
library(lattice)
xyplot(rating ~ year, data=movies)
qplot(year, rating, data=movies)

xyplot(rating ~ year | Comedy + Action, data = movies)
qplot(year, rating, data = movies, facets = ~ Comedy + Action)
# Or maybe
qplot(year, rating, data = movies, facets = Comedy ~ Action)

# While lattice has many different functions to produce different types of
# graphics (which are all basically equivalent to setting the panel argument),
# ggplot2 has qplot().

stripplot(~ rating, data = movies, jitter.data = TRUE)
qplot(rating, 1, data = movies, geom = "jitter")

histogram(~ rating, data = movies)
qplot(rating, data = movies, geom = "histogram")

bwplot(Comedy ~ rating ,data = movies)
qplot(factor(Comedy), rating, data = movies, type = "boxplot")

xyplot(wt ~ mpg, mtcars, type = c("p","smooth"))
qplot(mpg, wt, data = mtcars, geom = c("point","smooth"))

xyplot(wt ~ mpg, mtcars, type = c("p","r"))
qplot(mpg, wt, data = mtcars, geom = c("point","smooth"), method = "lm")

# The capabilities for scale manipulations are similar in both ggplot2 and
# lattice, although the syntax is a little different.

xyplot(wt ~ mpg | cyl, mtcars, scales = list(y = list(relation = "free")))
qplot(mpg, wt, data = mtcars) + facet_wrap(~ cyl, scales = "free")

xyplot(wt ~ mpg | cyl, mtcars, scales = list(log = 10))
qplot(mpg, wt, data = mtcars, log = "xy")

xyplot(wt ~ mpg | cyl, mtcars, scales = list(log = 2))
library(scales) # Load scales for log2_trans
```
qplot(mpg, wt, data = mtcars) + scale_x_continuous(trans = log2_trans()) +
  scale_y_continuous(trans = log2_trans())

xyplot(wt ~ mpg, mtcars, group = cyl, auto.key = TRUE)
# Map directly to an aesthetic like colour, size, or shape.
qplot(mpg, wt, data = mtcars, colour = cyl)

xyplot(wt ~ mpg, mtcars, xlim = c(20,30))
# Works like lattice, except you can't specify a different limit
# for each panel/facet
qplot(mpg, wt, data = mtcars, xlim = c(20,30))

# Both lattice and ggplot2 have similar options for controlling labels on the plot.

xyplot(wt ~ mpg, mtcars, xlab = "Miles per gallon", ylab = "Weight",
       main = "Weight-efficiency tradeoff")
qplot(mpg, wt, data = mtcars, xlab = "Miles per gallon", ylab = "Weight",
       main = "Weight-efficiency tradeoff")

xyplot(wt ~ mpg, mtcars, aspect = 1)
qplot(mpg, wt, data = mtcars, asp = 1)

# par.settings() is equivalent to + theme() and trellis.options.set()
# and trellis.par.get() to theme_set() and theme_get().
# More complicated lattice formulas are equivalent to rearranging the data
# before using ggplot2.

## End(Not run)

---

**update_element**

*Update theme param*

**Description**

Update contents of a theme. (Deprecated)

**Usage**

`update_element(name, ...)`

**Arguments**

- `name` name of a theme element
- `...` Pairs of name and value of theme parameters.

**Details**

This function is deprecated. Use `%replace%` or `+.gg` instead.
**update_geom_defaults**

Modify geom/stat aesthetic defaults for future plots

---

**Description**

Modify geom/stat aesthetic defaults for future plots

**Usage**

```r
dexpression(update_geom_defaults(geom, new))
deexpression(update_stat_defaults(stat, new))
```

**Arguments**

- `new` named list of aesthetics
- `stat, geom` name of geom/stat to modify

---

**Value**

Updated theme element

**See Also**

%+replace% and .gg

---

**Examples**

```r
## Not run:
x <- element_text(size = 15)
update_element(x, colour = "red")
# Partial matching works
update_element(x, col = "red")
# So does positional
update_element(x, "Times New Roman")
# And it throws an error if you use an argument that doesn't exist
update_element(x, noargument = 12)
# Or multiple arguments with the same name
update_element(x, size = 12, size = 15)

# Will look up element if given name
update_element("axis.text.x", colour = 20)
# Throws error if incorrectly named
update_element("axis.text", colour = 20)

## End(Not run)
```
Examples

update_geom_defaults("point", list(colour = "darkblue"))
qplot(mpg, wt, data = mtcars)
update_geom_defaults("point", list(colour = "black"))

update_labels(p, list(x = "New x"))
update_labels(p, list(x = expression(x / y ^ 2)))
update_labels(p, list(x = "New x", y = "New Y"))
update_labels(p, list(colour = "Fail silently"))

xlim

Convenience functions to set the limits of the x and y axis.

Description

Observations not in this range will be dropped completely and not passed to any other layers. If a NA value is substituted for one of the limits that limit is automatically calculated.

Usage

xlim(...)

ylim(...)

Arguments

... if numeric, will create a continuous scale, if factor or character, will create a discrete scale.
\texttt{xlim}

\textbf{See Also}

For changing x or y axis limits \textbf{without} dropping data observations, see \texttt{coord_cartesian}.

\textbf{Examples}

\begin{verbatim}
# xlim
xlim(c(15, 20))
xlim(20, 15)
xlim(c(10, 20))
xlim("a", "b", "c")
qplot(mpg, wt, data=mtcars) + xlim(15, 20)
# with automatic lower limit
qplot(mpg, wt, data=mtcars) + xlim(NA, 20)

# ylim
ylim(c(10, 20))
ylim("a", "b", "c")
yplot(mpg, wt, data=mtcars) + ylim(0, 4)
# with automatic upper limit
qplot(mpg, wt, data=mtcars) + ylim(0, NA)
\end{verbatim}
