

An Overview of the NMOF Package

Enrico Schumann

es@enricoschumann.net

1 The book and the package

1.1 The book

‘Numerical Methods and Optimization in Finance’ (NMOF, Gilli et al., 2011) is all about tools for computational finance, with emphasis on simulation and optimisation. Many chapters are organised as case studies, covering topics such as portfolio insurance or the valuation of financial derivatives. In particular, several chapters explain optimisation heuristics and show in detail how to use these methods for portfolio selection or the calibration of option pricing models. Some highlights:

- Simulation: how to create random variates under specified marginal distributions; how to induce cross-sectional correlation (beyond Cholesky for Gaussian variates) and serial dependencies; examples for copulae; resampling, bootstrapping data sets.
- Option pricing: binomial trees, finite differences and Monte Carlo simulation; but also integration methods for pricing with the characteristic function (eg, Heston, Bates, Variance-Gamma). Calibration of surfaces under such models.
- Portfolio optimisation: methods to optimise portfolio under any objective function (eg, drawdown, partial moments) and constraints (eg, cardinality constraints). Sample programs for classical mean-variance analysis are also included.
- Yield-curve calibration: various strategies how to calibrate a yield-curve model: through fitting to bootstrapped yields, to bond prices or to yields-to-maturity.

1.2 The package

The NMOF package provides many of the code examples and data sets used in Gilli et al. [2011]; it also contains several functions that have not been described in the book. Notably, the package provides implementations of a number of optimisation heuristics, among them Differential Evolution and Genetic Algorithms. There are also functions for valuing financial instruments (such as bonds and options) and helper functions for stochastic simulations.

2 What’s in the package

2.1 Optimisation

There are functions for Differential Evolution (DEopt), Genetic Algorithms (GAopt), (Stochastic) Local Search (LSopt), Particle Swarm (PSopt), Threshold Accepting (TAopt) and grid search (gridSearch).

2.2 Pricing financial instruments

For options, see `vanillaOptionEuropean`, `vanillaOptionAmerican`, `putCallParity`. For pricing methods that use the characteristic function, see `callCF`. For bond pricing, see `vanillaBond`.

2.3 Simulation

See `resampleC`, `mc` and `repairMatrix`.

2.4 Datasets

See `bundData`, `fundData` and `optionData`.

2.5 Code examples from the book

All R code examples in the book can be displayed (and used) via the function `showExample`. Call it without any argument to see all examples.

```
> showExample()
```

	Chapter	File
1	BinomialTrees	EuropeanCall.R
2	BinomialTrees	EuropeanCallBE.R
3	EconometricModels	DEabbr.R
4	EconometricModels	NSf.R
5	EconometricModels	PSabbr.R
[reached getOption("max.print") -- omitted 39 rows]		

2.6 Vignettes

The package comes with a number of tutorials, written as vignettes. See `?vignette` for how to extract the code from these documents.

```
> vignette(package = "NMOF") ## display vignette titles
```

3 Other resources

3.1 Websites

The book website: <http://nmof.net>

The package website: <http://enricoschumann.net/NMOF.htm>

3.2 Manual

A manual is available from <http://enricoschumann.net/NMOF.htm#NMOFmanual>, though it is still work in process. The code examples from the manual are also included in the package; they can be directly accessed from within R.

```
> file.show(system.file("NMOFex/NMOFman.R", package = "NMOF"))
```

3.3 Tests

A goal for the NMOF package is to provide reliable code. Thus, a large number of test cases is included.

Package version 0.34-2
Number of tests: 2431

These tests are stored in subdirectory `unitTests`.

3.4 News, feedback and discussion

New package releases and other news related to the book or the package are announced on the NMOF-news mailing list:

<https://lists.r-forge.r-project.org/cgi-bin/mailman/listinfo/nmof-news>

Applications, as long as they are finance-related, should be discussed on the R-SIG-Finance mailing list: <https://stat.ethz.ch/mailman/listinfo/r-sig-finance>

Please send bug reports or suggestions directly to the package maintainer, for instance by using `bug.report`.

```
> require("utils")
> bug.report("[NMOF] Unexpected behaviour in function XXX",
             maintainer("NMOF"), package = "NMOF")
```
