

# Package ‘ggmap’

August 21, 2015

**Version** 2.5.2

**Title** Spatial Visualization with ggplot2

**Description** A collection of functions to visualize spatial data and models on top of static maps from various online sources (e.g Google Maps and Stamen Maps). It includes tools common to those tasks, including functions for geolocation and routing.

**URL** <https://github.com/dkahle/ggmap>

**BugReports** <https://github.com/dkahle/ggmap/issues>

**Depends** R (>= 2.14.0), ggplot2 (>= 0.9.2)

**Imports** proto, scales, RgoogleMaps, png, plyr, reshape2, grid, rjson, mapproj, jpeg, geosphere, digest

**Suggests** MASS, stringr, hexbin, dplyr

**License** GPL-2

**LazyData** true

**NeedsCompilation** no

**Author** David Kahle [aut, cre],  
Hadley Wickham [aut]

**Maintainer** David Kahle <david.kahle@gmail.com>

**Repository** CRAN

**Date/Publication** 2015-08-21 07:38:44

bb2bbox

*Convert a bb specification to a bbox specification*

---

## Description

In ggmap, all maps (class ggmap) have the bb attribute, a data frame bounding box specification in terms of the bottom left and top right points of the spatial extent. This function converts this specification to a named double vector (with names left, bottom, right, top) specification that is used in some querying functions (e.g. get\_stamenmap).

## Usage

```
bb2bbox(bb)
```

**Arguments**

bb                    a bounding box in bb format (see examples)

**Value**

a bounding box in bbox format (see examples)

**Author(s)**

David Kahle <david.kahle@gmail.com>

**Examples**

```
gc <- geocode("statue of liberty", source = "google")

googMap <- get_googlemap(center = as.numeric(gc))
(bb <- attr(googMap, "bb"))
bb2bbox(bb)

stamMap <- get_stamenmap(bb2bbox(bb))

ggmap(googMap) +
  geom_point(
    aes(x = lon, y = lat),
    data = gc, colour = "red", size = 3
  )

ggmap(stamMap) +
  geom_point(
    aes(x = lon, y = lat),
    data = gc, colour = "red", size = 3
  )
```

---

calc\_zoom

*Calculate a zoom given a bounding box*

---

**Description**

calc\_zoom can calculate a zoom based on either (1) a data frame with longitude and latitude variables, (2) a longitude range and latitude range, or (3) a bounding box (bbox specification). The specification for (1) is identical to that of most R functions, for (2) simply put in a longitude range into lon and a latitude range into lat, and for (3) put the bounding box in for the lon argument.

**Usage**

```
calc_zoom(lon, lat, data, adjust = 0, f = 0.05)
```

**Arguments**

lon	longitude, see details
lat	latitude, see details
data	(optional) a data frame containing lon and lat as variables
adjust	number to add to the calculated zoom
f	argument to pass to make_bbox

**See Also**

[make\\_bbox](#), [bb2bbox](#)

**Examples**

```
# From data
calc_zoom(lon, lat, wind)

# From range
lon_range <- extendrange( wind$lon )
lat_range <- extendrange( wind$lat )
calc_zoom(lon_range, lat_range)

# From bounding box
box <- make_bbox(lon, lat, data = crime)
calc_zoom(box)
```

---

crime

*Crime data*

---

**Description**

Lightly cleaned Houston crime from January 2010 to August 2010 geocoded with Google Maps

**Author(s)**

Houston Police Department, City of Houston

**References**

<http://www.houstontx.gov/police/cs/stats2.htm>

---

distQueryCheck	<i>Check Google Maps Distance Matrix API query limit</i>
----------------	--

---

**Description**

Check Google Maps Distance Matrix API query limit

**Usage**

```
distQueryCheck()
```

**Value**

a data frame

**Author(s)**

David Kahle <david.kahle@gmail.com>

**See Also**

<http://code.google.com/apis/maps/documentation/distancematrix/>

**Examples**

```
distQueryCheck()
```

---

geocode	<i>Geocode</i>
---------	----------------

---

**Description**

Geocodes a location (find latitude and longitude) using either (1) the Data Science Toolkit (<http://www.datasciencetoolkit.org/about>) or (2) Google Maps. Note that when using Google you are agreeing to the Google Maps API Terms of Service at <https://developers.google.com/maps/terms>.

**Usage**

```
geocode(location, output = c("latlon", "latlon", "more", "all"),
  source = c("dsk", "google"), messaging = FALSE, sensor = FALSE,
  override_limit = FALSE, client = "", signature = "",
  nameType = c("long", "short"), data)
```

```
geocodeQueryCheck(userType = "free")
```

**Arguments**

location	a character vector of street addresses or place names (e.g. "1600 pennsylvania avenue, washington dc" or "Baylor University")
output	amount of output, "latlon", "latlona", "more", or "all"
source	"dsk" for Data Science Toolkit or "google" for Google
messaging	turn messaging on/off
sensor	whether or not the geocoding request comes from a device with a location sensor
override_limit	override the current query count ( <code>.GoogleGeocodeQueryCount</code> )
client	client ID for business users, see <a href="https://developers.google.com/maps/documentation/business/webservices/auth">https://developers.google.com/maps/documentation/business/webservices/auth</a>
signature	signature for business users, see <a href="https://developers.google.com/maps/documentation/business/webservices/auth">https://developers.google.com/maps/documentation/business/webservices/auth</a>
nameType	in some cases, Google returns both a long name and a short name. this parameter allows the user to specify which to grab.
data	deprecated in 2.5, use <code>mutate_geocode</code>
userType	User type, "free" or "business"

**Details**

Note that the Google Maps api limits to 2500 queries a day. Use `geocodeQueryCheck` to determine how many queries remain.

**Value**

If output is "latlon", "latlona", or "more", a data frame. If all, a list.

**Author(s)**

David Kahle <david.kahle@gmail.com>

**See Also**

`mutate_geocode`, <http://code.google.com/apis/maps/documentation/geocoding/>

**Examples**

```
## Not run: # Server response can be slow; this cuts down check time.

# types of input
geocode("houston texas")
geocode("baylor university", source = "google") # see known issues below
geocode("1600 pennsylvania avenue, washington dc", source = "google")
geocode("the white house", source = "google")
geocode(c("baylor university", "salvation army waco"), source = "google")

# types of output
```

```
geocode("houston texas", output = "latlon")
geocode("houston texas", output = "more", source = "google")
geocode("Baylor University", output = "more", source = "google")
str(geocode("Baylor University", output = "all", source = "google"))

# see how many requests we have left with google
geocodeQueryCheck()

# known issues :
# (1) source = "dsk" can't reliably geocode colloquial place names
geocode("city hall houston")
geocode("rice university")

## End(Not run)
```

---

geom\_leg

*Single line segments with rounded ends*

---

## Description

Single line segments with rounded ends

## Usage

```
geom_leg(mapping = NULL, data = NULL, stat = "identity",
         position = "identity", arrow = NULL, ...)
```

## Arguments

mapping	mapping
data	data
stat	stat
position	position
arrow	arrow
...	...

## Details

only intended for use in ggmaps package. only designed for mercator projection.

## See Also

geom\_segment in ggplot2, inspired by <http://spatialanalysis.co.uk/2012/02/great-maps-ggplot2/>,  
[route](#)

**Examples**

```
## Not run:

(legs_df <- route(
  "marrs mclean science, baylor university",
  "220 south 3rd street, waco, tx 76701", # ninfa's
  alternatives = TRUE))

options("device")$device(width = 11.65, height = 4.17)
qmap("424 clay avenue, waco, tx", zoom = 16, maprange = TRUE, maptype = "satellite",

  facet_wrap(~ route) + theme_bw() +
  labs(x = "Longitude", y = "Latitude", colour = "Routes")

qmap("424 clay avenue, waco, tx", zoom = 16, maprange = TRUE, maptype = "satellite",
  base_layer = ggplot(aes(x = startLon, y = startLat), data = legs_df)) +
  geom_leg(
    aes(x = startLon, y = startLat, xend = endLon, yend = endLat, colour = route),
    alpha = 3/4, size = 2, data = legs_df
  ) +
  scale_x_continuous(breaks = pretty(c(-97.1325,-97.119),4), lim = c(-97.1325,-97.119)) +
  facet_wrap(~ route) + theme_bw() +
  labs(x = "Longitude", y = "Latitude", colour = "Routes")

## End(Not run)
```

---

```
get_cloudmademap
```

```
Get a CloudMade map.
```

---

**Description**

get\_cloudmademap accesses a tile server for Stamen Maps and downloads/stiches map tiles/formats a map image. This function requires an api key which can be obtained for free from <http://cloudmade.com/user/show> (defunct?). Thousands of maptypes ("styles"), including create-your-own options, are available from <http://maps.cloudmade.com/editor> (defunct).

**Usage**

```
get_cloudmademap(bbox = c(left = -95.80204, bottom = 29.38048, right =
  -94.92313, top = 30.14344), zoom = 10, api_key, maptype = 1,
  highres = TRUE, crop = TRUE, messaging = FALSE, urlonly = FALSE,
  filename = "ggmapTemp", color = c("color", "bw"), ...)
```

**Arguments**

<code>bbox</code>	a bounding box in the format c(lowerleftlon, lowerleftlat, upperrightlon, upperrightlat).
<code>zoom</code>	a zoom level
<code>api_key</code>	character string containing cloud made api key, see details
<code>maptypes</code>	an integer of what cloud made calls style, see details
<code>highres</code>	double resolution
<code>crop</code>	crop raw map tiles to specified bounding box
<code>messaging</code>	turn messaging on/off
<code>urlonly</code>	return url only
<code>filename</code>	destination file for download (file extension added according to format)
<code>color</code>	color or black-and-white
<code>...</code>	...

**Value**

a ggmap object (a classed raster object with a bounding box attribute)

**Author(s)**

David Kahle <david.kahle@gmail.com>

**See Also**

<http://maps.cloudmade.com/> (defunct), [ggmap](#)

**Examples**

```
## Not run: # in what follows, enter your own api key

api_key <- '<your api key here>'

map <- get_cloudmademap(api_key = api_key)
ggmap(map)

map <- get_cloudmademap(maptypes = 997, api_key = api_key)
ggmap(map)

## End(Not run)
```

---

get_googlemap	<i>Get a Google Map.</i>
---------------	--------------------------

---

### Description

get\_googlemap accesses the Google Static Maps API version 2 to download a static map. Note that in most cases by using this function you are agreeing to the Google Maps API Terms of Service at <https://developers.google.com/maps/terms>.

### Usage

```
get_googlemap(center = c(lon = -95.3632715, lat = 29.7632836), zoom = 10,
  size = c(640, 640), scale = 2, format = c("png8", "gif", "jpg",
  "jpg-baseline", "png32"), maptype = c("terrain", "satellite", "roadmap",
  "hybrid"), language = "en-EN", sensor = FALSE, messaging = FALSE,
  urlonly = FALSE, filename = "ggmapTemp", color = c("color", "bw"),
  force = FALSE, where = tempdir(), archiving = FALSE, key = "", region,
  markers, path, visible, style, ...)
```

### Arguments

center	the center of the map. Either a longitude/latitude numeric vector, a string address (note that the latter uses geocode with source = "google").
zoom	map zoom, an integer from 3 (continent) to 21 (building), default value 10 (city)
size	rectangular dimensions of map in pixels - horizontal x vertical - with a max of c(640, 640). this parameter is affected in a multiplicative way by scale.
scale	multiplicative factor for the number of pixels returned possible values are 1, 2, or 4 (e.g. size = c(640,640) and scale = 2 returns an image with 1280x1280 pixels). 4 is reserved for google business users only. scale also affects the size of labels as well.
format	character string providing image format - png, jpeg, and gif formats available in various flavors
maptype	character string providing google map theme. options available are "terrain", "satellite", "roadmap", and "hybrid"
language	character string providing language of map labels (for themes with them) in the format "en-EN". not all languages are supported; for those which aren't the default language is used
sensor	specifies whether the application requesting the static map is using a sensor to determine the user's location
messaging	turn messaging on/off
urlonly	return url only
filename	destination file for download (file extension added according to format)
color	color or black-and-white

force	if the map is on file, should a new map be looked up?
where	where should the file drawer be located (without terminating "/")
archiving	use archived maps. note: by changing to TRUE you agree to the one of the approved uses listed in the Google Maps API Terms of Service : <a href="http://developers.google.com/maps/terms">http://developers.google.com/maps/terms</a> .
key	an api_key for business users
region	borders to display as a region code specified as a two-character ccTLD ("top-level domain") value, see <a href="http://en.wikipedia.org/wiki/List_of_Internet_top-level_domains#Country_code_top-level_domains">http://en.wikipedia.org/wiki/List_of_Internet_top-level_domains#Country_code_top-level_domains</a>
markers	data.frame with first column longitude, second column latitude, for which google markers should be embedded in the map image, or character string to be passed directly to api
path	data.frame (or list of data.frames) with first column longitude, second column latitude, for which a single path should be embedded in the map image, or character string to be passed directly to api
visible	a location as a longitude/latitude numeric vector (or data frame with first column longitude, second latitude) or vector of character string addresses which should be visible in map extent
style	character string to be supplied directly to the api for the style argument or a named vector (see examples). this is a powerful complex specification, see <a href="https://developers.google.com/maps/documentation/staticmaps/">https://developers.google.com/maps/documentation/staticmaps/</a>
...	...

**Value**

a ggmap object (a classed raster object with a bounding box attribute)

**Author(s)**

David Kahle <david.kahle@gmail.com>

**See Also**

<https://developers.google.com/maps/documentation/staticmaps/>, [ggmap](#)

**Examples**

```
## Not run: # to diminish run check time

get_googlemap(urlonly = TRUE)
ggmap(get_googlemap())

# markers and paths are easy to access
d <- function(x=-95.36, y=29.76, n,r,a){
  round(data.frame(
    lon = jitter(rep(x,n), amount = a),
    lat = jitter(rep(y,n), amount = a)
  ))
}
```

```

    ), digits = r)
  }
df <- d(n=50,r=3,a=.3)
map <- get_googlemap(markers = df, path = df,, scale = 2)
ggmap(map)
ggmap(map, fullpage = TRUE) +
  geom_point(aes(x = lon, y = lat), data = df, size = 3, colour = "black") +
  geom_path(aes(x = lon, y = lat), data = df)

gc <- geocode("waco, texas")
center <- as.numeric(gc)
ggmap(get_googlemap(center = center, color = "bw", scale = 2), extent = "device")

# the scale argument can be seen in the following
# (make your graphics device as large as possible)
ggmap(get_googlemap(center, scale = 1), extent = "panel") # pixelated
ggmap(get_googlemap(center, scale = 2), extent = "panel") # fine

# archiving; note that you must meet google's terms for this condition
map <- get_googlemap(archiving = TRUE)
map <- get_googlemap()
ggmap(map)

# style
map <- get_googlemap(style = c(feature = "all", element = "labels", visibility = "off"))
ggmap(map)

## End(Not run)

```

---

get\_map

*Grab a map.*

---

## Description

get\_map is a smart wrapper that queries the Google Maps, OpenStreetMap, Stamen Maps or Naver Map servers for a map.

## Usage

```

get_map(location = c(lon = -95.3632715, lat = 29.7632836), zoom = "auto",
  scale = "auto", maptype = c("terrain", "terrain-background", "satellite",
  "roadmap", "hybrid", "toner", "watercolor", "terrain-labels", "terrain-lines",
  "toner-2010", "toner-2011", "toner-background", "toner-hybrid",
  "toner-labels", "toner-lines", "toner-lite"), source = c("google", "osm",
  "stamen", "cloudmade"), force = ifelse(source == "google", TRUE, TRUE),

```

```
messaging = FALSE, urlonly = FALSE, filename = "ggmapTemp",
crop = TRUE, color = c("color", "bw"), language = "en-EN", api_key)
```

### Arguments

location	an address, longitude/latitude pair (in that order), or left/bottom/right/top bounding box
zoom	map zoom, an integer from 3 (continent) to 21 (building), default value 10 (city). openstreetmaps limits a zoom of 18, and the limit on stamen maps depends on the maptype. "auto" automatically determines the zoom for bounding box specifications, and is defaulted to 10 with center/zoom specifications. maps of the whole world currently not supported.
scale	scale argument of <a href="#">get_googlemap</a> or <a href="#">get_openstreetmap</a>
maptype	character string providing map theme. options available are "terrain", "terrain-background", "satellite", "roadmap", and "hybrid" (google maps), "terrain", "watercolor", and "toner" (stamen maps), or a positive integer for cloudmade maps (see <a href="#">?get_cloudmademap</a> )
source	Google Maps ("google"), OpenStreetMap ("osm"), Stamen Maps ("stamen"), or CloudMade maps ("cloudmade")
force	force new map (don't use archived version)
messaging	turn messaging on/off
urlonly	return url only
filename	destination file for download (file extension added according to format)
crop	(stamen and cloudmade maps) crop tiles to bounding box
color	color ("color") or black-and-white ("bw")
language	language for google maps
api_key	an api key for cloudmade maps

### Value

a ggmap object (a classed raster object with a bounding box attribute)

### Author(s)

David Kahle <david.kahle@gmail.com>

### See Also

[ggmap](#), [GetMap](#) in package [RgoogleMaps](#)

### Examples

```
map <- get_map()
map
str(map)
ggmap(map)
```

```
## Not run:
# not run by check to reduce time; also,
# osm may error due to server overload

(map <- get_map(maptype = "roadmap"))
(map <- get_map(source = "osm"))
(map <- get_map(source = "stamen", maptype = "watercolor"))

map <- get_map(location = "texas", zoom = 6, source = "stamen")
ggmap(map, fullpage = TRUE)

## End(Not run)
```

---

get\_navermap

*Get a Naver Map*

---

## Description

get\_navermap accesses the Naver Static Maps API version 1.1 to download a static map. Note that in most cases by using this function you are agreeing to the Naver Maps API Terms of Service at <http://dev.naver.com/openapi/apis/map/staticmap>.

## Usage

```
get_navermap(center = c(lon = 126.9849208, lat = 37.5664519), zoom = 4,
  size = c(640, 640), format = c("png", "jpeg", "jpg"),
  crs = c("EPSG:4326", "NHN:2048", "NHN:128", "EPSG:4258", "EPSG:4162",
    "EPSG:2096", "EPSG:2097", "EPSG:2098", "EPSG:900913"),
  baselayer = c("default", "satellite"), color = c("color", "bw"),
  overlayers = c("anno_satellite", "bicycle", "roadview", "traffic"), markers,
  key, uri, filename = "ggmapTemp", messaging = FALSE, urlonly = FALSE,
  force = FALSE, where = tempdir(), archiving = TRUE, ...)
```

## Arguments

center	the center of the map. this can be longitude/latitude numeric vector.
zoom	map zoom, an integer from 1 to 14 (building), default value 10
size	rectangular dimensions of map in pixels - horizontal x vertical - with a max of c(640, 640).
format	character string providing image format - png, jpeg(jpg) formats available in various flavors
crs	Coordinate system, this currently supports EPSG:4326
baselayer	base layer, this can be either "default", "satellite".
color	color or black-and-white

overlayers	overlay layers, this can be "anno_satellite", "bicycle", "roadview", "traffic".
markers	data.frame with first column longitude, second column latitude, for which naver markers should be embedded in the map image, or character string to be passed directly to api
key	key code from naver api center
uri	registered host url
filename	destination file for download (file extension added according to format)
messaging	turn messaging on/off
urlonly	return url only
force	if the map is on file, should a new map be looked up?
where	where should the file drawer be located (without terminating "/")
archiving	use archived maps. note: by changing to TRUE you agree to abide by any of the rules governing caching naver maps
...	...

```
## Not run:
# not run to reduce R CMD check time

map <- get_navermap(key="c75a09166a38196955adee04d3a51bf8", uri="www.r-project.org")
ggmap(map)

## End(Not run)
```

---

get\_openstreetmap      *Get an OpenStreetMap*

---

**Description**

get\_openstreetmap accesses a tile server for OpenStreetMap and downloads/formats a map image. This is simply a wrapper for the web-based version at <http://www.openstreetmap.org/>. If you don't know how to get the map you want, go there, navigate to the map extent that you want, click the export tab at the top of the page, and copy the information into this function.

**Usage**

```
get_openstreetmap(bbox = c(left = -95.80204, bottom = 29.38048, right =
-94.92313, top = 30.14344), scale = 606250, format = c("png", "jpeg",
"svg", "pdf", "ps"), messaging = FALSE, urlonly = FALSE,
filename = "ggmapTemp", color = c("color", "bw"), ...)
```

**Arguments**

bbox	a bounding box in the format c(lowerleftlon, lowerleftlat, upperrightlon, upperrightlat)
scale	scale parameter, see <a href="http://wiki.openstreetmap.org/wiki/MinScaleDenominator">http://wiki.openstreetmap.org/wiki/MinScaleDenominator</a> . smaller scales provide a finer degree of detail, where larger scales produce more coarse detail.  The scale argument is a tricky number to correctly specify. In most cases, if you get an error when downloading an openstreetmap the error is attributable to an improper scale specification. <a href="#">OSM_scale_lookup</a> can help; but the best way to get in the correct range is to go to <a href="http://www.openstreetmap.org/">http://www.openstreetmap.org/</a> , navigate to the map of interest, click export at the top of the page, click 'map image' and then copy down the scale listed.
format	character string providing image format - png, jpeg, svg, pdf, and ps formats
messaging	turn messaging on/off
urlonly	return url only
filename	destination file for download (file extension added according to format)
color	color or black-and-white
...	...

**Details**

receive an error message from `download.file` with the message HTTP status '503 Service Unavailable'. You can confirm this by setting `urlonly = TRUE`, and then entering the URL in a web browser. the solution is either (1) change sources or (2) wait for the OSM servers to come back up.

See <http://www.openstreetmap.org/copyright> for license and copyright information.

**Value**

a ggmap object (a classed raster object with a bounding box attribute)

**Author(s)**

David Kahle <david.kahle@gmail.com>

**See Also**

<http://www.openstreetmap.org/>, [ggmap](#)

**Examples**

```
## Not run:
# osm servers get overloaded, which can result in
# erroneous failed checks

osm <- get_openstreetmap(urlonly = TRUE)
ggmap(osm)

## End(Not run)
```

---

get_stamenmap	<i>Get a Stamen Map</i>
---------------	-------------------------

---

**Description**

get\_stamenmap accesses a tile server for Stamen Maps and downloads/stitches map tiles/formats a map image. Note that Stamen maps don't cover the entire world, e.g. <http://tile.stamen.com/terrain/#4/30.28/-87.21>

**Usage**

```
get_stamenmap(bbox = c(left = -95.80204, bottom = 29.38048, right = -94.92313,
  top = 30.14344), zoom = 10, matype = c("terrain", "terrain-background",
  "terrain-labels", "terrain-lines", "toner", "toner-2010", "toner-2011",
  "toner-background", "toner-hybrid", "toner-labels", "toner-lines",
  "toner-lite", "watercolor"), crop = TRUE, messaging = FALSE,
  urlonly = FALSE, color = c("color", "bw"), force = FALSE,
  where = tempdir(), ...)
```

**Arguments**

bbox	a bounding box in the format c(lowerleftlon, lowerleftlat, upperrightlon, upperrightlat).
zoom	a zoom level
matype	terrain, terrain-background, terrain-labels, terrain-lines, toner, toner-2010, toner-2011, toner-background, toner-hybrid, toner-labels, toner-lines, toner-lite, or watercolor.
crop	crop raw map tiles to specified bounding box
messaging	turn messaging on/off
urlonly	return url only
color	color or black-and-white
force	if the map is on file, should a new map be looked up?
where	where should the file drawer be located (without terminating "/")
...	...

**Value**

a ggmap object (a classed raster object with a bounding box attribute)

**See Also**

<http://maps.stamen.com/#watercolor>, [ggmap](#)

**Examples**

```

---

ggimage

*Plot an image using ggplot2*

---

## Description

ggimage is the near ggplot2 equivalent of image.

## Usage

```
ggimage(mat, fullpage = TRUE, coord_equal = TRUE, scale_axes = FALSE)
```

## Arguments

mat	a matrix, imagematrix, array, or raster (something that can be coerced by as.raster)
fullpage	should the image take up the entire viewport?
coord_equal	should the axes units be equal?
scale_axes	should the axes be [0,ncol(mat)-1]x[0,nrow(mat)-1] (F) or [0,1]x[0,1] (T)

## Value

a ggplot object

## Author(s)

David Kahle <david.kahle@gmail.com>

## Examples

```
img <- matrix(1:16, 4, 4)  
image(img)  
ggimage(t(img[,4:1]), fullpage = FALSE, scale_axes = TRUE)  
ggimage(t(img[,4:1]), fullpage = FALSE)  
  
## Not run:  
# not run due to slow performance  
  
data(hadley)  
ggimage(hadley)
```

```
ggimage(hadley, coord_equal = FALSE)

x <- seq(1, 438, 15); n <- length(x)
df <- data.frame(x = x, y = -(120*(scale((x - 219)^3 - 25000*x) + rnorm(n)/2 - 3)))
qplot(x, y, data = df, geom = c('smooth', 'point'))
ggimage(hadley, fullpage = FALSE) +
  geom_smooth(aes(x = x, y = y), fill = I('gray60'), data = df,
    colour = I('green'), size = I(1)) +
  geom_point(aes(x = x, y = y), data = df,
    colour = I('green'), size = I(3), fill = NA)

## End(Not run)
```

---

gglocator

*Locator for ggplots.*

---

## Description

Locator for ggplots. (Note : only accurate when extent = "normal" when using ggmap.)

## Usage

```
gglocator(n = 1, message = FALSE, xexpand = c(0.05, 0),
  yexpand = c(0.05, 0))
```

## Arguments

n	number of points to locate.
message	turn messaging from grid.ls on/off
xexpand	expand argument in scale_x_continuous
yexpand	expand argument in scale_y_continuous

## Value

a data frame with columns according to the x and y aesthetics

## Author(s)

Tyler Rinker with help from Baptiste Auguie and StackOverflow user DWin with additions and canning by David Kahle <david.kahle@gmail.com>.

**Examples**

```

if(interactive()){

# only run for interactive sessions

df <- expand.grid(x = 0:-5, y = 0:-5)
(p <- qplot(x, y, data = df) +
  annotate(geom = 'point', x = -2, y = -2, colour = 'red'))
gglocator()

p +
  scale_x_continuous(expand = c(0,0)) +
  scale_y_continuous(expand = c(0,0))
gglocator(1, xexpand = c(0,0), yexpand = c(0,0))

}

```

ggmap

*Plot a ggmap object***Description**

ggmap plots the raster object produced by [get\\_map](#).

**Usage**

```

ggmap(ggmap, extent = "panel", base_layer, maprange = FALSE,
  legend = "right", padding = 0.02, darken = c(0, "black"), ...)

```

**Arguments**

ggmap	an object of class ggmap (from function <code>get_map</code> )
extent	how much of the plot should the map take up? "normal", "device", or "panel" (default)
base_layer	a <code>ggplot(aes(...), ...)</code> call; see examples
maprange	logical for use with <code>base_layer</code> ; should the map define the x and y limits?
legend	"left", "right" (default), "bottom", "top", "bottomleft", "bottomright", "topleft", "topright", "none" (used with <code>extent = "device"</code> )
padding	distance from legend to corner of the plot (used with <code>legend</code> , formerly <code>b</code> )
darken	vector of the form <code>c(number, color)</code> , where <code>number</code> is in <code>[0, 1]</code> and <code>color</code> is a character string indicating the color of the darken. 0 indicates no darkening, 1 indicates a black-out.
...	...

**Value**

a ggplot object

## End(Not run)

```

---

`ggmapplot`*Don't use this function, use ggmap.*

---

**Description**

ggmapplot plots the raster object produced by [get\\_map](#).

**Usage**

```
ggmapplot(ggmap, fullpage = FALSE, base_layer, maprange = FALSE,  
          expand = FALSE, ...)
```

**Arguments**

<code>ggmap</code>	an object of class <code>ggmap</code> (from function <code>get_map</code> )
<code>fullpage</code>	logical; should the map take up the entire viewport?
<code>base_layer</code>	a <code>ggplot(aes(...), ...)</code> call; see examples
<code>maprange</code>	logical for use with <code>base_layer</code> ; should the map define the x and y limits?
<code>expand</code>	should the map extend to the edge of the panel? used with <code>base_layer</code> and <code>maprange=TRUE</code> .
<code>...</code>	...

**Value**

a `ggplot` object

**Author(s)**

David Kahle <david.kahle@gmail.com>

**See Also**

[get\\_map](#), [qmap](#)

**Examples**

```
## Not run:  
this is a deprecated function, use ggmap.  
  
## End(Not run)
```

---

hadley	<i>Highly unofficial ggplot2 image</i>
--------	--

---

**Description**

Highly unofficial ggplot2 image

**Author(s)**

Garrett Grolemond <grolemond@gmail.com>

---

inset	<i>Add ggplot2 insets to a map</i>
-------	------------------------------------

---

**Description**

This is identical to `ggplot2::annotation_custom` for use with `ggmap`

**Usage**

```
inset(grob, xmin = -Inf, xmax = Inf, ymin = -Inf, ymax = Inf)
```

**Arguments**

<code>grob</code>	grob to display
<code>xmin, xmax</code>	x location (in data coordinates) giving horizontal location of raster
<code>ymin, ymax</code>	y location (in data coordinates) giving vertical location of raster

**Details**

Most useful for adding tables, inset plots, and other grid-based decorations

**Note**

`annotation_custom` expects the `grob` to fill the entire viewport defined by `xmin`, `xmax`, `ymin`, `ymax`. Grobs with a different (absolute) size will be center-justified in that region. Inf values can be used to fill the full plot panel

---

<code>inset_raster</code>	<i>Add a raster annotation to a map</i>
---------------------------	---

---

**Description**

This is a special version of `ggplot2::annotation_raster` for use with `ggmap`

**Usage**

```
inset_raster(raster, xmin, xmax, ymin, ymax)
```

**Arguments**

<code>raster</code>	raster object to display
<code>xmin, xmax</code>	x location (in data coordinates) giving horizontal location of raster
<code>ymin, ymax</code>	y location (in data coordinates) giving vertical location of raster

**Details**

Most useful for adding bitmap images

---

<code>legs2route</code>	<i>Convert a leg-structured route to a route-structured route</i>
-------------------------	---

---

**Description**

Convert a leg-structured route to a route-structured route

**Usage**

```
legs2route(legsdf)
```

**Arguments**

<code>legsdf</code>	a legs-structured route, see <a href="#">route</a>
---------------------	--

**See Also**

`geom_path` in `ggplot2`

**Examples**

```
## Not run:

(legs_df <- route("houston","galveston"))
legs2route(legs_df)
(legs_df <- route(
  "marrs mclean science, baylor university",
  "220 south 3rd street, waco, tx 76701", # ninfa's
  alternatives = TRUE))

legs2route(legs_df)

from <- "houson, texas"
to <- "waco, texas"
legs_df <- route(from, to)

qmap("college station, texas", zoom = 8) +
  geom_segment(
    aes(x = startLon, y = startLat, xend = endLon, yend = endLat),
    colour = "red", size = 1.5, data = legs_df
  )
# notice boxy ends

qmap("college station, texas", zoom = 8) +
  geom_leg(
    aes(x = startLon, y = startLat, xend = endLon, yend = endLat),
    colour = "red", size = 1.5, data = legs_df
  )
# notice overshooting ends

route_df <- legs2route(legs_df)
qmap("college station, texas", zoom = 8) +
  geom_path(
    aes(x = lon, y = lat),
    colour = "red", size = 1.5, data = route_df, lineend = "round"
  )

## End(Not run)
```

**Description**

Convert a lon/lat coordinate to a tile coordinate for a given zoom. Decimal tile coordinates (x, y) are reported.

**Usage**

```
LonLat2XY(lon_deg, lat_deg, zoom, xpix = 256, ypix = 256)
```

**Arguments**

lon_deg	longitude in degrees
lat_deg	latitude in degrees
zoom	zoom
xpix	width of tile in pixels
ypix	length of tile in pixels

**Value**

a data frame with columns X, Y, x, y

**Author(s)**

David Kahle <david.kahle@gmail.com>, based on function LatLon2XY by Markus Loecher, Sense Networks <markus@sensenetWORKS.com> in package RgoogleMaps

**See Also**

[http://wiki.openstreetmap.org/wiki/Slippy\\_map\\_tilenames](http://wiki.openstreetmap.org/wiki/Slippy_map_tilenames)

**Examples**

```
## Not run:  
gc <- geocode('baylor university')  
LonLat2XY(gc$lon, gc$lat, 10)
```

```
## End(Not run)
```

---

make_bbox	<i>Compute a bounding box</i>
-----------	-------------------------------

---

**Description**

Compute a bounding box for a given longitude / latitude collection.

**Usage**

```
make_bbox(lon, lat, data, f = 0.05)
```

**Arguments**

lon	longitude
lat	latitude
data	(optional) a data frame containing lon and lat as variables
f	number specifying the fraction by which the range should be extended

**Examples**

```
make_bbox(lon, lat, data = crime)

(lon <- sample(crime$lon, 10))
(lat <- sample(crime$lat, 10))
make_bbox(lon, lat)
make_bbox(lon, lat, f = .10) # bigger box
```

---

mapdist	<i>Compute map distances using Google</i>
---------	---

---

**Description**

Compute map distances using Google Maps. Note that in most cases by using this function you are agreeing to the Google Maps API Terms of Service at <https://developers.google.com/maps/terms>.

**Usage**

```
mapdist(from, to, mode = c("driving", "walking", "bicycling"),
  output = c("simple", "all"), messaging = FALSE, sensor = FALSE,
  language = "en-EN", override_limit = FALSE)
```

**Arguments**

from	name of origin addresses in a data frame (vector accepted)
to	name of destination addresses in a data frame (vector accepted)
mode	driving, bicycling, or walking
output	amount of output
messaging	turn messaging on/off
sensor	whether or not the geocoding request comes from a device with a location sensor
language	language
override_limit	override the current query count (.GoogleDistQueryCount)

**Details**

if parameters from and to are specified as geographic coordinates, they are reverse geocoded with revgeocode. note that the google maps api limits to 2500 element queries a day.

**Value**

a data frame (output="simple") or all of the geocoded information (output="all")

**Author(s)**

David Kahle <david.kahle@gmail.com>

**See Also**

<http://code.google.com/apis/maps/documentation/distancematrix/>

**Examples**

```
mapdist("waco, texas", "houston, texas")

from <- c("houston, texas", "dallas")
to <- "waco, texas"
mapdist(from, to)
mapdist(from, to, mode = "bicycling")
mapdist(from, to, mode = "walking")

from <- c("houston", "houston", "dallas")
to <- c("waco, texas", "san antonio", "houston")
mapdist(from, to)

mapdist("the white house", "washington monument", mode = "walking")

# geographic coordinates are accepted as well
(wh <- as.numeric(geocode("the white house", source = "google")))
(wm <- as.numeric(geocode("washington monument", source = "google")))
mapdist(wh, wm, mode = "walking")
mapdist("the white house", wm, mode = "walking")
distQueryCheck()
```

---

mutate_geocode	<i>Geocode a dataset</i>
----------------	--------------------------

---

**Description**

mutate\_geocode geocodes a data frame and appends the new information to the data frame provided.

**Usage**

```
mutate_geocode(data, location, ...)
```

**Arguments**

data	a data frame
location	a character string specifying a location of interest (e.g. "Baylor University")
...	arguments to pass to <a href="#">geocode</a>

**Value**

data with geocoded information appended as columns

**Author(s)**

David Kahle <david.kahle@gmail.com>

**See Also**

[geocode](#)

**Examples**

```
df <- data.frame(  
  address = c("1600 Pennsylvania Avenue, Washington DC", "", "houston texas"),  
  stringsAsFactors = FALSE  
)  
  
## Not run: # Server response can be slow; this cuts down check time.  
mutate_geocode(df, address)  
  
library(dplyr)  
df %>% mutate_geocode(address)  
  
## End(Not run)
```

---

OSM\_scale\_lookup      *Look up OpenStreetMap scale for a given zoom level.*

---

## Description

Look up OpenStreetMap scale for a given zoom level.

## Usage

```
OSM_scale_lookup(zoom = 10)
```

## Arguments

zoom                  google zoom

## Details

The calculation of an appropriate OSM scale value for a given zoom level is a complicated task. For details, see <http://wiki.openstreetmap.org/wiki/FAQ> or <http://almien.co.uk/OSM/Tools/Scale/>.

## Value

scale

## Author(s)

David Kahle <david.kahle@gmail.com>

## Examples

```
OSM_scale_lookup(zoom = 3)
OSM_scale_lookup(zoom = 10)

## Not run:
# these can take a long time or are prone to crashing
# if the osm server load is too high

# these maps are were the ones used to tailor fit the scale
# the zooms were fixed
ggmap(get_map(zoom = 3, source = 'osm', scale = 47500000), extent = "device")
ggmap(get_map(zoom = 4, source = 'osm', scale = 32500000), extent = "device")
ggmap(get_map(zoom = 5, source = 'osm', scale = 15000000), extent = "device")
ggmap(get_map(zoom = 6, source = 'osm', scale = 10000000), extent = "device")
ggmap(get_map(zoom = 7, source = 'osm', scale = 5000000), extent = "device")
ggmap(get_map(zoom = 8, source = 'osm', scale = 2800000), extent = "device")
ggmap(get_map(zoom = 9, source = 'osm', scale = 1200000), extent = "device")
ggmap(get_map(zoom = 10, source = 'osm', scale = 575000), extent = "device")
ggmap(get_map(zoom = 11, source = 'osm', scale = 220000), extent = "device")
```

```
ggmap(get_map(zoom = 12, source = 'osm', scale = 110000), extent = "device")
ggmap(get_map(zoom = 13, source = 'osm', scale = 70000), extent = "device")
ggmap(get_map(zoom = 14, source = 'osm', scale = 31000), extent = "device")
ggmap(get_map(zoom = 15, source = 'osm', scale = 15000), extent = "device")
ggmap(get_map(zoom = 16, source = 'osm', scale = 7500), extent = "device")
ggmap(get_map(zoom = 17, source = 'osm', scale = 4000), extent = "device")
ggmap(get_map(zoom = 18, source = 'osm', scale = 2500), extent = "device")
ggmap(get_map(zoom = 19, source = 'osm', scale = 1750), extent = "device")

# the USA
lonR <- c(1.01, .99)*c(-124.73, -66.95)
latR <- c(.99, 1.01)*c(24.52, 49.38)
qmap(lonR = lonR, latR = latR, source = 'osm', scale = 325E5)

## End(Not run)
```

---

print.ggmap

*Print a map*

---

## Description

Print a console description of a map

## Usage

```
## S3 method for class 'ggmap'
print(x, ...)
```

## Arguments

x                    an object of class `ggmap`  
...                   additional parameters

## Value

Invisible string of the printed object.

## Examples

```
get_map()
ggmap(get_map())
```

---

qmap

*Quick map plot*

---

## Description

qmap is a wrapper for [ggmap](#) and [get\\_map](#).

## Usage

```
qmap(location = "houston", ...)
```

## Arguments

location	character; location of interest
...	stuff to pass to <a href="#">ggmap</a> and <a href="#">get_map</a> .

## Value

a ggplot object

## Author(s)

David Kahle <david.kahle@gmail.com>

## See Also

[ggmap](#) and [get\\_map](#).

## Examples

```
## Not run:
# these examples have been excluded for checking efficiency

qmap(location = "baylor university")
qmap(location = "baylor university", zoom = 14)
qmap(location = "baylor university", zoom = 14, source = "osm")

```

```
qmap("the white house", maprange = TRUE,
     base_layer = ggplot(aes(x=lon, y=lat), data = wh)) +
  geom_point()
```

```
## End(Not run)
```

---

qmpplot

*Quick map plot*

---

## Description

qmpplot is the ggmap equivalent to the ggplot2 function qplot and allows for the quick plotting of maps with data/models/etc.

## Usage

```
qmpplot(x, y, ..., data, zoom, source = "stamen", maptype = "toner-lite",
        extent = "device", legend = "right", padding = 0.02, force = FALSE,
        darken = c(0, "black"), mapcolor = "color", facets = NULL,
        margins = FALSE, geom = "auto", stat = list(NULL),
        position = list(NULL), xlim = c(NA, NA), ylim = c(NA, NA),
        main = NULL, f = 0.05, xlab = deparse(substitute(x)),
        ylab = deparse(substitute(y)))
```

## Arguments

x	longitude values
y	latitude values
...	other aesthetics passed for each layer
data	data frame to use (optional). If not specified, will create one, extracting vectors from the current environment.
zoom	map zoom, see <a href="#">get_map</a>
source	map source, see <a href="#">get_map</a>
maptype	map type, see <a href="#">get_map</a>
extent	how much of the plot should the map take up? "normal", "panel", or "device" (default)
legend	"left", "right" (default), "bottom", "top", "bottomleft", "bottomright", "topleft", "topright", "none" (used with extent = "device")
padding	distance from legend to corner of the plot (used with extent = "device")
force	force new map (don't use archived version)

darken	vector of the form <code>c(number, color)</code> , where <code>number</code> is in <code>[0, 1]</code> and <code>color</code> is a character string indicating the color of the darken. 0 indicates no darkening, 1 indicates a black-out.
mapcolor	color ("color") or black-and-white ("bw")
facets	faceting formula to use. Picks <code>facet_wrap</code> or <code>facet_grid</code> depending on whether the formula is one sided or two-sided
margins	whether or not margins will be displayed
geom	character vector specifying geom to use. defaults to "point"
stat	character vector specifying statistics to use
position	character vector giving position adjustment to use
xlim	limits for x axis
ylim	limits for y axis
main	character vector or expression for plot title
f	number specifying the fraction by which the range should be extended
xlab	character vector or expression for x axis label
ylab	character vector or expression for y axis label

### Examples

```
## Not run: # these are skipped to conserve R check time

 revgeocode

*Reverse geocode*

---

## Description

reverse geocodes a longitude/latitude location using Google Maps. Note that in most cases by using this function you are agreeing to the Google Maps API Terms of Service at <https://developers.google.com/maps/terms>.

## Usage

```

revgeocode(location, output = c("address", "more", "all"),
  messaging = FALSE, sensor = FALSE, override_limit = FALSE,
  client = "", signature = "")

```

## Arguments

location	a location in longitude/latitude format
output	amount of output
messaging	turn messaging on/off
sensor	whether or not the geocoding request comes from a device with a location sensor
override_limit	override the current query count (.GoogleGeocodeQueryCount)

client            client ID for business users, see <https://developers.google.com/maps/documentation/business/webservices>  
signature        signature for business users, see <https://developers.google.com/maps/documentation/business/webservices>

### Details

note that the google maps api limits to 2500 queries a day.

### Value

depends (at least an address)

### Author(s)

David Kahle <david.kahle@gmail.com>

### See Also

<http://code.google.com/apis/maps/documentation/geocoding/>

### Examples

```
## Not run: # Server response can be slow; this cuts down check time.

( gc <- as.numeric(geocode('Baylor University')) )
revgeocode(gc)
revgeocode(gc, output = 'more')
revgeocode(gc, output = 'all')
geocodeQueryCheck()

## End(Not run)
```

---

route	<i>Grab a route from Google</i>
-------	---------------------------------

---

### Description

Grab a route from Google. Note that in most cases by using this function you are agreeing to the Google Maps API Terms of Service at <https://developers.google.com/maps/terms>.

### Usage

```
route(from, to, mode = c("driving", "walking", "bicycling", "transit"),
      structure = c("legs", "route"), output = c("simple", "all"),
      alternatives = FALSE, messaging = FALSE, sensor = FALSE,
      override_limit = FALSE)
```

**Arguments**

from	name of origin addresses in a data frame (vector accepted)
to	name of destination addresses in a data frame (vector accepted)
mode	driving, bicycling, walking, or transit
structure	structure of output, see examples
output	amount of output
alternatives	should more than one route be provided?
messaging	turn messaging on/off
sensor	whether or not the geocoding request comes from a device with a location sensor
override_limit	override the current query count (.GoogleRouteQueryCount)

**Value**

a data frame (output="simple") or all of the geocoded information (output="all")

**Author(s)**

David Kahle <david.kahle@gmail.com>

**See Also**

<https://developers.google.com/maps/documentation/directions/>, [legs2route](#), [routeQueryCheck](#), [geom\\_leg](#)

**Examples**

```
## Not run: # to cut down on check time

from <- "houson, texas"
to <- "waco, texas"
route_df <- route(from, to, structure = "route")
qmap("college station, texas", zoom = 8) +
  geom_path(
    aes(x = lon, y = lat), colour = "red", size = 1.5,
    data = route_df, lineend = "round"
  )

qmap("college station, texas", zoom = 6) +
  geom_path(
    aes(x = lon, y = lat), colour = "red", size = 1.5,
    data = route_df, lineend = "round"
  )

routeQueryCheck()

(legs_df <- route(
```

```
"marrs mclean science, baylor university",
"220 south 3rd street, waco, tx 76701", # ninfa"s
alternatives = TRUE))

  labs(x = "Longitude", y = "Latitude", colour = "Routes")

## End(Not run)
```

---

routeQueryCheck

*Check Google Maps Directions API query limit*

---

## Description

Check Google Maps Directions API query limit

## Usage

```
routeQueryCheck()
```

## Value

a data frame

## Author(s)

David Kahle <david.kahle@gmail.com>

## See Also

<https://developers.google.com/maps/documentation/directions/>

## Examples

```
## Not run:
routeQueryCheck()

## End(Not run)
```

---

theme_inset	<i>Make a ggplot2 inset theme.</i>
-------------	------------------------------------

---

**Description**

theme\_inset is a ggplot2 theme geared towards making inset plots.

**Usage**

```
theme_inset(base_size = 12)
```

**Arguments**

base\_size      base size, not used.

**Value**

a ggplot2 theme (i.e., a list of class options).

**Author(s)**

David Kahle <david.kahle@gmail.com>

**Examples**

```
library(ggplot2)
## Not run:

n <- 50
df <- expand.grid(x = 1:n,y = 1:n)[sample(n^2,.5*n^2),]
qplot(x, y, data = df, geom = 'tile')
qplot(x, y, data = df, geom = 'tile') + theme_nothing()

qplot(1:10, 1:10) +
  annotation_custom(
    grob = ggplotGrob(qplot(1:10,1:10)),
    8, Inf, -Inf, 2
  )

qplot(1:10, 1:10) +
  annotation_custom(
    grob = ggplotGrob(qplot(1:10,1:10) + theme_nothing()),
    8, Inf, -Inf, 2
  )

qplot(1:10, 1:10) +
  annotation_custom(
    grob = ggplotGrob(qplot(1:10,1:10) + theme_inset()),
    8, Inf, -Inf, 2
  )
```

```
)

## End(Not run)
```

---

```
theme_nothing      Make a blank ggplot2 theme.
```

---

### Description

theme\_nothing simply strips all thematic element in ggplot2.

### Usage

```
theme_nothing(base_size = 12, legend = FALSE)
```

### Arguments

```
base_size      base size, not used.
legend         should the legend be included?
```

### Value

a ggplot2 theme (i.e., a list of class options).

### Author(s)

David Kahle <david.kahle@gmail.com>

### Examples

```
library(ggplot2)
## Not run:

n <- 50
df <- expand.grid(x = 1:n,y = 1:n)[sample(n^2,.5*n^2),]
p <- qplot(x, y, data = df, geom = 'tile')
p
p + theme_nothing()
p + theme_nothing(legend = TRUE) # no difference
p +
  scale_x_continuous(expand = c(0,0)) +
  scale_y_continuous(expand = c(0,0)) +
  theme_nothing()

qplot(1:10,1:10) +
  theme_nothing() +
  theme(panel.background = element_rect(fill = "black"))
```

```

df$class <- factor(sample(0:1, .5*n^2, replace = TRUE))
p <- qplot(x, y, data = df, geom = "tile", fill = class)
p
p + theme_nothing()
p + theme_nothing(legend = TRUE)

p <- p +
  scale_x_continuous(expand = c(0,0)) +
  scale_y_continuous(expand = c(0,0))
p
p + theme_nothing()
p + theme_nothing(legend = TRUE)

## End(Not run)

```

---

wind	<i>Wind data from Hurricane Ike</i>
------	-------------------------------------

---

### Description

Wind data from Hurricane Ike

### Details

Powell, M. D., S. H. Houston, L. R. Amat, and N Morisseau-Leroy, 1998: The HRD real-time hurricane wind analysis system. *J. Wind Engineer. and Indust. Aerodyn.* 77&78, 53-64

### Author(s)

Atlantic Oceanographic and Meteorological Laboratory (AOML), a division of the National Oceanic and Atmospheric Administration (NOAA)

### References

---

XY2LonLat	<i>Convert a tile coordinate to a lon/lat coordinate</i>
-----------	--

---

### Description

Convert a tile coordinate to a lon/lat coordinate for a given zoom. Decimal tile coordinates are accepted.

**Usage**

```
XY2LonLat(X, Y, zoom, x = 0, y = 0, xpix = 256, ypix = 256)
```

**Arguments**

X	horizontal map-tile coordinate (0 is map-left)
Y	vertical map-tile coordinate (0 is map-top)
zoom	zoom
x	within tile x (0 is tile-left)
y	within tile y (0 it tile-top)
xpix	width of tile in pixels
ypix	length of tile in pixels

**Value**

a data frame with columns lon and lat (in degrees)

**Author(s)**

David Kahle <david.kahle@gmail.com>, based on function XY2LatLon by Markus Loecher, Sense Networks <markus@sensenetWORKS.com> in package RgoogleMaps

**See Also**

[http://wiki.openstreetmap.org/wiki/Slippy\\_map\\_tilenames](http://wiki.openstreetmap.org/wiki/Slippy_map_tilenames)

**Examples**

```
## Not run:  
XY2LonLat(480, 845, zoom = 11)  
  
## End(Not run)
```
