

# Package ‘mlr’

June 13, 2015

**Title** Machine Learning in R

**Description** Interface to a large number of classification and regression techniques, including machine-readable parameter descriptions. There is also an experimental extension for survival analysis, clustering and general, example-specific cost-sensitive learning. Generic resampling, including cross-validation, bootstrapping and subsampling. Hyperparameter tuning with modern optimization techniques, for single- and multi-objective problems. Filter and wrapper methods for feature selection. Extension of basic learners with additional operations common in machine learning, also allowing for easy nested resampling. Most operations can be parallelized.

**URL** <https://github.com/berndbischl/mlr>

**BugReports** <https://github.com/berndbischl/mlr/issues>

**License** BSD\_2\_clause + file LICENSE

**Encoding** UTF-8

**Depends** R (>= 3.0.0), BBmisc (>= 1.9), ggplot2, ParamHelpers (>= 1.5), stats

**Imports** checkmate (>= 1.5.3), ggvis, parallelMap (>= 1.3), plyr, reshape2, shiny, survival

**Suggests** ada, adabag, bartMachine, brnn, bst, care, caret, class, clue, cluster, clusterSim, cIValid, cmaes, CoxBoost, crs, Cubist, DiceKriging, DiceOptim, DiscriMiner, e1071, earth, elasticnet, elmNN, emoa, extraTrees, flare, FNN, frbs, FSelector, gbm, GenSA, glmnet, Hmisc, irace, kernlab, kknn, klaR, knitr, kohonen, laGP, LiblineaR, lqa, MASS, mboost, mco, mda, mlbench, modeltools, mRMRe, nnet, nodeHarvest, pamr, party, penalized, pls, pROC (>= 1.8), randomForest, randomForestSRC (>= 1.6.1), RCurl, rFems, rjson, rmarkdown, robustbase, ROCR, rpart, rrla, rsm, RWeka, sda, sparsediscrim, sparseLDA, stepPlr, testthat, tgp, TH.data

**LazyData** yes

**ByteCompile** yes

**Version** 2.4

**VignetteBuilder** knitr

**NeedsCompilation** yes

---

Aggregation	<i>Aggregation object.</i>
-------------	----------------------------

---

**Description**

An aggregation method reduces the performance values of the test (and possibly the training sets) to a single value. To see all possible, implemented aggregations look at [aggregations](#).

The aggregation can access all relevant information of the result after resampling and combine them into a single value. Though usually something very simple like taking the mean of the test set performances is done.

Object members:

**id** [character(1) ] Name of aggregation method.

**fun** [function(task, perf.test, perf.train, measure, group, pred) ] Aggregation function.

### See Also

[makeAggregation](#)

---

aggregations

*Aggregation methods.*

---

### Description

- **test.mean**  
Mean of performance values on test sets.
- **test.sd**  
Standard deviation of performance values on test sets.
- **test.median**  
Median of performance values on test sets.
- **test.min**  
Minimum of performance values on test sets.
- **test.max**  
Maximum of performance values on test sets.
- **test.sum**  
Sum of performance values on test sets.
- **train.mean**  
Mean of performance values on training sets.
- **train.sd**  
Standard deviation of performance values on training sets.
- **train.median**  
Median of performance values on training sets.
- **train.min**  
Minimum of performance values on training sets.
- **train.max**  
Maximum of performance values on training sets.
- **train.sum**  
Sum of performance values on training sets.
- **b632**  
Aggregation for B632 bootstrap.
- **b632plus**  
Aggregation for B632+ bootstrap.

- **testgroup.mean**  
Performance values on test sets are grouped according to resampling method. The mean for very group is calculated, then the mean of those means. Mainly used for repeated CV.
- **test.join**  
Performance measure on joined test sets. This is especially useful for small sample sizes where unbalanced group sizes have a significant impact on the aggregation, especially for cross-validation test.join might make sense now. For the repeated CV, the performance is calculated on each repetition and then aggregated with the arithmetic mean.

### Usage

test.mean

test.sd

test.median

test.min

test.max

test.sum

test.range

test.sqrt.of.mean

train.mean

[Aggregation](#)

---

agri.task	<i>European Union Agricultural Workforces clustering task</i>
-----------	---

---

### Description

Contains the task (agri.task).

### References

See [agriculture](#).

---

analyzeFeatSelResult	<i>Show and visualize the steps of feature selection.</i>
----------------------	---

---

### Description

This function prints the steps [selectFeatures](#) took to find its optimal set of features and the reason why it stopped. It can also print information about all calculations done in each intermediate step.

Currently only implemented for sequential feature selection.

### Usage

```
analyzeFeatSelResult(res, reduce = TRUE)
```

### Arguments

res	<a href="#">[FeatSelResult]</a> The result of of <a href="#">selectFeatures</a> .
reduce	<a href="#">[logical(1)]</a> Per iteration: Print only the selected feature (or all features that were evaluated)? Default is TRUE.

### Value

invisible(NULL) .

bc.task	<i>Wisconsin Breast Cancer classification task</i>
---------	--

---

**Description**

Contains the task (bc.task).

**References**

See [BreastCancer](#). The column "Id" and all incomplete cases have been removed from the task.

---

 benchmark

*Benchmark experiment for multiple learners and tasks.*

---

### Description

Complete benchmark experiment to compare different learning algorithms across one or more tasks w.r.t. a given resampling strategy. Experiments are paired, meaning always the same training / test sets are used for the different learners. Furthermore, you can of course pass “enhanced” learners via wrappers, e.g., a learner can be automatically tuned using [makeTuneWrapper](#).

### Usage

```
benchmark(learners, tasks, resamplings, measures, keep.pred = TRUE,
          show.info = getMlrOption("show.info"))
```

### Arguments

learners	[(list of) <a href="#">Learner</a> ] Learning algorithms which should be compared.
tasks	[(list of) <a href="#">Task</a> ] Tasks that learners should be run on.
resamplings	[(list of) <a href="#">ResampleDesc</a>   <a href="#">ResampleInstance</a> ] Resampling strategy for each task. If only one is provided, it will be replicated to match the number of tasks. If missing, a 10-fold cross validation is used.
measures	[(list of) <a href="#">Measure</a> ] Performance measures for all tasks. If missing, the default measure of the first task is used.
keep.pred	[logical(1)] Keep the prediction data in the pred slot of the result object. If you do many experiments (on larger data sets) these objects might unnecessarily increase object size / mem usage, if you do not really need them. In this case you can this argument to FALSE. Default is TRUE.
show.info	[logical(1)] Print verbose output on console? Default is set via <a href="#">configureMlr</a> .

### Value

[BenchmarkResult](#) .

### See Also

Other benchmark: [BenchmarkResult](#); [getBMRaggrPerformances](#); [getBMRFeatSelResults](#); [getBMRFilteredFeatures](#); [getBMRLearnerIds](#); [getBMRPerformances](#); [getBMRPredictions](#); [getBMRTaskIds](#); [getBMRTuneResults](#)

---

BenchmarkResult	<i>Result of a benchmark run.</i>
-----------------	-----------------------------------

---

### Description

Container for results of benchmarked experiments using [benchmark](#). The structure of the object itself is rather complicated, it is recommended to retrieve required information via the `getBMR*` getter functions. You can also convert the object using [as.data.frame](#).

### See Also

Other benchmark: [benchmark](#); [getBMRAggrPerformances](#); [getBMRFeatSelResults](#); [getBMRFilteredFeatures](#); [getBMRLearnerIds](#); [getBMRPerformances](#); [getBMRPredictions](#); [getBMRTaskIds](#); [getBMRTuneResults](#)

---

<code>bh.task</code>	<i>Boston Housing regression task</i>
----------------------	---------------------------------------

---

### Description

Contains the task (`bh.task`).

### References

See [BostonHousing](#).

---

<code>capLargeValues</code>	<i>Convert large/infinite numeric values in a data.frame or task.</i>
-----------------------------	---

---

### Description

Convert numeric entries which large/infinite (absolute) values in a `data.frame`. Only numeric/integer columns are affected.

### Usage

```
capLargeValues(obj, cols = NULL, threshold = Inf, impute = threshold,
  what = "abs")
```

**Arguments**

obj	[data.frame   <a href="#">Task</a> ] Input data.
cols	[character] Which columns to convert. Default is all numeric columns.
threshold	[numeric(1)] Threshold for capping. Every entry whose absolute value is equal or larger is converted. Default is Inf.
impute	[numeric(1)] Replacement value for large entries. Large negative entries are converted to -impute. Default is threshold.
what	[character(1)] What kind of entries are affected? “abs” means $\text{abs}(x) > \text{threshold}$ , “pos” means $\text{abs}(x) > \text{threshold} \ \&\& \ x > 0$ , “neg” means $\text{abs}(x) > \text{threshold} \ \&\& \ x < 0$ . Default is “abs”.

**Value**

data.frame

**See Also**

Other eda\_and\_preprocess: [createDummyFeatures](#); [dropFeatures](#); [mergeSmallFactorLevels](#); [normalizeFeatures](#); [removeConstantFeatures](#); [summarizeColumns](#)

**Examples**

```
capLargeValues(iris, threshold = 5, impute = 5)
```

---

 configureMlr

*Configures the behavior of the package.*

---

**Description**

Configuration is done by setting custom [options](#).

If you do not set an option here, its current value will be kept.

If you call this function with an empty argument list, everything is set to its defaults.

**Usage**

```
configureMlr(show.info, on.learner.error, on.learner.warning,  
             on.par.without.desc, on.par.out.of.bounds, show.learner.output)
```

**Arguments**

show.info	[logical(1)] Some methods of mlr support a show.info argument to enable verbose output on the console. This option sets the default value for these arguments. Setting the argument manually in one of these functions will overwrite the default value for that specific function call. Default is TRUE.
on.learner.error	[character(1)] What should happen if an error in an underlying learning algorithm is caught: “stop”: R exception is generated. “warn”: A FailureModel will be created, which predicts only NAs and a warning will be generated. “quiet”: Same as “warn” but without the warning. Default is “stop”.
on.learner.warning	[character(1)] What should happen if a warning in an underlying learning algorithm is generated: “warn”: The warning is generated as usual. “quiet”: The warning is suppressed. Default is “warn”.
on.par.without.desc	[character(1)] What should happen if a parameter of a learner is set to a value, but no parameter description object exists, indicating a possibly wrong name: “stop”: R exception is generated. “warn”: Warning, but parameter is still passed along to learner. “quiet”: Same as “warn” but without the warning. Default is “stop”.
on.par.out.of.bounds	[character(1)] What should happen if a parameter of a learner is set to an out of bounds value. “stop”: R exception is generated. “warn”: Warning, but parameter is still passed along to learner. “quiet”: Same as “warn” but without the warning. Default is “stop”.
show.learner.output	[logical(1)] Should the output of the learning algorithm during training and prediction be shown or captured and suppressed? Default is TRUE.

**Value**

invisible(NULL) .

**See Also**Other configure: [getMlrOptions](#)

---

costiris.task	<i>Iris cost-sensitive classification task</i>
---------------	--

---

### Description

Contains the task (`costiris.task`).

### References

See [iris](#). The cost matrix was generated artificially following Tu, H.-H. and Lin, H.-T. (2010), One-sided support vector regression for multiclass cost-sensitive classification. In ICML, J. Fürnkranz and T. Joachims, Eds., Omnipress, 1095–1102.

---

createDummyFeatures	<i>Generate dummy variables for factor features.</i>
---------------------	--

---

### Description

Replace all factor features with their dummy variables. Internally `model.matrix` is used. Non factor features will be left untouched and passed to the result.

### Usage

```
createDummyFeatures(obj, target = character(0L), method = "1-of-n",
  exclude = character(0L))
```

### Arguments

obj	[data.frame   Task] Input data.
target	[character(1)   character(2)] Name of the target variable(s). Only used when obj is a data.frame, otherwise ignored. If survival analysis is applicable, these are the names of the survival time and event columns, so it has length 2.
method	[character(1)] Available are: “1-of-n”: For n factor levels there will be n dummy variables. “reference”: There will be n-1 dummy variables leaving out the first factor level of each variable.
exclude	[character] Names of the columns to exclude. The target does not have to be included here. Default is none.

**Value**

`data.frame | Task` . Same type as `obj`.

**See Also**

Other `eda_and_preprocess`: [capLargeValues](#); [dropFeatures](#); [mergeSmallFactorLevels](#); [normalizeFeatures](#); [removeConstantFeatures](#); [summarizeColumns](#)

---

`crossover`

*crossover*

---

**Description**

Takes two bit strings and creates a new one of the same size by selecting the items from the first string or the second, based on a given rate (the probability of choosing an element from the first string).

**Arguments**

<code>x</code>	[logical] First parent string.
<code>y</code>	[logical] Second parent string.
<code>rate</code>	[numeric(1)] A number representing the probability of selecting an element of the first string. Default is 0.5.

**Value**

[crossover](#) .

---

`downsample`

*Downsample (subsample) a task or a data.frame.*

---

**Description**

Decrease the observations in a task or a `ResampleInstance` to a given percentage of observations.

**Usage**

```
downsample(obj, perc = 1, stratify = FALSE)
```

**Arguments**

obj	[Task   ResampleInstance] Input data or a ResampleInstance.
perc	[numeric(1)] Percentage from [0, 1]. Default is 1.
stratify	[logical(1)] Only for classification: Should the downsampled data be stratified according to the target classes? Default is FALSE.

**Value**

data.frame | Task | ResampleInstance . Same type as obj.

**See Also**

[makeResampleInstance](#)

Other downsample: [makeDownsampleWrapper](#)

---

dropFeatures	<i>Drop some features of task.</i>
--------------	------------------------------------

---

**Description**

Drop some features of task.

**Usage**

```
dropFeatures(task, features)
```

**Arguments**

task	[Task] The task.
features	[character] Features to drop.

**Value**

Task .

**See Also**

Other eda\_and\_preprocess: [capLargeValues](#); [createDummyFeatures](#); [mergeSmallFactorLevels](#); [normalizeFeatures](#); [removeConstantFeatures](#); [summarizeColumns](#)

---

```
estimateResidualVariance
      Estimate the residual variance
```

---

### Description

Estimate the residual variance of a regression model on a given task. If a regression learner is provided instead of a model, the model is trained (see [train](#)) first.

### Usage

```
estimateResidualVariance(x, task, data, target)
```

### Arguments

x	[ <a href="#">Learner</a> or <a href="#">WrappedModel</a> ] Learner or wrapped model.
task	[ <a href="#">RegrTask</a> ] Regression task. If missing, data and target must be supplied.
data	[data.frame] A data frame containing the features and target variable. If missing, task must be supplied.
target	[character(1)] Name of the target variable. If missing, task must be supplied.

---

```
FailureModel      Failure model.
```

---

### Description

A subclass of [WrappedModel](#). It is created - if you set the respective option in [configureMlr](#) - when a model internally crashed during training. The model always predicts NAs.

Its encapsulated learner `.model` is simply a string: The error message that was generated when the model crashed. The following code shows how to access the message.

### Examples

```
configureMlr(on.learner.error = "warn")
data = iris
data$newfeat = 1 # will make LDA crash
task = makeClassifTask(data = data, target = "Species")
m = train("classif.lda", task) # LDA crashed, but mlr catches this
print(m)
print(m$learner.model) # the error message
p = predict(m, task) # this will predict NAs
```

```
print(p)
print(performance(p))
configureMlr(on.learner.error = "stop")
```

---

FeatSelControl                      *Create control structures for feature selection.*

---

## Description

Feature selection method used by [selectFeatures](#). The following methods are available:

**FeatSelControlExhaustive** Exhaustive search. All feature sets (up to a certain number of features `max.features`) are searched.

**FeatSelControlRandom** Random search. Features vectors are randomly drawn, up to a certain number of features `max.features`. A feature is included in the current set with probability `prob`. So we are basically drawing (0,1)-membership-vectors, where each element is Bernoulli(`prob`) distributed.

**FeatSelControlSequential** Deterministic forward or backward search. That means extending (forward) or shrinking (backward) a feature set. Depending on the given method different approaches are taken.

`sfs` Sequential Forward Search: Starting from an empty model, in each step the feature increasing the performance measure the most is added to the model.

`sbs` Sequential Backward Search: Starting from a model with all features, in each step the feature decreasing the performance measure the least is removed from the model.

`sffs` Sequential Floating Forward Search: Starting from an empty model, in each step the algorithm chooses the best model from all models with one additional feature and from all models with one feature less.

`sfbs` Sequential Floating Backward Search: Similar to `sffs` but starting with a full model.

**FeatSelControlGA** Search via genetic algorithm. The GA is a simple (`mu`, `lambda`) or (`mu + lambda`) algorithm, depending on the comma setting. A comma strategy selects a new population of size `mu` out of the `lambda > mu` offspring. A plus strategy uses the joint pool of `mu` parents and `lambda` offspring for selecting `mu` new candidates. Out of those `mu` features, the new `lambda` features are generated by randomly choosing pairs of parents. These are crossed over and `crossover.rate` represents the probability of choosing a feature from the first parent instead of the second parent. The resulting offspring is mutated, i.e., its bits are flipped with probability `mutation.rate`. If `max.features` is set, offspring are repeatedly generated until the setting is satisfied.

## Usage

```
makeFeatSelControlExhaustive(same.resampling.instance = TRUE,
  maxit = NA_integer_, max.features = NA_integer_, tune.threshold = FALSE,
  tune.threshold.args = list(), log.fun = NULL)
```

```
makeFeatSelControlGA(same.resampling.instance = TRUE, impute.val = NULL,
  maxit = NA_integer_, max.features = NA_integer_, comma = FALSE,
```

```

mu = 10L, lambda, crossover.rate = 0.5, mutation.rate = 0.05,
tune.threshold = FALSE, tune.threshold.args = list(), log.fun = NULL)

makeFeatSelControlRandom(same.resampling.instance = TRUE, maxit = 100L,
max.features = NA_integer_, prob = 0.5, tune.threshold = FALSE,
tune.threshold.args = list(), log.fun = NULL)

makeFeatSelControlSequential(same.resampling.instance = TRUE,
impute.val = NULL, method, alpha = 0.01, beta = -0.001,
maxit = NA_integer_, max.features = NA_integer_, tune.threshold = FALSE,
tune.threshold.args = list(), log.fun = NULL)

```

### Arguments

same.resampling.instance	[logical(1)] Should the same resampling instance be used for all evaluations to reduce variance? Default is TRUE.
maxit	[integer(1)] Maximal number of iterations. Note, that this is usually not equal to the number of function evaluations.
max.features	[integer(1)] Maximal number of features.
tune.threshold	[logical(1)] Should the threshold be tuned for the measure at hand, after each feature set evaluation, via <a href="#">tuneThreshold</a> ? Only works for classification if the predict type is “prob”. Default is FALSE.
tune.threshold.args	[list] Further arguments for threshold tuning that are passed down to <a href="#">tuneThreshold</a> . Default is none.
log.fun	[function   NULL] Function used for logging. If set to NULL, the internal default will be used. Otherwise a function with arguments learner, resampling, measures, par.set, control, opt.path, dob, x, y, remove.nas, and stage is expected. The default displays the performance measures, the time needed for evaluating, the currently used memory and the max memory ever used before (the latter two both taken from <a href="#">gc</a> ). See the implementation for details.
impute.val	[numeric] If something goes wrong during optimization (e.g, the learner crashes), this value is fed back to the tuner, so the tuning algorithm does not abort. It is not stored in the optimization path, an NA and a corresponding error message are logged instead. Note that this value is later multiplied by -1 for maximization measures internally, so you need to enter a larger positive value for maximization here as well. Default is the worst obtainable value of the performance measure you optimize for when you aggregate by mean value, or Inf instead. For multi-criteria optimization pass a vector of imputation values, one for each of your measures, in the same order as your measures.

comma	[logical(1)] Parameter of the GA feature selection, indicating whether to use a (mu, lambda) or (mu + lambda) GA. The default is FALSE.
mu	[integer(1)] Parameter of the GA feature selection. Size of the parent population.
lambda	[integer(1)] Parameter of the GA feature selection. Size of the children population (should be smaller or equal to mu).
crossover.rate	[numeric(1)] Parameter of the GA feature selection. Probability of choosing a bit from the first parent within the crossover mutation.
mutation.rate	[numeric(1)] Parameter of the GA feature selection. Probability of flipping a feature bit, i.e. switch between selecting / deselecting a feature.
prob	[numeric(1)] Parameter of the random feature selection. Probability of choosing a feature.
method	[character(1)] Parameter of the sequential feature selection. A character representing the method. Possible values are sfs (forward search), sbs (backward search), sfbs (floating forward search) and sfbs (floating backward search).
alpha	[numeric(1)] Parameter of the sequential feature selection. Minimal required value of improvement difference for a forward / adding step. Default is 0.01.
beta	[numeric(1)] Parameter of the sequential feature selection. Minimal required value of improvement difference for a backward / removing step. Negative values imply that you allow a slight decrease for the removal of a feature. Default is -0.001.

**Value**

`FeatSelControl` . The specific subclass is one of `FeatSelControlExhaustive`, `FeatSelControlRandom`, `FeatSelControlSequential`, `FeatSelControlGA`.

**See Also**

Other featsel: [analyzeFeatSelResult](#); [getFeatSelResult](#); [makeFeatSelWrapper](#); [selectFeatures](#)

---

FeatSelResult	<i>Result of feature selection.</i>
---------------	-------------------------------------

---

**Description**

Container for results of feature selection. Contains the obtained features, their performance values and the optimization path which lead there.

You can visualize it using [analyzeFeatSelResult](#).

**Details**

Object members:

**learner** [[Learner](#) ] Learner that was optimized.

**control** [[FeatSelControl](#) ] Control object from feature selection.

**x** [[character](#) ] Vector of feature names identified as optimal.

**y** [[numeric](#) ] Performance values for optimal x.

**threshold** [[numeric](#) ] Vector of finally found and used thresholds if `tune.threshold` was enabled in [FeatSelControl](#), otherwise not present and hence NULL.

**opt.path** [[OptPath](#) ] Optimization path which lead to x.

---

filterFeatures	<i>Filter features by thresholding filter values.</i>
----------------	---

---

**Description**

First, calls [generateFilterValuesData](#). Features are then selected via `select` and `val`.

**Usage**

```
filterFeatures(task, method = "rf.importance", fval = NULL, perc = NULL,
  abs = NULL, threshold = NULL, mandatory.feats = NULL, ...)
```

**Arguments**

task	[ <a href="#">Task</a> ] The task.
method	[ <a href="#">character</a> (1)] See <a href="#">listFilterMethods</a> . Default is "rf.importance".
fval	[ <a href="#">FilterValues</a> ] Result of <a href="#">generateFilterValuesData</a> . If you pass this, the filter values in the object are used for feature filtering. <code>method</code> and <code>...</code> are ignored then. Default is NULL and not used.
perc	[ <a href="#">numeric</a> (1)] If set, select <code>perc*100</code> top scoring features. Mutually exclusive with arguments <code>abs</code> and <code>threshold</code> .
abs	[ <a href="#">numeric</a> (1)] If set, select <code>abs</code> top scoring features. Mutually exclusive with arguments <code>perc</code> and <code>threshold</code> .
threshold	[ <a href="#">numeric</a> (1)] If set, select features whose score exceeds <code>threshold</code> . Mutually exclusive with arguments <code>perc</code> and <code>abs</code> .
mandatory.feats	[ <a href="#">character</a> ] Mandatory features which are always included regardless of their scores
...	[ <a href="#">any</a> ] Passed down to selected filter method.

**Value**

[Task](#) .

**See Also**

Other filter: [FilterValues](#); [generateFilterValuesData](#); [getFilterValues](#); [getFilteredFeatures](#); [makeFilterWrapper](#); [plotFilterValuesGGVIS](#); [plotFilterValues](#)

---

FilterValues

*Result of [generateFilterValuesData](#).*

---

**Description**

Result of [generateFilterValuesData](#).

**See Also**

Other filter: [filterFeatures](#); [generateFilterValuesData](#); [getFilterValues](#); [getFilteredFeatures](#); [makeFilterWrapper](#); [plotFilterValuesGGVIS](#); [plotFilterValues](#)

---

generateFilterValuesData

*Calculates feature filter values.*

---

**Description**

Calculates numerical filter values for features. For a list of features, use [listFilterMethods](#).

**Usage**

```
generateFilterValuesData(task, method = "rf.importance",
  nselect = getTaskNFeats(task), ...)
```

**Arguments**

task	[Task] The task.
method	[character] Filter method(s), see above. Default is “rf.importance”.
nselect	[integer(1)] Number of scores to request. Scores are getting calculated for all features per default.
...	[any] Passed down to selected method.

**Value**

[FilterValues](#) .

**See Also**

Other filter: [FilterValues](#); [filterFeatures](#); [getFilterValues](#); [getFilteredFeatures](#); [makeFilterWrapper](#); [plotFilterValuesGGVIS](#); [plotFilterValues](#)

Other filter: [FilterValues](#); [filterFeatures](#); [getFilterValues](#); [getFilteredFeatures](#); [makeFilterWrapper](#); [plotFilterValuesGGVIS](#); [plotFilterValues](#)

Other generate\_plot\_data: [generateLearningCurveData](#); [generateROCRCurvesData](#); [generateThreshVsPerfData](#); [getFilterValues](#)

generateLearningCurveData

*Generates a learning curve*

**Description**

Observe how the performance changes with an increasing number of observations.

**Usage**

```
generateLearningCurveData(learners, task, resampling = NULL,
  percs = seq(0.1, 1, by = 0.1), measures, stratify = FALSE,
  show.info = getMlrOption("show.info"))
```

**Arguments**

learners	[[list of <a href="#">Learner</a> ] Learning algorithms which should be compared.
task	[ <a href="#">Task</a> ] The task.
resampling	[ <a href="#">ResampleDesc</a>   <a href="#">ResampleInstance</a> ] Resampling strategy to evaluate the performance measure. If no strategy is given a default "Holdout" will be performed.
percs	[numeric] Vector of percentages to be drawn from the training split. These values represent the x-axis. Internally <a href="#">makeDownsampleWrapper</a> is used in combination with <a href="#">benchmark</a> . Thus for each percentage a different set of observations is drawn resulting in noisy performance measures as the quality of the sample can differ.
measures	[[list of <a href="#">Measure</a> ] Performance measures to generate learning curves for, representing the y-axis.
stratify	[logical(1)] Only for classification: Should the downsampled data be stratified according to the target classes?

show.info [logical(1)]  
Print verbose output on console? Default is set via [configureMLr](#).

### Value

A [data.frame] of class LearningCurveData.

### See Also

Other generate\_plot\_data: [generateFilterValuesData](#); [generateROCRCurvesData](#); [generateThreshVsPerfData](#); [getFilterValues](#)

Other learning\_curve: [plotLearningCurveGGVIS](#); [plotLearningCurve](#)

### Examples

```
r = generateLearningCurveData(list("classif.rpart", "classif.knn"),
  task = sonar.task, percs = seq(0.2, 1, by = 0.2),
  measures = list(tp, fp, tn, fn), resampling = makeResampleDesc(method = "Subsample", iters = 5),
  show.info = FALSE)
plotLearningCurve(r)
```

---

generateROCRCurvesData

*Generate binary classification predictions via ROCR ROC curves.*

---

### Description

Data is generated by calling [asROCRPrediction](#), and then ROCR's [performance](#).

See these methods in ROCR for further info.

### Usage

```
generateROCRCurvesData(obj, meas1 = "tpr", meas2 = "fpr",
  avg = "threshold", perf.args = list(), task.id = NULL)
```

### Arguments

obj [(list of) [Prediction](#) | (list of) [ResampleResult](#) | [BenchmarkResult](#)]  
Single prediction object, list of them, single resample result, list of them, or a benchmark result. In case of a list probably produced by different learners you want to compare, then name the list with the names you want to see in the plots, probably learner shortnames or ids.

meas1 [character(1)]  
Measure on x-axis. Note that this is a measure name from *\*ROCR\** and not from mlr! Default is "tpr".

meas2	[character(1)] Measure on y-axis. Note that this is a measure name from *ROCR* and not from mlr! Default is “fpr”.
avg	[chracter(1)] If obj is of class ResampleResult or BenchmarkResult, how are the predictions to be combined (by learner)? If obj is not one of these classes, this argument is ignored. Possibilities are “threshold”, “horizontal”, “vertical”, and “none”. Default is “threshold”.
perf.args	[named list] Further arguments passed to ROCR’s <a href="#">performance</a> . Usually not needed and meas1 and meas2 are set internally. Default is an empty list.
task.id	[character(1)] Selected task in <a href="#">BenchmarkResult</a> to do plots for, ignored otherwise. Default is first task.

**Value**

A ROCRCurvesData object, a list with elements giving the data output from [performance](#) and the input arguments.

**See Also**

Other generate\_plot\_data: [generateFilterValuesData](#); [generateLearningCurveData](#); [generateThreshVsPerfData](#); [getFilterValues](#)

Other predict: [asROCRPrediction](#); [getProbabilities](#); [plotROCRCurvesGGVIS](#); [plotROCRCurves](#); [plotViperCharts](#); [predict.WrappedModel](#); [setPredictThreshold](#); [setPredictType](#)

Other roc: [asROCRPrediction](#); [plotROCRCurvesGGVIS](#); [plotROCRCurves](#); [plotViperCharts](#)

---

generateThreshVsPerfData

*Generate threshold vs. performance(s) for 2-class classification.*

---

**Description**

Generate threshold vs. performance(s) for 2-class classification.

**Usage**

```
generateThreshVsPerfData(obj, measures, gridsize = 100L, task.id = NULL)
```

**Arguments**

obj	[(list of <a href="#">Prediction</a>   (list of) <a href="#">ResampleResult</a>   <a href="#">BenchmarkResult</a> ] Single prediction object, list of them, single resample result, list of them, or a benchmark result. In case of a list probably produced by different learners you want to compare, then name the list with the names you want to see in the plots, probably learner shortnames or ids.
measures	[ <a href="#">Measure</a>   list of <a href="#">Measure</a> ] Performance measure(s) to evaluate.
gridsize	[integer(1)] Grid resolution for x-axis (threshold). Default is 100.
task.id	[character(1)] Selected task in <a href="#">BenchmarkResult</a> to do plots for, ignored otherwise. Default is first task.

**See Also**

Other generate\_plot\_data: [generateFilterValuesData](#); [generateLearningCurveData](#); [generateROCRCurvesData](#); [getFilterValues](#)

Other thresh\_vs\_perf: [plotThreshVsPerfGGVIS](#); [plotThreshVsPerf](#)

---

getBMRAggrPerformances

*Extract the aggregated performance values from a benchmark result.*

---

**Description**

Either a list of lists of “aggr” numeric vectors, as returned by [resample](#), or these objects are rbind-ed with extra columns “task.id” and “learner.id”.

**Usage**

```
getBMRAggrPerformances(bmr, task.ids = NULL, learner.ids = NULL,
  as.df = FALSE)
```

**Arguments**

bmr	[ <a href="#">BenchmarkResult</a> ] Benchmark result.
task.ids	[character(1)] Restrict result to certain tasks. Default is all.
learner.ids	[character(1)] Restrict result to certain learners. Default is all.
as.df	[character(1)] Return one data.frame as result - or a list of lists of objects?. Default is FALSE

**Value**

list | data.frame . See above.

**See Also**

Other benchmark: [BenchmarkResult](#); [benchmark](#); [getBMRFeatSelResults](#); [getBMRFilteredFeatures](#); [getBMRLearnerIds](#); [getBMRPerformances](#); [getBMRPredictions](#); [getBMRTaskIds](#); [getBMRTuneResults](#)

---

getBMRFeatSelResults *Extract the feature selection results from a benchmark result.*

---

**Description**

Returns a list of lists of ??? data.frames, as returned by [resample](#), or these objects are rbind-ed with extra columns “task.id” and “learner.id”.

**Usage**

```
getBMRFeatSelResults(bmr, task.ids = NULL, learner.ids = NULL,
  as.df = FALSE)
```

**Arguments**

bmr	[ <a href="#">BenchmarkResult</a> ] Benchmark result.
task.ids	[character(1)] Restrict result to certain tasks. Default is all.
learner.ids	[character(1)] Restrict result to certain learners. Default is all.
as.df	[character(1)] Return one data.frame as result - or a list of lists of objects?. Default is FALSE

**Value**

list | data.frame . See above.

**See Also**

Other benchmark: [BenchmarkResult](#); [benchmark](#); [getBMRAggrPerformances](#); [getBMRFilteredFeatures](#); [getBMRLearnerIds](#); [getBMRPerformances](#); [getBMRPredictions](#); [getBMRTaskIds](#); [getBMRTuneResults](#)

---

getBMRFiltredFeatures

*Extract the feature selection results from a benchmark result.*

---

### Description

Returns a list of lists of ??? data.frames, as returned by [resample](#), or these objects are rbind-ed with extra columns “task.id” and “learner.id”.

### Usage

```
getBMRFiltredFeatures(bmr, task.ids = NULL, learner.ids = NULL,
  as.df = FALSE)
```

### Arguments

bmr	[ <a href="#">BenchmarkResult</a> ] Benchmark result.
task.ids	[character(1)] Restrict result to certain tasks. Default is all.
learner.ids	[character(1)] Restrict result to certain learners. Default is all.
as.df	[character(1)] Return one data.frame as result - or a list of lists of objects?. Default is FALSE

### Value

list | data.frame . See above.

### See Also

Other benchmark: [BenchmarkResult](#); [benchmark](#); [getBMRAggrPerformances](#); [getBMRFeatSelResults](#); [getBMRLearnerIds](#); [getBMRPerformances](#); [getBMRPredictions](#); [getBMRTaskIds](#); [getBMRTuneResults](#)

---

getBMRLearnerIds

*Return learner ids used in benchmark.*

---

### Description

Return learner ids used in benchmark.

### Usage

```
getBMRLearnerIds(bmr)
```

**Arguments**

bmr [\[BenchmarkResult\]](#)  
Benchmark result.

**Value**

list | character . See above.

**See Also**

Other benchmark: [BenchmarkResult](#); [benchmark](#); [getBMRAggrPerformances](#); [getBMRFeatSelResults](#); [getBMRFilteredFeatures](#); [getBMRPerformances](#); [getBMRPredictions](#); [getBMRTaskIds](#); [getBMRTuneResults](#)

---

getBMRPerformances *Extract the test performance values from a benchmark result.*

---

**Description**

Either a list of lists of “measure.test” data.frames, as returned by [resample](#), or these objects are rbind-ed with extra columns “task.id” and “learner.id”.

**Usage**

```
getBMRPerformances(bmr, task.ids = NULL, learner.ids = NULL,
  as.df = FALSE)
```

**Arguments**

bmr [\[BenchmarkResult\]](#)  
Benchmark result.

task.ids [\[character\(1\)\]](#)  
Restrict result to certain tasks. Default is all.

learner.ids [\[character\(1\)\]](#)  
Restrict result to certain learners. Default is all.

as.df [\[character\(1\)\]](#)  
Return one data.frame as result - or a list of lists of objects?. Default is FALSE

**Value**

list | data.frame . See above.

**See Also**

Other benchmark: [BenchmarkResult](#); [benchmark](#); [getBMRAggrPerformances](#); [getBMRFeatSelResults](#); [getBMRFilteredFeatures](#); [getBMRLearnerIds](#); [getBMRPredictions](#); [getBMRTaskIds](#); [getBMRTuneResults](#)

---

getBMRPredictions      *Extract the predictions from a benchmark result.*

---

### Description

Either a list of lists of [ResamplePrediction](#) objects, as returned by [resample](#), or these objects are rbind-ed with extra columns “task.id” and “learner.id”.

### Usage

```
getBMRPredictions(bmr, task.ids = NULL, learner.ids = NULL, as.df = FALSE)
```

### Arguments

bmr	[ <a href="#">BenchmarkResult</a> ] Benchmark result.
task.ids	[character(1)] Restrict result to certain tasks. Default is all.
learner.ids	[character(1)] Restrict result to certain learners. Default is all.
as.df	[character(1)] Return one data.frame as result - or a list of lists of objects?. Default is FALSE

### Value

list | data.frame . See above.

### See Also

Other benchmark: [BenchmarkResult](#); [benchmark](#); [getBMRAggrPerformances](#); [getBMRFeatSelResults](#); [getBMRFilteredFeatures](#); [getBMRLearnerIds](#); [getBMRPerformances](#); [getBMRTaskIds](#); [getBMRTuneResults](#)

---

getBMRTaskIds      *Return task ids used in benchmark.*

---

### Description

Return task ids used in benchmark.

### Usage

```
getBMRTaskIds(bmr)
```

**Arguments**

bmr [\[BenchmarkResult\]](#)  
Benchmark result.

**Value**

character .

**See Also**

Other benchmark: [BenchmarkResult](#); [benchmark](#); [getBMRAggrPerformances](#); [getBMRFeatSelResults](#); [getBMRFilteredFeatures](#); [getBMRLearnerIds](#); [getBMRPerformances](#); [getBMRPredictions](#); [getBMRTuneResults](#)

---

getBMRTuneResults *Extract the tuning results from a benchmark result.*

---

**Description**

Returns a list of lists of ??? as returned by [resample](#), or these objects are rbind-ed with extra columns “task.id” and “learner.id”.

**Usage**

```
getBMRTuneResults(bmr, task.ids = NULL, learner.ids = NULL, as.df = FALSE)
```

**Arguments**

bmr [\[BenchmarkResult\]](#)  
Benchmark result.

task.ids [\[character\(1\)\]](#)  
Restrict result to certain tasks. Default is all.

learner.ids [\[character\(1\)\]](#)  
Restrict result to certain learners. Default is all.

as.df [\[character\(1\)\]](#)  
Return one data.frame as result - or a list of lists of objects?. Default is FALSE

**Value**

list|data.frame . See above.

**See Also**

Other benchmark: [BenchmarkResult](#); [benchmark](#); [getBMRAggrPerformances](#); [getBMRFeatSelResults](#); [getBMRFilteredFeatures](#); [getBMRLearnerIds](#); [getBMRPerformances](#); [getBMRPredictions](#); [getBMRTaskIds](#)

---

getConfMatrix	<i>Confusion matrix.</i>
---------------	--------------------------

---

### Description

Calculates confusion matrix for (possibly resampled) prediction. Rows indicate true classes, columns predicted classes.

### Usage

```
getConfMatrix(pred, relative = FALSE)
```

### Arguments

pred	[ <a href="#">Prediction</a> ] Prediction object.
relative	[logical(1)] If TRUE rows are normalized to show relative frequencies. Default is FALSE.

### Value

matrix . A confusion matrix.

### See Also

[predict.WrappedModel](#)

### Examples

```
# get confusion matrix after simple manual prediction
allinds = 1:150
train = sample(allinds, 75)
test = setdiff(allinds, train)
mod = train("classif.lda", iris.task, subset = train)
pred = predict(mod, iris.task, subset = test)
print(getConfMatrix(pred))
print(getConfMatrix(pred, relative = TRUE))

# now after cross-validation
r = crossval("classif.lda", iris.task, iters = 2L)
print(getConfMatrix(r$pred))
```

---

getFailureModelMsg      *Return error message of FailureModel.*

---

### Description

Such a model is created when one sets the corresponding option in [configureMlr](#). If no failure occurred, NA is returned.

For complex wrappers this getter returns the first error message encountered in ANY model that failed.

### Usage

```
getFailureModelMsg(model)
```

### Arguments

model                    [\[WrappedModel\]](#)  
The model.

### Value

character(1) .

---

getFeatSelResult      *Returns the selected feature set and optimization path after training.*

---

### Description

Returns the selected feature set and optimization path after training.

### Usage

```
getFeatSelResult(object)
```

### Arguments

object                    [\[WrappedModel\]](#)  
Trained Model created with [makeFeatSelWrapper](#).

### Value

[FeatSelResult](#) .

### See Also

Other featsel: [FeatSelControl](#), [FeatSelControlExhaustive](#), [FeatSelControlGA](#), [FeatSelControlRandom](#), [FeatSelControlSequential](#), [makeFeatSelControlExhaustive](#), [makeFeatSelControlGA](#), [makeFeatSelControlRandom](#), [makeFeatSelControlSequential](#); [analyzeFeatSelResult](#); [makeFeatSelWrapper](#); [selectFeatures](#)

---

getFilteredFeatures *Returns the filtered features.*

---

### Description

Returns the filtered features.

### Usage

```
getFilteredFeatures(model)
```

### Arguments

model	[ <a href="#">WrappedModel</a> ] Trained Model created with <a href="#">makeFilterWrapper</a> .
-------	--

### Value

character .

### See Also

Other filter: [FilterValues](#); [filterFeatures](#); [generateFilterValuesData](#); [getFilterValues](#); [makeFilterWrapper](#); [plotFilterValuesGGVIS](#); [plotFilterValues](#)

---

getFilterValues *Calculates feature filter values.*

---

### Description

Calculates numerical filter values for features. For a list of features, use [listFilterMethods](#).

### Usage

```
getFilterValues(task, method = "rf.importance",
  nselect = getTaskNFeats(task), ...)
```

### Arguments

task	[ <a href="#">Task</a> ] The task.
method	[ <a href="#">character(1)</a> ] Filter method, see above. Default is "rf.importance".
nselect	[ <a href="#">integer(1)</a> ] Number of scores to request. Scores are getting calculated for all features per default.
...	[ <a href="#">any</a> ] Passed down to selected method.

**Value**

[FilterValues](#) .

**Note**

getFilterValues is deprecated in favor of [generateFilterValuesData](#).

**See Also**

Other filter: [FilterValues](#); [filterFeatures](#); [generateFilterValuesData](#); [getFilteredFeatures](#); [makeFilterWrapper](#); [plotFilterValuesGGVIS](#); [plotFilterValues](#)

Other filter: [FilterValues](#); [filterFeatures](#); [generateFilterValuesData](#); [getFilteredFeatures](#); [makeFilterWrapper](#); [plotFilterValuesGGVIS](#); [plotFilterValues](#)

Other generate\_plot\_data: [generateFilterValuesData](#); [generateLearningCurveData](#); [generateROCRCurvesData](#); [generateThreshVsPerfData](#)

---

getHomogeneousEnsembleModels

*Returns the list of fitted models.*

---

**Description**

Returns the list of fitted models.

**Usage**

```
getHomogeneousEnsembleModels(model, learner.models = FALSE)
```

**Arguments**

model	<a href="#">[WrappedModel]</a> Model produced by training a learner of homogeneous models.
learner.models	<a href="#">[logical(1)]</a> Return underlying R models or wrapped mlr models ( <a href="#">WrappedModel</a> ). Default is FALSE.

**Value**

list .

---

getHyperPars                      *Get current parameter settings for a learner.*

---

### Description

Get current parameter settings for a learner.

### Usage

```
getHyperPars(learner, for.fun = c("train", "predict", "both"))
```

### Arguments

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
for.fun	[character(1)] Restrict the returned settings to hyperparameters corresponding to when they are used (see <a href="#">LearnerParam</a> ). Must be a subset of: "train", "predict" or "both". Default is c("train", "predict", "both").

### Value

list . A named list of values.

### See Also

Other learner: [LearnerProperties](#), [addProperties](#), [hasProperties](#), [removeProperties](#), [setProperties](#); [Learner](#), [makeLearner](#); [getParamSet](#); [removeHyperPars](#); [setHyperPars](#); [setId](#); [setPredictThreshold](#); [setPredictType](#)

---

getLearnerModel                      *Get underlying R model of learner integrated into mlr.*

---

### Description

Get underlying R model of learner integrated into mlr.

### Usage

```
getLearnerModel(model)
```

### Arguments

model	[ <a href="#">WrappedModel</a> ] The model, returned by e.g., <a href="#">train</a> .
-------	--

**Value**

any . A fitted model, depending the learner / wrapped package. E.g., a model of class `rpart` for learner “`classif.rpart`”.

---

getMlrOptions	<i>Returns a list of mlr's options</i>
---------------	--

---

**Description**

Returns a list of mlr's options

**Usage**

```
getMlrOptions()
```

**Value**

list .

**See Also**

Other configure: [configureMlr](#)

---

getNestedTuneResultsOptPathDf	<i>Get the opt.paths from each tuning step from the outer resampling.</i>
-------------------------------	---

---

**Description**

After you resampled a tuning wrapper (see [makeTuneWrapper](#)) with `resample(..., extract = getTunerresult)` this helper returns a `data.frame` with with all `opt.paths` combined by `rbind`. An additional column `iter` indicates to what resampling iteration the row belongs.

**Usage**

```
getNestedTuneResultsOptPathDf(r)
```

**Arguments**

r	<a href="#">[ResampleResult]</a> The result of resampling of a tuning wrapper.
---	---

**Value**

`data.frame` . See above.

**See Also**

Other tune: [ModelMultiplexer](#), [makeModelMultiplexer](#); [TuneControl](#), [TuneControlCMAES](#), [TuneControlGenSA](#), [TuneControlGrid](#), [TuneControlIrace](#), [TuneControlRandom](#), [makeTuneControlCMAES](#), [makeTuneControlDesign](#), [makeTuneControlGenSA](#), [makeTuneControlGrid](#), [makeTuneControlIrace](#), [makeTuneControlRandom](#); [getNestedTuneResultsX](#); [getTuneResult](#); [makeModelMultiplexerParamSet](#); [makeTuneWrapper](#); [tuneParams](#); [tuneThreshold](#)

**Examples**

```
# see example of makeTuneWrapper
```

---

```
getNestedTuneResultsX Get the tuned hyperparameter settings from a nested tuning.
```

---

**Description**

After you resampled a tuning wrapper (see [makeTuneWrapper](#)) with `resample(..., extract = getTunerresult)` this helper returns a `data.frame` with the the best found hyperparameter settings for each resampling iteration.

**Usage**

```
getNestedTuneResultsX(r)
```

**Arguments**

`r` [\[ResampleResult\]](#)  
The result of resampling of a tuning wrapper.

**Value**

`data.frame` . One column for each tuned hyperparameter and one row for each outer resampling iteration.

**See Also**

Other tune: [ModelMultiplexer](#), [makeModelMultiplexer](#); [TuneControl](#), [TuneControlCMAES](#), [TuneControlGenSA](#), [TuneControlGrid](#), [TuneControlIrace](#), [TuneControlRandom](#), [makeTuneControlCMAES](#), [makeTuneControlDesign](#), [makeTuneControlGenSA](#), [makeTuneControlGrid](#), [makeTuneControlIrace](#), [makeTuneControlRandom](#); [getNestedTuneResultsOptPathDf](#); [getTuneResult](#); [makeModelMultiplexerParamSet](#); [makeTuneWrapper](#); [tuneParams](#); [tuneThreshold](#)

**Examples**

```
# see example of makeTuneWrapper
```

---

getParamSet	<i>Get a description of all possible parameter settings for a learner.</i>
-------------	--

---

**Description**

Get a description of all possible parameter settings for a learner.

**Usage**

```
getParamSet(learner)
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
---------	--

**Value**

[ParamSet](#) .

**See Also**

Other learner: [LearnerProperties](#), [addProperties](#), [hasProperties](#), [removeProperties](#), [setProperties](#); [Learner](#), [makeLearner](#); [getHyperPars](#); [removeHyperPars](#); [setHyperPars](#); [setId](#); [setPredictThreshold](#); [setPredictType](#)

---

getProbabilities	<i>Get probabilities for some classes.</i>
------------------	--

---

**Description**

Get probabilities for some classes.

**Usage**

```
getProbabilities(pred, cl)
```

**Arguments**

pred	[ <a href="#">Prediction</a> ] Prediction object.
cl	[character] Names of classes. Default is either all classes for multi-class problems or the positive class for binary classification.

**Value**

data.frame with numerical columns or a numerical vector if length of `cl` is 1. Order of columns is defined by `cl`.

**See Also**

Other predict: [asROCRPrediction](#); [generateROCRCurvesData](#); [plotROCRCurvesGGVIS](#); [plotROCRCurves](#); [plotViperCharts](#); [predict.WrappedModel](#); [setPredictThreshold](#); [setPredictType](#)

**Examples**

```
task = makeClassifTask(data = iris, target = "Species")
lrn = makeLearner("classif.lda", predict.type = "prob")
mod = train(lrn, task)
# predict probabilities
pred = predict(mod, newdata = iris)

# Get probabilities for all classes
head(getProbabilities(pred))

# Get probabilities for a subset of classes
head(getProbabilities(pred, c("setosa", "virginica")))
```

---

getRRPredictions

*Get predictions from resample results.*

---

**Description**

Very simple getter.

**Usage**

```
getRRPredictions(res)
```

**Arguments**

`res` [ResampleResult]  
The result of [resample](#) run with `keep.pred = TRUE`.

**Value**

ResamplePrediction .

**See Also**

Other resample: [ResampleDesc](#), [makeResampleDesc](#); [ResampleInstance](#), [makeResampleInstance](#); [ResamplePrediction](#); [ResampleResult](#); [bootstrapB632](#), [bootstrapB632plus](#), [bootstrapO0B](#), [crossval](#), [holdout](#), [repcv](#), [resample](#), [subsample](#)

---

```
getStackedBaseLearnerPredictions
```

*Returns the predictions for each base learner.*

---

**Description**

Returns the predictions for each base learner.

**Usage**

```
getStackedBaseLearnerPredictions(model, newdata = NULL)
```

**Arguments**

model	[WrappedModel] Wrapped model, result of train.
newdata	[data.frame] New observations, for which the predictions using the specified base learners should be returned. Default is NULL and extracts the base learner predictions that were made during the training.

**Details**

None.

---

```
getTaskCosts
```

*Extract costs in task.*

---

**Description**

Returns "NULL" if the task is not of type "costsens".

**Usage**

```
getTaskCosts(task, subset)
```

**Arguments**

task	[CostSensTask] The task.
subset	[integer] Selected cases. Default is all cases.

**Value**

matrix | NULL .

**See Also**

Other task: [getTaskData](#); [getTaskDescription](#); [getTaskFeatureNames](#); [getTaskFormula](#), [getTaskFormulaAsString](#); [getTaskId](#); [getTaskNFeats](#); [getTaskSize](#); [getTaskTargetNames](#); [getTaskTargets](#); [getTaskType](#); [subsetTask](#)

---

getTaskData	<i>Extract data in task.</i>
-------------	------------------------------

---

**Description**

Useful in [trainLearner](#) when you add a learning machine to the package.

**Usage**

```
getTaskData(task, subset, features, target.extra = FALSE,
  recode.target = "no")
```

**Arguments**

task	[Task] The task.
subset	[integer] Selected cases. Default is all cases.
features	[character] Selected features. Default is all.
target.extra	[logical(1)] Should target vector be returned separately? If not, a single data.frame including the target is returned, otherwise a list with the input data.frame and an extra vector for the targets. Default is FALSE.
recode.target	[character(1)] Should target classes be recoded? Only for binary classification. Possible are "no" (do nothing), "01", "-1+1" and "drop.levels". In the two latter cases the target vector is converted into a numeric vector. The positive class is coded as +1 and the negative class either as 0 or -1. "drop.levels" will remove empty factor levels in the target column. Default is "no".

**Value**

Either a data.frame or a list with data.frame data and vector target.

**See Also**

Other task: [getTaskCosts](#); [getTaskDescription](#); [getTaskFeatureNames](#); [getTaskFormula](#), [getTaskFormulaAsString](#); [getTaskId](#); [getTaskNFeats](#); [getTaskSize](#); [getTaskTargetNames](#); [getTaskTargets](#); [getTaskType](#); [subsetTask](#)

## Examples

```
library("mlbench")
data(BreastCancer)

df = BreastCancer
df$Id = NULL
task = makeClassifTask(id = "BreastCancer", data = df, target = "Class", positive = "malignant")
head(getTaskData)
head(getTaskData(task, features = c("Cell.size", "Cell.shape"), recode.target = "-1+1"))
head(getTaskData(task, subset = 1:100, recode.target = "01"))
```

---

getTaskDescription	<i>Get a summarizing task description.</i>
--------------------	--

---

## Description

Get a summarizing task description.

## Usage

```
getTaskDescription(x)
```

## Arguments

x	<a href="#">[Task   TaskDesc]</a> Task or its description object.
---	--

## Value

[TaskDesc](#) .

## See Also

Other task: [getTaskCosts](#); [getTaskData](#); [getTaskFeatureNames](#); [getTaskFormula](#); [getTaskFormulaAsString](#); [getTaskId](#); [getTaskNFeats](#); [getTaskSize](#); [getTaskTargetNames](#); [getTaskTargets](#); [getTaskType](#); [subsetTask](#)

---

`getTaskFeatureNames`    *Get feature names of task.*

---

### Description

Target column name is not included.

### Usage

```
getTaskFeatureNames(task)
```

### Arguments

<code>task</code>	<code>[Task]</code> The task.
-------------------	----------------------------------

### Value

character .

### See Also

Other task: [getTaskCosts](#); [getTaskData](#); [getTaskDescription](#); [getTaskFormula](#), [getTaskFormulaAsString](#); [getTaskId](#); [getTaskNFeats](#); [getTaskSize](#); [getTaskTargetNames](#); [getTaskTargets](#); [getTaskType](#); [subsetTask](#)

---

`getTaskFormulaAsString`  
*Get formula of a task.*

---

### Description

This is simply “<target> ~ .”.

### Usage

```
getTaskFormulaAsString(x, target = getTaskTargetNames(x),
  explicit.features = FALSE)
```

```
getTaskFormula(x, target = getTaskTargetNames(x), explicit.features = FALSE,
  env = NULL)
```

**Arguments**

x	[Task   TaskDesc] Task or its description object.
target	[character(1)] Left hand side of the formula. Default is defined by task x.
explicit.features	[logical(1)] Should the features (right hand side of the formula) be explicitly listed? Default is FALSE, i.e., they will be represented as ". ".
env	[environment] Environment of the formula. Set this to parent.frame() for the default behaviour. Default is NULL which deletes the environment.

**Value**

formula | character(1) .

**See Also**

Other task: [getTaskCosts](#); [getTaskData](#); [getTaskDescription](#); [getTaskFeatureNames](#); [getTaskId](#); [getTaskNFeats](#); [getTaskSize](#); [getTaskTargetNames](#); [getTaskTargets](#); [getTaskType](#); [subsetTask](#)

---

getTaskId	<i>Get the id of the task.</i>
-----------	--------------------------------

---

**Description**

Get the id of the task.

**Usage**

```
getTaskId(task)
```

**Arguments**

task	[Task] The task.
------	---------------------

**Value**

character(1) .

**See Also**

Other task: [getTaskCosts](#); [getTaskData](#); [getTaskDescription](#); [getTaskFeatureNames](#); [getTaskFormula](#), [getTaskFormulaAsString](#); [getTaskNFeats](#); [getTaskSize](#); [getTaskTargetNames](#); [getTaskTargets](#); [getTaskType](#); [subsetTask](#)

---

getTaskNFeats	<i>Get number of features in task.</i>
---------------	--

---

**Description**

Get number of features in task.

**Usage**

```
getTaskNFeats(task)
```

**Arguments**

task	<a href="#">[Task]</a> The task.
------	-------------------------------------

**Value**

integer(1) .

**See Also**

Other task: [getTaskCosts](#); [getTaskData](#); [getTaskDescription](#); [getTaskFeatureNames](#); [getTaskFormula](#), [getTaskFormulaAsString](#); [getTaskId](#); [getTaskSize](#); [getTaskTargetNames](#); [getTaskTargets](#); [getTaskType](#); [subsetTask](#)

---

getTaskSize	<i>Get number of observations in task.</i>
-------------	--

---

**Description**

Get number of observations in task.

**Usage**

```
getTaskSize(task)
```

**Arguments**

task	<a href="#">[Task]</a> The task.
------	-------------------------------------

**Value**

integer(1) .

**See Also**

Other task: [getTaskCosts](#); [getTaskData](#); [getTaskDescription](#); [getTaskFeatureNames](#); [getTaskFormula](#), [getTaskFormulaAsString](#); [getTaskId](#); [getTaskNFeats](#); [getTaskTargetNames](#); [getTaskTargets](#); [getTaskType](#); [subsetTask](#)

---

getTaskTargetNames      *Get the name(s) of the target column(s).*

---

**Description**

Get the name(s) of the target column(s).

**Usage**

```
getTaskTargetNames(task)
```

**Arguments**

task	[Task]
	The task.

**Value**

character .

**See Also**

Other task: [getTaskCosts](#); [getTaskData](#); [getTaskDescription](#); [getTaskFeatureNames](#); [getTaskFormula](#), [getTaskFormulaAsString](#); [getTaskId](#); [getTaskNFeats](#); [getTaskSize](#); [getTaskTargets](#); [getTaskType](#); [subsetTask](#)

---

getTaskTargets      *Get target column of task.*

---

**Description**

Get target column of task.

**Usage**

```
getTaskTargets(task, subset, recode.target = "no")
```

**Arguments**

task	[Task] The task.
subset	[integer] Selected cases. Default is all cases.
recode.target	[character(1)] Should target classes be recoded? Only for binary classification. Possible are “no” (do nothing), “01”, and “-1+1”. In the two latter cases the target vector is converted into a numeric vector. The positive class is coded as +1 and the negative class either as 0 or -1. Default is “no”.

**Value**

A factor for classification or a numeric for regression.

**See Also**

Other task: [getTaskCosts](#); [getTaskData](#); [getTaskDescription](#); [getTaskFeatureNames](#); [getTaskFormula](#), [getTaskFormulaAsString](#); [getTaskId](#); [getTaskNFeats](#); [getTaskSize](#); [getTaskTargetNames](#); [getTaskType](#); [subsetTask](#)

**Examples**

```
task = makeClassifTask(data = iris, target = "Species")
getTaskTargets(task)
getTaskTargets(task, subset = 1:50)
```

---

getTaskType	<i>Get the type of the task.</i>
-------------	----------------------------------

---

**Description**

Get the type of the task.

**Usage**

```
getTaskType(task)
```

**Arguments**

task	[Task] The task.
------	---------------------

**Value**

character(1) .

**See Also**

Other task: [getTaskCosts](#); [getTaskData](#); [getTaskDescription](#); [getTaskFeatureNames](#); [getTaskFormula](#), [getTaskFormulaAsString](#); [getTaskId](#); [getTaskNFeats](#); [getTaskSize](#); [getTaskTargetNames](#); [getTaskTargets](#); [subsetTask](#)

---

getTuneResult	<i>Returns the optimal hyperparameters and optimization path after training.</i>
---------------	--

---

**Description**

Returns the optimal hyperparameters and optimization path after training.

**Usage**

```
getTuneResult(object)
```

**Arguments**

object	<a href="#">[WrappedModel]</a> Trained Model created with <a href="#">makeTuneWrapper</a> .
--------	--

**Value**

[TuneResult](#) .

**See Also**

Other tune: [ModelMultiplexer](#), [makeModelMultiplexer](#); [TuneControl](#), [TuneControlCMAES](#), [TuneControlGenSA](#), [TuneControlGrid](#), [TuneControlIrace](#), [TuneControlRandom](#), [makeTuneControlCMAES](#), [makeTuneControlDesign](#), [makeTuneControlGenSA](#), [makeTuneControlGrid](#), [makeTuneControlIrace](#), [makeTuneControlRandom](#); [getNestedTuneResultsOptPathDf](#); [getNestedTuneResultsX](#); [makeModelMultiplexerParamSet](#); [makeTuneWrapper](#); [tuneParams](#); [tuneThreshold](#)

---

 imputations

*Built in imputation methods The built-ins are:*

- `imputeConstant(const)` for imputation using a constant value,
  - `imputeMedian()` for imputation using the median,
  - `imputeMode()` for imputation using the mode,
  - `imputeMin(multiplier)` for imputing constant values shifted below the minimum using  $\min(x) - \text{multiplier} * \text{diff}(\text{range}(x))$ ,
  - `imputeMin(multiplier)` for imputing constant values shifted above the maximum using  $\max(x) + \text{multiplier} * \text{diff}(\text{range}(x))$ ,
  - `imputeNormal(mean, sd)` for imputation using normally distributed random values. Mean and standard deviation will be calculated from the data if not provided.
  - `imputeHist(breaks, use.mids)` for imputation using random values with probabilities calculated using `table` or `hist`.
  - `imputeLearner(learner, preimpute)` for imputations using the response of a classification or regression learner.
- 

## Description

Built in imputation methods The built-ins are:

- `imputeConstant(const)` for imputation using a constant value,
- `imputeMedian()` for imputation using the median,
- `imputeMode()` for imputation using the mode,
- `imputeMin(multiplier)` for imputing constant values shifted below the minimum using  $\min(x) - \text{multiplier} * \text{diff}(\text{range}(x))$ ,
- `imputeMin(multiplier)` for imputing constant values shifted above the maximum using  $\max(x) + \text{multiplier} * \text{diff}(\text{range}(x))$ ,
- `imputeNormal(mean, sd)` for imputation using normally distributed random values. Mean and standard deviation will be calculated from the data if not provided.
- `imputeHist(breaks, use.mids)` for imputation using random values with probabilities calculated using `table` or `hist`.
- `imputeLearner(learner, preimpute)` for imputations using the response of a classification or regression learner.

## Usage

`imputeConstant(const)`

`imputeMedian()`

```

imputeMean()
imputeMode()
imputeMin(multiplier = 1)
imputeMax(multiplier = 1)
imputeUniform(min = NA_real_, max = NA_real_)
imputeNormal(mu = NA_real_, sd = NA_real_)
imputeHist(breaks, use.mids = TRUE)
imputeLearner(learner, features = NULL)

```

### Arguments

const	[any] Constant valued use for imputation.
multiplier	[numeric(1)] Value that stored minimum or maximum is multiplied with when imputation is done.
min	[numeric(1)] Lower bound for uniform distribution. If NA (default), it will be estimated from the data.
max	[numeric(1)] Upper bound for uniform distribution. If NA (default), it will be estimated from the data.
mu	[numeric(1)] Mean of normal distribution. If missing it will be estimated from the data.
sd	[numeric(1)] Standard deviation of normal distribution. If missing it will be estimated from the data.
breaks	[numeric(1)] Number of breaks to use in <a href="#">hist</a> . If missing, defaults to auto-detection via “Sturges”.
use.mids	[logical(1)] If x is numeric and a histogram is used, impute with bin mids (default) or instead draw uniformly distributed samples within bin range.
learner	[Learner] Supervised learner. Its predictions will be used for imputations. Note that the target column is not available for this operation.
features	[character] Features to use in learner for prediction. Default is NULL which uses all available features except the target column of the original task.

**See Also**

Other impute: [impute](#); [makeImputeMethod](#); [makeImputeWrapper](#); [reimpute](#)

---

 impute

*Impute and re-impute data*

---

**Description**

Allows imputation of missing feature values through various techniques. Note that you have the possibility to re-impute a data set in the same way as the imputation was performed during training. This especially comes in handy during resampling when one wants to perform the same imputation on the test set as on the training set.

The function `impute` performs the imputation on a data set and returns, alongside with the imputed data set, an “ImputationDesc” object which can contain “learned” coefficients and helpful data. It can then be passed together with a new data set to `reimpute`.

The imputation techniques can be specified for certain features or for feature classes, see function arguments.

You can either provide an arbitrary object, use a built-in imputation method listed under [imputations](#) or create one yourself using [makeImputeMethod](#).

**Usage**

```
impute(data, target = character(0L), classes = list(), cols = list(),
       dummy.classes = character(0L), dummy.cols = character(0L),
       dummy.type = "factor", force.dummies = FALSE, impute.new.levels = TRUE,
       recode.factor.levels = TRUE)
```

**Arguments**

<code>data</code>	[data.frame] Input data.
<code>target</code>	[character] Name of the column(s) specifying the response. Default is <code>character(0)</code> .
<code>classes</code>	[named list] Named list containing imputation techniques for classes of columns. E.g. <code>list(numeric = imputeMedia</code>
<code>cols</code>	[named list] Named list containing names of imputation methods to impute missing values in the data column referenced by the list element’s name. Overrides imputation set via <code>classes</code> .
<code>dummy.classes</code>	[character] Classes of columns to create dummy columns for. Default is <code>character(0)</code> .
<code>dummy.cols</code>	[character] Column names to create dummy columns (containing binary missing indicator) for. Default is <code>character(0)</code> .

<code>dummy.type</code>	[character(1)] How dummy columns are encoded. Either as 0/1 with type “numeric” or as “factor”. Default is “factor”.
<code>force.dummies</code>	[logical(1)] Force dummy creation even if the respective data column does not contain any NAs. Note that (a) most learners will complain about constant columns created this way but (b) your feature set might be stochastic if you turn this off. Default is FALSE.
<code>impute.new.levels</code>	[logical(1)] If new, unencountered factor level occur during reimputation, should these be handled as NAs and then be imputed the same way? Default is TRUE.
<code>recode.factor.levels</code>	[logical(1)] Recode factor levels after reimputation, so they match the respective element of <code>lvls</code> (in the description object) and therefore match the levels of the feature factor in the training data after imputation?. Default is TRUE.

## Details

The description object contains these slots

**target** [character ] See argument.

**features** [character ] Feature names, these are the column names of data, excluding target.

**lvls** [named list ] Mapping of column names of factor features to their levels, including newly created ones during imputation.

**impute** [named list ] Mapping of column names to imputation functions.

**dummies** [named list ] Mapping of column names to imputation functions.

**impute.new.levels** [logical(1) ] See argument.

**recode.factor.levels** [logical(1) ] See argument.

## Value

<code>data</code>	[data.frame]
<code>list</code>	Imputed data.
<code>desc</code>	[ImputationDesc] Description object.

## See Also

Other impute: [imputations](#), [imputeConstant](#), [imputeHist](#), [imputeLearner](#), [imputeMax](#), [imputeMean](#), [imputeMedian](#), [imputeMin](#), [imputeMode](#), [imputeNormal](#), [imputeUniform](#); [makeImputeMethod](#); [makeImputeWrapper](#); [reimpute](#)

**Examples**

```
df = data.frame(x = c(1, 1, NA), y = factor(c("a", "a", "b")), z = 1:3)
imputed = impute(df, target = character(0), cols = list(x = 99, y = imputeMode()))
print(imputed$data)
reimpute(data.frame(x = NA), imputed$desc)
```

---

iris.task	<i>Iris classification task</i>
-----------	---------------------------------

---

**Description**

Contains the task (`iris.task`).

**References**

See [iris](#).

---

isFailureModel	<i>Is the model a FailureModel?</i>
----------------	-------------------------------------

---

**Description**

Such a model is created when one sets the corresponding option in [configureMlr](#).

For complex wrappers this getter returns TRUE if ANY model contained in it failed.

**Usage**

```
isFailureModel(model)
```

**Arguments**

model	<a href="#">[WrappedModel]</a> The model.
-------	--

**Value**

logical(1) .

---

joinClassLevels	<i>Join some class existing levels to new, larger class levels for classification problems.</i>
-----------------	---

---

**Description**

Join some class existing levels to new, larger class levels for classification problems.

**Usage**

```
joinClassLevels(task, new.levels)
```

**Arguments**

task	[Task] The task.
new.levels	[list of character] Element names specify the new class levels to create, while the corresponding element character vector specifies the existing class levels which will be joined to the new one.

**Value**

[Task](#) .

**Examples**

```
joinClassLevels(iris.task, new.levels = list(foo = c("setosa", "virginica")))
```

---

learnerArgsToControl	<i>Convert arguments to control structure.</i>
----------------------	--

---

**Description**

Find all elements in ... which are not missing and call control on them.

**Usage**

```
learnerArgsToControl(control, ...)
```

**Arguments**

control	[function] Function that creates control structure.
...	[any] Arguments for control structure function.

**Value**

Control structure for learner.

---

LearnerProperties	<i>Set, add, remove or query properties of learners</i>
-------------------	---

---

**Description**

Properties can be accessed with `learner$properties`, which returns a character vector.

**Usage**

```
setProperties(learner, props)
addProperties(learner, props)
removeProperties(learner, props)
hasProperties(learner, props)
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
props	[character] Vector of properties to set, add, remove or query.

**Value**

`setProperties`, `addProperties` and `removeProperties` return an updated [Learner](#). `hasProperties` returns a logical vector of the same length of `props`.

**See Also**

Other learner: [Learner](#), [makeLearner](#); [getHyperPars](#); [getParamSet](#); [removeHyperPars](#); [setHyperPars](#); [setId](#); [setPredictThreshold](#); [setPredictType](#)

---

learners	<i>List of supported learning algorithms.</i>
----------	---

---

**Description**

All supported learners can be found by [listLearners](#) or as a table in the tutorial appendix: [http://berndbischl.github.io/mlr/tutorial/html/integrated\\_learners/](http://berndbischl.github.io/mlr/tutorial/html/integrated_learners/).

---

LearningCurveData	<i>Result of <a href="#">generateLearningCurveData</a>.</i>
-------------------	---

---

**Description**

Result of [generateLearningCurveData](#).

---

listFilterMethods	<i>List filter methods</i>
-------------------	----------------------------

---

**Description**

Returns a subset-able dataframe with filter information.

**Usage**

```
listFilterMethods(desc = TRUE, tasks = FALSE, features = FALSE)
```

**Arguments**

desc	[logical(1)] Provide more detailed information about filters.
tasks	[logical(1)] Provide information on supported tasks.
features	[logical(1)] Provide information on supported features.

**Value**

data.frame .

---

listLearners	<i>Find matching learning algorithms.</i>
--------------	---

---

**Description**

Returns the class names of learning algorithms which have specific characteristics, e.g. whether they supports missing values, case weights, etc.

Note that the packages of all learners are loaded during the search.

Note that for general cost-sensitive learning, mlr currently supports mainly “wrapper” approaches like [CostSensWeightedPairsWrapper](#), which are not listed, as they are not basic R learning algorithms.

**Usage**

```
listLearners(obj = NA_character_, properties = character(0L),
  quiet = TRUE, warn.missing.packages = TRUE, create = FALSE)

## Default S3 method:
listLearners(obj, properties = character(0L),
  quiet = TRUE, warn.missing.packages = TRUE, create = FALSE)

## S3 method for class 'character'
listLearners(obj, properties = character(0L),
  quiet = TRUE, warn.missing.packages = TRUE, create = FALSE)

## S3 method for class 'Task'
listLearners(obj, properties = character(0L), quiet = TRUE,
  warn.missing.packages = TRUE, create = FALSE)
```

**Arguments**

obj	[character(1)   <a href="#">Task</a> ] Either a task or the type of the task, in the latter case one of: “classif”, “regr”, “surv”, “costsens”, “cluster”. Default is NA, matching all types.
properties	[character] Set of required properties to filter for. Default is character(0).
quiet	[logical(1)] Construct learners quietly to check their properties, shows no package startup messages. Turn off if you suspect errors. Default is TRUE.
warn.missing.packages	[logical(1)] If some learner cannot be constructed because its package is missing, should a warning be shown? Default is TRUE.
create	[logical(1)] Instantiate objects (or return strings)? Default is FALSE.

**Value**

character | list of [Learner](#) . Named by ids of listed learners.

**Examples**

```
## Not run:
listLearners("classif", properties = c("multiclass", "prob"))
data = iris
task = makeClassifTask(data = data, target = "Species")
listLearners(task)

## End(Not run)
```

---

listMeasures	<i>Find matching measures.</i>
--------------	--------------------------------

---

### Description

Returns the matching measures which have specific characteristics, e.g. whether they supports classification or regression.

### Usage

```
listMeasures(obj, properties = character(0L), create = FALSE)

## Default S3 method:
listMeasures(obj, properties = character(0L),
             create = FALSE)

## S3 method for class 'character'
listMeasures(obj, properties = character(0L),
             create = FALSE)

## S3 method for class 'Task'
listMeasures(obj, properties = character(0L), create = FALSE)
```

### Arguments

obj	[character(1)   <a href="#">Task</a> ] Either a task or the type of the task, in the latter case one of: “classif”, “regr”, “surv”, “costsens”, “cluster”. Default is NA, matching all types.
properties	[character] Set of required properties to filter for. See <a href="#">Measure</a> for some standardized properties. Default is character(0).
create	[logical(1)] Instantiate objects (or return strings)? Default is FALSE.

### Value

character | list of [Measure](#) . Class names of matching measures or instantiated objects.

---

lung.task	<i>NCCTG Lung Cancer survival task</i>
-----------	--

---

**Description**

Contains the task (lung.task).

**References**

See [lung](#). Incomplete cases have been removed from the task.

---

makeAggregation	<i>Specify your own aggregation of measures</i>
-----------------	---

---

**Description**

This is an advanced feature of mlr. It gives access to some inner workings so the result might not be compatible with everything!

**Usage**

```
makeAggregation(id, fun)
```

**Arguments**

id	[character(1)] Name of the aggregation method. (Preferably the same name as the generated function)
fun	[function] A function with following signature: <code>function(task, perf.test, perf.train, measure, group, p</code> <ul style="list-style-type: none"> <li>• <b>task</b>: task (<a href="#">Task</a>) object</li> <li>• <b>perf.test</b>: numerical vector of <a href="#">performance</a> results on the test data set</li> <li>• <b>perf.train</b>: numerical vector of <a href="#">performance</a> results on the train data set</li> <li>• <b>measure</b>: <a href="#">Measure</a> object.</li> <li>• <b>group</b>: grouping vector</li> <li>• <b>pred</b>: <a href="#">Prediction</a> object</li> </ul>

**Value**

[Aggregation](#) object

**See Also**

[aggregations](#), [setAggregation](#)

**Examples**

```
# computes the interquartile range on all performance values
test.iqr = makeAggregation(id = "test.iqr",
  fun = function (task, perf.test, perf.train, measure, group, pred) IQR(perf.test))
```

---

makeBaggingWrapper      *Fuse learner with the bagging technique.*

---

**Description**

Fuses a learner with the bagging method (i.e., similar to what a randomForest does). Creates a learner object, which can be used like any other learner object. Models can easily be accessed via [getHomogeneousEnsembleModels](#).

Bagging is implemented as follows: For each iteration a random data subset is sampled (with or without replacement) and potentially the number of features is also restricted to a random subset. Note that this is usually handled in a slightly different way in the random forest where features are sampled at each tree split).

Prediction works as follows: For classification we do majority voting to create a discrete label and probabilities are predicted by considering the proportions of all predicted labels. For regression the mean value and the standard deviations across predictions is computed.

Note that the passed base learner must always have `predict.type = 'response'`, while the BaggingWrapper can estimate probabilities and standard errors, so it can be set, e.g., to `predict.type = 'prob'`. For this reason, when you call [setPredictType](#), the type is only set for the BaggingWrapper, not passed down to the inner learner.

**Usage**

```
makeBaggingWrapper(learner, bw.iters = 10L, bw.replace = TRUE, bw.size,
  bw.feats = 1)
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
bw.iters	[integer(1)] Iterations = number of fitted models in bagging. Default is 10.
bw.replace	[logical(1)] Sample bags with replacement (bootstrapping)? Default is TRUE.
bw.size	[numeric(1)] Percentage size of sampled bags. Default is 1 for bootstrapping and 0.632 for subsampling.
bw.feats	[numeric(1)] Percentage size of randomly selected features in bags. Default is 1. At least one feature will always be selected.

**Value**

[Learner](#) .

**See Also**

Other wrapper: [CostSensClassifModel](#), [CostSensClassifWrapper](#), [makeCostSensClassifWrapper](#); [CostSensRegrModel](#), [CostSensRegrWrapper](#), [makeCostSensRegrWrapper](#); [makeDownsampleWrapper](#); [makeFeatSelWrapper](#); [makeFilterWrapper](#); [makeImputeWrapper](#); [makeMulticlassWrapper](#); [makeOverBaggingWrapper](#); [makeOversampleWrapper](#), [makeUndersampleWrapper](#); [makePreprocWrapperCaret](#); [makePreprocWrapper](#); [makeSMOTEWrapper](#); [makeTuneWrapper](#); [makeWeightedClassesWrapper](#)

---

makeClassifTask	<i>Create a classification, regression, survival, cluster, or cost-sensitive classification task.</i>
-----------------	---

---

**Description**

The task encapsulates the data and specifies - through its subclasses - the type of the task. It also contains a description object detailing further aspects of the data.

Useful operators are: [getTaskFormula](#), [getTaskFormulaAsString](#), [getTaskFeatureNames](#), [getTaskData](#), [getTaskTargets](#), [subsetTask](#).

Object members:

**env** [environment ] Environment where data for the task are stored. Use [getTaskData](#) in order to access it.

**weights** [numeric ] See argument above. NULL if not present.

**blocking** [factor ] See argument above. NULL if not present.

**task.desc** [[TaskDesc](#) ] Encapsulates further information about the task.

**Usage**

```
makeClassifTask(id, data, target, weights = NULL, blocking = NULL,
  positive = NA_character_, fixup.data = "warn", check.data = TRUE)
```

```
makeClusterTask(id, data, weights = NULL, blocking = NULL,
  fixup.data = "warn", check.data = TRUE)
```

```
makeCostSensTask(id, data, costs, blocking = NULL, fixup.data = "warn",
  check.data = TRUE)
```

```
makeRegrTask(id, data, target, weights = NULL, blocking = NULL,
  fixup.data = "warn", check.data = TRUE)
```

```
makeSurvTask(id, data, target, censoring = "rcens", weights = NULL,
  blocking = NULL, fixup.data = "warn", check.data = TRUE)
```

**Arguments**

id	[character(1)] Id string for object. Default is the name of R variable passed to data.
data	[data.frame] A data frame containing the features and target variable(s).
target	[character(1)   character(2)] Name of the target variable. For survival analysis these are the names of the survival time and event columns, so it has length 2.
weights	[numeric] Optional, non-negative case weight vector to be used during fitting. Cannot be set for cost-sensitive learning. Default is NULL which means no (= equal) weights.
blocking	[factor] An optional factor of the same length as the number of observations. Observations with the same blocking level “belong together”. Specifically, they are either put all in the training or the test set during a resampling iteration. Default is NULL which means no blocking.
positive	[character(1)] Positive class for binary classification (otherwise ignored and set to NA). Default is the first factor level of the target attribute.
fixup.data	[character(1)] Should some basic cleaning up of data be performed? Currently this means removing empty factor levels for the columns. Possible choices are: “no” = Don’t do it. “warn” = Do it but warn about it. “quiet” = Do it but keep silent. Default is “warn”.
check.data	[logical(1)] Should sanity of data be checked initially at task creation? You should have good reasons to turn this off (one might be speed). Default is TRUE
costs	[data.frame] A numeric matrix or data frame containing the costs of misclassification. We assume the general case of observation specific costs. This means we have n rows, corresponding to the observations, in the same order as data. The columns correspond to classes and their names are the class labels (if unnamed we use y1 to yk as labels). Each entry (i,j) of the matrix specifies the cost of predicting class j for observation i.
censoring	[character(1)] Censoring type. Allowed choices are “rcens” for right censored data (default), “lcens” for left censored and “icens” for interval censored data using the “interval2” format. See <a href="#">Surv</a> for details.

**Value**

Task .

**Examples**

```
library(mlbench)
data(BostonHousing)
data(Ionosphere)

makeClassifTask(data = iris, target = "Species")
makeRegrTask(data = BostonHousing, target = "medv")
# an example of a classification task with more than those standard arguments:
blocking = factor(c(rep(1, 51), rep(2, 300)))
makeClassifTask(id = "myIonosphere", data = Ionosphere, target = "Class",
  positive = "good", blocking = blocking)
makeClusterTask(data = iris[, -5L])
```

---

makeCostMeasure	<i>Creates a measure for non-standard misclassification costs.</i>
-----------------	--

---

**Description**

Creates a measure for non-standard misclassification costs.

**Usage**

```
makeCostMeasure(id = "costs", minimize = TRUE, costs, task,
  combine = mean, best = NULL, worst = NULL)
```

**Arguments**

id	[character(1)] Name of measure. Default is "costs".
minimize	[logical(1)] Should the measure be minimized? Otherwise you are effectively specifying a benefits matrix. Default is TRUE.
costs	[matrix] Matrix of misclassification costs. Rows and columns have to be named with class labels, order does not matter. Rows indicate true classes, columns predicted classes.
task	[ <a href="#">ClassifTask</a> ] Classification task. Has to be passed, so validity of matrix names can be checked.

combine	[function] How to combine costs over all cases for a SINGLE test set? Note this is not the same as the aggregate argument in <a href="#">makeMeasure</a> You can set this as well via <a href="#">setAggregation</a> , as for any measure. Default is <a href="#">mean</a> .
best	[numeric(1)] Best obtainable value for measure. Default is -Inf or Inf, depending on minimize.
worst	[numeric(1)] Worst obtainable value for measure. Default is Inf or -Inf, depending on minimize.

**Value**

[Measure](#) .

**See Also**

---

makeCostSensClassifWrapper

*Wraps a classification learner for use in cost-sensitive learning.*

---

**Description**

Creates a wrapper, which can be used like any other learner object. The classification model can easily be accessed via [getHomogeneousEnsembleModels](#).

This is a very naive learner, where the costs are transformed into classification labels - the label for each case is the name of class with minimal costs. (If ties occur, the label which is better on average w.r.t. costs over all training data is preferred.) Then the classifier is fitted to that data and subsequently used for prediction.

**Usage**

```
makeCostSensClassifWrapper(learner)
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The classification learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
---------	---

**Value**

[Learner](#) .

**See Also**

Other costsens: [ClassifTask](#), [ClusterTask](#), [CostSensTask](#), [RegrTask](#), [SurvTask](#), [Task](#), [makeClassifTask](#), [makeClusterTask](#), [makeCostSensTask](#), [makeRegrTask](#), [makeSurvTask](#); [CostSensRegrModel](#), [CostSensRegrWrapper](#), [makeCostSensRegrWrapper](#); [CostSensWeightedPairsModel](#), [CostSensWeightedPairsWrapper](#), [makeCostSensWeightedPairsWrapper](#)

---

makeCostSensRegrWrapper

*Wraps a regression learner for use in cost-sensitive learning.*

---

**Description**

Creates a wrapper, which can be used like any other learner object. Models can easily be accessed via [getHomogeneousEnsembleModels](#).

For each class in the task, an individual regression model is fitted for the costs of that class. During prediction, the class with the lowest predicted costs is selected.

**Usage**

```
makeCostSensRegrWrapper(learner)
```

**Arguments**

learner      [[Learner](#) | character(1)]  
The regression learner. If you pass a string the learner will be created via [makeLearner](#).

**Value**

[Learner](#) .

**See Also**

Other costsens: [ClassifTask](#), [ClusterTask](#), [CostSensTask](#), [RegrTask](#), [SurvTask](#), [Task](#), [makeClassifTask](#), [makeClusterTask](#), [makeCostSensTask](#), [makeRegrTask](#), [makeSurvTask](#); [CostSensClassifModel](#), [CostSensClassifWrapper](#), [makeCostSensClassifWrapper](#); [CostSensWeightedPairsModel](#), [CostSensWeightedPairsWrapper](#), [makeCostSensWeightedPairsWrapper](#)

Other wrapper: [CostSensClassifModel](#), [CostSensClassifWrapper](#), [makeCostSensClassifWrapper](#); [makeBaggingWrapper](#); [makeDownsampleWrapper](#); [makeFeatSelWrapper](#); [makeFilterWrapper](#); [makeImputeWrapper](#); [makeMulticlassWrapper](#); [makeOverBaggingWrapper](#); [makeOversampleWrapper](#); [makeUndersampleWrapper](#); [makePreprocWrapperCaret](#); [makePreprocWrapper](#); [makeSMOTEWrapper](#); [makeTuneWrapper](#); [makeWeightedClassesWrapper](#)

---

makeCostSensWeightedPairsWrapper

*Wraps a classifier for cost-sensitive learning to produce a weighted pairs model.*

---

## Description

Creates a wrapper, which can be used like any other learner object. Models can easily be accessed via [getHomogeneousEnsembleModels](#).

For each pair of labels, we fit a binary classifier. For each observation we define the label to be the element of the pair with minimal costs. During fitting, we also weight the observation with the absolute difference in costs. Prediction is performed by simple voting.

This approach is sometimes called cost-sensitive one-vs-one (CS-OVO), because it is obviously very similar to the one-vs-one approach where one reduces a normal multi-class problem to multiple binary ones and aggregates by voting.

## Usage

```
makeCostSensWeightedPairsWrapper(learner)
```

## Arguments

learner	<a href="#">[Learner   character(1)]</a> The classification learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
---------	--

## Value

[Learner](#) .

## See Also

---

```
makeCustomResampledMeasure
```

*Construct your own resampled performance measure.*

---

### Description

Construct your own performance measure, used after resampling. Note that individual training / test set performance values will be set to NA, you only calculate an aggregated value. If you can define a function that makes sense for every single training / test set, implement your own [Measure](#).

### Usage

```
makeCustomResampledMeasure(id, minimize = TRUE, properties = character(0L),
  fun, extra.args = list(), best = NULL, worst = NULL)
```

### Arguments

id	[character(1)] Name of aggregated measure.
minimize	[logical(1)] Should the measure be minimized? Default is in TRUE.
properties	[character] Set of measure properties. Some standard property names include: <b>classif</b> Is the measure applicable for classification? <b>classif.multi</b> Is the measure applicable for multi-class classification? <b>regr</b> Is the measure applicable for regression? <b>surv</b> Is the measure applicable for survival? <b>costsens</b> Is the measure applicable for cost-sensitive learning? <b>req.pred</b> Is prediction object required in calculation? Usually the case. <b>req.truth</b> Is truth column required in calculation? Usually the case. <b>req.task</b> Is task object required in calculation? Usually not the case <b>req.model</b> Is model object required in calculation? Usually not the case. <b>req.feats</b> Are feature values required in calculation? Usually not the case. <b>req.prob</b> Are predicted probabilities required in calculation? Usually not the case, example would be AUC. Default is character(0).
fun	[function(task, pred, group, pred, extra.args)] Calculates performance value from <a href="#">ResamplePrediction</a> object. For rare case you can also use the task, the grouping or the extra arguments extra.args.
extra.args	[list] List of extra arguments which will always be passed to fun. Default is empty list.
best	[numeric(1)] Best obtainable value for measure. Default is -Inf or Inf, depending on minimize.

worst [numeric(1)]  
Worst obtainable value for measure. Default is Inf or -Inf, depending on minimize.

**Value**

[Measure](#) .

**See Also**

Other performance: [G1](#), [G2](#), [acc](#), [auc](#), [bac](#), [ber](#), [brier](#), [cindex](#), [db](#), [dunn](#), [f1](#), [fdr](#), [featperc](#), [fn](#), [fnr](#), [fp](#), [fpr](#), [gmean](#), [gpr](#), [mae](#), [mcc](#), [mcp](#), [meancosts](#), [measureACC](#), [measureAUC](#), [measureBAC](#), [measureBrier](#), [measureFDR](#), [measureFN](#), [measureFNR](#), [measureFP](#), [measureFPR](#), [measureGMEAN](#), [measureGPR](#), [measureMAE](#), [measureMCC](#), [measureMEDAE](#), [measureMEDSE](#), [measureMMCE](#), [measureMSE](#), [measureNPV](#), [measurePPV](#), [measureRMSE](#), [measureSAE](#), [measureSSE](#), [measureTN](#), [measureTNR](#), [measureTP](#), [measureTPR](#), [measures](#), [medae](#), [medse](#), [mmce](#), [mse](#), [multiclass.auc](#), [npv](#), [ppv](#), [rmse](#), [sae](#), [silhouette](#), [sse](#), [timeboth](#), [timepredict](#), [timetrain](#), [tn](#), [tnr](#), [tp](#), [tpr](#); [Measure](#), [makeMeasure](#); [makeCostMeasure](#); [performance](#)

---

`makeDownsampleWrapper` *Fuse learner with simple downsampling (subsampling).*

---

**Description**

Creates a learner object, which can be used like any other learner object. It will only be trained on a subset of the original data to save computational time.

**Usage**

```
makeDownsampleWrapper(learner, dw.perc = 1, dw.stratify = FALSE)
```

**Arguments**

learner [[Learner](#) | character(1)]  
The learner. If you pass a string the learner will be created via [makeLearner](#).

dw.perc [numeric(1)]  
See [downsample](#). Default is 1.

dw.stratify [logical(1)]  
See [downsample](#). Default is FALSE.

**Value**

[Learner](#) .

**See Also**

Other downsample: [downsample](#)

Other wrapper: [CostSensClassifModel](#), [CostSensClassifWrapper](#), [makeCostSensClassifWrapper](#); [CostSensRegrModel](#), [CostSensRegrWrapper](#), [makeCostSensRegrWrapper](#); [makeBaggingWrapper](#); [makeFeatSelWrapper](#); [makeFilterWrapper](#); [makeImputeWrapper](#); [makeMulticlassWrapper](#); [makeOverBaggingWrapper](#); [makeOversampleWrapper](#), [makeUndersampleWrapper](#); [makePreprocWrapperCaret](#); [makePreprocWrapper](#); [makeSMOTEWrapper](#); [makeTuneWrapper](#); [makeWeightedClassesWrapper](#)

---

makeFeatSelWrapper      *Fuse learner with feature selection.*

---

**Description**

Fuses a base learner with a search strategy to select variables. Creates a learner object, which can be used like any other learner object, but which internally uses [selectFeatures](#). If the train function is called on it, the search strategy and resampling are invoked to select an optimal set of variables. Finally, a model is fitted on the complete training data with these variables and returned. See [selectFeatures](#) for more details.

After training, the optimal features (and other related information) can be retrieved with [getFeatSelResult](#).

**Usage**

```
makeFeatSelWrapper(learner, resampling, measures, bit.names, bits.to.features,
  control, show.info = getMlrOption("show.info"))
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
resampling	[ <a href="#">ResampleInstance</a>   <a href="#">ResampleDesc</a> ] Resampling strategy for feature selection. If you pass a description, it is instantiated once at the beginning by default, so all points are evaluated on the same training/test sets. If you want to change that behaviour, look at <a href="#">FeatSelControl</a> .
measures	[list of <a href="#">Measure</a>   <a href="#">Measure</a> ] Performance measures to evaluate. The first measure, aggregated by the first aggregation function is optimized, others are simply evaluated.
bit.names	[character] Names of bits encoding the solutions. Also defines the total number of bits in the encoding. Per default these are the feature names of the task.
bits.to.features	[function(x, task)] Function which transforms an integer-0-1 vector into a character vector of selected features. Per default a value of 1 in the <i>i</i> th bit selects the <i>i</i> th feature to be in the candidate solution.

control	[see <a href="#">FeatSelControl</a> ] Control object for search method. Also selects the optimization algorithm for feature selection.
show.info	[logical(1)] Print verbose output on console? Default is set via <a href="#">configureMlr</a> .

**Value**

[Learner](#) .

**See Also**

Other featsel: [FeatSelControl](#), [FeatSelControlExhaustive](#), [FeatSelControlGA](#), [FeatSelControlRandom](#), [FeatSelControlSequential](#), [makeFeatSelControlExhaustive](#), [makeFeatSelControlGA](#), [makeFeatSelControlRandom](#), [makeFeatSelControlSequential](#); [analyzeFeatSelResult](#); [getFeatSelResult](#); [selectFeatures](#)

Other wrapper: [CostSensClassifModel](#), [CostSensClassifWrapper](#), [makeCostSensClassifWrapper](#); [CostSensRegrModel](#), [CostSensRegrWrapper](#), [makeCostSensRegrWrapper](#); [makeBaggingWrapper](#); [makeDownsampleWrapper](#); [makeFilterWrapper](#); [makeImputeWrapper](#); [makeMulticlassWrapper](#); [makeOverBaggingWrapper](#); [makeOversampleWrapper](#), [makeUndersampleWrapper](#); [makePreprocWrapperCaret](#); [makePreprocWrapper](#); [makeSMOTEWrapper](#); [makeTuneWrapper](#); [makeWeightedClassesWrapper](#)

**Examples**

```
# nested resampling with feature selection (with a pretty stupid algorithm for selection)
outer = makeResampleDesc("CV", iters = 2L)
inner = makeResampleDesc("Holdout")
ctrl = makeFeatSelControlRandom(maxit = 3)
lrn = makeFeatSelWrapper("classif.ksvm", resampling = inner, control = ctrl)
# we also extract the selected features for all iteration here
r = resample(lrn, iris.task, outer, extract = getFeatSelResult)
```

---

makeFilter	<i>Create a feature filter</i>
------------	--------------------------------

---

**Description**

Creates and registers custom feature filters. Implemented filters can be listed with [listFilterMethods](#).

**Usage**

```
makeFilter(name, desc, pkg, supported.tasks, supported.features, fun)
```

**Arguments**

name	[character(1)] Identifier for the filter.
desc	[character(1)] Short description of the filter.

pkg	[character(1)] Source package where the filter is implemented.
supported.tasks	[character] Task types supported.
supported.features	[character] Feature types supported.
fun	[function(task, nselect, ...)] Function which takes a task and returns a named numeric vector of scores, one score for each feature of task. Higher scores mean higher importance of the feature. At least nselect features must be calculated, the remaining may be set to NA or omitted, and thus will not be selected. the original order will be restored if necessary.

**Value**

Object of class “Filter”.

---

makeFilterWrapper      *Fuse learner with a feature filter method.*

---

**Description**

Fuses a base learner with a filter method. Creates a learner object, which can be used like any other learner object. Internally uses [filterFeatures](#) before every model fit.

After training, the selected features can be retrieved with [getFilteredFeatures](#).

Note that observation weights do not influence the filtering and are simply passed down to the next learner.

**Usage**

```
makeFilterWrapper(learner, fw.method = "rf.importance", fw.perc = NULL,
  fw.abs = NULL, fw.threshold = NULL, fw.mandatory.feats = NULL, ...)
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
fw.method	[character(1)] Filter method. See <a href="#">listFilterMethods</a> . Default is “rf.importance”.
fw.perc	[numeric(1)] If set, select fw.perc*100 top scoring features. Mutually exclusive with arguments fw.abs and fw.threshold.

fw.abs	[numeric(1)] If set, select fw.abs top scoring features. Mutually exclusive with arguments fw.perc and fw.threshold.
fw.threshold	[numeric(1)] If set, select features whose score exceeds fw.threshold. Mutually exclusive with arguments fw.perc and fw.abs.
fw.mandatory.feats	[character] Mandatory features which are always included regardless of their scores
...	[any] Additional parameters passed down to the filter.

**Value**

Learner .

**See Also**

Other filter: [FilterValues](#); [filterFeatures](#); [generateFilterValuesData](#); [getFilterValues](#); [getFilteredFeatures](#); [plotFilterValuesGGVIS](#); [plotFilterValues](#)

**Examples**

```
task = makeClassifTask(data = iris, target = "Species")
lrn = makeLearner("classif.lda")
inner = makeResampleDesc("Holdout")
outer = makeResampleDesc("CV", iters = 2)
lrn = makeFilterWrapper(lrn, fw.perc = 0.5)
mod = train(lrn, task)
print(getFilteredFeatures(mod))
# now nested resampling, where we extract the features that the filter method selected
r = resample(lrn, task, outer, extract = function(model) {
  getFilteredFeatures(model)
})
print(r$extract)
```

---

makeFixedHoldoutInstance

*Generate a fixed holdout instance for resampling.*

---

**Description**

Generate a fixed holdout instance for resampling.

**Usage**

```
makeFixedHoldoutInstance(train.inds, test.inds, size)
```

**Arguments**

train.inds	[integer] Indices for training set.
test.inds	[integer] Indices for test set.
size	[integer(1)] Size of the data set to resample. The function needs to know the largest possible index of the whole data set.

**Value**

[ResampleInstance](#) .

---

makeImputeMethod	<i>Create a custom imputation method.</i>
------------------	---

---

**Description**

This is a constructor to create your own imputation methods.

**Usage**

```
makeImputeMethod(learn, impute, args = list())
```

**Arguments**

learn	[function(data, target, col, ...)] Function to learn and extract information on column col out of data frame data. Argument target specifies the target column of the learning task. The function has to return a named list of values.
impute	[function(data, target, col, ...)] Function to impute missing values in col using information returned by learn on the same column. All list elements of the return values of learn are passed to this function into ....
args	[list] Named list of arguments to pass to learn via ....

**See Also**

Other impute: [imputations](#), [imputeConstant](#), [imputeHist](#), [imputeLearner](#), [imputeMax](#), [imputeMean](#), [imputeMedian](#), [imputeMin](#), [imputeMode](#), [imputeNormal](#), [imputeUniform](#); [impute](#); [makeImputeWrapper](#); [reimpute](#)

---

makeImputeWrapper      *Fuse learner with an imputation method.*

---

### Description

Fuses a base learner with an imputation method. Creates a learner object, which can be used like any other learner object. Internally uses `impute` before training the learner and `reimpute` before predicting.

### Usage

```
makeImputeWrapper(learner, classes = list(), cols = list(),
  dummy.cols = character(0L), dummy.type = "factor",
  impute.new.levels = TRUE, recode.factor.levels = TRUE)
```

### Arguments

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
classes	[named list] Named list containing imputation techniques for classes of columns. E.g. <code>list(numeric = imputeMedia</code>
cols	[named list] Named list containing names of imputation methods to impute missing values in the data column referenced by the list element's name. Overrides imputation set via classes.
dummy.cols	[character] Column names to create dummy columns (containing binary missing indicator) for. Default is <code>character(0)</code> .
dummy.type	[character(1)] How dummy columns are encoded. Either as 0/1 with type "numeric" or as "factor". Default is "factor".
impute.new.levels	[logical(1)] If new, unencountered factor level occur during reimputation, should these be handled as NAs and then be imputed the same way? Default is TRUE.
recode.factor.levels	[logical(1)] Recode factor levels after reimputation, so they match the respective element of <code>lvls</code> (in the description object) and therefore match the levels of the feature factor in the training data after imputation?. Default is TRUE.

### Value

[Learner](#) .

**See Also**

Other impute: [imputations](#), [imputeConstant](#), [imputeHist](#), [imputeLearner](#), [imputeMax](#), [imputeMean](#), [imputeMedian](#), [imputeMin](#), [imputeMode](#), [imputeNormal](#), [imputeUniform](#); [impute](#); [makeImputeMethod](#); [reimpute](#)

---

makeLearner

*Create learner object.*

---

**Description**

For a classification learner the `predict.type` can be set to “prob” to predict probabilities and the maximum value selects the label. The threshold used to assign the label can later be changed using the [setThreshold](#) function.

**Usage**

```
makeLearner(c1, id = c1, predict.type = "response",
  predict.threshold = NULL, fix.factors.prediction = FALSE, ...,
  par.vals = list(), config = list())
```

**Arguments**

<code>c1</code>	[character(1)] Class of learner. By convention, all classification learners start with “classif.”, all regression learners with “regr.”, all survival learners start with “surv.” and all clustering learners with “cluster.”. A list of all learners is available on the <a href="#">learners</a> help page.
<code>id</code>	[character(1)] Id string for object. Used to display object. Default is <code>c1</code> .
<code>predict.type</code>	[character(1)] Classification: “response” (= labels) or “prob” (= probabilities and labels by selecting the ones with maximal probability). Regression: “response” (= mean response) or “se” (= standard errors and mean response). Survival: “response” (= some sort of orderable risk) or “prob” (= time dependent probabilities). Clustering: “response” (= cluster IDS) or “prob” (= fuzzy cluster membership probabilities). Default is “response”.
<code>predict.threshold</code>	[numeric] Threshold to produce class labels. Has to be a named vector, where names correspond to class labels. Only for binary classification it can be a single numerical threshold for the positive class. See <a href="#">setThreshold</a> for details on how it is applied. Default is <code>NULL</code> which means 0.5 / an equal threshold for each class.

<code>fix.factors.prediction</code>	[logical(1)] In some cases, problems occur in underlying learners for factor features during prediction. If the new features have LESS factor levels than during training (a strict subset), the learner might produce an error like “type of predictors in new data do not match that of the training data”. In this case one can repair this problem by setting this option to TRUE. We will simply add the missing factor levels missing from the test feature (but present in training) to that feature. Default is FALSE.
<code>...</code>	[any] Optional named (hyper)parameters. Alternatively these can be given using the <code>par.vals</code> argument.
<code>par.vals</code>	[list] Optional list of named (hyper)parameters. The arguments in <code>...</code> take precedence over values in this list. We strongly encourage you to use one or the other to pass (hyper)parameters to the learner but not both.
<code>config</code>	[named list] Named list of config option to overwrite global settings set via <code>configureMlr</code> for this specific learner.

**Value**

[Learner](#) .

**See Also**

[\[resample\]](#), [\[predict.WrappedModel\]](#)

Other learner: [LearnerProperties](#), [addProperties](#), [hasProperties](#), [removeProperties](#), [setProperties](#); [getHyperPars](#); [getParamSet](#); [removeHyperPars](#); [setHyperPars](#); [setId](#); [setPredictThreshold](#); [setPredictType](#)

**Examples**

```
makeLearner("classif.rpart")
makeLearner("classif.lda", predict.type = "prob")
lrn = makeLearner("classif.lda", method = "t", nu = 10)
print(lrn$par.vals)
```

## Description

A measure object encapsulates a function to evaluate the performance of a prediction. Information about already implemented measures can be obtained here: [measures](#).

A learner is trained on a training set `d1`, results in a model `m`, predicts another set `d2` (which may be a different one or the training set), resulting in the prediction. The performance measure can now be defined using all of the information of the original task, the fitted model and the prediction.

Object slots:

**id** [character(1) ] See argument.

**minimize** [logical(1) ] See argument.

**properties** [character ] See argument.

**fun** [function ] See argument.

**extra.args** [list ] See argument.

**aggr** [[Aggregation](#) ] See argument.

**best** [numeric(1) ] See argument.

**worst** [numeric(1) ] See argument.

**name** [character(1) ] See argument.

**note** [character(1) ] See argument.

## Usage

```
makeMeasure(id, minimize, properties = character(0L), fun,
  extra.args = list(), aggr = test.mean, best = NULL, worst = NULL,
  name = id, note = "")
```

## Arguments

id	[character(1)] Name of measure.
minimize	[logical(1)] Should the measure be minimized? Default is in TRUE.
properties	[character] Set of measure properties. Some standard property names include: <b>classif</b> Is the measure applicable for classification? <b>classif.multi</b> Is the measure applicable for multi-class classification? <b>regr</b> Is the measure applicable for regression? <b>surv</b> Is the measure applicable for survival? <b>costsens</b> Is the measure applicable for cost-sensitive learning? <b>req.pred</b> Is prediction object required in calculation? Usually the case. <b>req.truth</b> Is truth column required in calculation? Usually the case. <b>req.task</b> Is task object required in calculation? Usually not the case. <b>req.model</b> Is model object required in calculation? Usually not the case. <b>req.feats</b> Are feature values required in calculation? Usually not the case.

	<b>req.prob</b> Are predicted probabilities required in calculation? Usually not the case, example would be AUC. Default is <code>character(0)</code> .
<code>fun</code>	[function(task, model, pred, extra.args)] Calculates performance value.
<code>extra.args</code>	[list] List of extra arguments which will always be passed to <code>fun</code> . Default is empty list.
<code>aggr</code>	[Aggregation] Aggregation function, which is used to aggregate the values measured on test / training sets of the measure to a single value. Default is <code>test.mean</code> .
<code>best</code>	[numeric(1)] Best obtainable value for measure. Default is <code>-Inf</code> or <code>Inf</code> , depending on minimize.
<code>worst</code>	[numeric(1)] Worst obtainable value for measure. Default is <code>Inf</code> or <code>-Inf</code> , depending on minimize.
<code>name</code>	[character] Name of the measure. Default is <code>id</code> .
<code>note</code>	[character] Description and additional notes for the learner. Default is <code>""</code> .

**Value**

Measure .

  sum((pred$data$response - pred$data$truth)^2)
makeMeasure(id = "my.sse", minimize = TRUE, properties = c("regr", "response"), fun = f)
```

---

`makeModelMultiplexer` *Create model multiplexer for model selection to tune over multiple possible models.*

---

### Description

Combines multiple base learners by dispatching on the hyperparameter “selected.learner” to a specific model class. This allows to tune not only the model class (SVM, random forest, etc) but also their hyperparameters in one go. Combine this with [tuneParams](#) and [makeTuneControlIrace](#) for a very powerful approach, see example below.

The parameter set is the union of all (unique) base learners. In order to avoid name clashes all parameter names are prefixed with the base learner id, i.e. “[learner.id].[parameter.name]”.

### Usage

```
makeModelMultiplexer(base.learners)
```

### Arguments

```
base.learners  [list of Learner]
                List of Learners with unique IDs.
```

### Value

`ModelMultiplexer` . A [Learner](#) specialized as `ModelMultiplexer`.

### Note

Note that logging output during tuning is somewhat shortened to make it more readable. I.e., the artificial prefix before parameter names is suppressed.

### See Also

Other multiplexer: [makeModelMultiplexerParamSet](#)

Other tune: [TuneControl](#), [TuneControlCMAES](#), [TuneControlGenSA](#), [TuneControlGrid](#), [TuneControlIrace](#), [TuneControlRandom](#), [makeTuneControlCMAES](#), [makeTuneControlDesign](#), [makeTuneControlGenSA](#), [makeTuneControlGrid](#), [makeTuneControlIrace](#), [makeTuneControlRandom](#); [getNestedTuneResultsOptPathDf](#); [getNestedTuneResultsX](#); [getTuneResult](#); [makeModelMultiplexerParamSet](#); [makeTuneWrapper](#); [tuneParams](#); [tuneThreshold](#)

### Examples

```
b1s = list(
  makeLearner("classif.ksvm"),
  makeLearner("classif.randomForest")
)
lrn = makeModelMultiplexer(b1s)
# simple way to construct param set for tuning
```

```

# parameter names are prefixed automatically and the 'requires'
# element is set, too, to make all paramaters subordinate to 'selected.learner'
ps = makeModelMultiplexerParamSet(lrn,
  makeNumericParam("sigma", lower = -10, upper = 10, trafo = function(x) 2^x),
  makeIntegerParam("ntree", lower = 1L, upper = 500L)
)
print(ps)
rdesc = makeResampleDesc("CV", iters = 2L)
# to save some time we use random search. but you probably want something like this:
# ctrl = makeTuneControlIrace(maxExperiments = 500L)
ctrl = makeTuneControlRandom(maxit = 10L)
res = tuneParams(lrn, iris.task, rdesc, par.set = ps, control = ctrl)
print(res)
print(head(as.data.frame(res$opt.path)))

# more unique and reliable way to construct the param set
ps = makeModelMultiplexerParamSet(lrn,
  classif.ksvm = makeParamSet(
    makeNumericParam("sigma", lower = -10, upper = 10, trafo = function(x) 2^x)
  ),
  classif.randomForest = makeParamSet(
    makeIntegerParam("ntree", lower = 1L, upper = 500L)
  )
)

# this is how you would construct the param set manually, works too
ps = makeParamSet(
  makeDiscreteParam("selected.learner", values = extractSubList(bls, "id")),
  makeNumericParam("classif.ksvm.sigma", lower = -10, upper = 10, trafo = function(x) 2^x,
    requires = quote(selected.learner == "classif.ksvm")),
  makeIntegerParam("classif.randomForest.ntree", lower = 1L, upper = 500L,
    requires = quote(selected.learner == "classif.randomForst"))
)

# all three ps-objects are exactly the same internally.

```

---

```
makeModelMultiplexerParamSet
```

*Creates a parameter set for model multiplexer tuning.*

---

## Description

Handy way to create the param set with less typing.

The following is done automatically:

- The `selected.learner` param is created
- Parameter names are prefixed.
- The `requires` field of each param is set. This makes all parameters subordinate to `selected.learner`

**Usage**

```
makeModelMultiplexerParamSet(multiplexer, ..., .check = TRUE)
```

**Arguments**

multiplexer	<a href="#">[ModelMultiplexer]</a> The multiplexer learner.
...	<a href="#">[ParamSet   Param]</a> (a) First option: Named param sets. Names must correspond to base learners. You only need to enter the parameters you want to tune without reference to the selected.learner field in any way. (b) Second option. Just the params you would enter in the param sets. Even shorterto create. Only works when it can be uniquely identified to which learner each of your passed parameters belongs.
.check	<a href="#">[logical]</a> Check that for each param in ... one param in found in the base learners. Default is TRUE

**Value**

[ParamSet](#) .

**See Also**

Other multiplexer: [ModelMultiplexer](#), [makeModelMultiplexer](#)

Other tune: [ModelMultiplexer](#), [makeModelMultiplexer](#); [TuneControl](#), [TuneControlCMAES](#), [TuneControlGenSA](#), [TuneControlGrid](#), [TuneControlIrace](#), [TuneControlRandom](#), [makeTuneControlCMAES](#), [makeTuneControlDesign](#), [makeTuneControlGenSA](#), [makeTuneControlGrid](#), [makeTuneControlIrace](#), [makeTuneControlRandom](#); [getNestedTuneResultsOptPathDf](#); [getNestedTuneResultsX](#); [getTuneResult](#); [makeTuneWrapper](#); [tuneParams](#); [tuneThreshold](#)

**Examples**

```
# See makeModelMultiplexer
```

---

makeMulticlassWrapper *Fuse learner with multiclass method.*

---

**Description**

Fuses a base learner with a multi-class method. Creates a learner object, which can be used like any other learner object. This way learners which can only handle binary classification will be able to handle multi-class problems, too.

We use a multiclass-to-binary reduction principle, where multiple binary problems are created from the multiclass task. How these binary problems are generated is defined by an error-correcting-output-code (ECOC) code book. This also allows the simple and well-known one-vs-one and one-vs-rest approaches. Decoding is currently done via Hamming decoding, see e.g. here <http://jmlr.org/papers/volume11/escalera10a/escalera10a.pdf>.

Currently, the approach always operates on the discrete predicted labels of the binary base models (instead of their probabilities) and the created wrapper cannot predict posterior probabilities.

### Usage

```
makeMulticlassWrapper(learner, mcw.method = "onevsrest")
```

### Arguments

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
mcw.method	[character(1)   function] “onevsone” or “onevsrest”. You can also pass a function, with signature <code>function(task)</code> and which returns a ECOC codematrix with entries +1,-1,0. Columns define new binary problems, rows correspond to classes (rows must be named). 0 means class is not included in binary problem. Default is “onevsrest”.

### Value

[Learner](#) .

### See Also

Other wrapper: [CostSensClassifModel](#), [CostSensClassifWrapper](#), [makeCostSensClassifWrapper](#); [CostSensRegrModel](#), [CostSensRegrWrapper](#), [makeCostSensRegrWrapper](#); [makeBaggingWrapper](#); [makeDownsampleWrapper](#); [makeFeatSelWrapper](#); [makeFilterWrapper](#); [makeImputeWrapper](#); [makeOverBaggingWrapper](#); [makeOversampleWrapper](#), [makeUndersampleWrapper](#); [makePreprocWrapperCaret](#); [makePreprocWrapper](#); [makeSMOTEWrapper](#); [makeTuneWrapper](#); [makeWeightedClassesWrapper](#)

---

makeOverBaggingWrapper

*Fuse learner with the bagging technique and oversampling for imbalance correction.*

---

### Description

Fuses a classification learner for binary classification with an over-bagging method for imbalance correction when we have strongly unequal class sizes. Creates a learner object, which can be used like any other learner object. Models can easily be accessed via [getHomogeneousEnsembleModels](#).

OverBagging is implemented as follows: For each iteration a random data subset is sampled. Minority class examples are oversampled with replacement with a given rate. Majority class examples are either simply copied into each bag, or bootstrapped with replacement until we have as many

majority class examples as in the original training data. Features are currently not changed or sampled.

Prediction works as follows: For classification we do majority voting to create a discrete label and probabilities are predicted by considering the proportions of all predicted labels.

### Usage

```
makeOverBaggingWrapper(learner, obw.iters = 10L, obw.rate = 1,
  obw.maxcl = "boot")
```

### Arguments

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
obw.iters	[integer(1)] Number of fitted models in bagging. Default is 10.
obw.rate	[numeric(1)] Factor to upsample the smaller class in each bag. Must be between 1 and Inf, where 1 means no oversampling and 2 would mean doubling the class size. Default is 1.
obw.maxcl	[character(1)] character value that controls how to sample majority class. “all” means every instance of the majority class gets in each bag, “boot” means the majority class instances are bootstrapped in each iteration. Default is “boot”.

### Value

[Learner](#) .

---

makePreprocWrapper	<i>Fuse learner with preprocessing.</i>
--------------------	---

---

### Description

Fuses a base learner with a preprocessing method. Creates a learner object, which can be used like any other learner object, but which internally preprocesses the data as requested. If the train or predict function is called on data / a task, the preprocessing is always performed automatically.

**Usage**

```
makePreprocWrapper(learner, train, predict, par.set = makeParamSet(),
  par.vals = list())
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
train	[function(data, target, args)] Function to preprocess the data before training. target is a string and denotes the target variable in data. args is a list of further arguments and parameters to influence the preprocessing. Must return a list(data, control), where data is the preprocessed data and control stores all information necessary to do the preprocessing before predictions.
predict	[function(data, target, args, control)] Function to preprocess the data before prediction. target is a string and denotes the target variable in data. args are the args that were passed to train. control is the object you returned in train.
par.set	[ <a href="#">ParamSet</a> ] Parameter set of <a href="#">LearnerParam</a> objects to describe the parameters in args. Default is empty set.
par.vals	[list] Named list of default values for params in args respectively par.set. Default is empty list.

**Value**

[Learner](#) .

**See Also**

Other wrapper: [CostSensClassifModel](#), [CostSensClassifWrapper](#), [makeCostSensClassifWrapper](#); [CostSensRegrModel](#), [CostSensRegrWrapper](#), [makeCostSensRegrWrapper](#); [makeBaggingWrapper](#); [makeDownsampleWrapper](#); [makeFeatSelWrapper](#); [makeFilterWrapper](#); [makeImputeWrapper](#); [makeMulticlassWrapper](#); [makeOverBaggingWrapper](#); [makeOversampleWrapper](#), [makeUndersampleWrapper](#); [makePreprocWrapperCaret](#); [makeSMOTEWrapper](#); [makeTuneWrapper](#); [makeWeightedClassesWrapper](#)

---

makePreprocWrapperCaret

*Fuse learner with preprocessing*

---

**Description**

Fuses a learner with preprocessing methods provided by [preProcess](#). Before training the preprocessing will be performed and the preprocessing model will be stored. Before prediction the preprocessing model will transform the test data according to the trained model.

After being wrapped the learner will support missing values although this will only be the case if `ppc.knnImpute`, `ppc.bagImpute` or `ppc.mediaImpute` is set to TRUE.

**Usage**

```
makePreprocWrapperCaret(learner, ...)
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
...	[any] See <a href="#">preProcess</a> for parameters not listed above. If you use them you might want to define them in the <code>add.par.set</code> so that they can be tuned.

**Value**

[Learner](#) .

**See Also**

Other wrapper: [CostSensClassifModel](#), [CostSensClassifWrapper](#), [makeCostSensClassifWrapper](#); [CostSensRegrModel](#), [CostSensRegrWrapper](#), [makeCostSensRegrWrapper](#); [makeBaggingWrapper](#); [makeDownsampleWrapper](#); [makeFeatSelWrapper](#); [makeFilterWrapper](#); [makeImputeWrapper](#); [makeMulticlassWrapper](#); [makeOverBaggingWrapper](#); [makeOversampleWrapper](#), [makeUndersampleWrapper](#); [makePreprocWrapper](#); [makeSMOTEWrapper](#); [makeTuneWrapper](#); [makeWeightedClassesWrapper](#)

---

`makeResampleDesc`

*Create a description object for a resampling strategy.*

---

**Description**

A description of a resampling algorithm contains all necessary information to create a [ResampleInstance](#), when given the size of the data set.

**Usage**

```
makeResampleDesc(method, predict = "test", ..., stratify = FALSE,
  stratify.cols = NULL)
```

**Arguments**

method	[character(1)] “CV” for cross-validation, “LOO” for leave-one-out, “RepCV” for repeated cross-validation, “Bootstrap” for out-of-bag bootstrap, “Subsample” for subsampling, “Holdout” for holdout.
predict	[character(1)] What to predict during resampling: “train”, “test” or “both” sets. Default is “test”.
...	[any] Further parameters for strategies.
	<b>iters</b> [integer(1) ] Number of iterations, for “CV”, “Subsample” and “Bootstrap”
	<b>split</b> [numeric(1) ] Proportion of training cases for “Holdout” and “Subsample” between 0 and 1. Default is 2/3.
	<b>reps</b> [integer(1) ] Repeats for “RepCV”. Here $\text{iters} = \text{folds} * \text{reps}$ . Default is 10.
	<b>folds</b> [integer(1) ] Folds in the repeated CV for RepCV. Here $\text{iters} = \text{folds} * \text{reps}$ . Default is 10.
stratify	[logical(1)] Should stratification be done for the target variable? For classification tasks, this means that the resampling strategy is applied to all classes individually and the resulting index sets are joined to make sure that the proportion of observations in each training set is as in the original data set. Useful for imbalanced class sizes. For survival tasks stratification is done on the events, resulting training sets with comparable censoring rates.
stratify.cols	[character] Stratify on specific columns referenced by name. All columns have to be factors. Note that you have to ensure yourself that stratification is possible, i.e. that each strata contains enough observations. This argument and stratify are mutually exclusive.

**Details**

Some notes on some special strategies:

**Repeated cross-validation** Use “RepCV”. Then you have to set the aggregation function for your preferred performance measure to “testgroup.mean” via [setAggregation](#).

**B632 bootstrap** Use “Bootstrap” for bootstrap and set predict to “both”. Then you have to set the aggregation function for your preferred performance measure to “b632” via [setAggregation](#).

**B632+ bootstrap** Use “Bootstrap” for bootstrap and set predict to “both”. Then you have to set the aggregation function for your preferred performance measure to “b632plus” via [setAggregation](#).

**Fixed Holdout set** Use [makeFixedHoldoutInstance](#).

Object slots:

**id** [character(1) ] Name of resampling strategy.

**iters** [integer(1) ] Number of iterations. Note that this is always the complete number of generated train/test sets, so for a 10-times repeated 5fold cross-validation it would be 50.

**predict** [character(1) ] See argument.

**stratify** [logical(1) ] See argument.

**All parameters passed in ... under the respective argument name** See arguments.

### Value

[ResampleDesc](#) .

### See Also

Other resample: [ResampleInstance](#), [makeResampleInstance](#); [ResamplePrediction](#); [ResampleResult](#); [bootstrapB632](#), [bootstrapB632plus](#), [bootstrap00B](#), [crossval](#), [holdout](#), [repcv](#), [resample](#), [subsample](#); [getRRRPredictions](#)

### Examples

```
# Bootstrapping
makeResampleDesc("Bootstrap", iters = 10)
makeResampleDesc("Bootstrap", iters = 10, predict = "both")

# Subsampling
makeResampleDesc("Subsample", iters = 10, split = 3/4)
makeResampleDesc("Subsample", iters = 10)

# Holdout a.k.a. test sample estimation
makeResampleDesc("Holdout")
```

---

`makeResampleInstance` *Instantiates a resampling strategy object.*

---

### Description

This class encapsulates training and test sets generated from the data set for a number of iterations. It mainly stores a set of integer vectors indicating the training and test examples for each iteration.

### Usage

```
makeResampleInstance(desc, task, size, ...)
```

### Arguments

desc	[ <a href="#">ResampleDesc</a>   character(1)] Resampling description object or name of resampling strategy. In the latter case <a href="#">makeResampleDesc</a> will be called internally on the string.
task	[ <a href="#">Task</a> ] Data of task to resample from. Prefer to pass this instead of size.

size [integer]  
Size of the data set to resample. Can be used instead of task.

... [any]  
Passed down to [makeResampleDesc](#) in case you passed a string in desc. Otherwise ignored.

### Details

Object slots:

**desc** [[ResampleDesc](#) ] See argument.

**size** [[integer\(1\)](#) ] See argument.

**train.inds** [[list of integer](#) ] List of of training indices for all iterations.

**test.inds** [[list of integer](#) ] List of of test indices for all iterations.

**group** [[factor](#) ] Optional grouping of resampling iterations. This encodes whether specific iterations 'belong together' (e.g. repeated CV), and it can later be used to aggregate performance values accordingly. Default is 'factor()'.

### Value

[ResampleInstance](#) .

### See Also

Other resample: [ResampleDesc](#), [makeResampleDesc](#); [ResamplePrediction](#); [ResampleResult](#); [bootstrapB632](#), [bootstrapB632plus](#), [bootstrapO0B](#), [crossval](#), [holdout](#), [repcv](#), [resample](#), [subsample](#); [getRRPredictions](#)

### Examples

```
rdesc = makeResampleDesc("Bootstrap", iters = 10)
rin = makeResampleInstance(rdesc, task = iris.task)

rdesc = makeResampleDesc("CV", iters = 50)
rin = makeResampleInstance(rdesc, size = nrow(iris))

rin = makeResampleInstance("CV", iters = 10, task = iris.task)
```

---

makeSMOTEWrapper	<i>Fuse learner with SMOTE oversampling for imbalance correction in binary classification.</i>
------------------	--

---

### Description

Creates a learner object, which can be used like any other learner object. Internally uses [smote](#) before every model fit.

Note that observation weights do not influence the sampling and are simply passed down to the next learner.

**Usage**

```
makeSMOTEWrapper(learner, sw.rate = 1, sw.nn = 5L, sw.standardize = TRUE,
  sw.alt.logic = FALSE)
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
sw.rate	[numeric(1)] Factor to oversample the smaller class. Must be between 1 and Inf, where 1 means no oversampling and 2 would mean doubling the class size. Default is 1.
sw.nn	[integer(1)] Number of nearest neighbors to consider. Default is 5.
sw.standardize	[logical(1)] Standardize input variables before calculating the nearest neighbors for data sets with numeric input variables only. For mixed variables (numeric and factor) the gower distance is used and variables are standardized anyway. Default is TRUE.
sw.alt.logic	[logical(1)] Use an alternative logic for selection of minority class observations. Instead of sampling a minority class element AND one of its nearest neighbors, each minority class element is taken multiple times (depending on rate) for the interpolation and only the corresponding nearest neighbor is sampled. Default is FALSE.

**Value**

[Learner](#) .

**See Also**

Other wrapper: [CostSensClassifModel](#), [CostSensClassifWrapper](#), [makeCostSensClassifWrapper](#); [CostSensRegrModel](#), [CostSensRegrWrapper](#), [makeCostSensRegrWrapper](#); [makeBaggingWrapper](#); [makeDownsampleWrapper](#); [makeFeatSelWrapper](#); [makeFilterWrapper](#); [makeImputeWrapper](#); [makeMulticlassWrapper](#); [makeOverBaggingWrapper](#); [makeOversampleWrapper](#), [makeUndersampleWrapper](#); [makePreprocWrapperCaret](#); [makePreprocWrapper](#); [makeTuneWrapper](#); [makeWeightedClassesWrapper](#)

---

makeStackedLearner      *Create a stacked learner object.*

---

**Description**

A stacked learner uses predictions of several base learners and fits a super learner using these predictions as features in order to predict the outcome. The following stacking methods are available:

average Averaging of base learner predictions without weights.

`stack.nocv` Fits the super learner, where in-sample predictions of the base learners are used.

`stack.cv` Fits the super learner, where the base learner predictions are computed by crossvalidated predictions (the resampling strategy can be set via the `resampling` argument).

## Usage

```
makeStackedLearner(base.learners, super.learner = NULL, predict.type = NULL,
  method = "stack.nocv", use.feats = FALSE, resampling = NULL)
```

## Arguments

- |                            |  |
|----------------------------|--|
| <code>base.learners</code> | <p>[(list of) <a href="#">Learner</a>]<br/>A list of learners created with <code>makeLearner</code>.</p>   |
| <code>super.learner</code> | <p>[<a href="#">Learner</a>   <code>character(1)</code>]<br/>The super learner that makes the final prediction based on the base learners. If you pass a string, the super learner will be created via <code>makeLearner</code>. Not used for <code>method = 'average'</code>. Default is <code>NULL</code>.</p>   |
| <code>predict.type</code>  | <p>[<code>character(1)</code>]<br/>Sets the type of the final prediction for <code>method = 'average'</code>. For other methods, the predict type should be set within <code>super.learner</code>. If the type of the base learner prediction, which is set up within <code>base.learners</code>, is<br/> <code>"prob"</code> then <code>predict.type = 'prob'</code> will use the average of all base learner predictions and <code>predict.type = 'response'</code> will use the class with highest probability as final prediction.<br/> <code>"response"</code> then, for classification tasks with <code>predict.type = 'prob'</code>, the final prediction will be the relative frequency based on the predicted base learner classes and classification tasks with <code>predict.type = 'response'</code> will use majority vote of the base learner predictions to determine the final prediction. For regression tasks, the final prediction will be the average of the base learner predictions.</p> |
| <code>method</code>        | <p>[<code>character(1)</code>]<br/> <code>"average"</code> for averaging the predictions of the base learners, <code>"stack.nocv"</code> for building a super learner using the predictions of the base learners and <code>"stack.cv"</code> for building a super learner using crossvalidated predictions of the base learners. Default is <code>"stack.nocv"</code>.</p>   |
| <code>use.feats</code>     | <p>[<code>logical(1)</code>]<br/>Whether the original features should also be passed to the super learner. Not used for <code>method = 'average'</code>. Default is <code>FALSE</code>.</p>  |
| <code>resampling</code>    | <p>[<a href="#">ResampleDesc</a>]<br/>Resampling strategy for <code>method = 'stack.cv'</code>. Currently only CV is allowed for resampling. The default <code>NULL</code> uses 5-fold CV.</p>   |

---

makeTuneWrapper      *Fuse learner with tuning.*

---

## Description

Fuses a base learner with a search strategy to select its hyperparameters. Creates a learner object, which can be used like any other learner object, but which internally uses [tuneParams](#). If the train function is called on it, the search strategy and resampling are invoked to select an optimal set of hyperparameter values. Finally, a model is fitted on the complete training data with these optimal hyperparameters and returned. See [tuneParams](#) for more details.

After training, the optimal hyperparameters (and other related information) can be retrieved with [getTuneResult](#).

## Usage

```
makeTuneWrapper(learner, resampling, measures, par.set, control,
  show.info = getMlrOption("show.info"))
```

## Arguments

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
resampling	[ <a href="#">ResampleInstance</a>   <a href="#">ResampleDesc</a> ] Resampling strategy to evaluate points in hyperparameter space. If you pass a description, it is instantiated once at the beginning by default, so all points are evaluated on the same training/test sets. If you want to change that behavior, look at <a href="#">TuneControl</a> .
measures	[list of <a href="#">Measure</a>   <a href="#">Measure</a> ] Performance measures to evaluate. The first measure, aggregated by the first aggregation function is optimized, others are simply evaluated.
par.set	[ <a href="#">ParamSet</a> ] Collection of parameters and their constraints for optimization.
control	[ <a href="#">TuneControl</a> ] Control object for search method. Also selects the optimization algorithm for tuning.
show.info	[logical(1)] Print verbose output on console? Default is set via <a href="#">configureMlr</a> .

## Value

[Learner](#) .

```
task = makeClassifTask(data = iris, target = "Species")
lrn = makeLearner("classif.ksvm")
# stupid mini grid
ps = makeParamSet(
  makeDiscreteParam("C", values = 1:2),
  makeDiscreteParam("sigma", values = 1:2)
)
ctrl = makeTuneControlGrid()
inner = makeResampleDesc("Holdout")
outer = makeResampleDesc("CV", iters = 2)
lrn = makeTuneWrapper(lrn, resampling = inner, par.set = ps, control = ctrl)
mod = train(lrn, task)
print(getTuneResult(mod))
# nested resampling for evaluation
# we also extract tuned hyper pars in each iteration
r = resample(lrn, task, outer, extract = getTuneResult)
print(r$extract)
getNestedTuneResultsOptPathDf(r)
getNestedTuneResultsX(r)
```

---

makeUndersampleWrapper

*Fuse learner with simple ove/underrsampling for imbalancy correction in binary classification.*

---

**Description**

Creates a learner object, which can be used like any other learner object. Internally uses [oversample](#) or [undersample](#) before every model fit.

Note that observation weights do not influence the sampling and are simply passed down to the next learner.

**Usage**

```
makeUndersampleWrapper(learner, usw.rate = 1)
```

```
makeOversampleWrapper(learner, osw.rate = 1)
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
usw.rate	[numeric(1)] Factor to downsample the bigger class. Must be between 0 and 1, where 1 means no downsampling, 0.5 implies reduction to 50 percent and 0 would imply reduction to 0 observations. Default is 1.
osw.rate	[numeric(1)] Factor to oversample the smaller class. Must be between 1 and Inf, where 1 means no oversampling and 2 would mean doubling the class size. Default is 1.

**Value**

[Learner](#) .

---

`makeWeightedClassesWrapper`

*Wraps a classifier for weighted fitting where each class receives a weight.*

---

**Description**

Creates a wrapper, which can be used like any other learner object.

Fitting is performed in a weighted fashion where each observation receives a weight, depending on the class it belongs to, see `wcw.weight`. This might help to mitigate problems caused by imbalanced class distributions.

This weighted fitting can be achieved in two ways:

a) The learner already has a parameter for class weighting, so one weight can directly be defined per class. Example: “`classif.ksvm`” and parameter `class.weights`. In this case we don’t really do anything fancy. We convert `wcw.weight` a bit, but basically simply bind its value to the class

weighting param. The wrapper in this case simply offers a convenient, consistent fashion for class weighting - and tuning! See example below.

b) The learner does not have a direct parameter to support class weighting, but supports observation weights, so `hasProperties(learner, 'weights')` is TRUE. This means that an individual, arbitrary weight can be set per observation during training. We set this weight depending on the class internally in the wrapper. Basically we introduce something like a new “class.weights” parameter for the learner via observation weights.

## Usage

```
makeWeightedClassesWrapper(learner, wcw.param = NULL, wcw.weight = 1)
```

## Arguments

learner	[ <a href="#">Learner</a>   character(1)] The classification learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
wcw.param	[character(1)] Name of already existing learner param which allows class weighting. Or NULL if such a param does not exist. Must during training accept a named vector of class weights, where length equals the number of classes. Default is NULL.
wcw.weight	[numeric] Weight for each class. Must be a vector of the same number of elements as classes are in task, and must also be in the same order as the class levels are in <code>task\$task.desc\$class.levels</code> . For convenience, one must pass a single number in case of binary classification, which is then taken as the weight of the positive class, while the negative class receives a weight of 1. Default is 1.

## Value

[Learner](#) .

## See Also

Other wrapper: [CostSensClassifModel](#), [CostSensClassifWrapper](#), [makeCostSensClassifWrapper](#); [CostSensRegrModel](#), [CostSensRegrWrapper](#), [makeCostSensRegrWrapper](#); [makeBaggingWrapper](#); [makeDownsampleWrapper](#); [makeFeatSelWrapper](#); [makeFilterWrapper](#); [makeImputeWrapper](#); [makeMulticlassWrapper](#); [makeOverBaggingWrapper](#); [makeOversampleWrapper](#), [makeUndersampleWrapper](#); [makePreprocWrapperCaret](#); [makePreprocWrapper](#); [makeSMOTEWrapper](#); [makeTuneWrapper](#)

## Examples

```
# using the direct parameter of the SVM
lrn = makeWeightedClassesWrapper("classif.ksvm", wcw.param = "class.weights", wcw.weight = 0.01)
res = holdout(lrn, sonar.task)
print(getConfMatrix(res$pred))

# using the observation weights of logreg
lrn = makeWeightedClassesWrapper("classif.logreg", wcw.weight = 0.01)
```

```

res = holdout(lrn, sonar.task)
print(getConfMatrix(res$pred))

# tuning the imbalance param and the SVM param in one go
lrn = makeWeightedClassesWrapper("classif.ksvm", wcw.param = "class.weights")
ps = makeParamSet(
  makeNumericParam("wcv.weight", lower = 1, upper = 10),
  makeNumericParam("C", lower = -12, upper = 12, trafo = function(x) 2^x),
  makeNumericParam("sigma", lower = -12, upper = 12, trafo = function(x) 2^x)
)
ctrl = makeTuneControlRandom(maxit = 3L)
rdesc = makeResampleDesc("CV", iters = 2L, stratify = TRUE)
res = tuneParams(lrn, sonar.task, rdesc, par.set = ps, control = ctrl)
print(res)
print(res$opt.path)

```

---

makeWrappedModel	<i>Induced model of learner.</i>
------------------	----------------------------------

---

## Description

Result from [train](#).

It internally stores the underlying fitted model, the subset used for training, features used for training, levels of factors in the data set and computation time that was spent for training.

Object members: See arguments.

The constructor `makeWrappedModel` is mainly for internal use.

## Usage

```
makeWrappedModel(learner, learner.model, task.desc, subset, features,
  factor.levels, time)
```

## Arguments

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
learner.model	[any] Underlying model.
task.desc	[ <a href="#">TaskDesc</a> ] Task description object.
subset	[integer] Subset used for training.
features	[character] Features used for training.
factor.levels	[named list of character] Levels of factor variables (features and potentially target) in training data. Named by variable name, non-factors do not occur in the list.

time [numeric(1)]  
Computation time for model fit in seconds.

### Value

[WrappedModel](#) .

---

measures	<i>Performance measures.</i>
----------	------------------------------

---

### Description

A performance measure is evaluated after a single train/predict step and returns a single number to assess the quality of the prediction (or maybe only the model, think AIC). The measure itself knows whether it wants to be minimized or maximized and for what tasks it is applicable.

All supported measures can be found by [listMeasures](#) or as a table in the tutorial appendix: <http://berndbischl.github.io/mlr/tutorial/html/measures/>.

If you want a measure for a misclassification cost matrix, look at [makeCostMeasure](#). If you want to implement your own measure, look at [makeMeasure](#).

Most measures can directly be accessed via the function named after the scheme measureX (e.g. `measureSSE`).

For clustering measures, we compact the predicted cluster IDs such that they form a continuous series starting with 1. If this is not the case, some of the measures will generate warnings.

### Usage

mergeSmallFactorLevels

*Merges small levels of factors into new level.*

---

### Description

Merges small levels of factors into new level.

**Usage**

```
mergeSmallFactorLevels(task, cols = NULL, min.perc = 0.01,  
  new.level = ".merged")
```

**Arguments**

task	[Task] The task.
cols	[character] Which columns to convert. Default is all factor and character columns.
min.perc	[numeric(1)] The smallest levels of a factor are merged until their combined proportion w.r.t. the length of the factor exceeds min.perc. Must be between 0 and 1. Default is 0.01.
new.level	[character(1)] New name of merged level. Default is “.merged”

**Value**

Task, where merged levels are combined into a new level of name new.level.

normalizeFeatures	<i>Normalize features</i>
-------------------	---------------------------

---

### Description

Normalize features by different methods. Internally `normalize` is used for every feature column. Non numerical features will be left untouched and passed to the result. For constant features most methods fail, special behaviour for this case is implemented.

### Usage

```
normalizeFeatures(task, method = "standardize", exclude = character(0L),
  range = c(0, 1), on.constant = "quiet")
```

### Arguments

task	[Task] The task.
method	[character(1)] Normalizing method. Available are: “center”: Subtract mean. “scale”: Divide by standard deviation. “standardize”: Center and scale. “range”: Scale to a given range.
exclude	[character] Names of the columns to exclude. The target does not have to be included here. Default is none.
range	[numeric(2)] Range for method “range”. Default is c(0, 1).
on.constant	[character(1)] How should constant vectors be treated? Only used, of “method != center”, since this methods does not fail for constant vectors. Possible actions are: “quiet”: Depending on the method, treat them quietly: “scale”: No division by standard deviation is done, input values. will be returned untouched. “standardize”: Only the mean is subtracted, no division is done. “range”: All values are mapped to the mean of the given range. “warn”: Same behaviour as “quiet”, but print a warning message. “stop”: Stop with an error.

### Value

Task .

---

oversample	<i>Over- or undersample binary classification task to handle class imbalance.</i>
------------	---

---

**Description**

Oversampling: From the smaller class, observations are randomly drawn with repetitions.

Undersampling: From the larger class, observations are randomly drawn without repetitions.

**Usage**

```
oversample(task, rate)
```

```
undersample(task, rate)
```

**Arguments**

`task` [\[Task\]](#)  
The task.

`rate` [\[numeric\(1\)\]](#)  
Factor to upsample the smaller or downsample the bigger class. For undersampling: Must be between 0 and 1, where 1 means no downsampling, 0.5 implies reduction to 50 percent and 0 would imply reduction to 0 observations. For oversampling: Must be between 1 and Inf, where 1 means no oversampling and 2 would mean doubling the class size.

**Value**

[Task](#) .

**See Also**

Other imbalance: [makeOverBaggingWrapper](#); [makeOversampleWrapper](#), [makeUndersampleWrapper](#); [smote](#)

---

 performance

*Measure performance of prediction.*

---

### Description

Measures the quality of a prediction w.r.t. some performance measure.

### Usage

```
performance(pred, measures, task = NULL, model = NULL, feats = NULL)
```

### Arguments

pred	[ <a href="#">Prediction</a> ] Prediction object.
measures	[ <a href="#">Measure</a>   list of <a href="#">Measure</a> ] Performance measure(s) to evaluate.
task	[ <a href="#">Task</a> ] Learning task, might be requested by performance measure, usually not needed except for clustering.
model	[ <a href="#">WrappedModel</a> ] Model built on training data, might be requested by performance measure, usually not needed.
feats	[ <a href="#">data.frame</a> ] Features of predicted data, usually not needed except for clustering. If the prediction was generated from a task, you can also pass this instead and the features are extracted from it.

### Value

named numeric . Performance value(s), named by measure(s).

### See Also

plotFilterValues	<i>Plot filter values using ggplot2.</i>
------------------	--

---

**Description**

Plot filter values using ggplot2.

**Usage**

```

plotFilterValues(fvalues, sort = "dec", n.show = 20L,
  feat.type.cols = FALSE)

```

**Arguments**

fvalues	[ <a href="#">FilterValues</a> ] Filter values.
sort	[character(1)] Sort features like this. "dec" = decreasing, "inc" = increasing, "none" = no sorting. Default is decreasing.
n.show	[integer(1)] Number of features (maximal) to show. Default is 20.

feat.type.cols [logical(1)]  
 Colors for factor and numeric features. FALSE means no colors. Default is FALSE.

### Value

ggplot2 plot object.

### See Also

Other filter: [FilterValues](#); [filterFeatures](#); [generateFilterValuesData](#); [getFilterValues](#); [getFilteredFeatures](#); [makeFilterWrapper](#); [plotFilterValuesGGVIS](#)

plotFilterValues(fv)
```

---

plotFilterValuesGGVIS *Plot filter values using ggvis.*

---

### Description

Plot filter values using ggvis.

### Usage

```
plotFilterValuesGGVIS(fvalues, sort = "dec", n.show = 20L,
  feat.type.cols = FALSE, interactive = FALSE)
```

### Arguments

fvalues	[ <a href="#">FilterValues</a> ] Filter values.
sort	[character(1)] Sort features like this. "dec" = decreasing, "inc" = increasing, "none" = no sorting. Default is decreasing.
n.show	[integer(1)] Number of features (maximal) to show. Default is 20.
feat.type.cols	[logical(1)] Colors for factor and numeric features. FALSE means no colors. Default is FALSE.

`interactive` [logical(1)]  
Whether to use Shiny to visualize multiple filter methods. If TRUE and `getFilterValues` was called with multiple methods, then returns a Shiny application with a drop-down menu allowing the visualization of said methods. If FALSE then a static ggvis plot is returned. Default is FALSE.

### Value

a ggvis plot object.

fv = generateFilterValuesData(iris.task, method = "chi.squared")  
plotFilterValuesGGVIS(fv)  
  
## End(Not run)
```

---

`plotLearnerPrediction` *Visualizes a learning algorithm on a 1D or 2D data set.*

---

### Description

Trains the model for 1 or 2 selected features, then displays it via [ggplot](#). Good for teaching or exploring models.

For classification and clustering, only 2D plots are supported. The data points, the classification and potentially through color alpha blending the posterior probabilities are shown.

For regression, 1D and 2D plots are supported. 1D shows the data, the estimated mean and potentially the estimated standard error. 2D does not show estimated standard error, but only the estimated mean via background color.

The plot title displays the model id, its parameters, the training performance and the cross-validation performance.

### Usage

```
plotLearnerPrediction(learner, task, features = NULL, measures, cv = 10L,  
  ..., gridsize, pointsize = 2, prob.alpha = TRUE, se.band = TRUE,  
  err.mark = "train", bg.cols = c("darkblue", "green", "darkred"),  
  err.col = "white", err.size = pointsize, greyscale = FALSE)
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
task	[ <a href="#">Task</a> ] The task.
features	[character] Selected features for model. By default the first 2 features are used.
measures	[ <a href="#">Measure</a>   list of <a href="#">Measure</a> ] Performance measure(s) to evaluate.
cv	[integer(1)] Do cross-validation and display in plot title? Number of folds. 0 means no CV. Default is 10.
...	[any] Parameters for learner.
gridsize	[integer(1)] Grid resolution per axis for background predictions. Default is 500 for 1D and 100 for 2D.
pointsize	[numeric(1)] Pointsize for ggplot2 <a href="#">geom_point</a> for data points. Default is 2.
prob.alpha	[logical(1)] For classification: Set alpha value of background to probability for predicted class? Allows visualization of “confidence” for prediction. If not, only a constant color is displayed in the background for the predicted label. Default is TRUE.
se.band	[logical(1)] For regression in 1D: Show band for standard error estimation? Default is TRUE.
err.mark	[character(1)]: For classification: Either mark error of the model on the training data (“train”) or during cross-validation (“cv”) or not at all with “none”. Default is “train”.
bg.cols	[character(3)] Background colors for classification and regression. Sorted from low, medium to high. Default is TRUE.
err.col	[character(1)] For classification: Color of misclassified data points. Default is “white”
err.size	[integer(1)] For classification: Size of of misclassified data points. Default is pointsize.
greyscale	[logical(1)] Should the plot be greyscale completely? Default is FALSE.

**Value**

The ggplot2 object.

---

plotLearningCurve      *Plot learning curve data using ggplot2.*

---

**Description**

Visualizes data size (percentage used for model) vs. performance measure(s).

**Usage**

```
plotLearningCurve(obj, facet = "measure")
```

**Arguments**

obj	[LearningCurveData] Result of <a href="#">generateLearningCurveData</a> , with class LearningCurveData.
facet	[character(1)] Selects "measure" or "learner" to be the faceting variable. The variable mapped to facet must have more than one unique value, otherwise it will be ignored. The variable not chosen is mapped to color if it has more than one unique value. The default is "measure".

**Value**

ggplot2 plot object.

**See Also**

Other learning\_curve: [generateLearningCurveData](#); [plotLearningCurveGGVIS](#)

Other plot: [plotFilterValuesGGVIS](#); [plotFilterValues](#); [plotLearningCurveGGVIS](#); [plotROCRCurvesGGVIS](#); [plotROCRCurves](#); [plotThreshVsPerfGGVIS](#); [plotThreshVsPerf](#)

---

plotLearningCurveGGVIS      *Plot learning curve data using ggvis.*

---

**Description**

Visualizes data size (percentage used for model) vs. performance measure(s).

**Usage**

```
plotLearningCurveGGVIS(obj, interaction = "measure")
```

**Arguments**

obj	[LearningCurveData] Result of <a href="#">generateLearningCurveData</a> .
interaction	[character(1)] Selects “measure” or “learner” to be used in a Shiny application making the interaction variable selectable via a drop-down menu. This variable must have more than one unique value, otherwise it will be ignored. The variable not chosen is mapped to color if it has more than one unique value. Note that if there are multiple learners and multiple measures interactivity is necessary as ggvis does not currently support faceting or subplots. The default is “measure”.

**Value**

a ggvis plot object.

**See Also**

Other learning\_curve: [generateLearningCurveData](#); [plotLearningCurve](#)

plotROCRCurves	<i>Plots results from generateROCRCurvesData using ggplot2.</i>
----------------	---

---

**Description**

Visualize how binary classification performs across different measures.

**Usage**

```
plotROCRCurves(obj, diagonal = FALSE, xlab, ylab, title = "")
```

**Arguments**

obj	[ROCRCurvesData] Result of <a href="#">generateROCRCurvesData</a> .
diagonal	[logical(1)] Whether to plot a dashed diagonal line. Default is false.
xlab	[character(1)] Label for x-axis. Default is meas1.
ylab	[character(1)] Label for y-axis. Default is meas2.
title	[character(1)] Title for plot. Default is an empty string.

**Value**

ggplot2 plot object.

**See Also**

---

`plotROCRCurvesGGVIS` *Plots results from `generateROCRCurvesData` using `ggvis`.*

---

**Description**

Visualize how binary classification performs across different measures.

**Usage**

```
plotROCRCurvesGGVIS(obj, diagonal = FALSE, cutoffs = FALSE)
```

**Arguments**

<code>obj</code>	[ROCRCurvesData] Result of <a href="#">generateROCRCurvesData</a> .
<code>diagonal</code>	[logical(1)] Whether to plot a dashed diagonal line. Default is FALSE.
<code>cutoffs</code>	[logical(1)] Whether to plot tooltips displaying threshold values using Shiny. The plot will be opened in the default browser.

**Value**

a ggvis plot object.

**See Also**

plotThreshVsPerf	<i>Plot threshold vs. performance(s) for 2-class classification using ggplot2.</i>
------------------	--

---

**Description**

Plot threshold vs. performance(s) for 2-class classification using ggplot2.

**Usage**

```
plotThreshVsPerf(obj, facet = "measure", mark.th = NA_real_)
```

**Arguments**

obj	[ThreshVsPerfData] Result of <a href="#">generateThreshVsPerfData</a> .
facet	[character(1)] Selects “measure” or “learner” to be the facetting variable. The variable mapped to facet must have more than one unique value, otherwise it will be ignored. The variable not chosen is mapped to color if it has more than one unique value. The default is “measure”.
mark.th	[numeric(1)] Mark given threshold with vertical line? Default is NA which means not to do it.

**Value**

ggplot2 plot object.

**See Also**

pvs = generateThreshVsPerfData(pred, list(tpr, fpr))
plotThreshVsPerfGGVIS(pvs)

## End(Not run)
```

---

`plotTuneMultiCritResult`*Plots multi-criteria results after tuning using ggplot2.*

---

**Description**

Visualizes the pareto front and possibly the dominated points.

**Usage**

```
plotTuneMultiCritResult(res, path = TRUE, col = NULL, shape = NULL,  
  pointsize = 2)
```

**Arguments**

<code>res</code>	[ <a href="#">TuneMultiCritResult</a> ] Result of <a href="#">tuneParamsMultiCrit</a> .
<code>path</code>	[ <a href="#">logical(1)</a> ] Visualize all evaluated points (or only the non-dominated pareto front)? For the full path, the size of the points on the front is slightly increased. Default is TRUE.
<code>col</code>	[ <a href="#">character(1)</a> ] Which column of <code>res\$opt.path</code> should be mapped to ggplot2 color? Default is NULL, which means none.
<code>shape</code>	[ <a href="#">character(1)</a> ] Which column of <code>res\$opt.path</code> should be mapped to ggplot2 shape? Default is NULL, which means none.
<code>pointsize</code>	[ <a href="#">numeric(1)</a> ] Point size for ggplot2 <a href="#">geom_point</a> for data points. Default is 2.

**Value**

ggplot2 plot object.

**See Also**

Other `tune_multicrit`: [TuneMultiCritControl](#), [TuneMultiCritControlGrid](#), [TuneMultiCritControlNSGA2](#), [TuneMultiCritControlRandom](#), [makeTuneMultiCritControlGrid](#), [makeTuneMultiCritControlNSGA2](#), [makeTuneMultiCritControlRandom](#); [plotTuneMultiCritResultGGVIS](#); [tuneParamsMultiCrit](#)

```

---

`plotTuneMultiCritResultGGVIS`*Plots multi-criteria results after tuning using ggvis.*

---

**Description**

Visualizes the pareto front and possibly the dominated points.

**Usage**

```
plotTuneMultiCritResultGGVIS(res, path = TRUE)
```

**Arguments**

<code>res</code>	<code>[TuneMultiCritResult]</code> Result of <code>tuneParamsMultiCrit</code> .
<code>path</code>	<code>[logical(1)]</code> Visualize all evaluated points (or only the non-dominated pareto front)? Points are colored according to their location. Default is TRUE.

**Value**

a ggvis plot object.

**See Also**

Other `tune_multicrit`: `TuneMultiCritControl`, `TuneMultiCritControlGrid`, `TuneMultiCritControlNSGA2`, `TuneMultiCritControlRandom`, `makeTuneMultiCritControlGrid`, `makeTuneMultiCritControlNSGA2`, `makeTuneMultiCritControlRandom`; `plotTuneMultiCritResult`; `tuneParamsMultiCrit`

**Examples**

```
# see tuneParamsMultiCrit
```

---

`plotViperCharts`*Visualize binary classification predictions via ViperCharts system.*

---

**Description**

This includes ROC, lift charts, cost curves, and so on. Please got to <http://viper.ijs.si> for further info.

For resampled learners, the predictions from different iterations are combined into one. That is, for example for cross-validation, the predictions appear on a single line even though they were made by different models. There is currently no facility to separate the predictions for different resampling iterations.

**Usage**

```
plotViperCharts(obj, chart = "rocc", browse = TRUE, auth.key = NULL,
  task.id = NULL)
```

**Arguments**

obj	[(list of <a href="#">Prediction</a>   (list of <a href="#">ResampleResult</a>   <a href="#">BenchmarkResult</a> )] Single prediction object, list of them, single resample result, list of them, or a benchmark result. In case of a list probably produced by different learners you want to compare, then name the list with the names you want to see in the plots, probably learner shortnames or ids.
chart	[character(1)] First chart to display in focus in browser. All other charts can be displayed by clicking on the browser page menu. Default is "rocc".
browse	[logical(1)] Open ViperCharts plot in web browser? If not you simple get the URL returned. Calls <a href="#">browseURL</a> . Default is TRUE.
auth.key	[character(1)] API key to use for call to Viper charts website. Only required if you want the chart to be private. Default is NULL.
task.id	[character(1)] Selected task in <a href="#">BenchmarkResult</a> to do plots for, ignored otherwise. Default is first task.

**Value**

character(1) . Invisibly returns the ViperCharts URL.

## Not run:
lrn1 = makeLearner("classif.logreg", predict.type = "prob")
lrn2 = makeLearner("classif.rpart", predict.type = "prob")
b = benchmark(list(lrn1, lrn2), pid.task)
z = plotViperCharts(b, chart = "lift", browse = TRUE)

## End(Not run)
```

---

predict.WrappedModel *Predict new data.*

---

### Description

Predict the target variable of new data using a fitted model. What is stored exactly in the [\[Prediction\]](#) object depends on the `predict.type` setting of the [Learner](#). If `predict.type` was set to “prob” probability thresholding can be done calling the [setThreshold](#) function on the prediction object.

The row names of the input task or newdata are preserved in the output.

### Usage

```
## S3 method for class 'WrappedModel'
predict(object, task, newdata, subset, ...)
```

### Arguments

object	<a href="#">[WrappedModel]</a> Wrapped model, result of <a href="#">train</a> .
task	<a href="#">[Task]</a> The task. If this is passed, data from this task is predicted.
newdata	<a href="#">[data.frame]</a> New observations which should be predicted. Pass this alternatively instead of task.
subset	<a href="#">[integer]</a> Index vector to subset task or newdata. Default is all data.
...	<a href="#">[any]</a> Currently ignored.

### Value

[Prediction](#) .

### See Also

Other predict: [asROCRPrediction](#); [generateROCRCurvesData](#); [getProbabilities](#); [plotROCRCurvesGGVIS](#); [plotROCRCurves](#); [plotViperCharts](#); [setPredictThreshold](#); [setPredictType](#)

### Examples

```
# train and predict
train.set = seq(1, 150, 2)
test.set = seq(2, 150, 2)
model = train("classif.lda", iris.task, subset = train.set)
p = predict(model, newdata = iris, subset = test.set)
print(p)
predict(model, task = iris.task, subset = test.set)
```

```
# predict now probabilities instead of class labels
lrn = makeLearner("classif.lda", predict.type = "prob")
model = train(lrn, iris.task, subset = train.set)
p = predict(model, task = iris.task, subset = test.set)
print(p)
getProbabilities(p)
```

---

Prediction	<i>Prediction object.</i>
------------	---------------------------

---

### Description

Result from [predict.WrappedModel](#). Use as `data.frame` to access all information in a convenient format. The function [getProbabilities](#) is useful to access predicted probabilities.

The data member of the object contains always the following columns: `id`, index numbers of predicted cases from the task, `response` either a numeric or a factor, the predicted response values, `truth`, either a numeric or a factor, the true target values. If probabilities were predicted, as many numeric columns as there were classes named `prob.classname`. If standard errors were predicted, a numeric column named `se`.

Object members:

**predict.type** [character(1) ] Type set in [setPredictType](#).

**data** [data.frame ] See details.

**threshold** [numeric(1) ] Threshold set in predict function.

**task.desc** [[TaskDesc](#) ] Task description object.

**time** [numeric(1) ] Time learner needed to generate predictions.

---

predictLearner	<i>Predict new data with an R learner.</i>
----------------	--

---

### Description

Mainly for internal use. Predict new data with a fitted model. You have to implement this method if you want to add another learner to this package.

### Usage

```
predictLearner(.learner, .model, .newdata, ...)
```

**Arguments**

<code>.learner</code>	[ <a href="#">RLearner</a> ] Wrapped learner.
<code>.model</code>	[ <a href="#">WrappedModel</a> ] Model produced by training.
<code>.newdata</code>	[ <code>data.frame</code> ] New data to predict. Does not include target column.
<code>...</code>	[any] Additional parameters, which need to be passed to the underlying predict function.

**Details**

Your implementation must adhere to the following: The model must be fitted on the subset of `.task` given by `.subset`. All parameters in `...` must be passed to the underlying training function.

**Value**

For classification: Either a factor for type “response” or a matrix for type “prob”. In the latter case the columns must be named with the class labels. For regressions: Either a numeric for type “response” or a matrix with two columns for type “se”. In the latter case first column is the estimated response (mean value) and the second column the estimated standard errors.

---

reimpute	<i>Re-impute a data set</i>
----------	-----------------------------

---

**Description**

This function accepts a data frame and a imputation description as returned by [impute](#) to perform the following actions:

1. Restore dropped columns, setting them to NA
2. Add dummy variables for columns as specified in `impute`
3. Optionally check factors for new levels to treat them as NAs
4. Reorder factor levels to ensure identical integer representation as before
5. Impute missing values using previously collected data

**Usage**

```
reimpute(x, desc)
```

**Arguments**

<code>x</code>	[ <code>data.frame</code> ] Object to reimpute. Currently only data frames are supported.
<code>desc</code>	[ <code>ImputationDesc</code> ] Imputation description as returned by <a href="#">impute</a> .

**Value**

Imputed x.

**See Also**

Other impute: [imputations](#), [imputeConstant](#), [imputeHist](#), [imputeLearner](#), [imputeMax](#), [imputeMean](#), [imputeMedian](#), [imputeMin](#), [imputeMode](#), [imputeNormal](#), [imputeUniform](#); [impute](#); [makeImputeMethod](#); [makeImputeWrapper](#)

---

removeConstantFeatures

*Remove constant features from a data set.*

---

**Description**

Constant features can lead to errors in some models and obviously provide no information in the training set that can be learned from. With the argument “perc”, there is a possibility to also remove features for which less than “perc” percent of the observations differ from the mode value.

**Usage**

```
removeConstantFeatures(task, perc = 0, dont.rm = character(0L),
  na.ignore = FALSE, tol = .Machine$double.eps^0.5,
  show.info = getMlrOption("show.info"))
```

**Arguments**

task	[ <a href="#">Task</a> ] The task.
perc	[numeric(1)] The percentage of a feature values in [0, 1) that must differ from the mode value. Default is 0, which means only constant features with exactly one observed level are removed.
dont.rm	[character] Names of the columns which must not be deleted. Default is no columns.
na.ignore	[logical(1)] Should NAs be ignored in the percentage calculation? (Or should they be treated as a single, extra level in the percentage calculation?) Default is FALSE.
tol	[numeric(1)] Numerical tolerance to treat two numbers as equal. Variables stored as double will get rounded accordingly before computing the mode. Default is <code>sqrt(.Machine\$double.eps)</code> .
show.info	[logical(1)] Print verbose output on console? Default is set via <a href="#">configureMlr</a> .

**Value**

[Task](#) .

**See Also**

Other eda\_and\_preprocess: [capLargeValues](#); [createDummyFeatures](#); [dropFeatures](#); [mergeSmallFactorLevels](#); [normalizeFeatures](#); [summarizeColumns](#)

---

removeHyperPars	<i>Remove hyperparameters settings of a learner.</i>
-----------------	--

---

**Description**

Remove settings (previously set through mlr) for some parameters. Which means that the default behavior for that param will now be used.

**Usage**

```
removeHyperPars(learner, ids = character(0L))
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
ids	[character] Parameter names to remove settings for. Default is character(0L).

**Value**

[Learner](#) .

**See Also**

Other learner: [LearnerProperties](#), [addProperties](#), [hasProperties](#), [removeProperties](#), [setProperties](#); [Learner](#), [makeLearner](#); [getHyperPars](#); [getParamSet](#); [setHyperPars](#); [setId](#); [setPredictThreshold](#); [setPredictType](#)

---

 resample

*Fit models according to a resampling strategy.*

---

### Description

The function `resample` fits a model specified by `Learner` on a `Task` and calculates predictions and performance `measures` for all training and all test sets specified by either a resampling description (`ResampleDesc`) or resampling instance (`ResampleInstance`).

You are able to return all fitted models (parameter models) or extract specific parts of the models (parameter `extract`) as returning all of them completely might be memory intensive.

The remaining functions on this page are convenience wrappers for the various existing resampling strategies. Note that if you need to work with precomputed training and test splits (i.e., resampling instances), you have to stick with `resample`.

### Usage

```
resample(learner, task, resampling, measures, weights = NULL,
         models = FALSE, extract, keep.pred = TRUE, ...,
         show.info = getMlrOption("show.info"))
```

```
crossval(learner, task, iters = 10L, stratify = FALSE, measures,
         models = FALSE, keep.pred = TRUE, ...,
         show.info = getMlrOption("show.info"))
```

```
repcv(learner, task, folds = 10L, reps = 10L, stratify = FALSE, measures,
      models = FALSE, keep.pred = TRUE, ...,
      show.info = getMlrOption("show.info"))
```

```
holdout(learner, task, split = 2/3, stratify = FALSE, measures,
        models = FALSE, keep.pred = TRUE, ...,
        show.info = getMlrOption("show.info"))
```

```
subsample(learner, task, iters = 30, split = 2/3, stratify = FALSE,
          measures, models = FALSE, keep.pred = TRUE, ...,
          show.info = getMlrOption("show.info"))
```

```
bootstrap00B(learner, task, iters = 30, stratify = FALSE, measures,
             models = FALSE, keep.pred = TRUE, ...,
             show.info = getMlrOption("show.info"))
```

```
bootstrapB632(learner, task, iters = 30, stratify = FALSE, measures,
              models = FALSE, keep.pred = TRUE, ...,
              show.info = getMlrOption("show.info"))
```

```
bootstrapB632plus(learner, task, iters = 30, stratify = FALSE, measures,
                  models = FALSE, keep.pred = TRUE, ...,
                  show.info = getMlrOption("show.info"))
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
task	[ <a href="#">Task</a> ] The task.
resampling	[ <a href="#">ResampleDesc</a> or <a href="#">ResampleInstance</a> ] Resampling strategy. If a description is passed, it is instantiated automatically.
measures	[ <a href="#">Measure</a>   list of <a href="#">Measure</a> ] Performance measure(s) to evaluate.
weights	[numeric] Optional, non-negative case weight vector to be used during fitting. If given, must be of same length as observations in task and in corresponding order. Overwrites weights specified in the task. By default NULL which means no weights are used unless specified in the task.
models	[logical(1)] Should all fitted models be returned? Default is FALSE.
extract	[function] Function used to extract information from a fitted model during resampling. Is applied to every <a href="#">WrappedModel</a> resulting from calls to <a href="#">train</a> during resampling. Default is to extract nothing.
keep.pred	[logical(1)] Keep the prediction data in the pred slot of the result object. If you do many experiments (on larger data sets) these objects might unnecessarily increase object size / mem usage, if you do not really need them. In this case you can this argument to FALSE. Default is TRUE.
...	[any] Further hyperparameters passed to learner.
show.info	[logical(1)] Print verbose output on console? Default is set via <a href="#">configureMlr</a> .
iters	[integer(1)] See <a href="#">ResampleDesc</a> .
stratify	[logical(1)] See <a href="#">ResampleDesc</a> .
folds	[integer(1)] See <a href="#">ResampleDesc</a> .
reps	[integer(1)] See <a href="#">ResampleDesc</a> .
split	[numeric(1)] See <a href="#">ResampleDesc</a> .

**Value**

[ResampleResult](#) . List of:

**See Also**

Other resample: [ResampleDesc](#), [makeResampleDesc](#); [ResampleInstance](#), [makeResampleInstance](#); [ResamplePrediction](#); [ResampleResult](#); [getRRPredictions](#)

**Examples**

```
task = makeClassifTask(data = iris, target = "Species")
rdesc = makeResampleDesc("CV", iters = 2)
r = resample(makeLearner("classif.qda"), task, rdesc)
print(r$aggr)
print(r$measures.test)
print(r$pred)
```

---

ResamplePrediction      *Prediction from resampling.*

---

**Description**

Contains predictions from resampling, returned (among other stuff) by function [resample](#). Can basically be used in the same way as [Prediction](#), its super class. The main differences are: (a) The internal data.frame (member data) contains an additional column `iter`, specifying the iteration of the resampling strategy, and and additional columns `set`, specifying whether the prediction was from an observation in the “train” or “test” set. (b) The prediction `time` is a numeric vector, its length equals the number of iterations.

**See Also**

Other resample: [ResampleDesc](#), [makeResampleDesc](#); [ResampleInstance](#), [makeResampleInstance](#); [ResampleResult](#); [bootstrapB632](#), [bootstrapB632plus](#), [bootstrapO0B](#), [crossval](#), [holdout](#), [repvcv](#), [resample](#), [subsample](#); [getRRPredictions](#)

---

ResampleResult      *ResampleResult object.*

---

**Description**

A resample result is created by [resample](#) and contains the following object members:

**task.id** [character(1) :] Name of the Task.

**learner.id** [character(1) :] Name of the Learner.

**measures.test** [data.frame :] Gives you access to performance measurements on the individual test sets. Rows correspond to sets in resampling iterations, columns to performance measures.

**measures.train** [data.frame :] Gives you access to performance measurements on the individual training sets. Rows correspond to sets in resampling iterations, columns to performance measures. Usually not available, only if specifically requested, see general description above.

**aggr** [numeric :] Named vector of aggregated performance values. Names are coded like this <measure>.<aggregation>.

**err.msgs** [data.frame :] Number of rows equals resampling iterations and columns are: “iter”, “train”, “predict”. Stores error messages generated during train or predict, if these were caught via `configureMlr`.

**pred** [`ResamplePrediction` :] Container for all predictions during resampling.

**models** [list of `WrappedModel` :] List of fitted models or NULL.

**extract** [list :] List of extracted parts from fitted models or NULL.

**runtime** [numeric(1) :] Time in seconds it took to execute the resampling.

The print method of this object gives a short overview, including task and learner ids, aggregated measures as well as mean and standard deviation of the measures.

---

RLearner

*Internal construction / wrapping of learner object.*

---

### Description

Wraps an already implemented learning method from R to make it accessible to mlr. Call this method in your constructor. You have to pass an id (name), the required package(s), a description object for all changeable parameters (you dont have to do this for the learner to work, but it is strongly recommended), and use property tags to define features of the learner.

### Usage

```
makeRLearner()
```

```
makeRLearnerClassif(cl, package, par.set, par.vals = list(),
  properties = character(0L), name = cl, short.name = cl, note = "")
```

```
makeRLearnerRegr(cl, package, par.set, par.vals = list(),
  properties = character(0L), name = cl, short.name = cl, note = "")
```

```
makeRLearnerSurv(cl, package, par.set, par.vals = list(),
  properties = character(0L), name = cl, short.name = cl, note = "")
```

```
makeRLearnerCluster(cl, package, par.set, par.vals = list(),
  properties = character(0L), name = cl, short.name = cl, note = "")
```

**Arguments**

cl	[character(1)] Class name for learner to create. By convention, all classification learners start with “classif.”, all regression learners with “regr.” and all survival learners start with “surv.”.
package	[character] Package(s) to load for the implementation of the learner.
par.set	[ParamSet] Parameter set of (hyper)parameters and their constraints.
par.vals	[list] Always set hyperparameters to these values when the object is constructed. Useful when default values are missing in the underlying function. The values can later be overwritten when the user sets hyperparameters. Default is empty list.
properties	[character(1)] Set of learner properties. Some standard property names include: <b>numerics</b> Can numeric features be handled? <b>factors</b> Can factor features be handled? <b>missings</b> Can missing features be handled? <b>oneclas,twoclass,multiclass</b> Can one-class, two-class or multi-class classification problems be handled? <b>prob</b> Can probabilities be predicted? <b>se</b> Can standard errors be predicted? Default is character(0).
name	[character(1)] Meaningful name for learner. Default is id.
short.name	[character(1)] Short name for learner. Should only be a few characters so it can be used in plots and tables. Default is id.
note	[character(1)] Additional notes regarding the learner and its integration in mlr. Default is “”.

**Value**

RLearnerClassif, RLearnerRegr or RLearnerSurv .

---

selectFeatures	<i>Feature selection by wrapper approach.</i>
----------------	---

---

**Description**

Optimizes the features for a classification or regression problem by choosing a variable selection wrapper approach. Allows for different optimization methods, such as forward search or a genetic algorithm. You can select such an algorithm (and its settings) by passing a corresponding control object. For a complete list of implemented algorithms look at the subclasses of [FeatSelControl]. All algorithms operate on a 0-1-bit encoding of candidate solutions. Per default a single bit corresponds to a single feature, but you are able to change this by using the arguments bit.names and bits.to.features. Thus allowing you to switch on whole groups of features with a single bit.

**Usage**

```
selectFeatures(learner, task, resampling, measures, bit.names, bits.to.features,
               control, show.info = getMlrOption("show.info"))
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
task	[ <a href="#">Task</a> ] The task.
resampling	[ <a href="#">ResampleInstance</a>   <a href="#">ResampleDesc</a> ] Resampling strategy for feature selection. If you pass a description, it is instantiated once at the beginning by default, so all points are evaluated on the same training/test sets. If you want to change that behaviour, look at <a href="#">FeatSelControl</a> .
measures	[list of <a href="#">Measure</a>   <a href="#">Measure</a> ] Performance measures to evaluate. The first measure, aggregated by the first aggregation function is optimized, others are simply evaluated.
bit.names	[character] Names of bits encoding the solutions. Also defines the total number of bits in the encoding. Per default these are the feature names of the task.
bits.to.features	[function(x, task)] Function which transforms an integer-0-1 vector into a character vector of selected features. Per default a value of 1 in the <i>i</i> th bit selects the <i>i</i> th feature to be in the candidate solution.
control	[see <a href="#">FeatSelControl</a> ] Control object for search method. Also selects the optimization algorithm for feature selection.
show.info	[logical(1)] Print verbose output on console? Default is set via <a href="#">configureMlr</a> .

**Value**

[FeatSelResult](#) .

**See Also**

Other featsel: [FeatSelControl](#), [FeatSelControlExhaustive](#), [FeatSelControlGA](#), [FeatSelControlRandom](#), [FeatSelControlSequential](#), [makeFeatSelControlExhaustive](#), [makeFeatSelControlGA](#), [makeFeatSelControlRandom](#), [makeFeatSelControlSequential](#); [analyzeFeatSelResult](#); [getFeatSelResult](#); [makeFeatSelWrapper](#)

**Examples**

```
rdesc = makeResampleDesc("Holdout")
ctrl = makeFeatSelControlSequential(method = "sfs", maxit = NA)
res = selectFeatures("classif.rpart", iris.task, rdesc, control = ctrl)
analyzeFeatSelResult(res)
```

---

setAggregation	<i>Set aggregation function of measure.</i>
----------------	---

---

**Description**

Set how this measure will be aggregated after resampling. To see possible aggregation functions: [aggregations](#).

**Usage**

```
setAggregation(measure, aggr)
```

**Arguments**

measure	[ <a href="#">Measure</a> ] Performance measure.
aggr	[ <a href="#">Aggregation</a> ] Aggregation function.

**Value**

[Measure](#) with changed aggregation behaviour.

---

setHyperPars	<i>Set the hyperparameters of a learner object.</i>
--------------	---

---

**Description**

Set the hyperparameters of a learner object.

**Usage**

```
setHyperPars(learner, ..., par.vals = list())
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
...	[any] Named (hyper)parameters with new setting. Alternatively these can be passed using the <code>par.vals</code> argument.
par.vals	[list] Optional list of named (hyper)parameter settings. The arguments in <code>...</code> take precedence over values in this list.

**Value**

[Learner](#) .

**See Also**

Other learner: [LearnerProperties](#), [addProperties](#), [hasProperties](#), [removeProperties](#), [setProperties](#); [Learner](#), [makeLearner](#); [getHyperPars](#); [getParamSet](#); [removeHyperPars](#); [setId](#); [setPredictThreshold](#); [setPredictType](#)

**Examples**

```
c11 = makeLearner("classif.ksvm", sigma = 1)
c12 = setHyperPars(c11, sigma = 10, par.vals = list(C = 2))
print(c11)
# note the now set and altered hyperparameters:
print(c12)
```

---

setHyperPars2	<i>Only exported for internal use.</i>
---------------	--

---

**Description**

Only exported for internal use.

**Usage**

```
setHyperPars2(learner, par.vals)
```

**Arguments**

learner	<a href="#">[Learner]</a> The learner.
par.vals	<a href="#">[list]</a> List of named (hyper)parameter settings.

---

setId	<i>Set the id of a learner object.</i>
-------	--

---

**Description**

Set the id of a learner object.

**Usage**

```
setId(learner, id)
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
id	[character(1)] New id for learner.

**Value**

[Learner](#) .

**See Also**

Other learner: [LearnerProperties](#), [addProperties](#), [hasProperties](#), [removeProperties](#), [setProperties](#); [Learner](#), [makeLearner](#); [getHyperPars](#); [getParamSet](#); [removeHyperPars](#); [setHyperPars](#); [setPredictThreshold](#); [setPredictType](#)

---

setPredictThreshold    *Set the probability threshold the learner should use.*

---

**Description**

See `predict.threshold` in [makeLearner](#) and [setThreshold](#).

For complex wrappers only the top-level `predict.type` is currently set.

**Usage**

```
setPredictThreshold(learner, predict.threshold)
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
predict.threshold	[numeric] Threshold to produce class labels. Has to be a named vector, where names correspond to class labels. Only for binary classification it can be a single numerical threshold for the positive class. See <a href="#">setThreshold</a> for details on how it is applied. Default is NULL which means 0.5 / an equal threshold for each class.

**Value**

[Learner](#) .

**See Also**

Other learner: [LearnerProperties](#), [addProperties](#), [hasProperties](#), [removeProperties](#), [setProperties](#); [Learner](#), [makeLearner](#); [getHyperPars](#); [getParamSet](#); [removeHyperPars](#); [setHyperPars](#); [setId](#); [setPredictType](#)

Other predict: [asROCRPrediction](#); [generateROCRCurvesData](#); [getProbabilities](#); [plotROCRCurvesGGVIS](#); [plotROCRCurves](#); [plotViperCharts](#); [predict.WrappedModel](#); [setPredictType](#)

---

setPredictType	<i>Set the type of predictions the learner should return.</i>
----------------	---

---

**Description**

Possible prediction types are: Classification: Labels or class probabilities (including labels). Regression: Numeric or response or standard errors (including numeric response). Survival: Linear predictor or survival probability.

For complex wrappers the predict type is usually also passed down the encapsulated learner in a recursive fashion.

**Usage**

```
setPredictType(learner, predict.type)
```

**Arguments**

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
predict.type	[character(1)] Classification: “response” or “prob”. Regression: “response” or “se”. Survival: “response” (linear predictor) or “prob”. Clustering: “response” or “prob”. Default is “response”.

**Value**

[Learner](#) .

**See Also**

Other learner: [LearnerProperties](#), [addProperties](#), [hasProperties](#), [removeProperties](#), [setProperties](#); [Learner](#), [makeLearner](#); [getHyperPars](#); [getParamSet](#); [removeHyperPars](#); [setHyperPars](#); [setId](#); [setPredictThreshold](#)

Other predict: [asROCRPrediction](#); [generateROCRCurvesData](#); [getProbabilities](#); [plotROCRCurvesGGVIS](#); [plotROCRCurves](#); [plotViperCharts](#); [predict.WrappedModel](#); [setPredictThreshold](#)

---

setThreshold                      *Set threshold of prediction object.*

---

### Description

Set threshold of prediction object for classification. Creates corresponding discrete class response for the newly set threshold. For binary classification: The positive class is predicted if the probability value exceeds the threshold. For multiclass: Probabilities are divided by corresponding thresholds and the class with maximum resulting value is selected. The result of both are equivalent if in the multi-threshold case the values are greater than 0 and sum to 1.

### Usage

```
setThreshold(pred, threshold)
```

### Arguments

pred	[Prediction] Prediction object.
threshold	[numeric] Threshold to produce class labels. Has to be a named vector, where names correspond to class labels. Only for binary classification it can be a single numerical threshold for the positive class.

### Value

[Prediction](#) with changed threshold and corresponding response.

### See Also

[predict.WrappedModel](#)

### Examples

```
## create task and train learner (LDA)
task = makeClassifTask(data = iris, target = "Species")
lrn = makeLearner("classif.lda", predict.type = "prob")
mod = train(lrn, task)

## predict probabilities and compute performance
pred = predict(mod, newdata = iris)
performance(pred, measures = mmce)
head(as.data.frame(pred))
## adjust threshold and predict probabilities again
threshold = c(setosa = 0.4, versicolor = 0.3, virginica = 0.3)
pred = setThreshold(pred, threshold = threshold)
performance(pred, measures = mmce)
head(as.data.frame(pred))
```

---

smote	<i>Synthetic Minority Oversampling Technique to handle class imbalance in binary classification.</i>
-------	--

---

### Description

In each iteration, samples one minority class element  $x_1$ , then one of  $x_1$ 's nearest neighbors:  $x_2$ . Both points are now interpolated / convex-combined, resulting in a new virtual data point  $x_3$  for the minority class.

The method handles factor features, too. The gower distance is used for nearest neighbor calculation, see [daisy](#). For interpolation, the new factor level for  $x_3$  is sampled from the two given levels of  $x_1$  and  $x_2$  per feature.

### Usage

```
smote(task, rate, nn = 5L, standardize = TRUE, alt.logic = FALSE)
```

### Arguments

task	[Task] The task.
rate	[numeric(1)] Factor to upsample the smaller class. Must be between 1 and Inf, where 1 means no oversampling and 2 would mean doubling the class size.
nn	[integer(1)] Number of nearest neighbors to consider. Default is 5.
standardize	[integer(1)] Standardize input variables before calculating the nearest neighbors for data sets with numeric input variables only. For mixed variables (numeric and factor) the gower distance is used and variables are standardized anyway. Default is TRUE.
alt.logic	[integer(1)] Use an alternative logic for selection of minority class observations. Instead of sampling a minority class element AND one of its nearest neighbors, each minority class element is taken multiple times (depending on rate) for the interpolation and only the corresponding nearest neighbor is sampled. Default is FALSE.

### Value

[Task](#) .

sonar.task	<i>Sonar classification task</i>
------------	----------------------------------

---

**Description**

Contains the task (sonar.task).

**References**

See [Sonar](#).

---

subsetTask	<i>Subset data in task.</i>
------------	-----------------------------

---

**Description**

Subset data in task.

**Usage**

```
subsetTask(task, subset, features)
```

**Arguments**

task	[Task] The task.
subset	[integer   logical(n)] Selected cases. Default is all cases.
features	[character] Selected inputs. Note that target feature is always included in the resulting task, you should not pass it here. Default is all features.

**Value**

[Task](#) . Task with subsetted data.

**See Also**

**Examples**

```
task = makeClassifTask(data = iris, target = "Species")
subsetTask(task, subset = 1:100)
```

---

summarizeColumns	<i>Summarize columns of data.frame or task.</i>
------------------	---

---

**Description**

Summarizes a data.frame, somewhat differently than the normal [summary](#) function of R. The function is mainly useful as a basic EDA tool on data.frames before they are converted to tasks, but can be used on tasks as well.

Columns can be of type numeric, integer, logical, factor, or character. Characters and logicals will be treated as factors.

**Usage**

```
summarizeColumns(obj)
```

**Arguments**

obj	[data.frame   <a href="#">Task</a> ] Input data.
-----	---

**Value**

data.frame . With columns:

name	Name of column.
type	Data type of column.
na	Number of NAs in column.
disp	Measure of dispersion, for numerics and integers <a href="#">sd</a> is used, for categorical columns the qualitative variation.
mean	Mean value of column, NA for categorical columns.
median	Median value of column, NA for categorical columns.
mad	MAD of column, NA for categorical columns.
min	Minimal value of column, for categorical columns the size of the smallest category.
max	Maximal value of column, for categorical columns the size of the largest category.
nlevs	For categorical columns, the number of factor levels, NA else.

**See Also**

Other `eda_and_preprocess`: [capLargeValues](#); [createDummyFeatures](#); [dropFeatures](#); [mergeSmallFactorLevels](#); [normalizeFeatures](#); [removeConstantFeatures](#)

**Examples**

```
summarizeColumns(iris)
```

---

<code>summarizeLevels</code>	<i>Summarizes factors of a data.frame by tabling them.</i>
------------------------------	--

---

**Description**

Characters and logicals will be treated as factors.

**Usage**

```
summarizeLevels(obj, cols = NULL)
```

**Arguments**

<code>obj</code>	[ <code>data.frame</code>   <a href="#">Task</a> ] Input data.
<code>cols</code>	[ <code>character</code> ] Restrict result to columns in <code>cols</code> . Default is all factor, character and logical columns of <code>obj</code> .

**Value**

`list` . Named list of tables.

---

<code>TaskDesc</code>	<i>Description object for task.</i>
-----------------------	-------------------------------------

---

**Description**

Description object for task, encapsulates basic properties of the task without having to store the complete data set.

## Details

Object members:

**id** [character(1) ] Id string of task.

**type** [character(1) ] Type of task, “`classif`” for classification, “`regr`” for regression, “`surv`” for survival, “`costsens`” for cost-sensitive classification.

**target** [character(0) | character(1) | character(2) ] Name of target variable. For “`surv`” these are the names of the survival time and event columns, so it has length 2. For “`costsens`” it has length 0, as there is no target column, but a cost matrix instead.

**size** [integer(1) ] Number of cases in data set.

**n.feats** [integer(2) ] Number of features, named vector with entries: “`numerics`”, “`factors`”, “`ordered`”.

**has.missings** [logical(1) ] Are missing values present?

**has.weights** [logical(1) ] Are weights specified for each observation?

**has.blocking** [logical(1) ] Is a blocking factor for cases available in the task?

**class.levels** [character ] All possible classes. Only present for “`classif`” and “`costsens`”.

**positive** [character(1) ] Positive class label for binary classification. Only present for “`classif`”, NA for multiclass.

**negative** [character(1) ] Negative class label for binary classification. Only present for “`classif`”, NA for multiclass.

---

train	<i>Train a learning algorithm.</i>
-------	------------------------------------

---

## Description

Given a [Task](#), creates a model for the learning machine which can be used for predictions on new data.

## Usage

```
train(learner, task, subset, weights = NULL)
```

## Arguments

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
task	[ <a href="#">Task</a> ] The task.
subset	[integer] An index vector specifying the training cases to be used for fitting. By default the complete data set is used.

**weights** [numeric]  
 Optional, non-negative case weight vector to be used during fitting. If given, must be of same length as subset and in corresponding order. By default NULL which means no weights are used unless specified in the task ([Task]). Weights from the task will be overwritten.

### Value

WrappedModel .

### See Also

[predict.WrappedModel](#)

### Examples

```
training.set = sample(1:nrow(iris), nrow(iris) / 2)

## use linear discriminant analysis to classify iris data
task = makeClassifTask(data = iris, target = "Species")
learner = makeLearner("classif.lda", method = "mle")
mod = train(learner, task, subset = training.set)
print(mod)

## use random forest to classify iris data
task = makeClassifTask(data = iris, target = "Species")
learner = makeLearner("classif.rpart", minsplit = 7, predict.type = "prob")
mod = train(learner, task, subset = training.set)
print(mod)
```

---

trainLearner

*Train an R learner.*

---

### Description

Mainly for internal use. Trains a wrapped learner on a given training set. You have to implement this method if you want to add another learner to this package.

### Usage

```
trainLearner(.learner, .task, .subset, .weights = NULL, ...)
```

### Arguments

**.learner** [RLearner]  
 Wrapped learner.

**.task** [Task]  
 Task to train learner on.

<code>.subset</code>	[integer] Subset of cases for training set, index the task with this. You probably want to use <a href="#">getTaskData</a> for this purpose.
<code>.weights</code>	[numeric] Weights for each observation.
<code>...</code>	[any] Additional (hyper)parameters, which need to be passed to the underlying train function.

### Details

Your implementation must adhere to the following: The model must be fitted on the subset of `.task` given by `.subset`. All parameters must in `...` must be passed to the underlying training function.

### Value

any `. Model of the underlying learner.`

---

TuneControl

*Create control structures for tuning.*

---

### Description

The following tuners are available:

**makeTuneControlGrid** Grid search. All kinds of parameter types can be handled. You can either use their correct param type and resolution, or discretize them yourself by always using [makeDiscreteParam](#) in the `par.set` passed to [tuneParams](#).

**makeTuneControlRandom** Random search. All kinds of parameter types can be handled.

**makeTuneControlDesign** Completely pre-specify a data.frame of design points to be evaluated during tuning. All kinds of parameter types can be handled.

**makeTuneControlCMAES** CMA Evolution Strategy with method [cma\\_es](#). Can handle numeric(vector) and integer(vector) hyperparameters, but no dependencies. For integers the internally proposed numeric values are automatically rounded. The sigma variance parameter is initialized to 1/4 of the span of box-constraints per parameter dimension.

**makeTuneControlGenSA** Generalized simulated annealing with method [GenSA](#). Can handle numeric(vector) and integer(vector) hyperparameters, but no dependencies. For integers the internally proposed numeric values are automatically rounded.

**makeTuneControlIrace** Tuning with iterated F-Racing with method [irace](#). All kinds of parameter types can be handled. We return the best of the final elite candidates found by irace in the last race. Its estimated performance is the mean of all evaluations ever done for that candidate.

Some notes on [irace](#): For resampling you have to pass a [ResampleDesc](#), not a [ResampleInstance](#). The resampling strategy is randomly instantiated `n.instances` times and these are the instances in the sense of [irace](#) (`instances` element of `tunerConfig` in [irace](#)). Also note that [irace](#) will always store its tuning results in a file on disk, see the package documentation for details on this and how to change the file path.

**Usage**

```

makeTuneControlCMAES(same.resampling.instance = TRUE, impute.val = NULL,
  start = NULL, tune.threshold = FALSE, tune.threshold.args = list(),
  log.fun = NULL, ...)

makeTuneControlDesign(same.resampling.instance = TRUE, impute.val = NULL,
  design = NULL, tune.threshold = FALSE, tune.threshold.args = list(),
  log.fun = NULL)

makeTuneControlGenSA(same.resampling.instance = TRUE, impute.val = NULL,
  start = NULL, tune.threshold = FALSE, tune.threshold.args = list(),
  log.fun = NULL, ...)

makeTuneControlGrid(same.resampling.instance = TRUE, impute.val = NULL,
  resolution = 10L, tune.threshold = FALSE, tune.threshold.args = list(),
  log.fun = NULL)

makeTuneControlIrace(impute.val = NULL, n.instances = 100L,
  show.irace.output = FALSE, tune.threshold = FALSE,
  tune.threshold.args = list(), log.fun = NULL, ...)

makeTuneControlRandom(same.resampling.instance = TRUE, maxit = 100L,
  tune.threshold = FALSE, tune.threshold.args = list(), log.fun = NULL)

```

**Arguments**

<code>same.resampling.instance</code>	<code>[logical(1)]</code> Should the same resampling instance be used for all evaluations to reduce variance? Default is TRUE.
<code>impute.val</code>	<code>[numeric]</code> If something goes wrong during optimization (e.g, the learner crashes), this value is fed back to the tuner, so the tuning algorithm does not abort. It is not stored in the optimization path, an NA and a corresponding error message are logged instead. Note that this value is later multiplied by -1 for maximization measures internally, so you need to enter a larger positive value for maximization here as well. Default is the worst obtainable value of the performance measure you optimize for when you aggregate by mean value, or Inf instead. For multi-criteria optimization pass a vector of imputation values, one for each of your measures, in the same order as your measures.
<code>start</code>	<code>[list]</code> Named list of initial parameter values.
<code>tune.threshold</code>	<code>[logical(1)]</code> Should the threshold be tuned for the measure at hand, after each hyperparameter evaluation, via <code>tuneThreshold</code> ? Only works for classification if the predict type is "prob". Default is FALSE.

tune.threshold.args	[list] Further arguments for threshold tuning that are passed down to <a href="#">tuneThreshold</a> . Default is none.
log.fun	[function   NULL] Function used for logging. If set to NULL, the internal default will be used. Otherwise a function with arguments learner, resampling, measures, par.set, control, opt.path, dob, x, y, remove.nas, and stage is expected. The default displays the performance measures, the time needed for evaluating, the currently used memory and the max memory ever used before (the latter two both taken from <a href="#">gc</a> ). See the implementation for details.
...	[any] Further control parameters passed to the control argument of <a href="#">cma_es</a> and tunerConfig argument of <a href="#">irace</a> .
design	[data.frame] data.frame containing the different parameter settings to be evaluated. The columns have to be named according to the ParamSet which will be used in <a href="#">tune()</a> . Proper designs can be created with <a href="#">generateDesign</a> for instance.
resolution	[integer] Resolution of the grid for each numeric/integer parameter in par.set. For vector parameters, it is the resolution per dimension. Either pass one resolution for all parameters, or a named vector. See <a href="#">generateGridDesign</a> . Default is 10.
n.instances	[integer(1)] Number of random resampling instances for irace, see details. Default is 100.
show.irace.output	[logical(1)] Show console output of irace while tuning? Default is FALSE.
maxit	[integer(1)] Number of iterations for random search. Default is 100.

**Value**

[TuneControl](#) . The specific subclass is one of [TuneControlGrid](#), [TuneControlRandom](#), [TuneControlCMAES](#), [TuneControlGenSA](#), [TuneControlIrace](#).

**See Also**

Other tune: [ModelMultiplexer](#), [makeModelMultiplexer](#); [getNestedTuneResultsOptPathDf](#); [getNestedTuneResultsX](#); [getTuneResult](#); [makeModelMultiplexerParamSet](#); [makeTuneWrapper](#); [tuneParams](#); [tuneThreshold](#)

---

TuneMultiCritControl *Create control structures for multi-criteria tuning.*

---

## Description

The following tuners are available:

**makeTuneMultiCritControlGrid** Grid search. All kinds of parameter types can be handled. You can either use their correct param type and resolution, or discretize them yourself by always using `makeDiscreteParam` in the `par.set` passed to `tuneParams`.

**makeTuneMultiCritControlRandom** Random search. All kinds of parameter types can be handled.

**makeTuneMultiCritControlNSGA2** Evolutionary method `nsga2`. Can handle numeric(vector) and integer(vector) hyperparameters, but no dependencies. For integers the internally proposed numeric values are automatically rounded.

## Usage

```
makeTuneMultiCritControlGrid(same.resampling.instance = TRUE,
  resolution = 10L, log.fun = NULL)
```

```
makeTuneMultiCritControlNSGA2(same.resampling.instance = TRUE,
  impute.val = NULL, log.fun = NULL, ...)
```

```
makeTuneMultiCritControlRandom(same.resampling.instance = TRUE,
  maxit = 100L, log.fun = NULL)
```

## Arguments

<code>same.resampling.instance</code>	[logical(1)] Should the same resampling instance be used for all evaluations to reduce variance? Default is TRUE.
<code>resolution</code>	[integer] Resolution of the grid for each numeric/integer parameter in <code>par.set</code> . For vector parameters, it is the resolution per dimension. Either pass one resolution for all parameters, or a named vector. See <code>generateGridDesign</code> . Default is 10.
<code>log.fun</code>	[function   NULL] Function used for logging. If set to NULL, the internal default will be used. Otherwise a function with arguments <code>learner</code> , <code>resampling</code> , <code>measures</code> , <code>par.set</code> , <code>control</code> , <code>opt.path</code> , <code>dob</code> , <code>x</code> , <code>y</code> , <code>remove.nas</code> , and <code>stage</code> is expected. The default displays the performance measures, the time needed for evaluating, the currently used memory and the max memory ever used before (the latter two both taken from <code>gc</code> ). See the implementation for details.

<code>impute.val</code>	[numeric] If something goes wrong during optimization (e.g, the learner crashes), this value is fed back to the tuner, so the tuning algorithm does not abort. It is not stored in the optimization path, an NA and a corresponding error message are logged instead. Note that this value is later multiplied by -1 for maximization measures internally, so you need to enter a larger positive value for maximization here as well. Default is the worst obtainable value of the performance measure you optimize for when you aggregate by mean value, or Inf instead. For multi-criteria optimization pass a vector of imputation values, one for each of your measures, in the same order as your measures.
<code>...</code>	[any] Further control parameters passed to the <code>control</code> argument of <code>cma_es</code> and <code>tunerConfig</code> argument of <code>irace</code> .
<code>maxit</code>	[integer(1)] Number of iterations for random search. Default is 100.

**Value**

`TuneMultiCritControl` . The specific subclass is one of `TuneMultiCritControlGrid`, `TuneMultiCritControlRandom`, `TuneMultiCritControlNSGA2`.

**See Also**

Other `tune_multicrit`: `plotTuneMultiCritResultGGVIS`; `plotTuneMultiCritResult`; `tuneParamsMultiCrit`

---

`TuneMultiCritResult`    *Result of multi-criteria tuning.*

---

**Description**

Container for results of hyperparameter tuning. Contains the obtained pareto set and front and the optimization path which lead there.

Object members:

**learner** [`Learner` ] Learner that was optimized.

**control** [`TuneControl` ] Control object from tuning.

**x** [`list` ] List of lists of non-dominated hyperparameter settings in pareto set. Note that when you have trafos on some of your params, x will always be on the TRANSFORMED scale so you directly use it.

**y** [`matrix` ] Pareto front for x.

**opt.path** [`OptPath` ] Optimization path which lead to x. Note that when you have trafos on some of your params, the `opt.path` always contains the UNTRANSFORMED values on the original scale. You can simply call `trafoOptPath(opt.path)` to transform them, or, as `data.frame(trafoOptPath(opt.pat`

---

tuneParams

*Hyperparameter tuning.*

---

### Description

Optimizes the hyperparameters of a learner. Allows for different optimization methods, such as grid search, evolutionary strategies, iterated F-race, etc. You can select such an algorithm (and its settings) by passing a corresponding control object. For a complete list of implemented algorithms look at [TuneControl](#).

Multi-criteria tuning can be done with [tuneParamsMultiCrit](#).

### Usage

```
tuneParams(learner, task, resampling, measures, par.set, control,
  show.info = getMlrOption("show.info"))
```

### Arguments

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
task	[ <a href="#">Task</a> ] The task.
resampling	[ <a href="#">ResampleInstance</a>   <a href="#">ResampleDesc</a> ] Resampling strategy to evaluate points in hyperparameter space. If you pass a description, it is instantiated once at the beginning by default, so all points are evaluated on the same training/test sets. If you want to change that behavior, look at <a href="#">TuneControl</a> .
measures	[list of <a href="#">Measure</a>   <a href="#">Measure</a> ] Performance measures to evaluate. The first measure, aggregated by the first aggregation function is optimized, others are simply evaluated.
par.set	[ <a href="#">ParamSet</a> ] Collection of parameters and their constraints for optimization.
control	[ <a href="#">TuneControl</a> ] Control object for search method. Also selects the optimization algorithm for tuning.
show.info	[logical(1)] Print verbose output on console? Default is set via <a href="#">configureMlr</a> .

### Value

[TuneResult](#) .

**See Also**

Other tune: [ModelMultiplexer](#), [makeModelMultiplexer](#); [TuneControl](#), [TuneControlCMAES](#), [TuneControlGenSA](#), [TuneControlGrid](#), [TuneControlIrace](#), [TuneControlRandom](#), [makeTuneControlCMAES](#), [makeTuneControlDesign](#), [makeTuneControlGenSA](#), [makeTuneControlGrid](#), [makeTuneControlIrace](#), [makeTuneControlRandom](#); [getNestedTuneResultsOptPathDf](#); [getNestedTuneResultsX](#); [getTuneResult](#); [makeModelMultiplexerParamSet](#); [makeTuneWrapper](#); [tuneThreshold](#)

**Examples**

```
# a grid search for an SVM (with a tiny number of points...)
# note how easily we can optimize on a log-scale
ps = makeParamSet(
  makeNumericParam("C", lower = -12, upper = 12, trafo = function(x) 2^x),
  makeNumericParam("sigma", lower = -12, upper = 12, trafo = function(x) 2^x)
)
ctrl = makeTuneControlGrid(resolution = 2L)
rdesc = makeResampleDesc("CV", iters = 2L)
res = tuneParams("classif.ksvm", iris.task, rdesc, par.set = ps, control = ctrl)
print(res)
print(as.data.frame(res$opt.path))
print(as.data.frame(trafoOptPath(res$opt.path)))

## Not run:
# we optimize the SVM over 3 kernels simultaneously
# note how we use dependent params (requires = ...) and iterated F-racing here
ps = makeParamSet(
  makeNumericParam("C", lower = -12, upper = 12, trafo = function(x) 2^x),
  makeDiscreteParam("kernel", values = c("vanilladot", "polydot", "rbfdot")),
  makeNumericParam("sigma", lower = -12, upper = 12, trafo = function(x) 2^x,
    requires = quote(kernel == "rbfdot")),
  makeIntegerParam("degree", lower = 2L, upper = 5L,
    requires = quote(kernel == "polydot"))
)
print(ps)
ctrl = makeTuneControlIrace(maxExperiments = 200L)
rdesc = makeResampleDesc("Holdout")
res = tuneParams("classif.ksvm", iris.task, rdesc, par.set = ps, control = ctrl)
print(res)
print(head(as.data.frame(res$opt.path)))

## End(Not run)
```

---

tuneParamsMultiCrit    *Hyperparameter tuning for multiple measures at once.*

---

**Description**

Optimizes the hyperparameters of a learner in a multi-criteria fashion. Allows for different optimization methods, such as grid search, evolutionary strategies, etc. You can select such an algorithm

(and its settings) by passing a corresponding control object. For a complete list of implemented algorithms look at [TuneMultiCritControl](#).

### Usage

```
tuneParamsMultiCrit(learner, task, resampling, measures, par.set, control,
  show.info = getMlrOption("show.info"))
```

### Arguments

learner	[ <a href="#">Learner</a>   character(1)] The learner. If you pass a string the learner will be created via <a href="#">makeLearner</a> .
task	[ <a href="#">Task</a> ] The task.
resampling	[ <a href="#">ResampleInstance</a>   <a href="#">ResampleDesc</a> ] Resampling strategy to evaluate points in hyperparameter space. If you pass a description, it is instantiated once at the beginning by default, so all points are evaluated on the same training/test sets. If you want to change that behavior, look at <a href="#">TuneMultiCritControl</a> .
measures	[list of <a href="#">Measure</a> ] Performance measures to optimize simultaneously.
par.set	[ <a href="#">ParamSet</a> ] Collection of parameters and their constraints for optimization.
control	[ <a href="#">TuneMultiCritControl</a> ] Control object for search method. Also selects the optimization algorithm for tuning.
show.info	[logical(1)] Print verbose output on console? Default is set via <a href="#">configureMlr</a> .

### Value

[TuneMultiCritResult](#) .

### See Also

Other `tune_multi`: [TuneMultiCritControl](#), [TuneMultiCritControlGrid](#), [TuneMultiCritControlNSGA2](#), [TuneMultiCritControlRandom](#), [makeTuneMultiCritControlGrid](#), [makeTuneMultiCritControlNSGA2](#), [makeTuneMultiCritControlRandom](#); [plotTuneMultiCritResultGGVIS](#); [plotTuneMultiCritResult](#)

### Examples

```
# multi-criteria optimization of (tpr, fpr) with NSGA-II
lrn = makeLearner("classif.ksvm")
rdesc = makeResampleDesc("Holdout")
ps = makeParamSet(
  makeNumericParam("C", lower = -12, upper = 12, trafo = function(x) 2^x),
  makeNumericParam("sigma", lower = -12, upper = 12, trafo = function(x) 2^x)
)
```

```
ctrl = makeTuneMultiCritControlNSGA2(popsiz = 4L, generations = 1L)
res = tuneParamsMultiCrit(lrn, sonar.task, rdesc, par.set = ps,
  measures = list(tpr, fpr), control = ctrl)
plotTuneMultiCritResult(res, path = TRUE)
```

---

TuneResult

*Result of tuning.*

---

### Description

Container for results of hyperparameter tuning. Contains the obtained point in search space, its performance values and the optimization path which lead there.

Object members:

**learner** [[Learner](#)] Learner that was optimized.

**control** [[TuneControl](#)] Control object from tuning.

**x** [[list](#)] Named list of hyperparameter values identified as optimal. Note that when you have `trafos` on some of your params, `x` will always be on the TRANSFORMED scale so you directly use it.

**y** [[numeric](#)] Performance values for optimal `x`.

**threshold** [[numeric](#)] Vector of finally found and used thresholds if `tune.threshold` was enabled in [TuneControl](#), otherwise not present and hence NULL.

**opt.path** [[OptPath](#)] Optimization path which lead to `x`. Note that when you have `trafos` on some of your params, the `opt.path` always contains the UNTRANSFORMED values on the original scale. You can simply call `trafo0ptPath(opt.path)` to transform them, or, as `data.frame(trafo0ptPath(opt.pat`

---

tuneThreshold

*Tune prediction threshold.*

---

### Description

Optimizes the threshold of prediction based on probabilities. Uses [optimizeSubInts](#) for 2class problems and [cma\\_es](#) for multiclass problems.

### Usage

```
tuneThreshold(pred, measure, task, model, nsub = 20L, control = list())
```

**Arguments**

pred	[ <a href="#">Prediction</a> ] Prediction object.
measure	[ <a href="#">Measure</a> ] Performance measure to optimize.
task	[ <a href="#">Task</a> ] Learning task. Rarely needed, only when required for the performance measure.
model	[ <a href="#">WrappedModel</a> ] Fitted model. Rarely needed, only when required for the performance measure.
nsub	[integer(1)] Passed to <a href="#">optimizeSubInts</a> for 2class problems. Default is 20.
control	[list] Control object for <a href="#">cma_es</a> when used. Default is empty list.

**Value**

list . A named list with with the following components: th is the optimal threshold, perf the performance value.

**See Also**

Other tune: [ModelMultiplexer](#), [makeModelMultiplexer](#); [TuneControl](#), [TuneControlCMAES](#), [TuneControlGenSA](#), [TuneControlGrid](#), [TuneControlIrace](#), [TuneControlRandom](#), [makeTuneControlCMAES](#), [makeTuneControlDesign](#), [makeTuneControlGenSA](#), [makeTuneControlGrid](#), [makeTuneControlIrace](#), [makeTuneControlRandom](#); [getNestedTuneResultsOptPathDf](#); [getNestedTuneResultsX](#); [getTuneResult](#); [makeModelMultiplexerParamSet](#); [makeTuneWrapper](#); [tuneParams](#)

---

wpbc.task

*Wisconsin Prognostic Breast Cancer (WPBC) survival task*

---

**Description**

Contains the task (wpbc.task).

**References**

See [wpbc](#). Incomplete cases have been removed from the task.
