

# Package ‘spatsurv’

October 21, 2015

**Type** Package

**Title** Bayesian Spatial Survival Analysis with Parametric Proportional Hazards Models

**Version** 0.9-11

**Date** 2015-09-04

**Author** Benjamin M. Taylor and Barry S. Rowlingson

**Maintainer** Benjamin M. Taylor <b.taylor1@lancaster.ac.uk>

**Description** Bayesian inference for parametric proportional hazards spatial survival models; flexible spatial survival models.

**License** GPL-3

**Imports** survival, sp, spatstat, raster, iterators, RandomFields, fields, rgl, Matrix, stringr, rgeos, RColorBrewer, geostatsp, OpenStreetMap, methods

**Suggests** rgdal, gpclib

**NeedsCompilation** no

**Depends** R (>= 2.10)

**Repository** CRAN

**Date/Publication** 2015-10-21 11:53:26

spatsurv-package      *spatsurv*

---

**Description**

An R package for spatially correlated parametric proportional hazards survival analysis.

**Usage**

spatsurv

**Format**

logi NA

**Details**

Package: spatsurv  
Version: 0.9-11  
Date: 2015-06-24  
License: GPL-3

**Dependencies** The package spatsurv depends upon some other important contributions to CRAN in order to operate; their uses here are indicated:

survival, sp, spatstat, raster, iterators, RandomFields, fields, rgl, Matrix, stringr, RColorBrewer, geostatsp, rgeos.

**Citation** To cite use of spatsurv, the user may refer to the following work:

spatsurv: an R Package for Bayesian Inference with Spatial Survival Models.  
Benjamin M. Taylor and Barry S. Rowlingson.  
Submitted to The Journal Of Statistical Software.

---

allocate      *allocate function*

---

**Description**

A function to allocate coordinates to an observation whose spatial location is known to the regional level

**Usage**

```
allocate(poly, popden, survdat, pid, sid, n = 2, wid = 2000)
```

**Arguments**

poly	a SpatialPolygonsDataFrame, on which the survival data exist in aggregate form
popden	a sub-polygon raster image of population density
survdat	data.frame containing the survival data
pid	name of the variable in the survival data that gives the region identifier in poly
sid	the name of the variable in poly to match the region identifier in survdat to
n	the number of different allocations to make. e.g. if n is 2 (the default) two candidate sets of locations are available.
wid	The default is 2000, interpreted in metres ie 2Km. size of buffer to add to window for raster cropping purposes: this ensures that for each polygon, the cropped raster covers it completely.

**Value**

matrices x and y, both of size (number of observations in survdat x n) giving n potential candidate locations of points in the columns of x and y.

---

alpha	<i>alpha function</i>
-------	-----------------------

---

**Description**

A function used in calculating the coefficients of a B-spline curve

**Usage**

```
alpha(i, j, knots, knotidx)
```

**Arguments**

i	index i
j	index j
knots	knot vector
knotidx	knot index

**Value**

a vector

---

B	<i>B function</i>
---	-------------------

---

**Description**

A recursive function used in calculating the coefficients of a B-spline curve

**Usage**

B(x, i, j, knots)

**Arguments**

x	locations at which to evaluate the B-spline
i	index i
j	index j
knots	a knot vector

**Value**

a vector of polynomial coefficients

---

basehazard	<i>basehazard function</i>
------------	----------------------------

---

**Description**

Generic function for computing the baseline hazard

**Usage**

basehazard(obj, ...)

**Arguments**

obj	an object
...	additional arguments – currently there are none, but this is for extensibility

**Value**

method basehazard

**See Also**

[basehazard.basehazardspec](#), [exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpowHaz](#)

basehazard.basehazardspec  
*basehazard.basehazardspec function*

---

### Description

A function to retrieve the baseline hazard function

### Usage

```
## S3 method for class 'basehazardspec'  
basehazard(obj, ...)
```

### Arguments

obj            an object of class basehazardspec  
...            additional arguments – currently there are none, but this is for extensibility

### Value

a function returning the baseline hazard

### See Also

[exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpowHaz](#)

---

baselinehazard            *baselinehazard function*

---

### Description

A function to compute quantiles of the posterior baseline hazard or cumulative baseline hazard.

### Usage

```
baselinehazard(x, t = NULL, n = 100, probs = c(0.025, 0.5, 0.975),  
              cumulative = FALSE, plot = TRUE, bw = FALSE, ...)
```

**Arguments**

x	an object inheriting class <code>mcmcspatsurv</code>
t	optional vector of times at which to compute the quantiles, Default is NULL, in which case a uniformly spaced vector of length n from 0 to the maximum time is used
n	the number of points at which to compute the quantiles if t is NULL
probs	vector of probabilities
cumulative	logical, whether to return the baseline hazard (default i.e. FALSE) or cumulative baseline hazard
plot	whether to plot the result
bw	Logical. Plot in black/white/greyscale? Default is to produce a colour plot. Useful for producing plots for journals that do not accept colour plots.
...	additional arguments to be passed to plot

**Value**

the vector of times and quantiles of the baseline or cumulative baseline hazard at those times

**See Also**

[print.mcmcspatsurv](#), [quantile.mcmcspatsurv](#), [summary.mcmcspatsurv](#), [vcov.mcmcspatsurv](#), [frailty-lag1](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [randompars](#), [predict.mcmcspatsurv](#), [priorposterior](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

---

betapriorGauss	<i>betapriorGauss function</i>
----------------	--------------------------------

---

**Description**

A function to define Gaussian priors for beta. This function simply stores a vector of means and standard deviations to be passed to the main MCMC function, `survspat`.

**Usage**

```
betapriorGauss(mean, sd)
```

**Arguments**

mean	the prior mean, a vector of length 1 or more. 1 implies a common mean.
sd	the prior standard deviation, a vector of length 1 or more. 1 implies a common standard deviation.

**Value**

an object of class "betapriorGauss"

**See Also**

[survspat](#), [betapriorGauss](#), [omegapriorGauss](#), [etapriorGauss](#), [indepGaussianprior](#), [derivindepGaussianprior](#)

---

Bspline.construct      *Bspline.construct function*

---

**Description**

A function to construct a B-spline basis matrix for given data and basis coefficients. Used in evaluating the baseline hazard.

**Usage**

```
Bspline.construct(x, basis)
```

**Arguments**

x	a vector, the data
basis	an object created by the getBbasis function

**Value**

a basis matrix

---

BsplineHaz      *BsplineHaz function*

---

**Description**

A function to define a parametric proportional hazards model where the baseline hazard is modelled by a basis spline. This function returns an object inheriting class 'basehazardspec', list of functions 'distinfo', 'basehazard', 'gradbasehazard', 'hessbasehazard', 'cumbasehazard', 'gradcumbasehazard', 'hesscumbasehazard' and 'densityquantile'

**Usage**

```
BsplineHaz(times, knots = quantile(times), degree = 3, MLinits = NULL)
```

**Arguments**

times	vector of survival times (both censored and uncensored)
knots	vector of knots in ascending order, must include minimum and maximum values of 'times'
degree	degree of the spline basis, default is 3
MLinits	optional starting values for the non-spatial maximisation routine using optim. Note that we are working with the log of the parameters. Default is -10 for each parameter.

**Details**

The `distinfo` function is used to provide basic distribution specific information to other `spatsurv` functions. The user is required to provide the following information in the returned list: `npars`, the number of parameters in this distribution; `parnames`, the names of the parameters; `trans`, the transformation scale on which the priors will be provided; `itrans`, the inverse transformation function that will be applied to the parameters before the hazard, and other functions are evaluated; `jacobian`, the derivative of the inverse transformation function with respect to each of the parameters; and `hessian`, the second derivatives of the inverse transformation function with respect to each of the parameters – note that currently the package `spatsurv` only allows the use of functions where the parameters are transformed independently.

The `basehazard` function is used to evaluate the baseline hazard function for the distribution of interest. It returns a function that accepts as input a vector of times, `t` and returns a vector.

The `gradbasehazard` function is used to evaluate the gradient of the baseline hazard function with respect to the parameters, this typically returns a vector. It returns a function that accepts as input a vector of times, `t`, and returns a matrix.

The `hessbasehazard` function is used to evaluate the Hessian of the baseline hazard function. It returns a function that accepts as input a vector of times, `t` and returns a list of hessian matrices corresponding to each `t`.

The `cumbasehazard` function is used to evaluate the cumulative baseline hazard function for the distribution of interest. It returns a function that accepts as input a vector of times, `t` and returns a vector.

The `gradcumbasehazard` function is used to evaluate the gradient of the cumulative baseline hazard function with respect to the parameters, this typically returns a vector. It returns a function that accepts as input a vector of times, `t`, and returns a matrix.

The `hesscumbasehazard` function is used to evaluate the Hessian of the cumulative baseline hazard function. It returns a function that accepts as input a vector of times, `t` and returns a list of hessian matrices corresponding to each `t`.

The `densityquantile` function is used to return quantiles of the density function. This is NOT REQUIRED for running the MCMC, merely for us in post-processing with the `predict` function where `type` is 'densityquantile'. In the case of the Weibull model for the baseline hazard, it can be shown that the `q`-th quantile is:

**Value**

an object inheriting class 'basehazardspec'

**See Also**

[exponentialHaz](#), [gompertzHaz](#), [makehamHaz](#), [weibullHaz](#)

---

checkSurvivalData      *checkSurvivalData function*

---

**Description**

A function to check whether the survival data to be passed to survspat is in the correct format

**Usage**

```
checkSurvivalData(s)
```

**Arguments**

s                      an object of class Surv, from the survival package

**Value**

if there are any issues with data format, these are returned with the data an error message explaining any issues with the data

---

circulant              *circulant function*

---

**Description**

generic function for constructing circulant matrices

**Usage**

```
circulant(x, ...)
```

**Arguments**

x                      an object  
...                    additional arguments

**Value**

method circulant

---

circulant.matrix      *circulant.matrix function*

---

**Description**

If  $x$  is a matrix whose columns are the bases of the sub-blocks of a block circulant matrix, then this function returns the block circulant matrix of interest.

**Usage**

```
## S3 method for class 'matrix'
circulant(x, ...)
```

**Arguments**

$x$                     a matrix object  
 ...                    additional arguments

**Value**

If  $x$  is a matrix whose columns are the bases of the sub-blocks of a block circulant matrix, then this function returns the block circulant matrix of interest.

---

circulant.numeric      *circulant.numeric function*

---

**Description**

returns a circulant matrix with base  $x$

**Usage**

```
## S3 method for class 'numeric'
circulant(x, ...)
```

**Arguments**

$x$                     an numeric object  
 ...                    additional arguments

**Value**

a circulant matrix with base  $x$

---

circulantij	<i>circulantij function</i>
-------------	-----------------------------

---

**Description**

A function to return the "idx" i.e.  $c(i,j)$  element of a circulant matrix with base "base".

**Usage**

```
circulantij(idx, base)
```

**Arguments**

idx	vector of length 2 th (i,j) (row,column) index to return
base	the base matrix of a circulant matrix

**Value**

the ij element of the full circulant

---

covmodel	<i>covmodel function</i>
----------	--------------------------

---

**Description**

A function to define the spatial covariance model, see also ?CovarianceFct. Note that the parameters defined by the 'pars' argument are fixed, i.e. not estimated by the MCMC algorithm. To have spatsurv estimate these parameters, the user must construct a new covariance function to do so, see the spatsurv vignette.

**Usage**

```
covmodel(model, pars)
```

**Arguments**

model	correlation type, a string see ?CovarianceFct
pars	vector of additional parameters for certain classes of covariance function (eg Matern), these must be supplied in the order given in ?CovarianceFct and are not estimated

**Value**

an object of class covmodel

**See Also**

CovarianceFct

---

CSplot	<i>CSplot function</i>
--------	------------------------

---

**Description**

A function to produce a diagnostic plot for model fit using the Cox-Snell residuals.

**Usage**

```
CSplot(mod, plot = TRUE, bw = FALSE, ...)
```

**Arguments**

mod	an object produced by the function survspat
plot	whether to plot the result, default is TRUE
bw	Logical. Plot in black/white/greyscale? Default is to produce a colour plot. Useful for producing plots for journals that do not accept colour plots.
...	other arguments to pass to plot

**Value**

the x and y values used in the plot

---

cumbasehazard	<i>cumbasehazard function</i>
---------------	-------------------------------

---

**Description**

Generic function for computing the cumulative baseline hazard

**Usage**

```
cumbasehazard(obj, ...)
```

**Arguments**

obj	an object
...	additional arguments – currently there are none, but this is for extensibility

**Value**

method cumbasehazard

**See Also**

[cumbasehazard.basehazardspec](#), [exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpow-Haz](#)

cumbasehazard.basehazardspec  
*cumbasehazard.basehazardspec function*

---

**Description**

A function to retrieve the cumulative baseline hazard function

**Usage**

```
## S3 method for class 'basehazardspec'  
cumbasehazard(obj, ...)
```

**Arguments**

obj                    an object of class basehazardspec  
...                    additional arguments – currently there are none, but this is for extensibility

**Value**

a function returning the cumulative baseline hazard

**See Also**

[exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpowHaz](#)

---

cumulativeBspline.construct  
*cumulativeBspline.construct function*

---

**Description**

A function to construct the integral of a B-spline curve given data and basis coefficients. Used in evaluating the cumulative baseline hazard.

**Usage**

```
cumulativeBspline.construct(x, basis)
```

**Arguments**

x                    a vector, the data  
basis                an object created by the getBbasis function

**Value**

an object that allows the integral of a given B-spline curve to be computed

---

densityquantile      *densityquantile function*

---

**Description**

Generic function for computing quantiles of the density function for a given baseline hazard. This may not be analytically tractable.

**Usage**

```
densityquantile(obj, ...)
```

**Arguments**

obj                    an object  
...                    additional arguments – currently there are none, but this is for extensibility

**Value**

method densityquantile

**See Also**

[densityquantile.basehazardspec](#), [exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpow-Haz](#)

---

densityquantile.basehazardspec  
*densityquantile.basehazardspec function*

---

**Description**

A function to retrieve the quantiles of the density function

**Usage**

```
## S3 method for class 'basehazardspec'  
densityquantile(obj, ...)
```

**Arguments**

obj                    an object of class basehazardspec  
...                    additional arguments – currently there are none, but this is for extensibility

**Value**

a function returning the density quantiles

**See Also**

[exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpowHaz](#)

---

densityquantile\_PP     *densityquantile\_PP function*

---

**Description**

A function to compute quantiles of the density function

**Usage**

```
densityquantile_PP(inputs)
```

**Arguments**

inputs	inputs for the function including the model matrix, frailties, fixed effects and the parameters of the baseline hazard derived from this model
--------	--

**Value**

quantiles of the density function for the individual

---

density\_PP     *density\_PP function*

---

**Description**

A function to compute an individual's density function

**Usage**

```
density_PP(inputs)
```

**Arguments**

inputs	inputs for the function including the model matrix, frailties, fixed effects and the parameters of the baseline hazard derived from this model
--------	--

**Value**

the density function for the individual

---

derivindepGaussianprior  
*derivindepGaussianprior function*

---

**Description**

A function for evaluating the first and second derivatives of the log of an independent Gaussian prior

**Usage**

```
derivindepGaussianprior(beta = NULL, omega = NULL, eta = NULL, priors)
```

**Arguments**

beta	a vector, the parameter beta
omega	a vector, the parameter omega
eta	a vector, the parameter eta
priors	an object of class 'mcmcPrior', see ?mcmcPrior

**Value**

returns the first and second derivatives of the prior

**See Also**

[survspat](#), [betapriorGauss](#), [omegapriorGauss](#), [etapriorGauss](#), [indepGaussianprior](#), [derivindepGaussianprior](#)

---

distinfo *distinfo function*

---

**Description**

Generic function for returning information about the class of baseline hazard functions employed.

**Usage**

```
distinfo(obj, ...)
```

**Arguments**

obj	an object
...	additional argument – currently there are none, but this is for extensibility

**Value**

method `distinfo`

**See Also**

[distinfo.basehazardspec](#), [exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpowHaz](#)

---

`distinfo.basehazardspec`  
*distinfo.basehazardspec function*

---

**Description**

A function to retrieve information on the baseline hazard distribution of choice

**Usage**

```
## S3 method for class 'basehazardspec'
distinfo(obj, ...)
```

**Arguments**

`obj` an object of class `basehazardspec`  
`...` additional arguments – currently there are none, but this is for extensibility

**Value**

a function returning information on the baseline hazard distribution of choice

**See Also**

[exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpowHaz](#)

---

`estimateY` *estimateY function*

---

**Description**

A function to get an initial estimate of Y, to be used in calibrating the MCMC. Not for general use

**Usage**

```
estimateY(X, betahat, omegahat, surv, control)
```

**Arguments**

X	the design matrix containing covariate information
betahat	an estimate of beta
omegahat	an estimate of omega
surv	an object of class Surv
control	a list containing various control parameters for the MCMC and post-processing routines

**Value**

an estimate of  $Y$ , to be used in calibrating the MCMC

---

etapriorGauss	<i>etapriorGauss function</i>
---------------	-------------------------------

---

**Description**

A function to define Gaussian priors for eta. This function simply stores a vector of means and standard deviations to be passed to the main MCMC function, survspat.

**Usage**

```
etapriorGauss(mean, sd)
```

**Arguments**

mean	the prior mean, a vector of length 1 or more. 1 implies a common mean.
sd	the prior standard deviation, a vector of length 1 or more. 1 implies a common standard deviation.

**Value**

an object of class "etapriorGauss"

**See Also**

[survspat](#), [betapriorGauss](#), [omegapriorGauss](#), [etapriorGauss](#), [indepGaussianprior](#), [derivindepGaussianprior](#)

---

Et_PP	<i>Et_PP function</i>
-------	-----------------------

---

**Description**

A function to compute an individual's approximate expected survival time using numerical integration. Note this appears to be unstable; the function is based on R's integrate function. Not intended for general use (yet!).

**Usage**

```
Et_PP(inputs)
```

**Arguments**

inputs	inputs for the function including the model matrix, frailties, fixed effects and the parameters of the baseline hazard derived from this model
--------	--

**Value**

the expected survival time for the individual, obtained by numerical integration of the density function.

---

EvalCov	<i>EvalCov function</i>
---------	-------------------------

---

**Description**

This function is used to evaluate the covariance function within the MCMC run. Not intended for general use.

**Usage**

```
EvalCov(cov.model, u, parameters)
```

**Arguments**

cov.model	an object of class covmodel
u	vector of distances
parameters	vector of parameters

**Value**

method EvalCov

---

ExponentialCovFct	<i>ExponentialCovFct function</i>
-------------------	-----------------------------------

---

**Description**

A function to declare and also evaluate an exponential covariance function.

**Usage**

```
ExponentialCovFct()
```

**Value**

the exponential covariance function

**See Also**

[SpikedExponentialCovFct](#), [covmodel](#), [CovarianceFct](#)

---

exponentialHaz	<i>exponentialHaz function</i>
----------------	--------------------------------

---

**Description**

A function to define a parametric proportional hazards model where the baseline hazard is taken from the exponential model. This function returns an object inheriting class 'basehazardspec', list of functions 'distinfo', 'basehazard', 'gradbasehazard', 'hessbasehazard', 'cumbasehazard', 'gradcumbasehazard', 'hesscumbasehazard' and 'densityquantile'

**Usage**

```
exponentialHaz()
```

**Details**

The `distinfo` function is used to provide basic distribution specific information to other `spatsurv` functions. The user is required to provide the following information in the returned list: `npars`, the number of parameters in this distribution; `parnames`, the names of the parameters; `trans`, the transformation scale on which the priors will be provided; `itrans`, the inverse transformation function that will be applied to the parameters before the hazard, and other functions are evaluated; `jacobian`, the derivative of the inverse transformation function with respect to each of the parameters; and `hessian`, the second derivatives of the inverse transformation function with respect to each of the parameters – note that currently the package `spatsurv` only allows the use of functions where the parameters are transformed independently.

The `basehazard` function is used to evaluate the baseline hazard function for the distribution of interest. It returns a function that accepts as input a vector of times, `t` and returns a vector.

The `gradbasehazard` function is used to evaluate the gradient of the baseline hazard function with respect to the parameters, this typically returns a vector. It returns a function that accepts as input a vector of times, `t`, and returns a matrix.

The `hessbasehazard` function is used to evaluate the Hessian of the baseline hazard function. It returns a function that accepts as input a vector of times, `t` and returns a list of hessian matrices corresponding to each `t`.

The `cumbasehazard` function is used to evaluate the cumulative baseline hazard function for the distribution of interest. It returns a function that accepts as input a vector of times, `t` and returns a vector.

The `gradcumbasehazard` function is used to evaluate the gradient of the cumulative baseline hazard function with respect to the parameters, this typically returns a vector. It returns a function that accepts as input a vector of times, `t`, and returns a matrix.

The `hesscumbasehazard` function is used to evaluate the Hessian of the cumulative baseline hazard function. It returns a function that accepts as input a vector of times, `t` and returns a list of hessian matrices corresponding to each `t`.

The `densityquantile` function is used to return quantiles of the density function. This is NOT REQUIRED for running the MCMC, merely for us in post-processing with the `predict` function where `type` is `'densityquantile'`. In the case of the Weibull model for the baseline hazard, it can be shown that the `q`-th quantile is:

### Value

an object inheriting class `'basehazardspec'`

### See Also

[tpowHaz](#), [gompertzHaz](#), [makehamHaz](#), [weibullHaz](#)

---

FFTgrid

*FFTgrid function*

---

### Description

A function to generate an FFT grid and associated quantities including cell dimensions, size of extended grid, centroids,

### Usage

```
FFTgrid(spatialdata, cellwidth, ext)
```

### Arguments

<code>spatialdata</code>	a <code>SpatialPixelsDataFrame</code> object
<code>cellwidth</code>	width of computational cells
<code>ext</code>	multiplying constant: the size of the extended grid: <code>ext*M</code> by <code>ext*N</code>

**Value**

a list

---

fixedpars	<i>fixedpars function</i>
-----------	---------------------------

---

**Description**

A function to return the mcmc chains for the covariate effects

**Usage**

```
fixedpars(x)
```

**Arguments**

x                    an object of class memcspatsurv

**Value**

the beta mcmc chains

**See Also**

[print.memcspatsurv](#), [quantile.memcspatsurv](#), [summary.memcspatsurv](#), [vcov.memcspatsurv](#), [frailty-lag1](#), [spatialpars](#), [hazardpars](#), [randompars](#), [baselinehazard](#), [predict.memcspatsurv](#), [priorposterior](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

---

fixmatrix	<i>fixmatrix function</i>
-----------	---------------------------

---

**Description**

!! THIS FUNCTION IS NOT INTENDED FOR GENERAL USE !!

**Usage**

```
fixmatrix(mat)
```

**Arguments**

mat                    a matrix

**Details**

A function to fix up an estimated covariance matrix using a VERY ad-hoc method.

**Value**

the fixed matrix

---

frailtylag1	<i>frailtylag1 function</i>
-------------	-----------------------------

---

**Description**

A function to produce a plot of, and return, the lag 1 (or higher, see argument 'lag') autocorrelation for each of the spatially correlated frailty chains

**Usage**

```
frailtylag1(object, plot = TRUE, lag = 1, ...)
```

**Arguments**

object	an object inheriting class <code>mcmcspsurv</code>
plot	logical whether to plot the result, default is TRUE
lag	the lag to plot, the default is 1
...	other arguments to be passed to the plot function

**Value**

the lag 1 autocorrelation for each of the spatially correlated frailty chains

**See Also**

[print.mcmcspsurv](#), [quantile.mcmcspsurv](#), [summary.mcmcspsurv](#), [vcov.mcmcspsurv](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [predict.mcmcspsurv](#), [priorposterior](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

---

fs	<i>London Fire Brigade property</i>
----	-------------------------------------

---

**Description**

London Fire Brigade property

**Usage**

```
fs
```

**Format**

data.frame

**Source**

---

 GammaFromY

*GammafromY function*

---

**Description**

A function to change Ys (spatially correlated noise) into Gammas (white noise). Used in the MALA algorithm.

**Usage**

```
GammafromY(Y, rootQeigs, mu)
```

**Arguments**

Y	Y matrix
rootQeigs	square root of the eigenvectors of the precision matrix
mu	parameter of the latent Gaussian field

**Value**

Gamma

---

GammaFromY\_SPDE

*GammaFromY\_SPDE function*

---

**Description**

A function to go from Y to Gamma

**Usage**

```
GammaFromY_SPDE(Y, U, mu)
```

**Arguments**

Y	Y
U	upper Cholesky matrix
mu	the mean

**Value**

the value of Gamma for the given Y

---

gencens	<i>gencens function</i>
---------	-------------------------

---

## Description

A function to generate observed times given a vector of true survival times and a vector of censoring times. Used in the simulation of survival data.

## Usage

```
gencens(survtimes, censtimes, type = "right")
```

## Arguments

survtimes	a vector of survival times
censtimes	a vector of censoring times for left or right censored data, 2-column matrix of censoring times for interval censoring (number of rows equal to the number of observations).
type	the type of censoring to generate can be 'right' (default), 'left' or 'interval'

## Value

an object of class 'Surv', the censoring indicator is equal to 1 if the event is uncensored and 0 otherwise for right/left censored data, or for interval censored data, the indicator is 0 uncensored, 1 right censored, 2 left censored, or 3 interval censored.

---

getBackground	<i>getBackground function</i>
---------------	-------------------------------

---

## Description

A function to

## Usage

```
getBackground(poly, type = "stamen-toner")
```

**Arguments**

poly	X
type	X

**Value**

...

---

getbb	<i>getbb function</i>
-------	-----------------------

---

**Description**

A function to get the bounding box of a Spatial object

**Usage**

```
getbb(obj)
```

**Arguments**

obj	a spatial object e.g. a SpatialPolygonsDataFrame, SpatialPolygons, etc ... anything with a bounding box that can be computed with bbox(obj)
-----	---

**Value**

a SpatialPolygons object: the bounding box

---

getBbasis	<i>getBbasis function</i>
-----------	---------------------------

---

**Description**

A function returning the piecewise polynomial coefficients for a B-spline basis function i.e. the basis functions.

**Usage**

```
getBbasis(x, knots, degree)
```

**Arguments**

x	a vector of data
knots	a vector of knots in ascending order. The first and last knots must be respectively the minimum and maximum of x.
degree	the degree of the spline

**Value**

the knots and the piecewise polynomial coefficients for a B-spline basis function i.e. the basis functions.

---

getcov	<i>getcov function</i>
--------	------------------------

---

**Description**

A function to return the covariance from a model based on the randomFields covariance functions. Not intended for general use.

**Usage**

```
getcov(u, sigma, phi, model, pars)
```

**Arguments**

u	distance
sigma	variance parameter
phi	scale parameter
model	correlation type, see ?CovarianceFct
pars	vector of additional parameters for certain classes of covariance function (eg Matern), these must be supplied in the order given in ?CovarianceFct and are not estimated

**Value**

this is just a wrapper for CovarianceFct

---

getgrd	<i>getgrd function</i>
--------	------------------------

---

**Description**

A function to create a regular grid over an observation window in order to model the spatial random effects as a Gaussian Markov random field.

**Usage**

```
getgrd(shape, cellwidth)
```

**Arguments**

shape            an object of class SpatialPolygons or SpatialPolygonsDataFrame  
 cellwidth        a scalar, the width of the grid cells

**Value**

a SpatialPolygons object: the grid on which prediction of the spatial effects will occur

**References**

1. Benjamin M. Taylor. Auxiliary Variable Markov Chain Monte Carlo for Spatial Survival and Geostatistical Models. Benjamin M. Taylor. Submitted. <http://arxiv.org/abs/1501.01665>

---

 getGrid

*getGrid* function
 

---

**Description**

A function to extract and return the computational grid from a gridded analysis.

**Usage**

```
getGrid(mod, returnclass = "SpatialPolygonsDataFrame")
```

**Arguments**

mod            an object of class mcmcspatsurv, returned by the function survspat  
 returnclass   the class of object to return, default is a 'SpatialPolygonsDataFrame'. Other options are 'raster', which returns a raster brick; or 'SpatialPixelsDataFrame'

**Value**

a SpatialPolygonsDataFrame in which Monte Carlo expectations can be stored and later plotted.

---

getleneta	<i>getleneta function</i>
-----------	---------------------------

---

**Description**

A function to compute the length of eta

**Usage**

```
getleneta(cov.model)
```

**Arguments**

cov.model      a covariance model

**Value**

the length of eta

---

getOptCellwidth	<i>getOptCellwidth function</i>
-----------------	---------------------------------

---

**Description**

A function to compute an optimal cellwidth close to an initial suggestion. This maximises the efficiency of the MCMC algorithm when in the control argument of the function survspat, the option gridded is set to TRUE

**Usage**

```
getOptCellwidth(dat, cellwidth, ext = 2, plot = TRUE)
```

**Arguments**

dat              any spatial data object whose bounding box can be computed using the function bbox.

cellwidth        an initial suggested cellwidth

ext              the extension parameter for the FFT transform, set to 2 by default

plot             whether to plot the grid and data to illustrate the optimal grid

**Value**

the optimum cell width

---

getparranges	<i>getparranges function</i>
--------------	------------------------------

---

**Description**

A function to extract parameter ranges for creating a grid on which to evaluate the log-posterior, used in calibrating the MCMC. This function is not intended for general use.

**Usage**

```
getparranges(priors, leneta, mult = 1.96)
```

**Arguments**

priors	an object of class <code>mcmcPriors</code>
leneta	the length of eta passed to the function
mult	defaults to 1.96 so the grid formed will be mean plus/minus 1.96 times the standard deviation

**Value**

an appropriate range used to calibrate the MCMC: the mean of the prior for eta plus/minus 1.96 times the standard deviation

---

getsurvdata	<i>getsurvdata function</i>
-------------	-----------------------------

---

**Description**

A function to return the survival data from an object of class `mcmcsurv`. This function is not intended for general use.

**Usage**

```
getsurvdata(x)
```

**Arguments**

x	an object of class <code>mcmcsurv</code>
---	--

**Value**

the survival data from an object of class `mcmcsurv`

---

`gompertzHaz`*gompertzHaz function*

---

### Description

A function to define a parametric proportional hazards model where the baseline hazard is taken from a Gompertz model. This function returns an object inheriting class 'basehazardspec', list of functions 'distinfo', 'basehazard', 'gradbasehazard', 'hessbasehazard', 'cumbasehazard', 'gradcumbasehazard', 'hesscumbasehazard' and 'densityquantile'

### Usage

```
gompertzHaz()
```

### Details

The `distinfo` function is used to provide basic distribution specific information to other `spatsurv` functions. The user is required to provide the following information in the returned list: `npars`, the number of parameters in this distribution; `parnames`, the names of the parameters; `trans`, the transformation scale on which the priors will be provided; `itrans`, the inverse transformation function that will be applied to the parameters before the hazard, and other functions are evaluated; `jacobian`, the derivative of the inverse transformation function with respect to each of the parameters; and `hessian`, the second derivatives of the inverse transformation function with respect to each of the parameters – note that currently the package `spatsurv` only allows the use of functions where the parameters are transformed independently.

The `basehazard` function is used to evaluate the baseline hazard function for the distribution of interest. It returns a function that accepts as input a vector of times, `t` and returns a vector.

The `gradbasehazard` function is used to evaluate the gradient of the baseline hazard function with respect to the parameters, this typically returns a vector. It returns a function that accepts as input a vector of times, `t`, and returns a matrix.

The `hessbasehazard` function is used to evaluate the Hessian of the baseline hazard function. It returns a function that accepts as input a vector of times, `t` and returns a list of hessian matrices corresponding to each `t`.

The `cumbasehazard` function is used to evaluate the cumulative baseline hazard function for the distribution of interest. It returns a function that accepts as input a vector of times, `t` and returns a vector.

The `gradcumbasehazard` function is used to evaluate the gradient of the cumulative baseline hazard function with respect to the parameters, this typically returns a vector. It returns a function that accepts as input a vector of times, `t`, and returns a matrix.

The `hesscumbasehazard` function is used to evaluate the Hessian of the cumulative baseline hazard function. It returns a function that accepts as input a vector of times, `t` and returns a list of hessian matrices corresponding to each `t`.

The `densityquantile` function is used to return quantiles of the density function. This is NOT REQUIRED for running the MCMC, merely for us in post-processing with the `predict` function where `type` is 'densityquantile'. In the case of the Weibull model for the baseline hazard, it can be shown that the `q`-th quantile is:

**Value**

an object inheriting class 'basehazardspec'

---

gradbasehazard.basehazardspec	<i>gradbasehazard.basehazardspec function</i>
-------------------------------	---

---

**Description**

A function to retrieve the gradient of the baseline hazard function

**Usage**

```
## S3 method for class 'basehazardspec'
gradbasehazard(obj, ...)
```

**Arguments**

obj                    an object of class basehazardspec  
...                    additional arguments – currently there are none, but this is for extensibility

**Value**

a function returning the gradient of the baseline hazard

**See Also**

[exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpowHaz](#)

---

gradcumbasehazard      *gradcumbasehazard function*

---

**Description**

Generic function for computing the gradient of the cumulative baseline hazard

**Usage**

```
gradcumbasehazard(obj, ...)
```

**Arguments**

obj                    an object  
...                    additional arguments – currently there are none, but this is for extensibility

**Value**

method gradcumbasehazard

**See Also**

---

gradcumbasehazard.basehazardspec  
*gradcumbasehazard.basehazardspec function*

---

### Description

A function to retrieve the gradient of the cumulative baseline hazard function

### Usage

```
## S3 method for class 'basehazardspec'
gradcumbasehazard(obj, ...)
```

### Arguments

obj                    an object of class basehazardspec  
 ...                    additional arguments – currently there are none, but this is for extensibility

### Value

a function returning the gradient of the cumulative baseline hazard

### See Also

[exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpowHaz](#)

---

grid2spdf                    *grid2spdf function*

---

### Description

A function to convert a regular (x,y) grid of centroids into a SpatialPoints object

### Usage

```
grid2spdf(xgrid, ygrid, proj4string = CRS(as.character(NA)))
```

### Arguments

xgrid                    vector of x centroids (equally spaced)  
 ygrid                    vector of x centroids (equally spaced)  
 proj4string            an optional proj4string, projection string for the grid, set using the function CRS

### Value

a SpatialPolygonsDataFrame

---

grid2spix	<i>grid2spix function</i>
-----------	---------------------------

---

**Description**

A function to convert a regular (x,y) grid of centroids into a SpatialPixels object

**Usage**

```
grid2spix(xgrid, ygrid, proj4string = CRS(as.character(NA)))
```

**Arguments**

xgrid	vector of x centroids (equally spaced)
ygrid	vector of x centroids (equally spaced)
proj4string	an optional proj4string, projection string for the grid, set using the function CRS

**Value**

a SpatialPixels object

---

grid2spts	<i>grid2spts function</i>
-----------	---------------------------

---

**Description**

A function to convert a regular (x,y) grid of centroids into a SpatialPoints object

**Usage**

```
grid2spts(xgrid, ygrid, proj4string = CRS(as.character(NA)))
```

**Arguments**

xgrid	vector of x centroids (equally spaced)
ygrid	vector of x centroids (equally spaced)
proj4string	an optional proj4string, projection string for the grid, set using the function CRS

**Value**

a SpatialPoints object

---

<code>gridY</code>	<i>gridY function</i>
--------------------	-----------------------

---

**Description**

A function to put estimated individual Y's onto a grid

**Usage**

```
gridY(Y, control)
```

**Arguments**

<code>Y</code>	estimate of Y
<code>control</code>	control parameters

**Value**

...

---

<code>gridY_polygonal</code>	<i>gridY_polygonal function</i>
------------------------------	---------------------------------

---

**Description**

A function to put estimated individual Y's onto a grid

**Usage**

```
gridY_polygonal(Y, control)
```

**Arguments**

<code>Y</code>	estimate of Y
<code>control</code>	control parameters

**Value**

...

---

guess_t	<i>guess_t function</i>
---------	-------------------------

---

**Description**

A function to get an initial guess of the failure time  $t$ , to be used in calibrating the MCMC. Not for general use

**Usage**

```
guess_t(surv)
```

**Arguments**

surv            an object of class Surv

**Value**

a guess at the failure times

---

hasNext	<i>generic hasNext method</i>
---------	-------------------------------

---

**Description**

test if an iterator has any more values to go

**Usage**

```
hasNext(obj)
```

**Arguments**

obj            an iterator

---

hasNext.iter	<i>hasNext.iter function</i>
--------------	------------------------------

---

**Description**

method for iter objects test if an iterator has any more values to go

**Usage**

```
## S3 method for class 'iter'
hasNext(obj)
```

**Arguments**

obj	an iterator
-----	-------------

---

hazardexceedance	<i>hazardexceedance function</i>
------------------	----------------------------------

---

**Description**

A function to compute exceedance probabilities for the spatially correlated frailties.

**Usage**

```
hazardexceedance(threshold, direction = "upper")
```

**Arguments**

threshold	vector of thresholds
direction	default is "upper" which will calculate $P(Y > \text{threshold})$ , alternative is "lower", which will calculate $P(Y < \text{threshold})$

**Value**

a function that can be passed to the function MCE in order to compute the exceedance probabilities

**See Also**

[print.mcmcpatsurv](#), [quantile.mcmcpatsurv](#), [summary.mcmcpatsurv](#), [vcov.mcmcpatsurv](#), [frailty-lag1](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [predict.mcmcpatsurv](#), [prior-posterior](#), [posteriorcov](#), [MCE](#),

---

hazardpars

*hazardpars function*

---

**Description**

A function to return the mcmc chains for the hazard function parameters

**Usage**

```
hazardpars(x)
```

**Arguments**

x                    an object of class `mcmcspatsurv`

**Value**

the omega mcmc chains

**See Also**

[print.mcmcspatsurv](#), [quantile.mcmcspatsurv](#), [summary.mcmcspatsurv](#), [vcov.mcmcspatsurv](#), [frailty-lag1](#), [spatialpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [predict.mcmcspatsurv](#), [priorposterior](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

---

hazard\_PP

*hazard\_PP function*

---

**Description**

A function to compute an individual's hazard function.

**Usage**

```
hazard_PP(inputs)
```

**Arguments**

inputs                inputs for the function including the model matrix, frailties, fixed effects and the parameters of the baseline hazard derived from this model

**Value**

the hazard function for the individual

---

hessbasehazard            *hessbasehazard function*

---

**Description**

Generic function for computing the hessian of the baseline hazard

**Usage**

```
hessbasehazard(obj, ...)
```

**Arguments**

obj                    an object  
 ...                    additional arguments – currently there are none, but this is for extensibility

**Value**

method hessbasehazard

**See Also**

[hessbasehazard.basehazardspec](#), [exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpow-Haz](#)

---

hessbasehazard.basehazardspec  
                                  *hessbasehazard.basehazardspec function*

---

**Description**

A function to retrieve the Hessian of the baseline hazard function

**Usage**

```
## S3 method for class 'basehazardspec'  
hessbasehazard(obj, ...)
```

**Arguments**

obj                    an object of class basehazardspec  
 ...                    additional arguments – currently there are none, but this is for extensibility

**Value**

a function returning the Hessian of the baseline hazard

**See Also**

[exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpowHaz](#)

---

hesscumbasehazard      *hesscumbasehazard function*

---

**Description**

Generic function for computing the Hessian of the cumulative baseline hazard

**Usage**

```
hesscumbasehazard(obj, ...)
```

**Arguments**

obj	an object
...	additional arguments – currently there are none, but this is for extensibility

**Value**

method hesscumbasehazard

**See Also**

[hesscumbasehazard.basehazardspec](#), [exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpowHaz](#)

---

hesscumbasehazard.basehazardspec  
*hesscumbasehazard.basehazardspec function*

---

**Description**

A function to retrieve the hessian of the cumulative baseline hazard function

**Usage**

```
## S3 method for class 'basehazardspec'  
hesscumbasehazard(obj, ...)
```

**Arguments**

obj	an object of class basehazardspec
...	additional arguments – currently there are none, but this is for extensibility

**Value**

a function returning the hessian of the cumulative baseline hazard

**See Also**

[exponentialHaz](#), [weibullHaz](#), [gompertzHaz](#), [makehamHaz](#), [tpowHaz](#)

---

`indepGaussianprior`     *indepGaussianprior function*

---

**Description**

A function for evaluating the log of an independent Gaussian prior for a given set of parameter values.

**Usage**

```
indepGaussianprior(beta = NULL, omega = NULL, eta = NULL, priors)
```

**Arguments**

<code>beta</code>	parameter beta at which prior is to be evaluated
<code>omega</code>	parameter omega at which prior is to be evaluated
<code>eta</code>	parameter eta at which prior is to be evaluated
<code>priors</code>	an object of class <code>mcmcPriors</code> , see <code>?mcmcPriors</code>

**Value**

the log of the prior evaluated at the given parameter values

**See Also**

[survspat](#), [betapriorGauss](#), [omegapriorGauss](#), [etapriorGauss](#), [indepGaussianprior](#), [derivindepGaussianprior](#)

---

inference.control      *inference.control function*

---

## Description

A function to control inferential settings. This function is used to set parameters for more advanced use of spatsurv.

## Usage

```
inference.control(gridded = FALSE, cellwidth = NULL, ext = 2,  
  optimcontrol = NULL, hessian = FALSE, plotcal = FALSE,  
  timeonlyMCMC = FALSE)
```

## Arguments

gridded	logical. Whether to perform computation on a grid. Default is FALSE.
cellwidth	the width of computational cells to use
ext	integer the number of times to extend the computational grid by in order to perform computation. The default is 2.
optimcontrol	a list of optional arguments to be passed to optim for non-spatial models
hessian	whether to return a numerical hessian. Set this to TRUE for non-spatial models. equal to the number of parameters of the baseline hazard
plotcal	logical, whether to produce plots of the MCMC calibration process, this is a technical option and should only be set to TRUE if poor mixing is evident (the printed h is low), then it is also useful to use a graphics device with multiple plotting windows.
timeonlyMCMC	logical, whether to only time the MCMC part of the algorithm, or whether to include in the reported running time the time taken to calibrate the method (default)

## Value

returns parameters to be used in the function survspat

## See Also

[survspat](#)

invtransformweibull *invtransformweibull function*

---

**Description**

A function to transform estimates of the (alpha, lambda) parameters of the weibull baseline hazard function, so they are commensurate with R's inbuilt density functions, (shape, scale).

**Usage**

```
invtransformweibull(x)
```

**Arguments**

x                    a vector of paramters

**Value**

the transformed parameters. For the weibull model, this transforms 'shape' 'scale' (see ?dweibull) to 'alpha' and 'lambda' for the MCMC

---

is.burnin            *is this a burn-in iteration?*

---

**Description**

if this mcmc iteration is in the burn-in period, return TRUE

**Usage**

```
is.burnin(obj)
```

**Arguments**

obj                    an mcmc iterator

**Value**

TRUE or FALSE

---

is.retain	<i>do we retain this iteration?</i>
-----------	-------------------------------------

---

**Description**

if this mcmc iteration is one not thinned out, this is true

**Usage**

```
is.retain(obj)
```

**Arguments**

obj            an mcmc iterator

**Value**

TRUE or FALSE

---

iteration	<i>iteration number</i>
-----------	-------------------------

---

**Description**

within a loop, this is the iteration number we are currently doing.

**Usage**

```
iteration(obj)
```

**Arguments**

obj            an mcmc iterator

**Details**

get the iteration number

**Value**

integer iteration number, starting from 1.

---

logPosterior	<i>logPosterior function</i>
--------------	------------------------------

---

### Description

A function to evaluate the log-posterior of a spatial parametric proportional hazards model. Not intended for general use.

### Usage

```
logPosterior(surv, X, beta, omega, eta, gamma, priors, cov.model, u, control,  
             gradient = FALSE, hessian = FALSE)
```

### Arguments

surv	an object of class Surv
X	the design matrix, containing covariate information
beta	parameter beta
omega	parameter omega
eta	parameter eta
gamma	parameter gamma
priors	the priors, an object of class 'mcmcPriors'
cov.model	the spatial covariance model
u	vector of interpoint distances
control	a list containing various control parameters for the MCMC and post-processing routines
gradient	logical whether to evaluate the gradient
hessian	logical whether to evaluate the Hessian

### Value

evaluates the log-posterior and the gradient and hessian, if required.

---

logPosterior\_gridded *logPosterior\_gridded function*

---

### Description

A function to evaluate the log-posterior of a spatial parametric proportional hazards model using gridded Y. Not intended for general use.

### Usage

```
logPosterior_gridded(surv, X, beta, omega, eta, gamma, priors, cov.model, u,  
  control, gradient = FALSE, hessian = FALSE)
```

### Arguments

surv	an object of class Surv
X	the design matrix, containing covariate information
beta	parameter beta
omega	parameter omega
eta	parameter eta
gamma	parameter gamma
priors	the priors, an object of class 'mcmcPriors'
cov.model	the spatial covariance model
u	vector of interpoint distances
control	a list containing various control parameters for the MCMC and post-processing routines
gradient	logical whether to evaluate the gradient
hessian	logical whether to evaluate the Hessian

### Value

evaluates the log-posterior and the gradient and hessian, if required.

### References

---

`logPosterior_polygonal`*logPosterior\_polygonal function*

---

**Description**

A function to evaluate the log-posterior of a spatial parametric proportional hazards model. Not intended for general use.

**Usage**

```
logPosterior_polygonal(surv, X, beta, omega, eta, gamma, priors, cov.model, u,  
  control, gradient = FALSE, hessian = FALSE)
```

**Arguments**

<code>surv</code>	an object of class <code>Surv</code>
<code>X</code>	the design matrix, containing covariate information
<code>beta</code>	parameter <code>beta</code>
<code>omega</code>	parameter <code>omega</code>
<code>eta</code>	parameter <code>eta</code>
<code>gamma</code>	parameter <code>gamma</code>
<code>priors</code>	the priors, an object of class <code>'mcmcPriors'</code>
<code>cov.model</code>	the spatial covariance model
<code>u</code>	vector of interpoint distances
<code>control</code>	a list containing various control parameters for the MCMC and post-processing routines
<code>gradient</code>	logical whether to evaluate the gradient
<code>hessian</code>	logical whether to evaluate the Hessian

**Value**

evaluates the log-posterior and the gradient and hessian, if required.

**References**

1. Benjamin M. Taylor. Auxiliary Variable Markov Chain Monte Carlo for Spatial Survival and Geostatistical Models. Benjamin M. Taylor. Submitted. <http://arxiv.org/abs/1501.01665>

---

logPosterior\_SPDE      *logPosterior\_SPDE function*

---

### Description

A function to evaluate the log-posterior of a spatial parametric proportional hazards model. Not intended for general use.

### Usage

```
logPosterior_SPDE(surv, X, beta, omega, eta, gamma, priors, cov.model, u,  
control, gradient = FALSE, hessian = FALSE)
```

### Arguments

surv	an object of class Surv
X	the design matrix, containing covariate information
beta	parameter beta
omega	parameter omega
eta	parameter eta
gamma	parameter gamma
priors	the priors, an object of class 'mcmcPriors'
cov.model	the spatial covariance model
u	vector of interpoint distances
control	a list containing various control parameters for the MCMC and post-processing routines
gradient	logical whether to evaluate the gradient
hessian	logical whether to evaluate the Hessian

### Value

evaluates the log-posterior and the gradient and hessian, if required.

---

loop.mcmc	<i>loop over an iterator</i>
-----------	------------------------------

---

**Description**

useful for testing progress bars

**Usage**

```
loop.mcmc(object, sleep = 1)
```

**Arguments**

object	an mcmc iterator
sleep	pause between iterations in seconds

---

makehamHaz	<i>makehamHaz function</i>
------------	----------------------------

---

**Description**

A function to define a parametric proportional hazards model where the baseline hazard is taken from the Gompertz-Makeham model. This function returns an object inheriting class 'basehazard-spec', list of functions 'distinfo', 'basehazard', 'gradbasehazard', 'hessbasehazard', 'cumbasehazard', 'gradcumbasehazard', 'hesscumbasehazard' and 'densityquantile'

**Usage**

```
makehamHaz()
```

**Details**

The `distinfo` function is used to provide basic distribution specific information to other `spatsurv` functions. The user is required to provide the following information in the returned list: `npars`, the number of parameters in this distribution; `parnames`, the names of the parameters; `trans`, the transformation scale on which the priors will be provided; `itrans`, the inverse transformation function that will be applied to the parameters before the hazard, and other functions are evaluated; `jacobian`, the derivative of the inverse transformation function with respect to each of the parameters; and `hessian`, the second derivatives of the inverse transformation function with respect to each of the parameters – note that currently the package `spatsurv` only allows the use of functions where the parameters are transformed independently.

The `basehazard` function is used to evaluate the baseline hazard function for the distribution of interest. It returns a function that accepts as input a vector of times, `t` and returns a vector.

The gradbasehazard function is used to evaluate the gradient of the baseline hazard function with respect to the parameters, this typically returns a vector. It returns a function that accepts as input a vector of times,  $t$ , and returns a matrix.

The hessbasehazard function is used to evaluate the Hessian of the baseline hazard function. It returns a function that accepts as input a vector of times,  $t$  and returns a list of hessian matrices corresponding to each  $t$ .

The cumbasehazard function is used to evaluate the cumulative baseline hazard function for the distribution of interest. It returns a function that accepts as input a vector of times,  $t$  and returns a vector.

The gradcumbasehazard function is used to evaluate the gradient of the cumulative baseline hazard function with respect to the parameters, this typically returns a vector. It returns a function that accepts as input a vector of times,  $t$ , and returns a matrix.

The hesscumbasehazard function is used to evaluate the Hessian of the cumulative baseline hazard function. It returns a function that accepts as input a vector of times,  $t$  and returns a list of hessian matrices corresponding to each  $t$ .

The densityquantile function is used to return quantiles of the density function. This is NOT REQUIRED for running the MCMC, merely for us in post-processing with the predict function where type is 'densityquantile'. In the case of the Weibull model for the baseline hazard, it can be shown that the  $q$ -th quantile is:

### Value

an object inheriting class 'basehazardspec'

### See Also

[tpowHaz](#), [exponentialHaz](#), [gompertzHaz](#), [weibullHaz](#)

---

maxlikparamPHsurv	<i>maxlikparamPHsurv function</i>
-------------------	-----------------------------------

---

### Description

A function to get initial estimates of model parameters using maximum likelihood. Not intended for general purpose use.

### Usage

```
maxlikparamPHsurv(surv, X, control)
```

### Arguments

surv	an object of class Surv
X	the design matrix, containing covariate information
control	a list containing various control parameters for the MCMC and post-processing routines

**Value**

initial estimates of the parameters

**References**

1. Benjamin M. Taylor. Auxiliary Variable Markov Chain Monte Carlo for Spatial Survival and Geostatistical Models. Benjamin M. Taylor. Submitted. <http://arxiv.org/abs/1501.01665>

---

MCE

*MCE function*

---

**Description**

A function to compute Monte Carlo expectations from an object inheriting class `mcmcspsurv`

**Usage**

```
MCE(object, fun)
```

**Arguments**

<code>object</code>	an object inheriting class <code>mcmcspsurv</code>
<code>fun</code>	a function with arguments <code>beta</code> , <code>omega</code> , <code>eta</code> and <code>Y</code>

**Value**

the Monte Carlo mean of the function over the posterior.

**See Also**

[print.mcmcspsurv](#), [quantile.mcmcspsurv](#), [summary.mcmcspsurv](#), [vcov.mcmcspsurv](#), [frailty-lag1](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [predict.mcmcspsurv](#), [prior-posterior](#), [posteriorcov](#), [hazardexceedance](#)

---

mcmcLoop	<i>iterator for MCMC loops</i>
----------	--------------------------------

---

**Description**

control an MCMC loop with this iterator

**Usage**

```
mcmcLoop(N, burnin, thin, trim = TRUE, progressor = mcmcProgressPrint)
```

**Arguments**

N	number of iterations
burnin	length of burn-in
thin	frequency of thinning
trim	whether to cut off iterations after the last retained iteration
progressor	a function that returns a progress object

---

mcmcpars	<i>mcmcpars function</i>
----------	--------------------------

---

**Description**

A function for setting MCMC options.

**Usage**

```
mcmcpars(nits, burn, thin, inits = NULL, adaptivescheme = NULL)
```

**Arguments**

nits	numer of iterations,
burn	length of burnin
thin	thinning parameter eg operated on chain every 'thin' iteration (eg store output or compute some posterior functional)
inits	NOT CURRENTLY IN USE
adaptivescheme	NOT CURRENTLY IN USE

**Value**

mcmc parameters

---

`mcmcPriors`*mcmcPriors function*

---

**Description**

A function to define priors for the MCMC.

**Usage**

```
mcmcPriors(betaprior = NULL, omegaprior = NULL, etaprior = NULL,  
          call = NULL, derivative = NULL)
```

**Arguments**

<code>betaprior</code>	prior for beta, the covariate effects
<code>omegaprior</code>	prior for omega, the parameters of the baseline hazard
<code>etaprior</code>	prior for eta, the parameters of the latent field
<code>call</code>	function to evaluate the log-prior e.g. <code>logindepGaussianprior</code>
<code>derivative</code>	function to evaluate the first and second derivatives of the prior

**Details**

The package `spatsurv` only provides functionality for the built-in Gaussian priors. However, the choice of prior is extensible by the user by creating functions similar to the functions `betapriorGauss`, `omegapriorGauss`, `etapriorGauss`, `indepGaussianprior` and `derivindepGaussianprior`: the first three of which provide a mechanism for storing and retrieving the parameters of the priors; the fourth, a function for evaluating the log of the prior for a given set of parameter values; and the fifth, a function for evaluating the first and second derivatives of the log of the prior. It is assumed that parameters are a priori independent. The user interested in using other priors is encouraged to look at the structure of the five functions mentioned above.

**Value**

an object of class `mcmcPriors`

**See Also**

[survspat](#), [betapriorGauss](#), [omegapriorGauss](#), [etapriorGauss](#), [indepGaussianprior](#), [derivindepGaussianprior](#)

---

`mcmcProgressNone`      *null progress monitor*

---

**Description**

a progress monitor that does nothing

**Usage**

`mcmcProgressNone(mcmcloop)`

**Arguments**

`mcmcloop`      an mcmc loop iterator

**Value**

a progress monitor

---

`mcmcProgressPrint`      *printing progress monitor*

---

**Description**

a progress monitor that prints each iteration

**Usage**

`mcmcProgressPrint(mcmcloop)`

**Arguments**

`mcmcloop`      an mcmc loop iterator

**Value**

a progress monitor

mcmcProgressTextBar     *text bar progress monitor*

---

**Description**

a progress monitor that uses a text progress bar

**Usage**

```
mcmcProgressTextBar(mcmcloop)
```

**Arguments**

mcmcloop     an mcmc loop iterator

**Value**

a progress monitor

---

midpts     *midpts function*

---

**Description**

A function to compute the midpoints of a vector

**Usage**

```
midpts(x)
```

**Arguments**

x     a vector

**Value**

the midpoints, a vector of length  $\text{length}(x)-1$

---

neighLocs	<i>neighLocs function</i>
-----------	---------------------------

---

**Description**

A function used in the computation of neighbours on non-rectangular grids. Not intended for general use.

**Usage**

```
neighLocs(coord, cellwidth, order)
```

**Arguments**

coord	coordinate of interest
cellwidth	a scalar, the width of the grid cells
order	the order of the SPDE approximation: see Lindgren et al 2011 for details

**Value**

coordinates of centroids of neighbours

**References**

---

neighOrder	<i>neighOrder function</i>
------------	----------------------------

---

**Description**

A function to compute the order of a set of neighbours. Not intended for general use.

**Usage**

```
neighOrder(neighlocs)
```

**Arguments**

neighlocs	an object created by the function neighLocs
-----------	---

**Value**

the neighbour orders

**References**

---

<code>nextStep</code>	<i>next step of an MCMC chain</i>
-----------------------	-----------------------------------

---

**Description**

just a wrapper for nextElem really.

**Usage**

```
nextStep(object)
```

**Arguments**

`object`            an mcmc loop object

---

<code>NonSpatialLogLikelihood_or_gradient</code>	<i>NonSpatialLogLikelihood_or_gradient function</i>
--	---

---

**Description**

A function to evaluate the log-likelihood of a non-spatial parametric proportional hazards model. Not intended for general use.

**Usage**

```
NonSpatialLogLikelihood_or_gradient(surv, X, beta, omega, control,
  loglikelihood, gradient)
```

**Arguments**

surv	an object of class Surv
X	the design matrix, containing covariate information
beta	parameter beta
omega	parameter omega
control	a list containing various control parameters for the MCMC and post-processing routines
loglikelihood	logical whether to evaluate the log-likelihood
gradient	logical whether to evaluate the gradient

**Value**

...

1. Benjamin M. Taylor. Auxiliary Variable Markov Chain Monte Carlo for Spatial Survival and Geostatistical Models. Benjamin M. Taylor. Submitted. <http://arxiv.org/abs/1501.01665>

---

omegapriorGauss	<i>omegapriorGauss function</i>
-----------------	---------------------------------

---

**Description**

A function to define Gaussian priors for omega. This function simply stores a vector of means and standard deviations to be passed to the main MCMC function, survspat.

**Usage**

```
omegapriorGauss(mean, sd)
```

**Arguments**

mean	the prior mean, a vector of length 1 or more. 1 implies a common mean.
sd	the prior standard deviation, a vector of length 1 or more. 1 implies a common standard deviation.

**Value**

an object of class "omegapriorGauss"

**See Also**

[survspat](#), [betapriorGauss](#), [omegapriorGauss](#), [etapriorGauss](#), [indepGaussianprior](#), [derivindepGaussianprior](#)

plotsurv

*plotsurv function***Description**

A function to produce a 2-D plot of right censored spatial survival data.

**Usage**

```
plotsurv(spp, ss, maxcex = 1, transform = identity, background = NULL,
  eventpt = 19, eventcol = "red", censpt = "+", censcol = "black",
  xlim = NULL, ylim = NULL, xlab = NULL, ylab = NULL, add = FALSE,
  ...)
```

**Arguments**

spp	A spatial points data frame
ss	A Surv object (with right-censoring)
maxcex	maximum size of dots default is equivalent to setting cex equal to 1
transform	optional transformation to apply to the data, a function, for example 'sqrt'
background	a background object to plot default is null, which gives a blank background note that if non-null, the parameters xlim and ylim will be derived from this object.
eventpt	The type of point to illustrate events, default is 19 (see ?pch)
eventcol	the colour of events, default is black
censpt	The type of point to illustrate events, default is "+" (see ?pch)
censcol	the colour of censored observations, default is red
xlim	optional x-limits of plot, default is to choose this automatically
ylim	optional y-limits of plot, default is to choose this automatically
xlab	label for x-axis
ylab	label for y-axis
add	logical, whether to add the survival plot on top of an existing plot, default is FALSE, which produces a plot in a new device
...	other arguments to pass to plot

**Value**

Plots the survival data non-censored observations appear as dots and censored observations as crosses. The size of the dot is proportional to the observed time.

---

polyadd	<i>polyadd function</i>
---------	-------------------------

---

**Description**

A function to add two polynomials in the form of vectors of coefficients. The first element of the vector being the constant (order 0) term

**Usage**

```
polyadd(poly1, poly2)
```

**Arguments**

poly1	a vector of coefficients for the first polynomial of length degree plus 1
poly2	a vector of coefficients for the second polynomial of length degree plus 1

**Value**

the coefficients of the sum of poly1 and poly2

---

polymult	<i>polymult function</i>
----------	--------------------------

---

**Description**

A function to multiply two polynomials in the form of vectors of coefficients. The first element of the vector being the constant (order 0) term

**Usage**

```
polymult(poly1, poly2)
```

**Arguments**

poly1	a vector of coefficients for the first polynomial of length degree plus 1
poly2	a vector of coefficients for the second polynomial of length degree plus 1

**Value**

the coefficients of the product of poly1 and poly2

---

posteriorcov                    *posteriorcov function*

---

### Description

A function to produce a plot of the posterior covariance function with upper and lower quantiles.

### Usage

```
posteriorcov(x, probs = c(0.025, 0.5, 0.975), rmax = NULL, n = 100,
  plot = TRUE, bw = FALSE, ...)
```

### Arguments

x	an object of class mcmcspatsurv
probs	vector of probabilities to be fed to quantile function
rmax	maximum distance in space to compute this distance up to
n	the number of points at which to evaluate the posterior covariance.
plot	whether to plot the result
bw	Logical. Plot in black/white/greyscale? Default is to produce a colour plot. Useful for producing plots for journals that do not accept colour plots.
...	other arguments to be passed to matplot function

### Value

produces a plot of the posterior spatial covariance function.

### See Also

[print.mcmcspatsurv](#), [quantile.mcmcspatsurv](#), [summary.mcmcspatsurv](#), [vcov.mcmcspatsurv](#), [frailty-lag1](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [predict.mcmcspatsurv](#), [prior-posterior](#), [MCE](#), [hazardexceedance](#)

---

predict.mcmcspatsurv    *predict.mcmcspatsurv function*

---

### Description

A function to produce predictions from MCMC output. These could include quantiles of the individual density, survival or hazard functions or quantiles of the density function (if available analytically).

**Usage**

```
## S3 method for class 'mcmcpatsurv'
predict(object, type = "density", t = NULL,
        n = 110, indx = NULL, probs = c(0.025, 0.5, 0.975), plot = TRUE,
        pause = TRUE, bw = FALSE, ...)
```

**Arguments**

object	an object of class mcmcpatsurv
type	can be "density", "hazard", "survival" or "densityquantile". Default is "density". Note that "densityquantile" is not always analytically tractable for some choices of baseline hazard function.
t	optional vector of times at which to compute the quantiles, Default is NULL, in which case a uniformly spaced vector of length n from 0 to the maximum time is used
n	the number of points at which to compute the quantiles if t is NULL
indx	the index number of a particular individual or vector of indices of individuals for which the quantiles should be produced
probs	vector of probabilities
plot	whether to plot the result
pause	logical whether to pause between plots, the default is TRUE
bw	Logical. Plot in black/white/greyscale? Default is to produce a colour plot. Useful for producing plots for journals that do not accept colour plots.
...	other arguments, not used here

**Value**

the required predictions

**See Also**

[print.mcmcpatsurv](#), [quantile.mcmcpatsurv](#), [summary.mcmcpatsurv](#), [vcov.mcmcpatsurv](#), [frailty-lag1](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [priorposterior](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

---

print.mcmc

*print.mcmc function*

---

**Description**

print method print an mcmc iterator's details

**Usage**

```
## S3 method for class 'mcmc'
print(x, ...)
```

**Arguments**

x	a mcmc iterator
...	other args

---

```
print.mcmcspatsurv     print.mcmcspatsurv function
```

---

**Description**

A function to print summary tables from an MCMC run

**Usage**

```
## S3 method for class 'mcmcspatsurv'
print(x, probs = c(0.5, 0.025, 0.975), digits = 3,
      scientific = -3, ...)
```

**Arguments**

x	an object inheriting class mcmcspatsurv
probs	vector of quantiles to return
digits	see help file ?format
scientific	see help file ?format
...	additional arguments, not used here

**Value**

prints summary tables to the console

**See Also**

[quantile.mcmcspatsurv](#), [summary.mcmcspatsurv](#), [vcov.mcmcspatsurv](#), [frailtylag1](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [predict.mcmcspatsurv](#), [priorposterior](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

---

print.mlspatsurv      *print.mlspatsurv function*

---

**Description**

A function to print summary tables from an MCMC run

**Usage**

```
## S3 method for class 'mlspatsurv'  
print(x, probs = c(0.5, 0.025, 0.975), digits = 3,  
      scientific = -3, ...)
```

**Arguments**

x	an object inheriting class memcspatsurv
probs	vector of quantiles to return
digits	see help file ?format
scientific	see help file ?format
...	additional arguments, not used here

**Value**

prints summary tables to the console

**See Also**

[quantile.memcspatsurv](#), [summary.memcspatsurv](#), [vcov.memcspatsurv](#), [frailtylag1](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [predict.memcspatsurv](#), [priorposterior](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

---

print.textSummary      *print.textSummary function*

---

**Description**

A function to print summary tables from an MCMC run

**Usage**

```
## S3 method for class 'textSummary'  
print(x, ...)
```

**Arguments**

x                    an object inheriting class textSummary  
 ...                    additional arguments, not used here

**Value**

prints a text summary of 'x' to the console

---

priorposterior            *priorposterior function*

---

**Description**

A function to produce plots of the prior (which shows as a red line) and posterior (showing as a histogram)

**Usage**

```
priorposterior(x, breaks = 30, ylab = "Density", main = "",
  pause = TRUE, bw = FALSE, ...)
```

**Arguments**

x                    an object inheriting class mcmcspatsurv  
 breaks                see ?hist  
 ylab                 optional y label  
 main                 optional title  
 pause                logical whether to pause between plots, the default is TRUE  
 bw                    Logical. Plot in black/white/greyscale? Default is to produce a colour plot.  
                       Useful for producing plots for journals that do not accept colour plots.  
 ...                    other arguments passed to the hist function

**Value**

plots of the prior (red line) and posterior (histogram).

**See Also**

[print.mcmcspatsurv](#), [quantile.mcmcspatsurv](#), [summary.mcmcspatsurv](#), [vcov.mcmcspatsurv](#), [frailty-lag1](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [predict.mcmcspatsurv](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

---

proposalVariance      *proposalVariance function*

---

**Description**

A function to compute an approximate scaling matrix for the MCMC algorithm. Not intended for general use.

**Usage**

```
proposalVariance(X, surv, betahat, omegahat, Yhat, priors, cov.model, u,
  control)
```

**Arguments**

X	the design matrix, containing covariate information
surv	an object of class Surv
betahat	an estimate of beta
omegahat	an estimate of omega
Yhat	an estimate of Y
priors	the priors
cov.model	the spatial covariance model
u	a vector of pairwise distances
control	a list containing various control parameters for the MCMC and post-processing routines

**Value**

an estimate of eta and also an approximate scaling matrix for the MCMC

---

proposalVariance\_gridded  
*proposalVariance\_gridded function*

---

**Description**

A function to compute an approximate scaling matrix for the MCMC algorithm. Not intended for general use.

**Usage**

```
proposalVariance_gridded(X, surv, betahat, omegahat, Yhat, priors, cov.model, u,
  control)
```

**Arguments**

<code>X</code>	the design matrix, containing covariate information
<code>surv</code>	an object of class <code>Surv</code>
<code>betahat</code>	an estimate of beta
<code>omegahat</code>	an estimate of omega
<code>Yhat</code>	an estimate of Y
<code>priors</code>	the priors
<code>cov.model</code>	the spatial covariance model
<code>u</code>	a vector of pairwise distances
<code>control</code>	a list containing various control parameters for the MCMC and post-processing routines

**Value**

an estimate of eta and also an approximate scaling matrix for the MCMC

---

`proposalVariance_polygonal`  
*proposalVariance\_polygonal function*

---

**Description**

A function to compute an approximate scaling matrix for the MCMC algorithm. Not intended for general use.

**Usage**

```
proposalVariance_polygonal(X, surv, betahat, omegahat, Yhat, priors, cov.model,
  u, control)
```

**Arguments**

<code>X</code>	the design matrix, containing covariate information
<code>surv</code>	an object of class <code>Surv</code>
<code>betahat</code>	an estimate of beta
<code>omegahat</code>	an estimate of omega
<code>Yhat</code>	an estimate of Y
<code>priors</code>	the priors
<code>cov.model</code>	the spatial covariance model
<code>u</code>	a vector of pairwise distances
<code>control</code>	a list containing various control parameters for the MCMC and post-processing routines

**Value**

an estimate of eta and also an approximate scaling matrix for the MCMC

---

proposalVariance\_SPDE *proposalVariance\_SPDE function*

---

**Description**

A function to compute an approximate scaling matrix for the MCMC algorithm. Not intended for general use.

**Usage**

```
proposalVariance_SPDE(X, surv, betahat, omegahat, Yhat, priors, cov.model, u,
  control)
```

**Arguments**

X	the design matrix, containing covariate information
surv	an object of class Surv
betahat	an estimate of beta
omegahat	an estimate of omega
Yhat	an estimate of Y
priors	the priors
cov.model	the spatial covariance model
u	a vector of pairwise distances
control	a list containing various control parameters for the MCMC and post-processing routines

**Value**

an estimate of eta and also an approximate scaling matrix for the MCMC

---

 QuadApprox

*QuadApprox function*

---

### Description

A function to compute the second derivative of a function (of several real variables) using a quadratic approximation on a grid of points defined by the list `argRanges`. Also returns the local maximum.

### Usage

```
QuadApprox(fun, npts, argRanges, plot = FALSE, ...)
```

### Arguments

<code>fun</code>	a function
<code>npts</code>	integer number of points in each direction
<code>argRanges</code>	a list of ranges on which to construct the grid for each parameter
<code>plot</code>	whether to plot the quadratic approximation of the posterior (for two-dimensional parameters only)
<code>...</code>	other arguments to be passed to <code>fun</code>

### Value

a 2 by 2 matrix containing the curvature at the maximum and the (x,y) value at which the maximum occurs

---

quantile.mcmcspatsurv *quantile.mcmcspatsurv function*

---

### Description

A function to extract quantiles of the parameters from an mcmc run

### Usage

```
## S3 method for class 'mcmcspatsurv'
quantile(x, probs = c(0.025, 0.5, 0.975), ...)
```

### Arguments

<code>x</code>	an object inheriting class <code>mcmcspatsurv</code>
<code>probs</code>	vector of probabilities
<code>...</code>	other arguments to be passed to the function, not used here

**Value**

quantiles of model parameters

**See Also**

[print.mcmcsurv](#), [summary.mcmcsurv](#), [vcov.mcmcsurv](#), [frailtylag1](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [predict.mcmcsurv](#), [priorposterior](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

---

quantile.mlspatsurv    *quantile.mlspatsurv function*

---

**Description**

A function to extract quantiles of the parameters from an mcmc run

**Usage**

```
## S3 method for class 'mlspatsurv'  
quantile(x, probs = c(0.025, 0.5, 0.975), ...)
```

**Arguments**

x	an object inheriting class mcmcsurv
probs	vector of probabilities
...	other arguments to be passed to the function, not used here

**Value**

quantiles of model parameters

**See Also**

[print.mcmcsurv](#), [summary.mcmcsurv](#), [vcov.mcmcsurv](#), [frailtylag1](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [predict.mcmcsurv](#), [priorposterior](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

randompars                    *randompars function*

---

### Description

A function to return the mcmc chains for the spatially correlated frailties

### Usage

```
randompars(x)
```

### Arguments

x                    an object of class `mcmcsurv`

### Value

the Y mcmc chains

### See Also

[print.mcmcsurv](#), [quantile.mcmcsurv](#), [summary.mcmcsurv](#), [vcov.mcmcsurv](#), [frailty-lag1](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [baselinehazard](#), [predict.mcmcsurv](#), [priorposterior](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

---

reconstruct.bs                    *reconstruct.bs function*

---

### Description

When `bs(varname)` has been used in the formula of a model, this function can be used to reconstruct the posterior relative risk of that parameter over time.

### Usage

```
reconstruct.bs(mod, varname, probs = c(0.025, 0.975), bw = FALSE,  
              xlab = NULL, ylab = NULL, plot = TRUE, ...)
```

**Arguments**

mod	model output, created by function survspat
varname	name of the variable modelled by a B-spline
probs	upper and lower quantiles for confidence regions to plot> The default is c(0.025,0.975).
bw	Logical. Plot in black/white/greyscale? Default is to produce a colour plot. Useful for producing plots for journals that do not accept colour plots.
xlab	label for x axis, there is a sensible default
ylab	label for y axis, there is a sensible default
plot	logical, whether to plot the effect of varname over time
...	other arguments to be passed to the plotting function.

**Value**

median, upper and lower confidence bands for the effect of varname over time; the function also produces a plot.

---

resetLoop	<i>reset iterator</i>
-----------	-----------------------

---

**Description**

call this to reset an iterator's state to the initial

**Usage**

```
resetLoop(obj)
```

**Arguments**

obj	an mcmc iterator
-----	------------------

---

residuals.mcmcspatsurv	<i>residuals.mcmcspatsurv function</i>
------------------------	--

---

**Description**

A function to compute Cox-Snell / modified Cox-Snell / Martingale or Deviance residuals

**Usage**

```
## S3 method for class 'mcmcspatsurv'
residuals(object, type = "Cox-Snell", ...)
```

**Arguments**

object	an object produced by the function survspat
type	type of residuals to return. Possible choices are 'Cox-Snell', 'modified-Cox-Snell', 'Martingale' or 'deviance'.
...	other arguments (not used here)

**Value**

the residuals

---

setTxtProgressBar2      *set the progress bar*

---

**Description**

update a text progress bar. See help(txtProgressBar) for more info.

**Usage**

```
setTxtProgressBar2(pb, value, title = NULL, label = NULL)
```

**Arguments**

pb	text progress bar object
value	new value
title	ignored
label	text for end of progress bar

---

setupHazard      *setupHazard function*

---

**Description**

A function to set up the baseline hazard, cumulative hazard and derivative functions for use in evaluating the log posterior. This function is not intended for general use.

**Usage**

```
setupHazard(dist, pars, grad = FALSE, hess = FALSE)
```

**Arguments**

dist	an object of class 'basehazardspec'
pars	parameters with which to create the functions necessary to evaluate the log posterior
grad	logical, whether to create gradient functions for the baseline hazard and cumulative hazard
hess	logical, whether to create hessian functions for the baseline hazard and cumulative hazard

**Value**

a list of functions used in evaluating the log posterior

---

setupPrecMatStruct     *setupPrecMatStruct function*

---

**Description**

A function to set up the computational grid and precision matrix structure for SPDE models.

**Usage**

```
setupPrecMatStruct(shape, cellwidth, no)
```

**Arguments**

shape	an object of class SpatialPolygons or SpatialPolygonsDataFrame
cellwidth	a scalar, the width of the grid cells
no	the order of the SPDE approximation: see Lindgren et al 2011 for details

**Value**

the computational grid and a function for constructing the precision matrix

**References**

---

showGrid	<i>showGrid function</i>
----------	--------------------------

---

### Description

A function to show the grid that will be used for a given cellwidth

### Usage

```
showGrid(dat, cellwidth, ext = 2)
```

### Arguments

dat	any spatial data object whose bounding box can be computed using the function <code>bbox</code> .
cellwidth	an initial suggested cellwidth
ext	the extension parameter for the FFT transform, set to 2 by default

### Value

a plot showing the grid and the data. Ideally the data should only just fit inside the grid.

---

simsurv	<i>simsurv function</i>
---------	-------------------------

---

### Description

A function to simulate spatial parametric proportional hazards model. The function works by simulating candidate survival times using MCMC in parallel for each individual based on each individual's covariates and the common parameter effects, beta.

### Usage

```
simsurv(X = cbind(age = runif(100, 5, 50), sex = rbinom(100, 1, 0.5), cancer =
  rbinom(100, 1, 0.2)), beta = c(0.0296, 0.0261, 0.035), omega = 1,
  dist = "exp", coords = matrix(runif(2 * nrow(X)), nrow(X), 2),
  cov.parameters = c(1, 0.1), cov.model = covmodel(model = "exponential",
  pars = NULL), mcmc.control = mcmcpars(nits = 1e+05, burn = 10000, thin =
  90), savechains = TRUE)
```

**Arguments**

X	a matrix of covariate information
beta	the parameter effects
omega	vector of parameters for the baseline hazard model
dist	the distribution choice: exp or weibull at present
coords	matrix with 2 columns giving the coordinates at which to simulate data
cov.parameters	a vector: the parameters for the covariance function
cov.model	an object of class covmodel, see ?covmodel
mcmc.control	mcmc control paramters, see ?mcmcpars
savechains	save all chains? runs faster if set to FALSE, but then you'll be unable to conduct convergence/mixing diagnostics

**Value**

in list element 'survtimes', a vector of simulated survival times (the last simulated value from the MCMC chains) in list element 'T' the MCMC chains

**See Also**

[covmodel](#), [survspat](#), [tpowHaz](#), [exponentialHaz](#), [gompertzHaz](#), [makehamHaz](#), [weibullHaz](#)

---

spatialpars

*spatialpars function*

---

**Description**

A function to return the mcmc chains for the spatial covariance function parameters

**Usage**

```
spatialpars(x)
```

**Arguments**

x	an object of class mcmcparsurv
---	--------------------------------

**Value**

the eta mcmc chains

**See Also**

[print.mcmcparsurv](#), [quantile.mcmcparsurv](#), [summary.mcmcparsurv](#), [vcov.mcmcparsurv](#), [frailty-lag1](#), [hazardpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [predict.mcmcparsurv](#), [priorposterior](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

---

spatsurvVignette	<i>spatsurvVignette function</i>
------------------	----------------------------------

---

**Description**

Display the introductory vignette for the spatsurv package.

**Usage**

```
spatsurvVignette()
```

**Value**

displays the vignette by calling browseURL

---

SPDE	<i>SPDE function</i>
------	----------------------

---

**Description**

A function to declare and evaluate an SPDE covariance function.

**Usage**

```
SPDE(ord)
```

**Arguments**

ord	the order of the model to be used, currently an integer between 1 and 3. See Lindgren 2011 paper.
-----	---

**Value**

an covariance function based on the SPDE model

**See Also**

[ExponentialCovFct](#), [covmodel](#), [CovarianceFct](#)

---

SPDEprec	<i>SPDEprec function</i>
----------	--------------------------

---

**Description**

A function to used in entering elements into the precision matrix of an SPDE model. Not intended for general use.

**Usage**

```
SPDEprec(a, ord)
```

**Arguments**

a	parameter a, see Lindgren et al 2011.
ord	the order of the SPDE model, see Lindgren et al 2011.

**Value**

a function used for creating the precision matrix

**References**

1. Benjamin M. Taylor. Auxiliary Variable Markov Chain Monte Carlo for Spatial Survival and Geostatistical Models. Benjamin M. Taylor. Submitted. <http://arxiv.org/abs/1501.01665>
2. Finn Lindgren, Havard Rue, Johan Lindstrom. An explicit link between Gaussian fields and Gaussian Markov random fields: the stochastic partial differential equation approach. Journal of the Royal Statistical Society: Series B 73(4)

---

SpikedExponentialCovFct	<i>SpikedExponentialCovFct function</i>
-------------------------	---

---

**Description**

A function to declare and also evaluate a spiked exponential covariance function. This is an exponential covariance function with a nugget.

**Usage**

```
SpikedExponentialCovFct()
```

**Value**

the spiked exponential covariance function

**See Also**

[ExponentialCovFct](#), [covmodel](#), [CovarianceFct](#)

---

spplot1                      *spplot1 function*

---

**Description**

A function to provide spplot-like plotting capability but NOT using trellis graphics. This function also acts as an interface for fast plotting of `SpatialPolygonsDataFrame` or `SpatialPixelsDataFrame` objects using leaflet HTML plotting capabilities to get zoomable plots with real-world context: transformation to the correct projection is done automatically.

**Usage**

```
spplot1(x, what, palette = brewer.pal(5, "Oranges"), breaks = NULL,
        legpos = "topleft", fun = identity, include.lowest = TRUE, bty = "n",
        bg = NULL, printlegend = TRUE, bw = FALSE, useLeaflet = FALSE,
        urltemplate = urlTemplate("Stamen_Toner"), fillOpacity = 0.5,
        legendOpacity = 0.5, OSMBg = NULL, leafletLegend = TRUE, ...)
```

**Arguments**

x	a <code>SpatialPolygonsDataFrame</code> or a <code>SpatialPointsDataFrame</code>
what	the name of the variable to plot
palette	the palette, can either be a vector of names of colours, or a vector of colours produced for example by the <code>brewer.pal</code> function.
breaks	optional breaks for the legend, a vector of length <code>1 + length(palette)</code>
legpos	the position of the legend, options are 'topleft', 'topright', 'bottomleft', 'bottomright'
fun	an optional function of the data to plot, default is the identity function
include.lowest	see <code>?cut</code>
bty	see <code>?legend</code>
bg	see <code>?legend</code>
printlegend	logical: print the legend?
bw	Logical. Plot in black/white/greyscale? Default is to produce a colour plot. Useful for producing plots for journals that do not accept colour plots.
useLeaflet	whether to use leaflet to produce a zoomable map this requires the leaflet package, available by issuing the command <code>"devtools::install_github('rstudio/leaflet')"</code>
urltemplate	template for leaflet map background, default is <code>urlTemplate('Stamen-Toner')</code> , but any valid web address for leaflet templates will work here. See <code>?urlTemplate</code> .
fillOpacity	see <code>?addPolygons</code>

<code>legendOpacity</code>	see <code>opacity</code> argument in function <code>addLegend</code>
<code>OSMbg</code>	optional OpenStreetMap background to add to plot, obtain this using the function <code>getBackground</code>
<code>leafletLegend</code>	logical, display the leaflet legend?
<code>...</code>	other arguments to be passed to plot

**Details**

See <http://leaflet-extras.github.io/leaflet-providers/preview/> for examples of leaflet templates.

Instructions on installing the leaflet R package are available from <https://rstudio.github.io/leaflet/>

**Value**

either produces a plot or if `useLeaflet` is `TRUE`, returns a leaflet map widget to which further layers can be added

**See Also**

[urlTemplate](#), [getBackground](#), [brewer.pal](#)

<code>splot_compare</code>	<i>splot_compare function</i>
----------------------------	-------------------------------

**Description**

A function to compare two `SpatialPolgonsDataFrame` or `SpatialPointsDataFrame` objects using a unified legend for the variable of interest in both

**Usage**

```
splot_compare(x, y, what, what1 = what, palette = brewer.pal(9, "Oranges"),
  legpos = "topleft", border = NA, fun = identity, t1 = "", t2 = "",
  bw = FALSE, ...)
```

**Arguments**

<code>x</code>	a <code>SpatialPolgonsDataFrame</code> or a <code>SpatialPointsDataFrame</code>
<code>y</code>	a <code>SpatialPolgonsDataFrame</code> or a <code>SpatialPointsDataFrame</code>
<code>what</code>	the name of the variable from <code>x</code> to plot
<code>what1</code>	the name of the variable from <code>y</code> to plot. default is to plot the variable of the same name
<code>palette</code>	the palette, can either be a vector of names of colours, or a vector of colours produced for example by the <code>brewer.pal</code> function.

legpos	the position of the legend, options are 'topleft', 'topright', 'bottomleft', 'bottomright'
border	see ?spplot
fun	an optional function of the data to plot, default is the identity function
t1	title for the plot of x
t2	title for the plot of y
bw	Logical. Plot in black/white/greyscale? Default is to produce a colour plot. Useful for producing plots for journals that do not accept colour plots.
...	other arguments to be passed to the plot function

**Value**

produces a plot comparing  $x[[\text{what}]]$  and  $y[[\text{what1}]]$

---

Summarise

*Summarise function*

---

**Description**

A function to completely summarise the output of an object of class `mcmcspatsurv`.

**Usage**

```
Summarise(obj, digits = 3, scientific = -3, inclIntercept = FALSE,
          printmode = "LaTeX", displaymode = "console", ...)
```

**Arguments**

obj	an object produced by a call to <code>lgcpPredictSpatialPlusPars</code> , <code>lgcpPredictAggregateSpatialPlusPars</code> , <code>lgcpPredictSpatioTemporalPlusPars</code> or <code>lgcpPredictMultitypeSpatialPlusPars</code>
digits	see the option "digits" in ?format
scientific	see the option "scientific" in ?format
inclIntercept	logical: whether to summarise the intercept term, default is FALSE.
printmode	the format of the text to return, can be 'LaTeX' (the default) or 'text' for plain text.
displaymode	default is 'console' alternative is 'rstudio'
...	other arguments passed to the function "format"

**Value**

A text summary, that can be pasted into a LaTeX document and later edited.

---

summary.mcmc	<i>summary.mcmc function</i>
--------------	------------------------------

---

**Description**

summary of an mcmc iterator print out values of an iterator and reset it. DONT call this in a loop that uses this iterator - it will reset it. And break.

**Usage**

```
## S3 method for class 'mcmc'
summary(object, ...)
```

**Arguments**

object	an mcmc iterator
...	other args

---

summary.mcmcpatsurv	<i>summary.mcmcpatsurv function</i>
---------------------	-------------------------------------

---

**Description**

A function to return summary tables from an MCMC run

**Usage**

```
## S3 method for class 'mcmcpatsurv'
summary(object, probs = c(0.5, 0.025, 0.975), ...)
```

**Arguments**

object	an object inheriting class mcmcpatsurv
probs	vector of quantiles to return
...	additional arguments

**Value**

summary tables to the console

**See Also**

[print.mcmcpatsurv](#), [quantile.mcmcpatsurv](#), [vcov.mcmcpatsurv](#), [frailtylag1](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [predict.mcmcpatsurv](#), [priorposterior](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

---

`surv3d`*Spatial Survival Plot in 3D*

---

**Description**

Do a 3d plot of spatial survival data

**Usage**

```
surv3d(spp, ss, lwd = 2, lcol = "black", lalpha = 1, pstyle = c("point",  
  "text"), psize = c(20, 10), pcol = c("red", "black"), ptext = c("X",  
  ""), palpha = 1, title = "Spatial Survival", basegrid = TRUE,  
  baseplane = TRUE)
```

**Arguments**

<code>spp</code>	A spatial points data frame
<code>ss</code>	A Surv object (with right-censoring)
<code>lwd</code>	Line width for stems
<code>lcol</code>	Line colour for stems
<code>lalpha</code>	Opacity for stems
<code>pstyle</code>	Point style "point" or "text"
<code>psize</code>	Vector of length 2 for uncensored/censored points size
<code>pcol</code>	Vector of length 2 for uncensored/censored points colours
<code>ptext</code>	Vector of length 2 for uncensored/censored text characters
<code>palpha</code>	Opacity for points/text
<code>title</code>	Main title for plot
<code>basegrid</code>	add a grid at t=0
<code>baseplane</code>	add a plane at t=0

**Details**

Uses rgl graphics to make a spinny zoomy plot

**Value**

nothing

**Author(s)**

Barry S Rowlingson

**Examples**

```
## Not run:
require(sp)
require(survival)
d = data.frame(
  x=runif(40)*1.5,
  y = runif(40),
  age=as.integer(20+30*runif(40)),
  sex = sample(c("M", "F"), 40, TRUE)
)
coordinates(d)=~x+y
d$surv = Surv(as.integer(5+20*runif(40)), runif(40)>.9)
clear3d(); surv3d(d, d$surv, baseplane=TRUE, basegrid=TRUE)
clear3d(); surv3d(d, d$surv, baseplane=TRUE, basegrid=TRUE, pstyle="t", lalpha=0.5, lwd=3, palpha=1)

## End(Not run)
```

---

survival_PP	<i>survival_PP function</i>
-------------	-----------------------------

---

**Description**

A function to compute an individual's survival function

**Usage**

```
survival_PP(inputs)
```

**Arguments**

inputs	inputs for the function including the model matrix, frailties, fixed effects and the parameters of the baseline hazard derived from this model
--------	--

**Value**

the survival function for the individual

---

survspat	<i>survspat function</i>
----------	--------------------------

---

**Description**

A function to run a Bayesian analysis on censored spatial survival data assuming a proportional hazards model using an adaptive Metropolis-adjusted Langevin algorithm.

**Usage**

```
survspat(formula, data, dist, cov.model, mcmc.control, priors, shape = NULL,
         ids = list(shpid = NULL, dataid = NULL),
         control = inference.control(grided = FALSE))
```

**Arguments**

formula	the model formula in a format compatible with the function flexsurvreg from the flexsurv package
data	a SpatialPointsDataFrame object containing the survival data as one of the columns
dist	choice of distribution function for baseline hazard. Current options are: exponentialHaz, weibullHaz, gompertzHaz, makehamHaz, tpowHaz
cov.model	an object of class covmodel, see ?covmodel ?ExponentialCovFct or ?SpikedExponentialCovFct
mcmc.control	mcmc control parameters, see ?mcmcpars
priors	an object of class Priors, see ?mcmcPriors
shape	when data is a data.frame, this can be a SpatialPolygonsDataFrame, or a SpatialPointsDataFrame, used to model spatial variation at the small region level. The regions are the polygons, or they represent the (possibly weighted) centroids of the polygons.
ids	named list entry shpid character string giving name of variable in shape to be matched to variable dataid in data. dataid is the second entry of the named list.
control	additional control parameters, see ?inference.control

**Value**

an object inheriting class 'mcmcpatsurv' for which there exist methods for printing, summarising and making inference from.

---

survpatNS	<i>survpatNS function</i>
-----------	---------------------------

---

## Description

A function to perform maximum likelihood inference for non-spatial survival data.

## Usage

```
survpatNS(formula, data, dist, control = inference.control())
```

## Arguments

formula	the model formula in a format compatible with the function <code>flexsurvreg</code> from the <code>flexsurv</code> package
data	a <code>SpatialPointsDataFrame</code> object containing the survival data as one of the columns
dist	choice of distribution function for baseline hazard. Current options are: <code>exponentialHaz</code> , <code>weibullHaz</code> , <code>gompertzHaz</code> , <code>makehamHaz</code> , <code>tpowHaz</code>
control	additional control parameters, see <code>?inference.control</code>

## Value

an object inheriting class `'mcmcspatsurv'` for which there exist methods for printing, summarising and making inference from.

## References

1. Benjamin M. Taylor. Auxiliary Variable Markov Chain Monte Carlo for Spatial Survival and Geostatistical Models. Benjamin M. Taylor. Submitted. <http://arxiv.org/abs/1501.01665>

---

textSummary	<i>textSummary function</i>
-------------	-----------------------------

---

### Description

A function to print a text description of the inferred parameters beta and eta from a call to the function `lgcpPredictSpatialPlusPars`, `lgcpPredictAggregateSpatialPlusPars`, `lgcpPredictSpatioTemporalPlusPars` or `lgcpPredictMultitypeSpatialPlusPars`

### Usage

```
textSummary(obj, digits = 3, scientific = -3, inclIntercept = FALSE,
            printmode = "LaTeX", ...)
```

### Arguments

<code>obj</code>	an object produced by a call to <code>lgcpPredictSpatialPlusPars</code> , <code>lgcpPredictAggregateSpatialPlusPars</code> , <code>lgcpPredictSpatioTemporalPlusPars</code> or <code>lgcpPredictMultitypeSpatialPlusPars</code>
<code>digits</code>	see the option "digits" in <code>?format</code>
<code>scientific</code>	see the option "scientific" in <code>?format</code>
<code>inclIntercept</code>	logical: whether to summarise the intercept term, default is FALSE.
<code>printmode</code>	the format of the text to return, can be 'LaTeX' (the default) or 'text' for plain text.
<code>...</code>	other arguments passed to the function "format"

### Value

A text summary, that can be pasted into a LaTeX document and later edited.

---

tpowHaz	<i>tpowHaz function</i>
---------	-------------------------

---

### Description

A function to define a parametric proportional hazards model where the baseline hazard is taken from the 'powers of t' model. This function returns an object inheriting class 'basehazardspec', list of functions 'distinfo', 'basehazard', 'gradbasehazard', 'hessbasehazard', 'cumbasehazard', 'gradcumbasehazard', 'hesscumbasehazard' and 'densityquantile'

### Usage

```
tpowHaz(powers)
```

**Arguments**

`powers` a vector of powers of  $t$ . These are powers are treated as fixed in estimation routines and it is assumed that the log cumulative baseline hazard is a linear combination of these powers of  $t$

**Details**

The `distinfo` function is used to provide basic distribution specific information to other `spatsurv` functions. The user is required to provide the following information in the returned list: `npars`, the number of parameters in this distribution; `parnames`, the names of the parameters; `trans`, the transformation scale on which the priors will be provided; `itrans`, the inverse transformation function that will be applied to the parameters before the hazard, and other functions are evaluated; `jacobian`, the derivative of the inverse transformation function with respect to each of the parameters; and `hessian`, the second derivatives of the inverse transformation function with respect to each of the parameters – note that currently the package `spatsurv` only allows the use of functions where the parameters are transformed independently.

The `basehazard` function is used to evaluate the baseline hazard function for the distribution of interest. It returns a function that accepts as input a vector of times,  $t$  and returns a vector.

The `gradbasehazard` function is used to evaluate the gradient of the baseline hazard function with respect to the parameters, this typically returns a vector. It returns a function that accepts as input a vector of times,  $t$ , and returns a matrix.

The `hessbasehazard` function is used to evaluate the Hessian of the baseline hazard function. It returns a function that accepts as input a vector of times,  $t$  and returns a list of hessian matrices corresponding to each  $t$ .

The `cumbasehazard` function is used to evaluate the cumulative baseline hazard function for the distribution of interest. It returns a function that accepts as input a vector of times,  $t$  and returns a vector.

The `gradcumbasehazard` function is used to evaluate the gradient of the cumulative baseline hazard function with respect to the parameters, this typically returns a vector. It returns a function that accepts as input a vector of times,  $t$ , and returns a matrix.

The `hesscumbasehazard` function is used to evaluate the Hessian of the cumulative baseline hazard function. It returns a function that accepts as input a vector of times,  $t$  and returns a list of hessian matrices corresponding to each  $t$ .

The `densityquantile` function is used to return quantiles of the density function. This is NOT REQUIRED for running the MCMC, merely for us in post-processing with the `predict` function where `type` is `'densityquantile'`. In the case of the Weibull model for the baseline hazard, it can be shown that the  $q$ -th quantile is:

**Value**

an object inheriting class `'basehazardspec'`

**See Also**

[exponentialHaz](#), [gompertzHaz](#), [makehamHaz](#), [weibullHaz](#)

---

transformweibull	<i>transformweibull function</i>
------------------	----------------------------------

---

**Description**

A function to back-transform estimates of the parameters of the weibull baseline hazard function, so they are commensurate with R's inbuilt density functions. Transforms from (shape, scale) to (alpha, lambda)

**Usage**

```
transformweibull(x)
```

**Arguments**

x	a vector of paramters
---	-----------------------

**Value**

the transformed parameters. For the weibull model, this is the back-transform from 'alpha' and 'lambda' to 'shape' 'scale' (see ?dweibull).

---

txtProgressBar2	<i>A text progress bar with label</i>
-----------------	---------------------------------------

---

**Description**

This is the base txtProgressBar but with a little modification to implement the label parameter for style=3. For full info see txtProgressBar

**Usage**

```
txtProgressBar2(min = 0, max = 1, initial = 0, char = "=", width = NA,
  title = "", label = "", style = 1)
```

**Arguments**

min	min value for bar
max	max value for bar
initial	initial value for bar
char	the character (or character string) to form the progress bar.
width	progress bar width
title	ignored
label	text to put at the end of the bar
style	bar style

---

urlTemplate	<i>urlTemplate function</i>
-------------	-----------------------------

---

**Description**

A function to return a url for a leaflet template for use as map backgrounds with the `spplot1` function.

**Usage**

```
urlTemplate(name = "Stamen_Toner")
```

**Arguments**

name                    name of the template to use, the default is 'Stamen\_Toner'

**Details**

Possible templates are: OpenStreetMap\_Mapnik, OpenStreetMap\_BlackAndWhite, OpenStreetMap\_DE, OpenStreetMap\_France, OpenStreetMap\_HOT, OpenTopoMap, Thunderforest\_OpenCycleMap, Thunderforest\_Transport, Thunderforest\_Landscape, Thunderforest\_Outdoors, OpenMapSurfer\_Roads, OpenMapSurfer\_Grayscale, Hydda\_Full, Hydda\_Base, MapQuestOpen\_OSM, Stamen\_Toner, Stamen\_TonerBackground, Stamen\_TonerLite, Stamen\_Watercolor, Stamen\_Terrain, Stamen\_TerrainBackground, Stamen\_TopOSMRelief, Esri\_WorldStreetMap, Esri\_WorldTopoMap, Esri\_WorldImagery, Esri\_WorldTerrain, Esri\_WorldShadedRelief, Esri\_WorldPhysical, Esri\_OceanBasemap, Esri\_NatGeoWorldMap, Esri\_WorldGrayCanvas, Acetate\_all, Acetate\_terrain, HERE\_satelliteDay, HERE\_hybridDayMobile, HERE\_hybridDay

See <http://leaflet-extras.github.io/leaflet-providers/preview/> for other leaflet templates

**Value**

url for the leaflet template

---

vcov.mcmcspatsurv	<i>vcov.mcmcspatsurv function</i>
-------------------	-----------------------------------

---

**Description**

A function to return the variance covariance matrix of the parameters beta, omega and eta

**Usage**

```
## S3 method for class 'mcmcspatsurv'
vcov(object, ...)
```

**Arguments**

object            an object inheriting class `mcmcspatsurv`  
 ...              other arguments, not used here

**Value**

the variance covariance matrix of the parameters beta, omega and eta

**See Also**

[print.mcmcspatsurv](#), [quantile.mcmcspatsurv](#), [summary.mcmcspatsurv](#), [frailtylag1](#), [spatialpars](#), [hazardpars](#), [fixedpars](#), [randompars](#), [baselinehazard](#), [predict.mcmcspatsurv](#), [priorposterior](#), [posteriorcov](#), [MCE](#), [hazardexceedance](#)

---

<code>vcov.mlspatsurv</code>	<i>vcov.mlspatsurv function</i>
------------------------------	---------------------------------

---

**Description**

A function to return the variance covariance matrix of the parameters beta, omega and eta

**Usage**

```
## S3 method for class 'mlspatsurv'
vcov(object, ...)
```

**Arguments**

object            an object inheriting class `mcmcspatsurv`  
 ...              other arguments, not used here

**Value**

the variance covariance matrix of the parameters beta, omega and eta

**See Also**

---

`weibullHaz`*weibullHaz function*

---

### Description

A function to define a parametric proportional hazards model where the baseline hazard is taken from the Weibull model. This function returns an object inheriting class 'basehazardspec', list of functions 'distinfo', 'basehazard', 'gradbasehazard', 'hessbasehazard', 'cumbasehazard', 'gradcumbasehazard', 'hesscumbasehazard' and 'densityquantile'

### Usage

```
weibullHaz()
```

### Details

The `distinfo` function is used to provide basic distribution specific information to other `spatsurv` functions. The user is required to provide the following information in the returned list: `npars`, the number of parameters in this distribution; `parnames`, the names of the parameters; `trans`, the transformation scale on which the priors will be provided; `itrans`, the inverse transformation function that will be applied to the parameters before the hazard, and other functions are evaluated; `jacobian`, the derivative of the inverse transformation function with respect to each of the parameters; and `hessian`, the second derivatives of the inverse transformation function with respect to each of the parameters – note that currently the package `spatsurv` only allows the use of functions where the parameters are transformed independently.

The `basehazard` function is used to evaluate the baseline hazard function for the distribution of interest. It returns a function that accepts as input a vector of times, `t` and returns a vector.

The `gradbasehazard` function is used to evaluate the gradient of the baseline hazard function with respect to the parameters, this typically returns a vector. It returns a function that accepts as input a vector of times, `t`, and returns a matrix.

The `hessbasehazard` function is used to evaluate the Hessian of the baseline hazard function. It returns a function that accepts as input a vector of times, `t` and returns a list of hessian matrices corresponding to each `t`.

The `cumbasehazard` function is used to evaluate the cumulative baseline hazard function for the distribution of interest. It returns a function that accepts as input a vector of times, `t` and returns a vector.

The `gradcumbasehazard` function is used to evaluate the gradient of the cumulative baseline hazard function with respect to the parameters, this typically returns a vector. It returns a function that accepts as input a vector of times, `t`, and returns a matrix.

The `hesscumbasehazard` function is used to evaluate the Hessian of the cumulative baseline hazard function. It returns a function that accepts as input a vector of times, `t` and returns a list of hessian matrices corresponding to each `t`.

The `densityquantile` function is used to return quantiles of the density function. This is NOT REQUIRED for running the MCMC, merely for us in post-processing with the `predict` function where `type` is 'densityquantile'. In the case of the Weibull model for the baseline hazard, it can be shown that the  $q$ -th quantile is:

**Value**

an object inheriting class 'basehazardspec'

YfromGamma

*YfromGamma function*

**Description**

A function to change Gammas (white noise) into Ys (spatially correlated noise). Used in the MALA algorithm.

**Usage**

```
YfromGamma(Gamma, invrootQeigs, mu)
```

**Arguments**

Gamma	Gamma matrix
invrootQeigs	inverse square root of the eigenvectors of the precision matrix
mu	parameter of the latent Gaussian field

**Value**

Y

YFromGamma\_SPDE

*YFromGamma\_SPDE function*

**Description**

A function to go from Gamma to Y

**Usage**

```
YFromGamma_SPDE(gamma, U, mu)
```

**Arguments**

gamma	Gamma
U	upper Cholesky matrix
mu	the mean

**Value**

the value of Y for the given Gamma
