Package 'wrswoR'

August 29, 2016

Encoding UTF-8

Type Package

Title Weighted Random Sampling without Replacement

Version 1.0-1

Date 2016-03-02

Description A collection of implementations of classical and novel algorithms for weighted sampling without replacement.

License GPL-3

Depends R (>= 3.0.2)

Imports Rcpp, logging (>= 0.4-13)

LinkingTo Rcpp (>= 0.11.5)

Suggests wrswoR.benchmark (>= 0.1), import, kimisc (>= 0.2-4), testthat, roxygen2, knitr, rmarkdown, rticles (>= 0.1), knitcitations, metap, tidyr, microbenchmark, sampling, BatchExperiments, dplyr, ggplot2, tikzDevice (>= 0.9-1)

`wrswoR-package` *Faster weighted sampling without replacement*

Description

R's default sampling without replacement using `sample.int` seems to require quadratic run time, e.g., when using weights drawn from a uniform distribution. For large sample sizes, this is too slow. This package contains several alternative implementations.

Details

Implementations are adapted from http://stackoverflow.com/q/15113650/946850.

Examples

```
sample_int_rej(100, 50, 1:100)
```

`sample_int_R` *Weighted sampling without replacement*

Description

These functions implement weighted sampling without replacement using various algorithms, i.e., they take a sample of the specified `size` from the elements of `1:n` without replacement, using the weights defined by `prob`. The call `sample_int_*(n, size, prob)` is equivalent to `sample.int(n, size, replace=F, pro` (The results will most probably be different for the same random seed, but the returned samples are distributed identically for both calls.) Except for `sample_int_R` (which has quadratic complexity as of this writing), all functions have complexity $O(n \log n)$ or better and often run faster than R's implementation, especially when `n` and `size` are large.

Usage

```
sample_int_R(n, size, prob)

sample_int_ccrank(n, size, prob)

sample_int_crank(n, size, prob)

sample_int_expj(n, size, prob)

sample_int_expjs(n, size, prob)

sample_int_rank(n, size, prob)

sample_int_rej(n, size, prob)
```

Arguments

n	a positive number, the number of items to choose from. See 'Details.'
size	a non-negative integer giving the number of items to choose.
prob	A vector of probability weights for obtaining the elements of the vector being sampled.

Details

`sample_int_R` is a simple wrapper for `sample.int`.

`sample_int_expj` and `sample_int_expjs` implement one-pass random sampling with a reservor with exponential jumps (Efraimidis and Spirakis, 2006, Algorithm A-ExpJ). Both functions are implemented in `Rcpp`; `*_expj` uses log-transformed keys, `*_expjs` implements the algorithm in the paper verbatim (at the cost of numerical stability).

`sample_int_rank`, `sample_int_crank` and `sample_int_ccrank` implement one-pass random sampling (Efraimidis and Spirakis, 2006, Algorithm A). The first function is implemented purely in R, the other two are optimized `Rcpp` implementations (`_crank` uses R vectors internally, while `*_ccrank` uses `std::vector`; surprisingly, `*_crank` seems to be faster on most inputs). It can be shown that the order statistic of $U^{(1/w_i)}$ has the same distribution as random sampling without replacement ($U = \text{uniform}(0, 1)$ distribution). To increase numerical stability, $\log(U)/w_i$ is computed instead; the log transform does not change the order statistic.

`sample_int_rej` uses repeated weighted sampling with replacement and a variant of rejection sampling. It is implemented purely in R. This function simulates weighted sampling without replacement using somewhat more draws *with* replacement, and then discarding duplicate values (rejection sampling). If too few items are sampled, the routine calls itself recursively on a (hopefully) much smaller problem. See also http://stats.stackexchange.com/q/20590/6432.

Value

An integer vector of length `size` with elements from `1:n`.
