

Package ‘distrMod’

September 4, 2016

Version 2.6.1

Date 2016-09-04

Title Object Oriented Implementation of Probability Models

Description Implements S4 classes for probability models based on packages 'distr' and 'distrEx'.

Depends R(>= 2.14.0), distr(>= 2.5.2), distrEx(>= 2.4), RandVar(>= 0.6.3), MASS, stats4, methods

Imports startupmsg, sfsmisc, graphics, stats, grDevices

Suggests ismev, evd

ByteCompile yes

License LGPL-3

Encoding latin1

URL <http://distr.r-forge.r-project.org/>

LastChangedDate {`$LastChangedDate`: 2016-09-04 13:12:50 +0200 (So, 04 Sep 2016) `$`}

LastChangedRevision {`$LastChangedRevision`: 1120 `$`}

SVNRevision 1104

NeedsCompilation no

Author Matthias Kohl [aut, cph],
Peter Ruckdeschel [cre, cph],

distrMod-package *distrMod – Object Oriented Implementation of Probability Models*

Description

Based on the packages **distr** and **distrEx** package **distrMod** provides a flexible framework which allows computation of estimators like maximum likelihood or minimum distance estimators for probability models.

Details

```

Package:      distrMod
Version:     2.6
Date:        2016-04-23
Depends:     R(>= 2.14.0), distr(>= 2.5.2), distrEx(>= 2.4), RandVar(>= 0.6.3), MASS, stats4, methods
Imports:     startupmsg, sfsmisc, graphics, stats, grDevices
Suggests:    ismev, evd, RobExtremes
ByteCompile: yes
License:     LGPL-3
URL:         http://distr.r-forge.r-project.org/
SVNRevision: 1104

```

Classes

[*]: there is a generating function with the same name

```

#####
ProbFamily classes
#####

Additional slots:
criterion(numeric)

#####
Confidence interval class
#####
slots:
type(character), confint(array),
estimate.call(call), name.estimate(character),
trafo.estimate(list[of function, matrix]),
nuisance.estimate(OptionalNumeric)
"Confint"

```

Methods

besides accessor and replacement functions, we have methods

- solve, sqrt for matrices checkL2deriv, existsPIC for class L2ParamFamily LogDeriv for class L2GroupParamFamily
- validParameter for classes ParamFamily, L2ScaleFamily, L2LocationFamily, and L2LocationScaleFamily
- modifyModel for the pairs of classes L2ParamFamily and ParamFamParameter, L2LocationFamily and ParamFamParameter, L2ScaleFamily and ParamFamParameter, L2LocationScaleFamily and ParamFamParameter, GammaFamily and ParamFamParameter, and ExpScaleFamily and ParamFamParameter
- mceCalc for the pair of classes numeric and ParamFamily
- mleCalc for the pairs of classes numeric and ParamFamily, numeric and BinomFamily, numeric and PoisFamily, numeric and NormLocationFamily, numeric and NormScaleFamily, and numeric and NormLocationScaleFamily
- coerce from class MCEstimate to class mle
- confint for class Estimate profile for class MCEstimate

Functions

Management of global options:

"distrModOptions", "distrModoptions", "getdistrModOption",

check for ker of matrix: "isKerAinKerB"

particular norms: "EuclideanNorm", "QuadFormNorm"

onesided bias: "positiveBias", "negativeBias",

Estimators:

"Estimator", "MCEstimator", "MLEstimator", "MDEstimator"

special location/scale models:

"L2LocationUnknownScaleFamily", "L2ScaleUnknownLocationFamily"

some special normal models:

"NormScaleUnknownLocationFamily", "NormLocationUnknownScaleFamily",

Start-up-Banner

You may suppress the start-up banner/message completely by setting options("StartupBanner"="off") somewhere before loading this package by library or require in your R-code / R-session.

If option "StartupBanner" is not defined (default) or setting options("StartupBanner"=NULL) or options("StartupBanner"="complete") the complete start-up banner is displayed.

For any other value of option "StartupBanner" (i.e., not in c(NULL,"off","complete")) only the version information is displayed.

The same can be achieved by wrapping the library or require call into either suppressStartupMessages() or onlytypeStartupMessages(.,atypes="version").

As for general packageStartupMessage's, you may also suppress all the start-up banner by wrapping the library or require call into suppressPackageStartupMessages() from **startupmsg**-version 0.5 on.

Demos

Demos are available — see demo(package="distrMod").

Scripts

Example scripts are available — see folder 'scripts' in the package folder to package **distrMod** in your library.

Package versions

Note: The first two numbers of package versions do not necessarily reflect package-individual development, but rather are chosen for the distrXXX family as a whole in order to ease updating "depends" information.

Note

Some functions of packages **stats**, **base** have intentionally been masked, but completely retain their functionality — see `distrModMASK()`.

If any of the packages **stats4**, **fBasics** is to be used together with **distrMod**, the latter must be attached *after* any of the first mentioned. Otherwise `confint()` defined as *method* in **distrMod** may get masked.

To re-mask, you may use `confint <- distrMod::confint`. See also `distrModMASK()`

.checkEstClassForParamFamily-methods

Methods for Function .checkEstClassForParamFamily in Package 'distrMod'

Description

.checkEstClassForParamFamily-methods

Usage

```
.checkEstClassForParamFamily(PFam, estimator)
## S4 method for signature 'ANY,ANY'
.checkEstClassForParamFamily(PFam, estimator)
```

Arguments

PFam a parametric family.
estimator an estimator.

Details

The respective methods can be used to cast an estimator to a model-specific subclass with particular methods.

Value

The (default) ANY, ANY-method returns the estimator unchanged.

Author(s)

Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

addAlphTrsp2col	<i>"addAlphTrsp2col"</i>
-----------------	--------------------------

Description

Adds alpha transparency to a given color.

Usage

```
addAlphTrsp2col(col, alpha=255)
```

Arguments

col	any valid color
alpha	tranparancy; an integer value in [0,255]

Value

a color in rgb coordinates

Author(s)

Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

Examples

```
addAlphTrsp2col(rgb(1,0.3,0.03), 25)
addAlphTrsp2col("darkblue", 25)
addAlphTrsp2col("#AAAAAAA", 25)
palette(rainbow(6))
addAlphTrsp2col(2, 25)
```

`asBias`*Generating function for asBias-class*

Description

Generates an object of class "asBias".

Usage

```
asBias(biastype = symmetricBias(), normtype = NormType())
```

Arguments

<code>biastype</code>	a bias type of class <code>BiasType</code>
<code>normtype</code>	a norm type of class <code>NormType</code>

Value

Object of class "asBias"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

[asBias-class](#)

Examples

```
asBias()  
  
## The function is currently defined as  
function(biastype = symmetricBias(), normtype = NormType()){  
  new("asBias",biastype = biastype, normtype = normtype) }
```

`asBias-class`*Standardized Asymptotic Bias*

Description

Class of standardized asymptotic bias; i.e., the neighborhood radius is omitted respectively, set to 1.

Objects from the Class

Objects can be created by calls of the form `new("asBias", ...)`. More frequently they are created via the generating function `asBias`.

Slots

`type` Object of class "character": "asymptotic bias".

`biastype` Object of class "BiasType": symmetric, one-sided or asymmetric

`normtype` Object of class "NormType": norm in which a multivariate parameter is considered

Extends

Class "asRiskwithBias", directly.

Class "asRisk", by class "asRiskwithBias"

Class "RiskType", by class "asRisk".

Examples

```
new("asBias")
```

asCov *Generating function for asCov-class*

Description

Generates an object of class "asCov".

Usage

```
asCov()
```

Value

Object of class "asCov"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.

Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

See Also

[asCov-class](#)

Examples

```
asCov()  
  
## The function is currently defined as  
function(){ new("asCov") }
```

asCov-class *Asymptotic covariance*

Description

Class of asymptotic covariance.

Objects from the Class

Objects can be created by calls of the form `new("asCov", ...)`. More frequently they are created via the generating function `asCov`.

Slots

type Object of class "character": "asymptotic covariance".

Extends

Class "asRisk", directly.
Class "RiskType", by class "asRisk".

Methods

No methods defined with class "asCov" in the signature.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Examples

```
new("asCov")
```

asGRisk-class

Convex asymptotic risk

Description

Class of special convex asymptotic risks.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

type Object of class "character".
biastype Object of class "BiasType": symmetric, one-sided or asymmetric
normtype Object of class "NormType": norm in which a multivariate parameter is considered

Extends

Class "asRisk", directly.
Class "RiskType", by class "asRisk".

Methods

No methods defined with class "asGRisk" in the signature.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

[asRisk-class](#)

asHampel

Generating function for asHampel-class

Description

Generates an object of class "asHampel".

Usage

```
asHampel(bound = Inf, biastype = symmetricBias(), normtype = NormType())
```

Arguments

bound	positive real: bias bound
biastype	a bias type of class BiasType
normtype	a norm type of class NormType

Value

Object of class asHampel

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

- Hampel et al. (1986) *Robust Statistics. The Approach Based on Influence Functions*. New York: Wiley.

See Also

[asHampel-class](#)

Examples

```
asHampel()

## The function is currently defined as
function(bound = Inf, biastype = symmetricBias(), normtype = NormType()){
  new("asHampel", bound = bound, biastype = biastype, normtype = normtype) }
```

asHampel-class	<i>Asymptotic Hampel risk</i>
----------------	-------------------------------

Description

Class of asymptotic Hampel risk which is the trace of the asymptotic covariance subject to a given bias bound (bound on gross error sensitivity).

Objects from the Class

Objects can be created by calls of the form `new("asHampel", ...)`. More frequently they are created via the generating function `asHampel`.

Slots

`type` Object of class "character": "trace of asymptotic covariance for given bias bound".

`bound` Object of class "numeric": given positive bias bound.

`biastype` Object of class "BiasType": symmetric, one-sided or asymmetric

Extends

Class "asRiskwithBias", directly.

Class "asRisk", by class "asRiskwithBias". Class "RiskType", by class "asRisk".

Methods

bound signature(object = "asHampel"): accessor function for slot bound.

show signature(object = "asHampel")

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

new("asHampel")
```

asMSE

Generating function for asMSE-class

Description

Generates an object of class "asMSE".

Usage

```
asMSE(biastype = symmetricBias(), normtype = NormType())
```

Arguments

biastype a bias type of class BiasType
normtype a norm type of class NormType

Value

Object of class "asMSE"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

- Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.
- Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

See Also[asMSE-class](#)**Examples**

```
asMSE()  
  
## The function is currently defined as  
function(biastype = symmetricBias(), normtype = NormType()){  
  new("asMSE", biastype = biastype, normtype = normtype) }
```

asMSE-class

Asymptotic mean square error

Description

Class of asymptotic mean square error.

Objects from the Class

Objects can be created by calls of the form `new("asMSE", ...)`. More frequently they are created via the generating function `asMSE`.

Slots

`type` Object of class "character": "asymptotic mean square error".

`biastype` Object of class "BiasType": symmetric, one-sided or asymmetric

`normtype` Object of class "NormType": norm in which a multivariate parameter is considered

Extends

Class "asGRisk", directly.

Class "asRiskwithBias", by class "asGRisk".

Class "asRisk", by class "asRiskwithBias".

Class "RiskType", by class "asGRisk".

Methods

No methods defined with class "asMSE" in the signature.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

- Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.

See Also

[asGRisk-class](#), [asMSE](#)

Examples

```
new("asMSE")
```

asRisk-class

Asymptotic risk

Description

Class of asymptotic risks.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

type Object of class "character".

Extends

Class "RiskType", directly.

Methods

No methods defined with class "asRisk" in the signature.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

See Also

[RiskType-class](#)

asRiskwithBias-class *Asymptotic risk*

Description

Class of asymptotic risks.

Objects from the Class

A “virtual” Class (although it does not contain "VIRTUAL"): No objects may be created from it.

Slots

type Object of class "character".
 biastype Object of class "BiasType".
 normtype Object of class "NormType".

Extends

Class "RiskType", directly.

Methods

biastype signature(object = "asRiskwithBias"): accessor function for slot biastype.
biastype<- signature(object = "asRiskwithBias", value = "BiasType"): replacement function for slot biastype.
normtype signature(object = "asRiskwithBias"): accessor function for slot normtype.
normtype<- signature(object = "asRiskwithBias", value = "NormType"): replacement function for slot normtype.
norm signature(object = "asRiskwithBias"): accessor function for slot fct of slot norm.

`asSemivar`*Generating function for asSemivar-class*

Description

Generates an object of class "asSemivar".

Usage

```
asSemivar(sign = 1)
```

Arguments

`sign` positive (=1) or negative Bias (=-1)

Value

Object of class "asSemivar"

Author(s)

Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

References

Ruckdeschel, P. (2005) Optimally One-Sided Bounded Influence Curves. *Mathematical Methods in Statistics* 14(1), 105-131.

See Also[onesidedBias-class](#)**Examples**

```
asSemivar()
```

asSemivar-class	<i>Semivariance Risk Type</i>
-----------------	-------------------------------

Description

Class for semi-variance risk.

Objects from the Class

Objects can be created by calls of the form `new("asSemivar", ...)`. More frequently they are created via the generating function `asSemivar`.

Slots

`type` Object of class "character": "asymptotic mean square error".

`biastype` Object of class "BiasType": symmetric, one-sided or asymmetric

`normtype` Object of class "NormType": norm in which a multivariate parameter is considered

Methods

sign `signature(object = "asSemivar")`: accessor function for slot `sign`.

sign<- `signature(object = "asSemivar", value = "numeric")`: replacement function for slot `sign`.

Extends

Class "asGRisk", directly.

Class "asRiskwithBias", by class "asGRisk".

Class "asRisk", by class "asRiskwithBias".

Class "RiskType", by class "asGRisk".

asUnOvShoot-class *Asymptotic under-/overshoot probability*

Description

Class of asymptotic under-/overshoot probability.

Objects from the Class

Objects can be created by calls of the form `new("asUnOvShoot", ...)`. More frequently they are created via the generating function `asUnOvShoot`.

Slots

`type` Object of class "character": "asymptotic under-/overshoot probability".

`width` Object of class "numeric": half the width of given confidence interval.

`biastype` Object of class "BiasType": symmetric, one-sided or asymmetric

Extends

Class "asGRisk", directly.

Class "asRiskwithBias", by class "asGRisk".

Class "asRisk", by class "asRiskwithBias".

Class "RiskType", by class "asGRisk".

Methods

width signature(object = "asUnOvShoot"): accessor function for slot width.

show signature(object = "asUnOvShoot")

```

BetaFamily

Generating function for Beta families

Description

Generates an object of class "L2ParamFamily" which represents a Beta family.

Usage

```
BetaFamily(shape1 = 1, shape2 = 1, trafo, withL2derivDistr = TRUE)
```

Arguments

shape1	positive real: shape1 parameter
shape2	positive real: shape2 parameter
trafo	matrix: transformation of the parameter
withL2derivDistr	logical: shall the distribution of the L2 derivative be computed? Defaults to TRUE; setting it to FALSE speeds up computations.

Details

The slots of the corresponding L2 differentiable parameteric family are filled.

Value

Object of class "L2ParamFamily"

Author(s)

Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

BinomFamily*Generating function for Binomial families*

Description

Generates an object of class "L2ParamFamily" which represents a Binomial family where the probability of success is the parameter of interest.

Usage

```
BinomFamily(size = 1, prob = 0.5, trafo)
```

Arguments

size	number of trials
prob	probability of success
trafo	function in param or matrix: transformation of the parameter

Details

The slots of the corresponding L2 differentiable parameteric family are filled.

Value

Object of class "L2ParamFamily"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

CauchyLocationScaleFamily

Generating function for Cauchy location and scale families

Description

Generates an object of class "L2LocationScaleFamily" which represents a normal location and scale family.

Usage

```
CauchyLocationScaleFamily(loc = 0, scale = 1, trafo)
```

Arguments

loc	location
scale	scale
trafo	function in param or matrix: transformation of the parameter

Details

The slots of the corresponding L2 differentiable parameteric family are filled.

Value

Object of class "L2LocationScaleFamily"

Author(s)

`checkL2deriv`*Generic function for checking L2-derivatives*

Description

Generic function for checking the L2-derivative of an L2-differentiable family of probability measures.

Usage

```
checkL2deriv(L2Fam, ...)
```

Arguments

L2Fam	L2-differentiable family of probability measures
...	additional parameters

Details

The precisions of the centering and the Fisher information are computed.

Value

The maximum deviation is returned.

Confint-class	<i>Confint-class</i>
---------------	----------------------

Description

Return value S4 classes for method “confint”.

Objects from the Class

Objects could in principle be created by calls of the form `new("Confint", ...)`. The preferred form is to have them created via a call to `confint`.

Slots

`type` Object of class "character": type of the confidence interval (asymptotic, bootstrap,...). Can be of length >2. Then in printing, the first element is printed in the gap '[...]' in 'an [...]' confidence interval', while the other elements are printed below.

`confint` Object of class "array": the confidence interval(s).

`call.estimate` Object of class "call": the estimate(s) for which the confidence intervals are produced.

`name.estimate` Object of class "character": the name of the estimate(s) for which the confidence intervals are produced.

`samplesize.estimate`: Object of class "numeric": the sample size of the estimate(s) for which the confidence intervals are (only complete cases) produced.

`completeness.estimate`: Object of class "logical": complete cases at which the estimate was evaluated.

`trafo.estimate` Object of class "matrix": the trafo/derivative matrix of the estimate(s) for which the confidence intervals are produced.

`nuisance.estimate` Object of class "OptionalNumeric": the nuisance parameter (if any) at which the confidence intervals are produced.

`fixed.estimate` Object of class "OptionalNumeric": the fixed part of the parameter (if any) at which the confidence intervals are produced.

Methods

type signature(object = "Confint"): accessor function for slot type.

confint signature(object = "Confint", method = "missing"): accessor function for slot type.

call.estimate signature(object = "Confint"): accessor function for slot call.estimate.

name.estimate signature(object = "Confint"): accessor function for slot name.estimate.

trafo.estimate signature(object = "Confint"): accessor function for slot trafo.estimate.

samplesize.estimate signature(object = "Confint"): (with additional argument `onlycompletecases` defaulting to TRUE returns the sample size; in case there are any incomplete cases and argument `onlycompletecases` is FALSE, the number of these is added to slot `samplesize`).

completecases.estimate signature(object = "Confint"): accessor function for slot completecases.estimate.

nuisance.estimate signature(object = "Confint"): accessor function for slot nuisance.estimate.

fixed.estimate signature(object = "Confint"): accessor function for slot fixed.estimate.

show signature(object = "Confint"): shows a detailed view of the object; slots nuisance.estimate and fixed.estimate are only shown if non-null, and slot trafo.estimate only if different from a unit matrix.

print signature(object = "Confint"): just as show, but with additional arguments digits.

Details for methods 'show', 'print'

Detailedness of output by methods show, print is controlled by the global option show.details to be set by [distrModoptions](#).

As method show is used when inspecting an object by typing the object's name into the console, show comes without extra arguments and hence detailedness must be controlled by global options.

Method print may be called with a (partially matched) argument show.details, and then the global option is temporarily set to this value.

More specifically, when show.detail is matched to "minimal" you will be shown only the type of the confidence interval(s) and its/their values. When show.detail is matched to "medium", you will in addition see the type of the estimator(s) for which it is produced, the corresponding call of the estimator, its sample size, and, if present, the value of the corresponding nuisance parameter. Finally, when show.detail is matched to "maximal", additionally you will be shown the fixed part of the parameter (if present) and the transformation of the estimator (if non-trivial, i.e. the identity) in form of its function code respectively of its derivative matrix.

Note

The pretty-printing code for methods show and print has been borrowed from confint.default in package **stats**.

print(ci, digits = 4, show.details="maximal")
print(ci, digits = 4, show.details="medium")
print(ci, digits = 4, show.details="minimal")

```

confint-methods

Methods for function confint in Package 'distrMod'

Description

Methods for function `confint` in package **distrMod**; by default uses `confint` and its corresponding S3-methods, but also computes (asymptotic) confidence intervals for objects of class `Estimate`. Computes confidence intervals for one or more parameters in a fitted model.

Usage

```

confint(object, method, ...)
## S4 method for signature 'ANY,missing'
confint(object, method, parm, level = 0.95, ...)
## S4 method for signature 'Estimate,missing'
confint(object, method, level = 0.95)
## S4 method for signature 'mle,missing'
confint(object, method, parm, level = 0.95, ...)
## S4 method for signature 'profile.mle,missing'
confint(object, method, parm, level = 0.95, ...)

```

Arguments

<code>object</code>	in default / signature ANY case: a fitted model object, in signature <code>Estimate</code> case, an object of class <code>Estimate</code>
<code>parm</code>	only used in default / signature ANY case: a specification of which parameters are to be given confidence intervals, either a vector of numbers or a vector of names. If missing, all parameters are considered.
<code>level</code>	the confidence level required.
<code>method</code>	not yet used (only as missing; later to allow for various methods)
<code>...</code>	additional argument(s) for methods.

Details

confint is a generic function. Its behavior differs according to its arguments.

signature ANY,missing: the default method; uses the S3 generic of package **stats**, see [confint](#).

signature Estimate,missing: will return a corresponding confidence interval assuming asymptotic normality, and hence needs suitably filled slot `asvar` in argument object. Besides the actual bounds, organized in an array just as in the S3 generic, the return value also captures the name of the estimator for which it is produced, as well as the corresponding call producing the estimator, and the corresponding `trafo` and nuisance slots/parts.

Value

signature ANY,missing:

A matrix (or vector) with columns giving lower and upper confidence limits for each parameter. These will be labelled as $(1-\text{level})/2$ and $1 - (1-\text{level})/2$ in % (by default 2.5% and 97.5%).

signature Estimate,missing:

An object of class `Confint`

```

distrModMASK

Masking of/by other functions in package "distrMod"

Description

Provides information on the (intended) masking of and (non-intended) masking by other other functions in package **distrMod**

Usage

```
distrModMASK(library = NULL)
```

Arguments

library a character vector with path names of R libraries, or NULL. The default value of NULL corresponds to all libraries currently known. If the default is used, the loaded packages are searched before the libraries

Value

no value is returned

Author(s)

Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

Examples

```
distrModMASK()
```

distrModOptions *Function to change the global variables of the package 'distrMod'*

Description

With `distrModOptions` you can inspect and change the global variables of the package **distrMod**.

Usage

```
distrModOptions(...)
getdistrModOption(x)
distrModoptions(...)
```

Arguments

...	any options can be defined, using name = value or by passing a list of such tagged values.
x	a character string holding an option name.

Details

Invoking `distrModoptions()` with no arguments returns a list with the current values of the options. To access the value of a single option, one should use `getdistrModOption("show.details")`, e.g., rather than `distrModoptions("show.details")` which is a *list* of length one.

Value

`distrModoptions()` returns a list of the global options of **distrMod**.
`distrModoptions("show.details")` returns the global option `show.details` as a list of length 1.
`distrModoptions("show.details" = "minimal")` sets the value of the global option `show.details` to "minimal". `getdistrModOption("show.details")` the current value set for option `show.details`.

distrModoptions

For compatibility with spelling in package **distr**, `distrModoptions` is just a synonym to `distrModoptions`.

Currently available options

show.details degree of detailedness for method show for objects of classes of the **distrXXX** family of packages. Possible values are

"maximal" all information is shown

"minimal" only the most important information is shown

"medium" somewhere in the middle; see actual show-methods for details.

The default value is "maximal".

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>,

Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

getdistrModOption("show.details")
```

Estimate-class

Estimate-class.

Description

Class of estimates.

Objects from the Class

Objects can be created by calls of the form `new("Estimate", ...)`. More frequently they are created via the generating function `Estimator`.

Slots

`name` Object of class "character": name of the estimator.

`estimate` Object of class "ANY": estimate.

`estimate.call` Object of class "call": call by which estimate was produced.

`Infos` object of class "matrix" with two columns named `method` and `message`: additional informations.

asvar object of class "OptionalNumericOrMatrix" which may contain the asymptotic (co)variance of the estimator.

samplesize object of class "numeric" — the samplesize (only complete cases are counted) at which the estimate was evaluated.

completecases object of class "logical" — complete cases at which the estimate was evaluated.

nuis.idx object of class "OptionalNumeric": indices of estimate belonging to the nuisance part.

fixed object of class "OptionalNumeric": the fixed and known part of the parameter.

trafo object of class "list": a list with components fct and mat (see below).

untransformed.estimate Object of class "ANY": untransformed estimate.

untransformed.asvar object of class "OptionalNumericOrMatrix" which may contain the asymptotic (co)variance of the untransformed estimator.

Methods

name signature(object = "Estimate"): accessor function for slot name.

name<- signature(object = "Estimate"): replacement function for slot name.

estimate signature(object = "Estimate"): accessor function for slot estimate.

untransformed.estimate signature(object = "Estimate"): accessor function for slot untransformed.estimate.

estimate.call signature(object = "Estimate"): accessor function for slot estimate.call.

samplesize signature(object = "Estimate"): (with additional argument onlycompletecases defaulting to TRUE returns the sample size; in case there are any incomplete cases and argument onlycompletecases is FALSE, the number of these is added to slot samplesize.

completecases signature(object = "Estimate"): accessor function for slot completecases.

asvar signature(object = "Estimate"): accessor function for slot asvar.

asvar<- signature(object = "Estimate"): replacement function for slot asvar.

untransformed.asvar signature(object = "Estimate"): accessor function for slot untransformed.asvar.

nuisance signature(object = "Estimate"): accessor function for nuisance part of slot estimate.

main signature(object = "Estimate"): accessor function for main part of slot estimate.

fixed signature(object = "Estimate"): accessor function for slot fixed.

Infos signature(object = "Estimate"): accessor function for slot Infos.

Infos<- signature(object = "Estimate"): replacement function for slot Infos.

addInfo<- signature(object = "Estimate"): function to add an information to slot Infos.

show signature(object = "Estimate")

print signature(object = "Estimate"): just as show, but with additional arguments digits.

Details for methods 'show', 'print'

Detailedness of output by methods `show`, `print` is controlled by the global option `show.details` to be set by `distrModoptions`.

As method `show` is used when inspecting an object by typing the object's name into the console, `show` comes without extra arguments and hence detailedness must be controlled by global options.

Method `print` may be called with a (partially matched) argument `show.details`, and then the global option is temporarily set to this value.

More specifically, when `show.detail` is matched to "minimal" you will be shown only the name/type of the estimator, the value of its main part, and, if present, the corresponding standard errors, as well as, also if present, the value of the nuisance part. When `show.detail` is matched to "medium", you will in addition see the class of the estimator, its call and its sample-size and, if present, the fixed part of the parameter and the asymptotic covariance matrix. Also the information gathered in the `Infos` slot is shown. Finally, when `show.detail` is matched to "maximal", and if, in addition, you estimate non-trivial (i.e. not the identity) transformation of the parameter of the parametric family, you will also be shown this transformation in form of its function and its derivative matrix at the estimated parameter value, as well as the estimator (with standard errors, if present) and (again, if present) the corresponding asymptotic covariance of the untransformed, total (i.e. main and nuisance part) parameter.

`trafo` realizes partial influence curves; i.e.; we are only interested in some possibly lower dimensional smooth (not necessarily linear or even coordinate-wise) aspect/transformation τ of the parameter θ .

To be coherent with the corresponding *nuisance* implementation, we make the following convention:

The full parameter θ is split up coordinate-wise in a main parameter θ' and a nuisance parameter θ'' (which is unknown, too, hence has to be estimated, but only is of secondary interest) and a fixed, known part θ''' .

Without loss of generality, we restrict ourselves to the case that transformation τ only acts on the main parameter θ' — if we want to transform the whole parameter, we only have to assume that both nuisance parameter θ'' and fixed, known part of the parameter θ''' have length 0.

To the implementation:

Slot `trafo` can either contain a (constant) matrix D_θ or a function

$$\tau: \Theta' \rightarrow \tilde{\Theta}, \quad \theta \mapsto \tau(\theta)$$

mapping main parameter θ' to some range $\tilde{\Theta}$.

If *slot value* `trafo` is a function, besides $\tau(\theta)$, it will also return the corresponding derivative matrix $\frac{\partial}{\partial \theta} \tau(\theta)$. More specifically, the return value of this function `theta` is a list with entries `fval`, the function value $\tau(\theta)$, and `mat`, the derivative matrix.

In case `trafo` is a matrix D , we interpret it as such a derivative matrix $\frac{\partial}{\partial \theta} \tau(\theta)$, and, correspondingly, $\tau(\theta)$ as the linear mapping $\tau(\theta) = D\theta$.

Note

The pretty-printing code for methods `show` and `print` has been borrowed from `print.fittedistr` in package **MASS** by B.D. Ripley.

[Estimator](#)

Examples

```
x <- rnorm(100)
Estimator(x, estimator = mean, name = "mean")

x1 <- x; x1[sample(1:100,10)] <- NA
myEst1 <- Estimator(x1, estimator = mean, name = "mean")
samplesize(myEst1)
samplesize(myEst1, onlycomplete = FALSE)
```

Estimator

Function to compute estimates

Description

The function Estimator provides a general way to compute estimates.

Usage

```
Estimator(x, estimator, name, Infos, asvar = NULL, nuis.idx,
          trafo = NULL, fixed = NULL, asvar.fct, na.rm = TRUE, ...,
          ParamFamily = NULL, .withEvalAsVar = TRUE)
```

Arguments

x	(empirical) data
estimator	function: estimator to be evaluated on x.
name	optional name for estimator.
Infos	character: optional informations about estimator
asvar	optionally the asymptotic (co)variance of the estimator
nuis.idx	optionally the indices of the estimate belonging to nuisance parameter
fixed	optionally (numeric) the fixed part of the parameter
trafo	an object of class <code>MatrixorFunction</code> – a transformation for the main parameter
asvar.fct	optionally: a function to determine the corresponding asymptotic variance; if given, <code>asvar.fct</code> takes arguments <code>L2Fam</code> (the parametric model as object of class <code>L2ParamFamily</code>) and <code>param</code> (the parameter value as object of class <code>ParamFamParameter</code>); arguments are called by name; <code>asvar.fct</code> may also process further arguments passed through the <code>...</code> argument.

`na.rm` logical: if TRUE, the estimator is evaluated at `complete.cases(x)`.
`...` further arguments to estimator.
`ParamFamily` an optional object of class `ParamFamily`. Passed on to `asvar.fct` to compute asymptotic variances.
`.withEvalAsVar` logical: shall slot `asVar` be evaluated (if `asvar.fct` is given) or just the call be returned?

Details

The argument `criterion` has to be a function with arguments the empirical data as well as an object of class "Distribution" and possibly ...

Value

An object of S4-class "Estimate".

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>,
 Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

See Also

[Estimate-class](#)

Examples

```

x <- rnorm(100)
Estimator(x, estimator = mean, name = "mean")

X <- matrix(rnorm(1000), nrow = 10)
Estimator(X, estimator = rowMeans, name = "mean")

```

EvenSymmetric

Generating function for EvenSymmetric-class

Description

Generates an object of class "EvenSymmetric".

Usage

```
EvenSymmetric(SymmCenter = 0)
```

Arguments

`SymmCenter` numeric: center of symmetry

Value

Object of class "EvenSymmetric"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[EvenSymmetric-class](#), [FunctionSymmetry-class](#)

Examples

```
EvenSymmetric()  
  
## The function is currently defined as  
function(SymmCenter = 0){  
  new("EvenSymmetric", SymmCenter = SymmCenter)  
}
```

EvenSymmetric-class *Class for Even Functions*

Description

Class for even functions.

Objects from the Class

Objects can be created by calls of the form `new("EvenSymmetric")`. More frequently they are created via the generating function `EvenSymmetric`.

Slots

`type` Object of class "character": contains "even function"
`SymmCenter` Object of class "numeric": center of symmetry

Extends

Class "FunctionSymmetry", directly.
Class "Symmetry", by class "FunctionSymmetry".

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[EvenSymmetric](#), [FunctionSymmetry-class](#)

Examples

```
new("EvenSymmetric")
```

existsPIC-methods *Methods for Function existsPIC in Package 'distrMod'*

Description

existsPIC-methods to check whether in a given L2 differentiable model at parameter value theta there exist (partial) influence curves to Trafo D_θ .

Usage

```
existsPIC(object, ...)
## S4 method for signature 'L2ParamFamily'
existsPIC(object, warning = TRUE, tol = .Machine$double.eps^.5)
```

Arguments

object	L2ParamFamily
...	further arguments used by specific methods.
warning	logical: should a warning be issued if there exist no (partial) influence curves?
tol	the tolerance the linear algebraic operations. Default is <code>.Machine\$double.eps^.5</code> .

Details

To check the existence of (partial) influence curves and, simultaneously, for bounded (partial) influence curves, by Lemma 1.1.3 in Kohl(2005) [resp. the fact that $\ker I = \ker J$ for $J = E(\Lambda', 1)'(\Lambda', 1)w$ and $w = \min(1, b/|(\Lambda', 1)|]$, it suffices to check that $\ker I$ is a subset of $\ker D_\theta$. This is done by a call to `isKerAinKerB`.

ExpScaleFamily	<i>Generating function for exponential scale families</i>
----------------	---

Description

Generates an object of class "L2ScaleFamily" which represents an exponential scale family.

Usage

```
ExpScaleFamily(scale = 1, trafo)
```

Arguments

scale	scale (= 1/rate)
trafo	function in param or matrix: optional transformation of the parameter

Details

The slots of the corresponding L2 differentiable parameteric family are filled. The scale parameter corresponds to $1/\text{rate}$.

Value

Object of class "L2ScaleFamily"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

fiHampel-class	<i>Finite-sample Hampel risk</i>
----------------	----------------------------------

Description

Class of finite-sample Hampel risk which is the trace of the finite-sample covariance subject to a given bias bound (bound on gross error sensitivity).

Objects from the Class

Objects can be created by calls of the form `new("fiHampel", ...)`. More frequently they are created via the generating function `fiHampel`.

Slots

`type` Object of class "character": "trace of finite-sample covariance for given bias bound".
`bound` Object of class "numeric": given positive bias bound.

Extends

Class "fiRisk", directly.
Class "RiskType", by class "fiRisk".

Methods

bound signature(object = "fiHampel"): accessor function for slot bound.
show signature(object = "fiHampel")

FunSymmList*Generating function for FunSymmList-class*

Description

Generates an object of class "FunSymmList".

Usage

```
FunSymmList(...)
```

Arguments

... Objects of class "FunctionSymmetry" which shall form the list of symmetry types.

Value

Object of class "FunSymmList"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[FunSymmList-class](#)

Examples

```
FunSymmList(NonSymmetric(), EvenSymmetric(SymmCenter = 1),  
            OddSymmetric(SymmCenter = 2))
```

```
## The function is currently defined as  
function (...){  
  new("FunSymmList", list(...))  
}
```

FunSymmList-class *List of Symmetries for a List of Functions*

Description

Create a list of symmetries for a list of functions

Objects from the Class

Objects can be created by calls of the form `new("FunSymmList", ...)`. More frequently they are created via the generating function `FunSymmList`.

Slots

.Data Object of class "list". A list of objects of class "FunctionSymmetry".

Extends

Class "list", from data part.
Class "vector", by class "list".

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[FunctionSymmetry-class](#)

Examples

```
new("FunSymmList", list(NonSymmetric(), EvenSymmetric(SymmCenter = 1),
                        OddSymmetric(SymmCenter = 2)))
```

GammaFamily *Generating function for Gamma families*

Description

Generates an object of class "L2ParamFamily" which represents a Gamma family.

Usage

```
GammaFamily(scale = 1, shape = 1, trafo, withL2derivDistr = TRUE)
```

Arguments

scale positive real: scale parameter
 shape positive real: shape parameter
 trafo matrix: transformation of the parameter
 withL2derivDistr
 logical: shall the distribution of the L2 derivative be computed? Defaults to TRUE; setting it to FALSE speeds up computations.

Details

The slots of the corresponding L2 differentiable parameteric family are filled.

Value

Object of class "L2ParamFamily"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

Examples

```
InfoNorm()

## The function is currently defined as
function(){ new("InfoNorm") }
```

isKerAinKerB

isKerAinKerB

Description

For two matrices A and B checks whether the null space of A is a subspace of the null space of B, in other words, if $Ax = 0$ entails $Bx = 0$.

Usage

```
isKerAinKerB(A, B, tol = .Machine$double.eps)
```

Arguments

A	a matrix; if A is a vector, A is coerced to a matrix by <code>as.matrix</code> .
B	a matrix; if B is a vector, B is coerced to a matrix by <code>as.matrix</code> .
tol	the tolerance for detecting linear dependencies in the columns of a and up to which the two projectors are seen as equal (see below).

Details

via calls to `svd`, the projectors π_A and π_B onto the respective orthogonal complements of $\ker(A)$ and $\ker(B)$ are calculated and then is checked whether $\pi_B \pi_A = \pi_B$.

Value

logical

Author(s)

Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

Examples

```
ma <- cbind(1,1,c(1,1,7))
D <- t(ma %*% c(0,1,-1))
isKerAinKerB(D,ma)
isKerAinKerB(ma,D)
```

L2GroupParamFamily-class

L2 differentiable parametric group family

Description

Class of L2 differentiable parametric group families.

Objects from the Class

Objects can be created by calls of the form `new("L2GroupParamFamily", ...)`. More frequently, this class is just used as an intermediate class to classes of specific group models like [L2LocationFamily-class](#), [L2ScaleFamily-class](#), and [L2LocationScaleFamily-class](#).

Slots

`name` [inherited from class "ProbFamily"] object of class "character": name of the family.

`distribution` [inherited from class "ProbFamily"] object of class "Distribution": member of the family.

`distrSymm` [inherited from class "ProbFamily"] object of class "DistributionSymmetry": symmetry of distribution.

`param` [inherited from class "ParamFamily"] object of class "ParamFamParameter": parameter of the family.

`fam.call` [inherited from class "ParamFamily"] object of class "call": call by which parametric family was produced.

`makeOKPar` [inherited from class "ParamFamily"] object of class "function": has argument `param` — the (total) parameter, returns valid parameter; used if `optim` resp. `optimize` — try to use "illegal" parameter values; then `makeOKPar` makes a valid parameter value out of the illegal one.

`startPar` [inherited from class "ParamFamily"] object of class "function": has argument `x` — the data, returns starting parameter for `optim` resp. `optimize` — a starting estimator in case parameter is multivariate or a search interval in case parameter is univariate.

`modifyParam` [inherited from class "ParamFamily"] object of class "function": mapping from the parameter space (represented by "param") to the distribution space (represented by "distribution").
`props` [inherited from class "ProbFamily"] object of class "character": properties of the family.
`L2deriv` [inherited from class "L2ParamFamily"] object of class "EuclRandVariable": L2 derivative of the family.
`L2deriv.fct` [inherited from class "L2ParamFamily"] object of class "function": mapping from the parameter space (argument `param` of class "ParamFamParameter") to a mapping from observation `x` to the value of the L2derivative; `L2deriv.fct` is then used from observation `x` to value of the L2derivative; `L2deriv.fct` is used by `modifyModel` to move the L2deriv according to a change in the parameter
`L2derivSymm` [inherited from class "L2ParamFamily"] object of class "FunSymmList": symmetry of the maps included in `L2deriv`.
`L2derivDistr` [inherited from class "L2ParamFamily"] object of class "UnivarDistrList": list which includes the distribution of `L2deriv`.
`L2derivDistrSymm` [inherited from class "L2ParamFamily"] object of class "DistrSymmList": symmetry of the distributions included in `L2derivDistr`.
`FisherInfo.fct` [inherited from class "L2ParamFamily"] object of class "function": mapping from the parameter space (argument `param` of class "ParamFamParameter") to the set of positive semidefinite matrices; `FisherInfo.fct` is used by `modifyModel` to move the Fisher information according to a change in the parameter
`FisherInfo` [inherited from class "L2ParamFamily"] object of class "PosDefSymmMatrix": Fisher information of the family.
`LogDeriv` object of class "function": has argument `x`; the negative logarithmic derivative of the density of the model distribution at the "standard" parameter value.

Extends

Class "L2ParamFamily", directly.
 Class "ParamFamily", by class "L2ParamFamily".
 Class "ProbFamily", by class "ParamFamily".

Methods

LogDeriv signature(object = "L2GroupParamFamily"): accessor function for slot `LogDeriv`.
LogDeriv<- signature(object = "L2GroupParamFamily"): replacement function for slot `LogDeriv`.

Author(s)

Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

References

Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.
 Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

See Also

[L2ParamFamily-class](#), [ParamFamily-class](#)

Examples

```
F1 <- new("L2GroupParamFamily")
plot(F1)
```

L2LocationFamily *Generating function for L2LocationFamily-class*

Description

Generates an object of class "L2LocationFamily".

Usage

```
L2LocationFamily(loc = 0, name, centraldistribution = Norm(),
                 locname = "loc", modParam, LogDeriv,
                 L2derivDistr.0, FisherInfo.0, distrSymm, L2derivSymm,
                 L2derivDistrSymm, trafo, .returnClsName = NULL)
```

Arguments

loc	numeric: location parameter of the model.
name	character: name of the parametric family.
centraldistribution	object of class "AbscontDistribution"; we assume from the beginning, that centraldistribution is symmetric about its median.
modParam	optional function: mapping from the parameter space (represented by "param") to the distribution space (represented by "distribution").
locname	a character vector of length 1 containing the name of the location parameter
LogDeriv	function with argument x: the negative logarithmic derivative of the density of the central distribution; if missing, it is determined numerically using numeric differentiation.
L2derivDistr.0	object of class "UnivariateDistribution": distribution of the L2derivative at the central distribution
FisherInfo.0	object of class "PosSemDefSymmMatrix": Fisher information of the model at the "standard" parameter value
distrSymm	object of class "DistributionSymmetry": symmetry of distribution.
L2derivSymm	object of class "FunSymmList": symmetry of the maps contained in L2deriv
L2derivDistrSymm	object of class "DistrSymmList": symmetry of the distributions contained in L2derivDistr

trafo matrix or function in param: transformation of the parameter

.returnClsName the class name of the return value; by default this argument is NULL whereupon the return class will be L2LocationScaleFamily; but, internally, this generating function is also used to produce objects of class Classes NormLocationFamily and GumbelLocationFamily (the latter in package **RobExtremes**).

Details

If name is missing, the default “L2 location family” is used. The function modParam is optional. If it is missing, it is constructed from centraldistribution using the location structure of the model. Slot param is filled accordingly with the argument trafo passed to L2LocationFamily. In case L2derivDistr.0 is missing, L2derivDistr is computed via imageDistr, else L2derivDistr is assigned L2derivDistr.0, coerced to “UnivariateDistributionList”. In case FisherInfo.0 is missing, Fisher information is computed from L2deriv using E. If distrSymm is missing, it is set to symmetry about loc. If L2derivSymm is missing, it is set to no symmetry, and if L2derivDistrSymm is missing, it is set to no symmetry, too.

Value

Object of class “L2LocationFamily”

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>,
Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

References

L2LocationFamily-class

L2 differentiable parametric group family

Description

Class of L2 differentiable parametric group families.

Objects from the Class

Objects can be created by calls of the form `new("L2LocationFamily", ...)`. More frequently they are created via the generating function `L2LocationFamily`.

Slots

`name` [inherited from class "ProbFamily"] object of class "character": name of the family.

`distribution` [inherited from class "ProbFamily"] object of class "Distribution": member of the family.

`distrSymm` [inherited from class "ProbFamily"] object of class "DistributionSymmetry": symmetry of distribution.

`param` [inherited from class "ParamFamily"] object of class "ParamFamParameter": parameter of the family.

`fam.call` [inherited from class "ParamFamily"] object of class "call": call by which parametric family was produced.

`makeOKPar` [inherited from class "ParamFamily"] object of class "function": has argument `param` — the (total) parameter, returns valid parameter; used if `optim resp. optimize`— try to use "illegal" parameter values; then `makeOKPar` makes a valid parameter value out of the illegal one.

`startPar` [inherited from class "ParamFamily"] object of class "function": has argument `x` — the data, returns starting parameter for `optim resp. optimize`— a starting estimator in case parameter is multivariate or a search interval in case parameter is univariate.

`modifyParam` [inherited from class "ParamFamily"] object of class "function": mapping from the parameter space (represented by "param") to the distribution space (represented by "distribution").

`props` [inherited from class "ProbFamily"] object of class "character": properties of the family.

`L2deriv` [inherited from class "L2ParamFamily"] object of class "EuclRandVariable": L2 derivative of the family.

`L2deriv.fct` [inherited from class "L2ParamFamily"] object of class "function": mapping from the parameter space (argument `param` of class "ParamFamParameter") to a mapping from observation `x` to the value of the L2derivative; `L2deriv.fct` is then used from observation `x` to value of the L2derivative; `L2deriv.fct` is used by `modifyModel` to move the L2deriv according to a change in the parameter

`L2derivSymm` [inherited from class "L2ParamFamily"] object of class "FunSymmList": symmetry of the maps included in `L2deriv`.

L2derivDistr [inherited from class "L2ParamFamily"] object of class "UnivarDistrList": list which includes the distribution of L2deriv.

L2derivDistrSymm [inherited from class "L2ParamFamily"] object of class "DistrSymmList": symmetry of the distributions included in L2derivDistr.

FisherInfo.fct [inherited from class "L2ParamFamily"] object of class "function": mapping from the parameter space (argument param of class "ParamFamParameter") to the set of positive semidefinite matrices; FisherInfo.fct is used by modifyModel to move the Fisher information according to a change in the parameter

FisherInfo [inherited from class "L2ParamFamily"] object of class "PosDefSymmMatrix": Fisher information of the family.

LogDeriv [inherited from class "L2GroupParamFamily"] object of class "function": has argument x; the negative logarithmic derivative of the density of the model distribution at the "standard" parameter value.

locscalename [inherited from class "L2LocationScaleUnion"] object of class "character": names of location and scale parameter

Extends

Class "L2LocationScaleUnion", directly.

Class "L2GroupParamFamily", by class "L2LocationScaleUnion".

Class "L2ParamFamily", by class "L2GroupParamFamily".

Class "ParamFamily", by class "L2ParamFamily".

Class "ProbFamily", by class "ParamFamily".

Methods

modifyModel signature(model = "L2LocationFamily", param = "ParamFamParameter"): moves the L2-location family model to parameter param

```
L2LocationScaleFamily(loc = 0, scale = 1, name, centraldistribution = Norm(),
                      locscalename = c("loc", "scale"), modParam, LogDeriv,
                      L2derivDistr.0, FisherInfo.0, distrSymm, L2derivSymm,
                      L2derivDistrSymm, trafo, .returnClsName = NULL)
```

Arguments

loc	numeric: location parameter of the model.
scale	positive number: scale of the model.
name	character: name of the parametric family.
centraldistribution	object of class "AbscontDistribution": central distribution; we assume by default, that centraldistribution is symmetric about 0
modParam	optional function: mapping from the parameter space (represented by "param") to the distribution space (represented by "distribution").
locscalename	a character vector of length 2 containing the names of the location and scale parameter; either unnamed, then order must be c(loc, scale), or named, then names must be "loc" and "scale"
LogDeriv	function with argument x: the negative logarithmic derivative of the density of the central distribution; if missing, it is determined numerically using numeric differentiation.
L2derivDistr.0	list of length 2 of objects of class "UnivariateDistribution": (marginal) distributions of the coordinates of the L2derivative at the central distribution
FisherInfo.0	object of class "PosSemDefSymmMatrix": Fisher information of the model at the "standard" parameter value
distrSymm	object of class "DistributionSymmetry": symmetry of distribution.
L2derivSymm	object of class "FunSymmList": symmetry of the maps contained in L2deriv
L2derivDistrSymm	object of class "DistrSymmList": symmetry of the distributions contained in L2derivDistr
trafo	matrix or function in param: transformation of the parameter
.returnClsName	the class name of the return value; by default this argument is NULL whereupon the return class will be L2LocationScaleFamily; but, internally, this generating function is also used to produce objects of class NormalLocationScaleFamily, CauchyLocationScaleFamily.

Details

If name is missing, the default “L2 location and scale family” is used. The function modParam is optional. If it is missing, it is constructed from centraldistribution using the location and scale structure of the model. Slot param is filled accordingly with the argument trafo passed to L2LocationScaleFamily. In case L2derivDistr.0 is missing, L2derivDistr is computed via imageDistr, else L2derivDistr is assigned L2derivDistr.0, coerced to “UnivariateDistributionList”. In case FisherInfo.0 is missing, Fisher information is computed from L2deriv using E. If distrSymm is missing, it is set to symmetry about loc. If L2derivSymm is missing, its location and scale components are set to no symmetry, respectively. If L2derivDistrSymm is missing, its location and scale components are set to no symmetry, respectively.

Value

Object of class “L2LocationScaleFamily”

L2LocationScaleFamily-class

L2 differentiable parametric group family

Description

Class of L2 differentiable parametric group families.

Objects from the Class

Objects can be created by calls of the form new(“L2LocationScaleFamily”, ...). More frequently they are created via the generating function L2LocationScaleFamily.

Slots

- name [inherited from class "ProbFamily"] object of class "character": name of the family.
- distribution [inherited from class "ProbFamily"] object of class "Distribution": member of the family.
- distrSymm [inherited from class "ProbFamily"] object of class "DistributionSymmetry": symmetry of distribution.
- param [inherited from class "ParamFamily"] object of class "ParamFamParameter": parameter of the family.
- fam.call [inherited from class "ParamFamily"] object of class "call": call by which parametric family was produced.
- makeOKPar [inherited from class "ParamFamily"] object of class "function": has argument param — the (total) parameter, returns valid parameter; used if optim resp. optimize— try to use "illegal" parameter values; then makeOKPar makes a valid parameter value out of the illegal one.
- startPar [inherited from class "ParamFamily"] object of class "function": has argument x — the data, returns starting parameter for optim resp. optimize— a starting estimator in case parameter is multivariate or a search interval in case parameter is univariate.
- modifyParam [inherited from class "ParamFamily"] object of class "function": mapping from the parameter space (represented by "param") to the distribution space (represented by "distribution").
- props [inherited from class "ProbFamily"] object of class "character": properties of the family.
- L2deriv [inherited from class "L2ParamFamily"] object of class "Euc1RandVariable": L2 derivative of the family.
- L2deriv.fct [inherited from class "L2ParamFamily"] object of class "function": mapping from the parameter space (argument param of class "ParamFamParameter") to a mapping from observation x to the value of the L2derivative; L2deriv.fct is then used from observation x to value of the L2derivative; L2deriv.fct is used by modifyModel to move the L2deriv according to a change in the parameter
- L2derivSymm [inherited from class "L2ParamFamily"] object of class "FunSymmList": symmetry of the maps included in L2deriv.
- L2derivDistr [inherited from class "L2ParamFamily"] object of class "UnivarDistrList": list which includes the distribution of L2deriv.
- L2derivDistrSymm [inherited from class "L2ParamFamily"] object of class "DistrSymmList": symmetry of the distributions included in L2derivDistr.
- FisherInfo.fct [inherited from class "L2ParamFamily"] object of class "function": mapping from the parameter space (argument param of class "ParamFamParameter") to the set of positive semidefinite matrices; FisherInfo.fct is used by modifyModel to move the Fisher information according to a change in the parameter
- FisherInfo [inherited from class "L2ParamFamily"] object of class "PosDefSymmMatrix": Fisher information of the family.
- LogDeriv [inherited from class "L2GroupParamFamily"] object of class "function": has argument x; the negative logarithmic derivative of the density of the model distribution at the "standard" parameter value.
- locscalename [inherited from class "L2LocationScaleUnion"] object of class "character": names of location and scale parameter

Extends

Class "L2LocationScaleUnion", directly.
 Class "L2GroupParamFamily", by class "L2LocationScaleUnion".
 Class "L2ParamFamily", by class "L2GroupParamFamily".
 Class "ParamFamily", by class "L2ParamFamily".

L2LocationUnknownScaleFamily

Generating function for L2LocationScaleFamily-class in nuisance situation

Description

Generates an object of class "L2LocationScaleFamily" in the situation where location is main, scale nuisance parameter.

Usage

```
L2LocationUnknownScaleFamily(loc = 0, scale = 1, name, centraldistribution = Norm(),
  locscalename = c("loc", "scale"), modParam, LogDeriv,
  L2derivDistr.0, FisherInfo.0, distrSymm, L2derivSymm,
  L2derivDistrSymm, trafo, .returnClsName = NULL)
```

Arguments

loc	numeric: location parameter of the model.
scale	positive number: scale of the model.
name	character: name of the parametric family.
centraldistribution	object of class "AbscontDistribution": central distribution; we assume by default, that centraldistribution is symmetric about 0
modParam	optional function: mapping from the parameter space (represented by "param") to the distribution space (represented by "distribution").
locscalename	a character vector of length 2 containing the names of the location and scale parameter; either unnamed, then order must be c(loc, scale), or named, then names must be "loc" and "scale"
LogDeriv	function with argument x: the negative logarithmic derivative of the density of the central distribution; if missing, it is determined numerically using numeric differentiation.
L2derivDistr.0	list of length 2 of objects of class "UnivariateDistribution": (marginal) distributions of the coordinates of the L2derivative at the central distribution
FisherInfo.0	object of class "PosSemDefSymmMatrix": Fisher information of the model at the "standard" parameter value
distrSymm	object of class "DistributionSymmetry": symmetry of distribution.
L2derivSymm	object of class "FunSymmList": symmetry of the maps contained in L2deriv
L2derivDistrSymm	object of class "DistrSymmList": symmetry of the distributions contained in L2derivDistr
trafo	matrix or function in param: transformation of the parameter
.returnClsName	the class name of the return value; by default this argument is NULL whereupon the return class will be L2LocationScaleFamily; but, internally, this generating function is also used to produce objects of class NormalLocationScaleFamily.

Details

If name is missing, the default "L2 location family with unknown scale (as nuisance)" is used. The function modParam is optional. If it is missing, it is constructed from centraldistribution using the location and scale structure of the model. Slot param is filled accordingly with the argument trafo passed to L2LocationUnknownScaleFamily. In case L2derivDistr.0 is missing, L2derivDistr is computed via imageDistr, else L2derivDistr is assigned L2derivDistr.0, coerced to "UnivariateDistributionList". In case FisherInfo.0 is missing, Fisher information is computed from L2deriv using E. If distrSymm is missing, it is set to symmetry about loc. If L2derivSymm is missing, its location and scale components are set to no symmetry, respectively. If L2derivDistrSymm is missing, its location and scale components are set to no symmetry, respectively.

Value

Object of class "L2LocationScaleFamily"

Author(s)

Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

References

Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.

Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

Examples

```
F1 <- L2LocationUnknownScaleFamily()
plot(F1)
```

L2ParamFamily

Generating function for L2ParamFamily-class

Description

Generates an object of class "L2ParamFamily".

Usage

```
L2ParamFamily(name, distribution = Norm(), distrSymm,
  main = main(param), nuisance = nuisance(param),
  fixed = fixed(param), trafo = trafo(param),
  param = ParamFamParameter(name = paste("Parameter of", name),
    main = main, nuisance = nuisance,
    fixed = fixed, trafo = trafo),
  props = character(0),
  startPar = NULL, makeOKPar = NULL,
  modifyParam = function(theta){ Norm(mean=theta) },
  L2deriv.fct = function(param) {force(theta <- param@main)
    return(function(x) {x-theta})},
  L2derivSymm, L2derivDistr, L2derivDistrSymm,
  FisherInfo.fct, FisherInfo = FisherInfo.fct(param),
  .returnClsName = NULL, .withMDE = TRUE)
```

Arguments

name	character string: name of the family
distribution	object of class "Distribution": member of the family
distrSymm	object of class "DistributionSymmetry": symmetry of distribution.
main	numeric vector: main parameter
nuisance	numeric vector: nuisance parameter
fixed	numeric vector: fixed part of the parameter
trafo	function in param or matrix: transformation of the parameter
param	object of class "ParamFamParameter": parameter of the family
startPar	startPar is a function in the observations \times returning initial information for MCEstimator used by optimize resp. optim; i.e; if (total) parameter is of length 1, startPar returns a search interval, else it returns an initial parameter value.
makeOKPar	makeOKPar is a function in the (total) parameter param; used if optim resp. optimize— try to use "illegal" parameter values; then makeOKPar makes a valid parameter value out of the illegal one; if NULL slot makeOKPar of ParamFamily is used to produce it.
modifyParam	function: mapping from the parameter space (represented by "param") to the distribution space (represented by "distribution").
props	character vector: properties of the family
L2deriv.fct	function: mapping from the parameter space (argument param of class "ParamFamParameter") to a mapping from observation x to the value of the L2derivative; L2deriv.fct is used by modifyModel to move the L2deriv according to a change in the parameter
L2derivSymm	object of class "FunSymmList": symmetry of the maps contained in L2deriv
L2derivDistr	object of class "UnivarDistrList": distribution of L2deriv
L2derivDistrSymm	object of class "DistrSymmList": symmetry of the distributions contained in L2derivDistr
FisherInfo.fct	function: mapping from the parameter space (argument param of class "ParamFamParameter") to the set of positive semidefinite matrices; FisherInfo.fct is used by modifyModel to move the Fisher information according to a change in the parameter
FisherInfo	object of class "PosSemDefSymmMatrix": Fisher information of the family
.returnClsName	the class name of the return value; by default this argument is NULL whereupon the return class will be L2ParamFamily; but, internally, this generating function is also used to e.g. produce objects of class BinomialFamily, PoisFamily GammaFamily, BetaFamily.
.withMDE	logical of length 1: Tells R how to use the function from slot startPar in case of a kStepEstimator—use it as is or to compute the starting point for a minimum distance estimator which in turn then serves as starting point for roptest / robest (from package ROptEst). If TRUE (default) the latter alternative is used. Ignored if ROptEst is not used.

Details

If name is missing, the default “L2 differentiable parametric family of probability measures” is used. In case `distrSymm` is missing it is set to `NoSymmetry()`. If `param` is missing, the parameter is created via `main`, `nuisance` and `trafo` as described in [ParamFamParameter](#). In case `L2derivSymm` is missing, it is filled with an object of class `FunSymmList` with entries `NonSymmetric()`. In case `L2derivDistr` is missing, it is computed via `imageDistr`. If `L2derivDistrSymm` is missing, it is set to an object of class `DistrSymmList` with entries `NoSymmetry()`. In case `FisherInfo` is missing, it is computed from `L2deriv` using `E`.

Value

Object of class “L2ParamFamily”

Author(s)

L2ParamFamily-class *L2 differentiable parametric family*

Description

Class of L2 differentiable parametric families.

Objects from the Class

Objects can be created by calls of the form `new("L2ParamFamily", ...)`. More frequently they are created via the generating function `L2ParamFamily`.

Slots

- name [inherited from class "ProbFamily"] object of class "character": name of the family.
- distribution [inherited from class "ProbFamily"] object of class "Distribution": member of the family.
- distrSymm [inherited from class "ProbFamily"] object of class "DistributionSymmetry": symmetry of distribution.
- param [inherited from class "ParamFamily"] object of class "ParamFamParameter": parameter of the family.
- fam.call [inherited from class "ParamFamily"] object of class "call": call by which parametric family was produced.
- makeOKPar [inherited from class "ParamFamily"] object of class "function": has argument param — the (total) parameter, returns valid parameter; used if optim resp. optimize— try to use “illegal” parameter values; then makeOKPar makes a valid parameter value out of the illegal one.
- startPar [inherited from class "ParamFamily"] object of class "function": has argument x — the data, returns starting parameter for optim resp. optimize— a starting estimator in case parameter is multivariate or a search interval in case parameter is univariate.
- modifyParam [inherited from class "ParamFamily"] object of class "function": mapping from the parameter space (represented by "param") to the distribution space (represented by "distribution").
- props [inherited from class "ProbFamily"] object of class "character": properties of the family.
- L2deriv object of class "EuclRandVariable": L2 derivative of the family.
- L2deriv.fct object of class "function": mapping from the parameter space (argument param of class "ParamFamParameter") to a mapping from observation x to the value of the L2derivative; L2deriv.fct is then used from observation x to value of the L2derivative; L2deriv.fct is used by modifyModel to move the L2deriv according to a change in the parameter
- L2derivSymm [object of class "FunSymmList": symmetry of the maps included in L2deriv.
- L2derivDistr object of class "OptionalDistrListOrCall" (i.e., NULL or an object of class "DistrList" or the respective call to generate the latter object): if non-null and non-call, a list which includes the distribution of L2deriv.
- L2derivDistrSymm object of class "DistrSymmList": symmetry of the distributions included in L2derivDistr.
- FisherInfo.fct object of class "function": mapping from the parameter space (argument param of class "ParamFamParameter") to the set of positive semidefinite matrices; FisherInfo.fct is used by modifyModel to move the Fisher information according to a change in the parameter
- FisherInfo object of class "PosDefSymmMatrix": Fisher information of the family.
- .withEvalL2derivDistr logical of length one: if TRUE slot L2derivDistr gets evaluated, otherwise it is only kept as call.

Extends

- Class "ParamFamily", directly.
- Class "ProbFamily", by class "ParamFamily".

Methods

L2deriv signature(object = "L2ParamFamily"): accessor function for L2deriv.

L2deriv signature(object = "L2ParamFamily", param = "ParamFamParameter"): returns the L2derivative at param, i.e. evaluates slot function L2deriv.fct at param.

L2derivSymm signature(object = "L2ParamFamily"): accessor function for L2derivSymm.

L2derivDistr signature(object = "L2ParamFamily"): accessor function for L2derivDistr.

L2derivDistrSymm signature(object = "L2ParamFamily"): accessor function for L2derivDistrSymm.

FisherInfo signature(object = "L2ParamFamily"): accessor function for FisherInfo.

FisherInfo signature(object = "L2ParamFamily", param = "ParamFamParameter"): returns the Fisher Information at param, i.e. evaluates slot function FisherInfo.fct at param.

checkL2deriv signature(object = "L2ParamFamily"): check centering of L2deriv and compute precision of Fisher information.

E signature(object = "L2ParamFamily", fun = "EuclRandVariable", cond = "missing"): expectation of fun under the distribution of object.

E signature(object = "L2ParamFamily", fun = "EuclRandMatrix", cond = "missing"): expectation of fun under the distribution of object.

E signature(object = "L2ParamFamily", fun = "EuclRandVarList", cond = "missing"): expectation of fun under the distribution of object.

plot signature(x = "L2ParamFamily"): plot of distribution and L2deriv. More precisely, this method has arguments `plot(x, withSweave = getdistrOption("withSweave"),` `main = F` where

x object of class "L2ParamFamily"

withSweave logical: if TRUE (for working with Sweave) no extra device is opened and height/width are not set

main logical: is a main title to be used? or just as argument main in `plot.default`.

inner logical: do panels have their own titles? or character vector of / cast to length 'number of plotted panels' with the corresponding panel titles. For further information, see also `plot` and the description of argument main in `plot.default`.

sub logical: is a sub-title to be used? or just as argument sub in `plot.default`.

tmar top margin – useful for non-standard main title sizes

bmar bottom margin – useful for non-standard sub title sizes

cex.inner magnification to be used for inner titles relative to the current setting of cex; as in `par`; can be a vector of length 2; in this case the first component is for the distribution panels, the second for the L2-derivative-panels.

col.inner character or integer code; color for the inner title

mfColRow shall default partition in panels be used — defaults to TRUE

to.draw.arg Either NULL (default; everything is plotted) or a vector of either integers (the indices of the subplots to be drawn) or characters — the names of the subplots to be drawn: these names are to be chosen among `c("d", "p", "q", dimnms)` where `dimnms` is either the row names of the trafo matrix `rownames(trafo(x@param))` or if the last

expression is NULL a vector "dim<dimnr>", dimnr running through the number of rows of the trafo matrix.

withSubst logical; if TRUE (default) pattern substitution for titles and labels is used; otherwise no substitution is used.

... additional arguments for plot — see [plot](#), [plot.default](#), [plot.stepfun](#)

If ... contains argument ylim, this may either be as in [plot.default](#) (i.e. a vector of length 2) or a vector of length 4, where the first two elements are the values for ylim in panels "d.c" and "d.d", and the last two elements are the values for ylim resp. xlim in panels "p", "p.c", "p.d" and "q", "q.c", "q.d". In all title and axis label arguments, if withSubst is TRUE, the following patterns are substituted:

"%C" class of argument x

"%A" deparsed argument x

"%D" time/date-string when the plot was generated

In addition, argument ... may contain arguments `panel.first`, `panel.last`, i.e., hook expressions to be evaluated at the very beginning and at the very end of each panel (within the then valid coordinates). To be able to use these hooks for each panel individually, they may also be lists of expressions (of the same length as the number of panels and run through in the same order as the panels).

modifyModel signature(model = "L2ParamFamily", param = "ParamFamParameter"): moves the L2-parametric Family model to parameter param

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>
Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

plot(F2, mfColRow = FALSE,
     to.draw.arg=c("p", "q", "loc"))
plot(F2, mfColRow = FALSE, inner=list("empirical cdf", "pseudo-inverse",
    "L2-deriv, loc.part"), to.draw.arg=c("p", "q", "loc"))
```

L2ScaleFamily

*Generating function for L2ScaleFamily-class***Description**

Generates an object of class "L2ScaleFamily".

Usage

```
L2ScaleFamily(scale = 1, loc = 0, name, centraldistribution = Norm(),
              locscalename = c("loc", "scale"), modParam, LogDeriv,
              L2derivDistr.0, FisherInfo.0, distrSymm, L2derivSymm,
              L2derivDistrSymm, trafo, .returnClsName = NULL)
```

Arguments

scale	positive number: scale parameter of the model
loc	numeric: location parameter of the model
name	character: name of the parametric family.
centraldistribution	object of class "AbscontDistribution": central distribution; we assume from the beginning, that centraldistribution is symmetric about 0
locscalename	a character vector of length 1 or 2 containing the names of the scale resp. of location and scale parameter; if length is 2, locscalename is either unnamed, then order must be c(scale,loc), or named, then names must be "loc" and "scale".
modParam	optional function: mapping from the parameter space (represented by "param") to the distribution space (represented by "distribution").
LogDeriv	function with argument x: the negative logarithmic derivative of the density of the central distribution; if missing, it is determined numerically using numeric differentiation.
L2derivDistr.0	object of class "UnivariateDistribution": distribution of the L2derivative at the central distribution
FisherInfo.0	object of class "PosSemDefSymmMatrix": Fisher information of the model at the "standard" parameter value
distrSymm	object of class "DistributionSymmetry": symmetry of distribution.
L2derivSymm	object of class "FunSymmList": symmetry of the maps contained in L2deriv
L2derivDistrSymm	object of class "DistrSymmList": symmetry of the distributions contained in L2derivDistr
trafo	matrix or function in param: transformation of the parameter

`.returnClsName` the class name of the return value; by default this argument is NULL whereupon the return class will be `L2ScaleFamily`; but, internally, this generating function is also used to produce objects of class `NormScaleFamily`, `ExpScaleFamily`, and `LnormScaleFamily`.

Details

If `name` is missing, the default “L2 scale family” is used. The function `modParam` is optional. If it is missing, it is constructed from `centraldistribution` using the scale structure of the model. Slot `param` is filled accordingly with the argument `trafo` passed to `L2ScaleFamily`. In case `L2derivDistr.0` is missing, `L2derivDistr` is computed via `imageDistr`, else `L2derivDistr` is assigned `L2derivDistr.0`, coerced to “`UnivariateDistributionList`”. In case `FisherInfo.0` is missing, Fisher information is computed from `L2deriv` using `E`. If `distrSymm` is missing, it is set to symmetry about `loc`. If `L2derivSymm` is missing, it is set to no symmetry, and if `L2derivDistrSymm` is missing, it is set to no symmetry.

Value

Object of class “`L2ScaleFamily`”

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>,
Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

`L2ScaleFamily-class` *L2 differentiable parametric group family*

Description

Class of L2 differentiable parametric group families.

Objects from the Class

Objects can be created by calls of the form `new("L2ScaleFamily", ...)`. More frequently they are created via the generating function `L2ScaleFamily`.

Slots

- `name` [inherited from class "ProbFamily"] object of class "character": name of the family.
- `distribution` [inherited from class "ProbFamily"] object of class "Distribution": member of the family.
- `distrSymm` [inherited from class "ProbFamily"] object of class "DistributionSymmetry": symmetry of distribution.
- `param` [inherited from class "ParamFamily"] object of class "ParamFamParameter": parameter of the family.
- `fam.call` [inherited from class "ParamFamily"] object of class "call": call by which parametric family was produced.
- `makeOKPar` [inherited from class "ParamFamily"] object of class "function": has argument `param` — the (total) parameter, returns valid parameter; used if `optim resp. optimize`— try to use "illegal" parameter values; then `makeOKPar` makes a valid parameter value out of the illegal one.
- `startPar` [inherited from class "ParamFamily"] object of class "function": has argument `x` — the data, returns starting parameter for `optim resp. optimize`— a starting estimator in case parameter is multivariate or a search interval in case parameter is univariate.
- `modifyParam` [inherited from class "ParamFamily"] object of class "function": mapping from the parameter space (represented by "param") to the distribution space (represented by "distribution").
- `props` [inherited from class "ProbFamily"] object of class "character": properties of the family.
- `L2deriv` [inherited from class "L2ParamFamily"] object of class "EuclRandVariable": L2 derivative of the family.
- `L2deriv.fct` [inherited from class "L2ParamFamily"] object of class "function": mapping from the parameter space (argument `param` of class "ParamFamParameter") to a mapping from observation `x` to the value of the L2derivative; `L2deriv.fct` is then used from observation `x` to value of the L2derivative; `L2deriv.fct` is used by `modifyModel` to move the `L2deriv` according to a change in the parameter
- `L2derivSymm` [inherited from class "L2ParamFamily"] object of class "FunSymmList": symmetry of the maps included in `L2deriv`.
- `L2derivDistr` [inherited from class "L2ParamFamily"] object of class "UnivarDistrList": list which includes the distribution of `L2deriv`.
- `L2derivDistrSymm` [inherited from class "L2ParamFamily"] object of class "DistrSymmList": symmetry of the distributions included in `L2derivDistr`.
- `FisherInfo.fct` [inherited from class "L2ParamFamily"] object of class "function": mapping from the parameter space (argument `param` of class "ParamFamParameter") to the set of positive semidefinite matrices; `FisherInfo.fct` is used by `modifyModel` to move the Fisher information according to a change in the parameter
- `FisherInfo` [inherited from class "L2ParamFamily"] object of class "PosDefSymmMatrix": Fisher information of the family.

LogDeriv [inherited from class "L2GroupParamFamily"] object of class "function": has argument x; the negative logarithmic derivative of the density of the model distribution at the "standard" parameter value.

locscalename [inherited from class "L2LocationScaleUnion"] object of class "character": names of location and scale parameter

Extends

Class "L2LocationScaleUnion", directly.

Class "L2GroupParamFamily", by class "L2LocationScaleUnion".

Class "L2ParamFamily", by class "L2GroupParamFamily".

Class "ParamFamily", by class "L2ParamFamily".

Class "ProbFamily", by class "ParamFamily".

Methods

modifyModel signature(model = "L2ScaleFamily", param = "ParamFamParameter"): moves the L2-scale family model to parameter param

L2ScaleUnknownLocationFamily

Generating function for L2LocationScaleFamily-class in nuisance situation

Description

Generates an object of class "L2LocationScaleFamily" in the situation where scale is main, location nuisance parameter.

Usage

```
L2ScaleUnknownLocationFamily(loc = 0, scale = 1, name, centraldistribution = Norm(),
                             locscalename = c("loc", "scale"), modParam, LogDeriv,
                             L2derivDistr.0, FisherInfo.0, distrSymm, L2derivSymm,
                             L2derivDistrSymm, trafo, .returnClsName = NULL)
```

Arguments

loc	numeric: location parameter of the model.
scale	positive number: scale of the model.
name	character: name of the parametric family.
centraldistribution	object of class "AbscontDistribution": central distribution; we assume by default, that centraldistribution is symmetric about 0
modParam	optional function: mapping from the parameter space (represented by "param") to the distribution space (represented by "distribution").
locscalename	a character vector of length 2 containing the names of the location and scale parameter; either unnamed, then order must be c(loc, scale), or named, then names must be "loc" and "scale"
LogDeriv	function with argument x: the negative logarithmic derivative of the density of the central distribution; if missing, it is determined numerically using numeric differentiation.
L2derivDistr.0	list of length 2 of objects of class "UnivariateDistribution": (marginal) distributions of the coordinates of the L2derivative at the central distribution
FisherInfo.0	object of class "PosSemDefSymmMatrix": Fisher information of the model at the "standard" parameter value
distrSymm	object of class "DistributionSymmetry": symmetry of distribution.
L2derivSymm	object of class "FunSymmList": symmetry of the maps contained in L2deriv
L2derivDistrSymm	object of class "DistrSymmList": symmetry of the distributions contained in L2derivDistr
trafo	matrix or function in param: transformation of the parameter
.returnClsName	the class name of the return value; by default this argument is NULL whereupon the return class will be L2LocationScaleFamily; but, internally, this generating function is also used to produce objects of class NormalLocationScaleFamily, CauchyLocationScaleFamily.

Details

If name is missing, the default "L2 scale family with unknown location (as nuisance)" is used. The function modParam is optional. If it is missing, it is constructed from centraldistribution using the location and scale structure of the model. Slot param is filled accordingly with the argument trafo passed to L2ScaleUnknownLocationFamily. In case L2derivDistr.0 is missing,

L2derivDistr is computed via imageDistr, else L2derivDistr is assigned L2derivDistr.0, coerced to "UnivariateDistributionList". In case FisherInfo.0 is missing, Fisher information is computed from L2deriv using E. If distrSymm is missing, it is set to symmetry about loc. If L2derivSymm is missing, its location and scale components are set to no symmetry, respectively. If L2derivDistrSymm is missing, its location and scale components are set to no symmetry, respectively.

Value

Object of class "L2LocationScaleFamily"

LnormScaleFamily	<i>Generating function for lognormal scale families</i>
------------------	---

Description

Generates an object of class "L2ScaleFamily" which represents a lognormal scale family.

Usage

```
LnormScaleFamily(meanlog = 0, sdlog = 1, trafo)
```

Arguments

meanlog	mean of the distribution on the log scale
sdlog	standard deviation of the distribution on the log scale
trafo	matrix: transformation of the parameter

Details

The slots of the corresponding L2 differentiable parameteric family are filled.

Value

Object of class "L2ScaleFamily"

mceCalc-methods

Methods for functions mceCalc and mleCalc in Package 'distrMod'

Description

Methods for functions `mceCalc` and `mleCalc` in package **distrMod**;

Usage

```
mceCalc(x, PFam, ...)
mleCalc(x, PFam, ...)
## S4 method for signature 'numeric,ParamFamily'
mceCalc(x, PFam, criterion,
        startPar = NULL, penalty = 1e20, crit.name,
        Infos = NULL, validity.check = TRUE,
        withthetaPar = FALSE,...)
## S4 method for signature 'numeric,ParamFamily'
mleCalc(x, PFam, startPar = NULL,
        penalty = 1e20, dropZeroDensity = TRUE, Infos = NULL,
        validity.check = TRUE, ...)
## S4 method for signature 'numeric,BinomFamily'
```

```

mleCalc(x, PFam, ...)
## S4 method for signature 'numeric,PoisFamily'
mleCalc(x, PFam, ...)
## S4 method for signature 'numeric,NormLocationFamily'
mleCalc(x, PFam, ...)
## S4 method for signature 'numeric,NormScaleFamily'
mleCalc(x, PFam, ...)
## S4 method for signature 'numeric,NormLocationScaleFamily'
mleCalc(x, PFam, ...)

```

Arguments

x	numeric; data at which to evaluate the estimator
PFam	an object of class ParamFamily; the parametric family at which to evaluate the estimator
criterion	a function measuring the “goodness of fit”
startPar	in case <code>optim</code> is used: a starting value for the parameter fit; in case <code>optimize</code> is used: a vector containing a search interval for the (one-dim) parameter
penalty	numeric; penalizes non-permitted parameter values
crit.name	character; the name of the criterion; may be missing
withthetaPar	logical; shall Parameter theta be transmitted?
Infos	matrix; info slot to be filled in object of class MCEstimate; may be missing
validity.check	logical: shall return parameter value be checked for validity?
dropZeroDensity	logical of length 1; shall observations with density zero be dropped? Optimizers like <code>optim</code> require finite values, so get problems when negative loglikelihood is evaluated.
...	additional argument(s) for <code>optim</code> / <code>optimize</code>

Details

`mceCalc` is used internally by function `MCEstimator` to allow for method dispatch according to argument `PFam`; similarly, and for the same purpose `mleCalc` is used internally by function `MLEstimator`. This way we / or any other developer can write particular methods for special cases where we may avoid using numerical optimization without interfering with existing code. For programming one’s own `mleCalc` / `mceCalc` methods, there is the helper function [meRes](#) to produce consistent return values.

Value

a list with components

estimate	— the estimate as a named vector of numeric
criterion	— the criterion value (i.e.; a numeric of length 1); e.g. the neg. log likelihood
est.name	— the name of the estimator
param	— estimate coerced to class ParamFamParameter

crit.fct	— a function with the named components of theta as arguments returning the criterion value; used for profiling / coercing to class mle
method	— a character reporting how the estimate was obtained, i.e., by optim, by optimize or by explicit calculations
crit.name	character; the name of the criterion; may be ""
Infos	matrix; info slot to be filled in object of class MCEstimate; may be NULL
samplesize	numeric; sample size of x

MCEstimate-class	<i>MCEstimate-class.</i>
------------------	--------------------------

Description

Class of minimum criterion estimates.

Objects from the Class

Objects can be created by calls of the form `new("MCEstimate", ...)`. More frequently they are created via the generating functions `MCEstimator`, `MDEstimator` or `MLEstimator`.

Slots

`name` Object of class "character": name of the estimator.

`estimate` Object of class "ANY": estimate.

`estimate.call` Object of class "call": call by which estimate was produced.

`criterion` Object of class "numeric": minimum value of the considered criterion.

`criterion.fct` Object of class "function": the considered criterion function; used for compatibility with class "mle" from package **stats4**; should be a function returning the criterion; i.e. a numeric of length 1 and should have as arguments all named components of argument `untransformed.estimate`

`method` Object of class "character": the method by which the estimate was calculated, i.e.; "optim", "optimize", or "explicit calculation"; used for compatibility with class "mle" from package **stats4**, could be any character value.

`Infos` object of class "matrix" with two columns named `method` and `message`: additional informations.

`optimwarn` object of class "character" warnings issued during optimization.

`startPar` — object of class "ANY"; filled either with NULL (no starting value used) or with "numeric" — the value of the starting parameter.

`asvar` object of class "OptionalMatrix" which may contain the asymptotic (co)variance of the estimator.

`samplesize` object of class "numeric" — the samplesize at which the estimate was evaluated.

`nuis.idx` object of class "OptionalNumeric": indices of estimate belonging to the nuisance part

fixed object of class "OptionalNumeric": the fixed and known part of the parameter.
trafo object of class "list": a list with components fct and mat (see below).
untransformed.estimate Object of class "ANY": untransformed estimate.
untransformed.asvar object of class "OptionalNumericOrMatrix" which may contain the asymptotic (co)variance of the untransformed estimator.
completecases object of class "logical" — complete cases at which the estimate was evaluated.
startPar object of class "ANY"; usually filled with argument startPar of generating function MCEstimator, MLEstimator, MDEstimator.

Extends

Class "Estimate", directly.

Methods

criterion signature(object = "MCEstimate"): accessor function for slot criterion.
criterion<- signature(object = "MCEstimate"): replacement function for slot criterion.
optimwarn signature(object = "MCEstimate"): accessor function for slot optimwarn.
startPar signature(object = "MCEstimate"): accessor function for slot startPar.
criterion.fct signature(object = "MCEstimate"): accessor function for slot criterion.fct.
show signature(object = "Estimate")
coerce signature(from = "MCEstimate", to = "mle"): create a "mle" object from a "MCEstimate" object
profile signature(fitted = "MCEstimate"): coerces fitted to class "mle" and then calls the corresponding [profile](#)-method from package **stats4**; for details we confer to the corresponding man page.

MCEstimator

Function to compute minimum criterion estimates

Description

The function `MCEstimator` provides a general way to compute estimates for a given parametric family of probability measures which can be obtained by minimizing a certain criterion. For instance, the negative log-Likelihood in case of the maximum likelihood estimator or some distance between distributions like in case of minimum distance estimators.

Usage

```

MCEstimator(x, ParamFamily, criterion, crit.name,
            startPar = NULL, Infos, trafo = NULL,
            penalty = 1e20, validity.check = TRUE, asvar.fct, na.rm = TRUE,
            ..., .withEvalAsVar = TRUE)

```

Arguments

<code>x</code>	(empirical) data
<code>ParamFamily</code>	object of class "ParamFamily"
<code>criterion</code>	function: criterion to minimize; see Details section.
<code>crit.name</code>	optional name for criterion.
<code>startPar</code>	initial information used by <code>optimize</code> resp. <code>optim</code> ; i.e; if (total) parameter is of length 1, <code>startPar</code> is a search interval, else it is an initial parameter value; if <code>NULL</code> slot <code>startPar</code> of <code>ParamFamily</code> is used to produce it; in the multivariate case, <code>startPar</code> may also be of class <code>Estimate</code> , in which case slot <code>untransformed.estimate</code> is used.
<code>Infos</code>	character: optional informations about estimator
<code>trafo</code>	an object of class <code>MatrixorFunction</code> – a transformation for the main parameter
<code>penalty</code>	(non-negative) numeric: penalizes non valid parameter-values
<code>validity.check</code>	logical: shall return parameter value be checked for validity? Defaults to <code>yes</code> (<code>TRUE</code>)
<code>asvar.fct</code>	optionally: a function to determine the corresponding asymptotic variance; if given, <code>asvar.fct</code> takes arguments <code>L2Fam</code> (the parametric model as object of class <code>L2ParamFamily</code>) and <code>param</code> (the parameter value as object of class <code>ParamFamParameter</code>); arguments are called by name; <code>asvar.fct</code> may also process further arguments passed through the <code>...</code> argument
<code>na.rm</code>	logical: if <code>TRUE</code> , the estimator is evaluated at <code>complete.cases(x)</code> .
<code>...</code>	further arguments to <code>criterion</code> or <code>optimize</code> or <code>optim</code> , respectively.
<code>.withEvalAsVar</code>	logical: shall slot <code>asVar</code> be evaluated (if <code>asvar.fct</code> is given) or just the call be returned?

Details

The argument `criterion` has to be a function with arguments the empirical data as well as an object of class "Distribution" and possibly Uses `mceCalc` for method dispatch.

Value

An object of S4-class "MCEstimate" which inherits from class "Estimate".

Note

The criterion function may be called together with a parameter `thetaPar` which is the current parameter value under consideration, i.e.; the value under which the model distribution is considered. Hence, if desired, particular criterion functions could make use of this information, by, say computing the criterion differently for different parameter values.

```

MDEstimator

Function to compute minimum distance estimates

Description

The function MDEstimator provides a general way to compute minimum distance estimates.

Usage

```

MDEstimator(x, ParamFamily, distance = KolmogorovDist, dist.name,
            paramDepDist = FALSE, startPar = NULL, Infos, trafo = NULL,
            penalty = 1e20, validity.check = TRUE, asvar.fct, na.rm = TRUE,
            ..., .withEvalAsVar = TRUE)

```

Arguments

x	(empirical) data
ParamFamily	object of class "ParamFamily"
distance	(generic) function: to compute distance between (empirical) data and objects of class "Distribution".
dist.name	optional name of distance
paramDepDist	logical; will computation of distance be parameter dependent (see also note below)? if TRUE, distance function must be able to digest a parameter thetaPar; otherwise this parameter will be eliminated if present in ...-argument.
startPar	initial information used by optimize resp. optim; i.e; if (total) parameter is of length 1, startPar is a search interval, else it is an initial parameter value; if NULL slot startPar of ParamFamily is used to produce it; in the multivariate case, startPar may also be of class Estimate, in which case slot untransformed.estimate is used.
Infos	character: optional informations about estimator

<code>trafo</code>	an object of class <code>MatrixorFunction</code> – a transformation for the main parameter
<code>penalty</code>	(non-negative) numeric: penalizes non valid parameter-values
<code>validity.check</code>	logical: shall return parameter value be checked for validity? Defaults to yes (TRUE)
<code>asvar.fct</code>	optionally: a function to determine the corresponding asymptotic variance; if given, <code>asvar.fct</code> takes arguments <code>L2Fam</code> ((the parametric model as object of class <code>L2ParamFamily</code>)) and <code>param</code> (the parameter value as object of class <code>ParamFamParameter</code>); arguments are called by name; <code>asvar.fct</code> may also process further arguments passed through the ... argument
<code>na.rm</code>	logical: if TRUE, the estimator is evaluated at <code>complete.cases(x)</code> .
...	further arguments to <code>criterion</code> or <code>optimize</code> or <code>optim</code> , respectively.
<code>.withEvalAsVar</code>	logical: shall slot <code>asVar</code> be evaluated (if <code>asvar.fct</code> is given) or just the call be returned?

Details

The argument `distance` has to be a (generic) function with arguments the empirical data as well as an object of class "Distribution" and possibly ...; e.g. `KolmogorovDist` (default), `TotalVarDist` or `HellingerDist`. Uses `mceCalc` for method dispatch.

Value

An object of S4-class "MCEstimate" which inherits from class "Estimate".

Note

The distance function may be called together with a parameter `thetaPar` which is the current parameter value under consideration, i.e.; the value under which the model distribution is considered. Hence, if desired, particular distance functions could make use of this information, by, say computing the distance differently for different parameter values.

```

meRes

helper functions for mceCalc and mleCalc

Description

helper functions to produce consistent lists to be digested in functions [mceCalc](#) and [mleCalc](#)

Usage

```

meRes(x, estimate, criterion.value, param, crit.fct, method = "explicit solution",
      crit.name = "Maximum Likelihood", Infos, warns = "", startPar = NULL)
get.criterion.fct(theta, Data, ParamFam, criterion.ff, fun, ...)
## S4 method for signature 'numeric'
samplesize(object)

```

Arguments

<code>x</code>	numeric; the data at which to evaluate the estimate
<code>estimate</code>	numeric; the estimate
<code>criterion.value</code>	numeric; the value of the criterion
<code>param</code>	object of class <code>ParamFamParameter</code> ; the parameter value
<code>crit.fct</code>	a function to fill slot <code>minuslogl</code> when an object of class <code>MCEstimate</code> is coerced to class <code>mle</code> (from package stats4); to this end function <code>get.criterion.fct</code> (also see details below) is helpful (at least if the dimension of the estimator is larger than 1).
<code>method</code>	character; describes how the estimate was obtained
<code>crit.name</code>	character; name of the criterion
<code>Infos</code>	optional matrix of characters in two columns; information to be attached to the estimate
<code>warns</code>	collected warnings in optimization
<code>samplesize</code>	numeric; the sample size at which the estimator was evaluated
<code>theta</code>	the parameter value as named numeric vector
<code>Data</code>	numeric; the data at which to evaluate the MCE
<code>ParamFam</code>	an object of class <code>ParamFamily</code> ; the parametric family at which to evaluate the MCE
<code>criterion.ff</code>	the criterion function used in the MCE
<code>fun</code>	wrapper to the criterion function used in the MCE (with certain checking whether parameter value is permitted and possibly penalizing if not; see code to , for example.)
<code>startPar</code>	value of argument <code>StartPar</code> — starting parameter used.
<code>...</code>	further arguments to be passed to <code>optim / optimize</code>
<code>object</code>	numeric; the data at which to evaluate the estimate

Details

`get.criterion.fct` produces a function `criterion.fct` to fill slot `minuslogl` when an object of class `MCEstimate` is coerced to class `mle` (from package **stats4**); this way we may use profiling methods introduced there also for objects of our classes. More specifically, we produce a function where all coordinates/components of `theta` appear as separate named arguments, which then calls `fun` with these separate arguments again stacked to one (named) vector argument;

`samplesize` determines the samplesize of argument `object`, i.e.; if `object` has an attribute `dim`, it returns `dim(object)[2]`, else `length(object)`.

Value

<code>meRes</code>	a list of prescribed structure to be digested in functions <code>mceCalc</code> and <code>mleCalc</code> by the internal helper function <code>.process.meCalcRes</code> .
<code>get.criterion.fct</code>	a function; see details below;
<code>samplesize</code>	numeric

Author(s)

Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

MLEstimator

Function to compute maximum likelihood estimates

Description

The function MLEstimator provides a general way to compute maximum likelihood estimates for a given parametric family of probability measures. This is done by calling the function MCEstimator which minimizes the negative log-Likelihood.

Usage

```
MLEstimator(x, ParamFamily, startPar = NULL,
            Infos, trafo = NULL, penalty = 1e20,
            validity.check = TRUE, na.rm = TRUE, ...,
            .withEvalAsVar = TRUE, dropZeroDensity = TRUE)
```

Arguments

x	(empirical) data
ParamFamily	object of class "ParamFamily"
startPar	initial information used by optimize resp. optim; i.e; if (total) parameter is of length 1, startPar is a search interval, else it is an initial parameter value; if NULL slot startPar of ParamFamily is used to produce it; in the multivariate case, startPar may also be of class Estimate, in which case slot untransformed.estimate is used.
Infos	character: optional informations about estimator
trafo	an object of class MatrixorFunction – a transformation for the main parameter
penalty	(non-negative) numeric: penalizes non valid parameter-values
validity.check	logical: shall return parameter value be checked for validity? Defaults to yes (TRUE)
na.rm	logical: if TRUE, the estimator is evaluated at complete.cases(x).
...	further arguments to criterion or optimize or optim, respectively.
.withEvalAsVar	logical: shall slot asVar be evaluated (if asvar.fct is given) or just the call be returned?
dropZeroDensity	logical of length 1; shall observations with density zero be dropped? Optimizers like optim require finite values, so get problems when negative loglikelihood is evaluated.

Details

The function uses `mleCalc` for method dispatch; this method by default calls `mceCalc` using the negative log-likelihood as criterion which should be minimized.

Value

An object of S4-class "MCEstimate" which inherits from class "Estimate".

modifyModel-methods *Methods for function modifyModel in Package 'distrMod'*

Description

Methods for function `modifyModel` in package **distrMod**; `modifyModel` moves a model from one parameter value to another.

Usage

```

modifyModel(model, param, ...)
## S4 method for signature 'ParamFamily,ParamFamParameter'
modifyModel(model,param,
             .withCall = TRUE, ...)
## S4 method for signature 'L2ParamFamily,ParamFamParameter'
modifyModel(model,param,
             .withCall = TRUE, .withL2derivDistr = TRUE, ...)
## S4 method for signature 'L2LocationFamily,ParamFamParameter'
modifyModel(model,param, ...)
## S4 method for signature 'L2ScaleFamily,ParamFamParameter'
modifyModel(model,param, ...)

```

```
## S4 method for signature 'L2LocationScaleFamily,ParamFamParameter'
modifyModel(model,
             param, ...)
## S4 method for signature 'GammaFamily,ParamFamParameter'
modifyModel(model,param, ...)
## S4 method for signature 'ExpScaleFamily,ParamFamParameter'
modifyModel(model,param, ...)
```

Arguments

<code>model</code>	an object of class <code>ParamFamily</code> — the model to move.
<code>param</code>	an object of class <code>ParamFamParameter</code> — the parameter to move to.
<code>.withCall</code>	logical: shall slot <code>fam.call</code> be updated?
<code>.withL2derivDistr</code>	logical: shall slot <code>L2derivDistr</code> be updated or just the call to do the updated be stored?
<code>...</code>	additional argument(s) for methods; not used so far

Details

`modifyModel` is merely used internally for moving the model along modified parameter values during a model fit.

It generally simply copies the original model and only modifies the affected slots, i.e. `distribution`, the distribution of the observations, `param`, the parameter, `L2deriv`, the L2-derivative at the parameter, `L2FisherInfo`, the Fisher information at the parameter, the symmetry slots `distrSymm`, `L2derivSymm`, and `L2derivDistrSymm`, and, finally, `L2derivDistr` the (marginal) distribution(s) of the L2derivative. By default, also slot `fam.call` is updated.

In case `model` is of class `L2LocationFamily`, `L2ScaleFamily`, or `L2LocationScaleFamily`, symmetry slots are updated to be centered about the median of the (central) distribution (assuming the latter is symmetric about the median); as an intermediate step, these methods call the general `modifyModel`-method for signature `L2ParamFamily`; in this call, however, slot `fam.call` is not updated (this is the reason for argument `.withCall`); this is then done in the individual parts of the corresponding method.

Value

a corresponding instance of the model in argument `model` with moved parameters.

NbinomFamily

Generating function for Nbinomial families

Description

Generates an object of class "L2ParamFamily" which represents a Nbinomial family where the probability of success is the parameter of interest.

Usage

```
NbinomFamily(size = 1, prob = 0.5, trafo)
NbinomwithSizeFamily(size = 1, prob = 0.5, trafo, withL2derivDistr = TRUE)
NbinomMeanSizeFamily(size = 1, mean = 0.5, trafo, withL2derivDistr = TRUE )
```

Arguments

size	number of trials
prob	probability of success
mean	alternative parameter for negative binomial parameter
trafo	function in param or matrix: transformation of the parameter
withL2derivDistr	logical: shall the distribution of the L2 derivative be computed? Defaults to TRUE; setting it to FALSE speeds up computations.

Details

The slots of the corresponding L2 differentiable parameteric family are filled. NbinomFamily assumes size to be known; while for NbinomwithSizeFamily it is a second (unknown) parameter; for NbinomMeanSizeFamily is like NbinomwithSizeFamily but uses the size,mean parametrization instead of the size,prob one.

Value

Object of class "L2ParamFamily"

Author(s)

Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

norm

Norm functions

Description

Functions to determine certain norms.

Usage

```
EuclideanNorm(x)  
QuadFormNorm(x,A)
```

Arguments

x	vector or matrix; norm is determined columnwise
A	pos. semidefinite Matrix

Value

the columnwise evaluated norms

Author(s)

Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

}
```

OddSymmetric-class *Class for Odd Functions*

Description

Class for odd functions.

Objects from the Class

Objects can be created by calls of the form `new("OddSymmetric")`. More frequently they are created via the generating function `OddSymmetric`.

Slots

type Object of class "character": contains "odd function"
 SymmCenter Object of class "numeric": center of symmetry

Extends

Class "FunctionSymmetry", directly.
 Class "Symmetry", by class "FunctionSymmetry".

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[OddSymmetric](#), [FunctionSymmetry-class](#)

Examples

```
new("OddSymmetric")
```

onesidedBias-class *onesided Bias Type*

Description

Class of onesided bias types.

Objects from the Class

Objects can be created by calls of the form `new("onesidedBias", ...)`. More frequently they are created via the generating function `positiveBias` or `negativeBias`.

Slots

name Object of class "character".
 sign Object of class "numeric"; to be in $\{-1,1\}$ — whether bias is to be positive or negative

Methods

sign signature(object = "onesidedBias"): accessor function for slot sign.
sign<- signature(object = "onesidedBias", value = "numeric"): replacement function for slot sign.

Extends

Class "BiasType", directly.

Author(s)

Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

Examples

```
positiveBias()
## The function is currently defined as
function(){ new("onesidedBias", name = "positive Bias", sign = 1) }

negativeBias()
## The function is currently defined as
function(){ new("onesidedBias", name = "negative Bias", sign = -1) }

pB <- positiveBias()
sign(pB)
try(sign(pB) <- -2) ## error
sign(pB) <- -1
```

ParamFamily

Generating function for ParamFamily-class

Description

Generates an object of class "ParamFamily".

Usage

```
ParamFamily(name, distribution = Norm(), distrSymm, modifyParam,
            main = main(param), nuisance = nuisance(param),
            fixed = fixed(param), trafo = trafo(param),
            param = ParamFamParameter(name = paste("Parameter of",
                                                    name), main = main, nuisance = nuisance,
                                       fixed = fixed, trafo = trafo),
            props = character(0),
            startPar = NULL, makeOKPar = NULL)
```

Arguments

name	character string: name of family
distribution	object of class "Distribution": member of the family
distrSymm	object of class "DistributionSymmetry": symmetry of distribution.
startPar	startPar is a function in the observations x returning initial information for MCEstimator used by optimize resp. optim; i.e. if (total) parameter is of length 1, startPar returns a search interval, else it returns an initial parameter value.
makeOKPar	makeOKPar is a function in the (total) parameter param; used if optim resp. optimize— try to use "illegal" parameter values; then makeOKPar makes a valid parameter value out of the illegal one; if NULL slot makeOKPar of ParamFamily is used to produce it.
main	numeric vector: main parameter
nuisance	numeric vector: nuisance parameter
fixed	numeric vector: fixed part of the parameter
trafo	function in param or matrix: transformation of the parameter
param	object of class "ParamFamParameter": parameter of the family
modifyParam	function: mapping from the parameter space (represented by "param") to the distribution space (represented by "distribution").
props	character vector: properties of the family

Details

If name is missing, the default "'parametric family of probability measures'" is used. In case distrSymm is missing it is set to NoSymmetry(). If param is missing, the parameter is created via main, nuisance and trafo as described in [ParamFamParameter](#). One has to specify a function which represents a mapping from the parameter space to the corresponding distribution space; e.g., in case of normal location a simple version of such a function would be `function(theta){ Norm(mean = theta) }`.

Value

Object of class "ParamFamily"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>,
Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

```

ParamFamily-class *Parametric family of probability measures.*

Description

Class of parametric families of probability measures.

Objects from the Class

Objects can be created by calls of the form `new("ParamFamily", ...)`. More frequently they are created via the generating function `ParamFamily`.

Slots

`name` [inherited from class "ProbFamily"] object of class "character": name of the family.
`distribution` [inherited from class "ProbFamily"] object of class "Distribution": member of the family.
`distrSymm` [inherited from class "ProbFamily"] object of class "DistributionSymmetry": symmetry of distribution.

param object of class "ParamFamParameter": parameter of the family.
fam.call object of class "call": call by which parametric family was produced.
makeOKPar object of class "function": has argument `param` — the (total) parameter, returns valid parameter; used if `optim resp. optimize`— try to use “illegal” parameter values; then `makeOKPar` makes a valid parameter value out of the illegal one.
startPar object of class "function": has argument `x` — the data, returns starting parameter for `optim resp. optimize`— a starting estimator in case parameter is multivariate or a search interval in case parameter is univariate.
modifyParam object of class "function": mapping from the parameter space (represented by "param") to the distribution space (represented by "distribution").
props [inherited from class "ProbFamily"] object of class "character": properties of the family.
.withMDE object of class "logical" (of length 1): Tells R how to use the function from slot `startPar` in case of a `kStepEstimator` — use it as is or to compute the starting point for a minimum distance estimator which in turn then serves as starting point for `roptest / robest` (from package **R`OptEst`**). If TRUE (default) the latter alternative is used. Ignored if **R`OptEst`** is not used.
.withEvalAsVar object of class "logical" (of length 1): Tells R whether in determining `kStepEstimators` one evaluates the asymptotic variance or just produces a call to do so.

Extends

Class "ProbFamily", directly.

Methods

main signature(object = "ParamFamily"): wrapped accessor function for slot `main` of slot `param`.
nuisance signature(object = "ParamFamily"): wrapped accessor function for slot `nuisance` of slot `param`.
fixed signature(object = "ParamFamily"): wrapped accessor function for slot `fixed` of slot `param`.
trafo signature(object = "ParamFamily", param = "missing"): wrapped accessor function for slot `trafo` of slot `param`.
param signature(object = "ParamFamily"): accessor function for slot `param`.
modifyParam signature(object = "ParamFamily"): accessor function for slot `modifyParam`.
fam.call signature(object = "ParamFamily"): accessor function for slot `fam.call`.
plot signature(x = "ParamFamily"): plot of slot `distribution`.
show signature(object = "ParamFamily")

Details for methods 'show', 'print'

Detailedness of output by methods `show`, `print` is controlled by the global option `show.details` to be set by [distrModoptions](#).

As method `show` is used when inspecting an object by typing the object's name into the console, `show` comes without extra arguments and hence detailedness must be controlled by global options.

Method `print` may be called with a (partially matched) argument `show.details`, and then the global option is temporarily set to this value.

For class `ParamFamily`, this becomes relevant for slot `param`. For details therefore confer to [ParamFamParameter-class](#).

ParamFamParameter *Generating function for ParamFamParameter-class*

Description

Generates an object of class "ParamFamParameter".

Usage

```
ParamFamParameter(name, main = numeric(0), nuisance, fixed, trafo,
  ..., .returnClsName = NULL)
```

Arguments

<code>name</code>	(optional) character string: name of parameter
<code>main</code>	numeric vector: main parameter
<code>nuisance</code>	(optional) numeric vector: nuisance parameter
<code>fixed</code>	(optional) numeric vector: fixed part of the parameter
<code>trafo</code>	(optional) <code>MatrixorFunction</code> : transformation of the parameter
<code>...</code>	(optional) additional arguments for further return classes, e.g. <code>withPosRestr</code> (only use case so far) for class <code>ParamWithShapeFamParameter</code>
<code>.returnClsName</code>	character or <code>NULL</code> ; if non-null, the generated object will be of class <code>.returnClsName</code> , which must be a subclass of <code>ParamFamParameter</code> .

Details

If name is missing, the default “parameter of a parametric family of probability measures” is used. If nuisance is missing, the nuisance parameter is set to NULL. The number of columns of trafo have to be equal and the number of rows have to be not larger than the sum of the lengths of main and nuisance. If trafo is missing, no transformation to the parameter is applied; i.e., trafo is set to an identity matrix.

Value

Object of class "ParamFamParameter" (or, if non-null, of class .returnClsName)

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>
Peter Ruckdeschel <peter.ruckdeschel@uni-oldenburg.de>

[ParamFamParameter-class](#)

Examples

```
ParamFamParameter(main = 0, nuisance = 1, fixed = 2,
  trafo = function(x) list(fval = sin(x),
    mat = matrix(cos(x),1,1))
)
```

ParamFamParameter-class

Parameter of a parametric family of probability measures

Description

Class of the parameter of parametric families of probability measures.

Objects from the Class

Objects can be created by calls of the form `new("ParamFamParameter", ...)`. More frequently they are created via the generating function `ParamFamParameter`.

Slots

main Object of class "numeric": main parameter.
 nuisance Object of class "OptionalNumeric": optional nuisance parameter.
 fixed Object of class "OptionalNumeric": optional fixed part of the parameter.
 trafo Object of class "MatrixorFunction": transformation of the parameter.

name Object of class "character": name of the parameter.
withPosRestr (for ParamWithShapeFamParameter and ParamWithScaleAndShapeFamParameter):
 Object of class "logical": Is shape restricted to be positive?

Extends

Class "Parameter", directly.
 Class "OptionalParameter", by class "Parameter".

Methods

main signature(object = "ParamFamParameter"): accessor function for slot main.
main<- signature(object = "ParamFamParameter"): replacement function for slot main.
nuisance signature(object = "ParamFamParameter"): accessor function for slot nuisance.
nuisance<- signature(object = "ParamFamParameter"): replacement function for slot nuisance.
fixed signature(object = "ParamFamParameter"): accessor function for slot fixed.
fixed<- signature(object = "ParamFamParameter"): replacement function for slot fixed.
trafo signature(object = "ParamFamParameter"): accessor function for slot trafo.
trafo<- signature(object = "ParamFamParameter"): replacement function for slot trafo.
length signature(x = "ParamFamParameter"): sum of the lengths of main and nuisance.
dimension signature(x = "ParamFamParameter"): length of main.
withPosRestr signature(object = "ParamWithShapeFamParameter"): accessor function for slot trafo.
withPosRestr<- signature(object = "ParamWithShapeFamParameter"): replacement function for slot trafo.
show signature(object = "ParamFamParameter")
show signature(object = "ParamWithShapeFamParameter")
show signature(object = "ParamWithScaleAndShapeFamParameter")

Details for methods 'show', 'print'

Detailedness of output by methods show, print is controlled by the global option show.details to be set by [distrModoptions](#).

As method show is used when inspecting an object by typing the object's name into the console, show comes without extra arguments and hence detailedness must be controlled by global options.

Method print may be called with a (partially matched) argument show.details, and then the global option is temporarily set to this value.

More specifically, when show.detail is matched to "minimal" only class and name as well as main and nuisance part of the parameter are shown. When show.detail is matched to "medium", and if you estimate non-trivial (i.e. not the identity) transformation of the parameter of the parametric family, you will in addition be shown the derivative matrix, if the transformation is given in form of this matrix, while, if the transformation is in function form, you will only be told this. Finally, when show.detail is matched to "maximal", and you have a non-trivial transformation in function form, you will also be shown the code to this function.

PoisFamily

Generating function for Poisson families

Description

Generates an object of class "L2ParamFamily" which represents a Poisson family.

Usage

```
PoisFamily(lambda = 1, trafo)
```

Arguments

lambda	positive mean
trafo	function in param or matrix: transformation of the parameter

Details

The slots of the corresponding L2 differentiable parameteric family are filled.

Value

Object of class "L2ParamFamily"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[onesidedBias-class](#)

Examples

```
positiveBias()

## The function is currently defined as
function(){ new("onesidedBias", name = "positive Bias", sign = 1) }
```

Description

Methods for print to the S4 classes in package **distrMod**;

Usage

```
## S4 method for signature 'ShowDetails'
print(x, digits = getOption("digits"),
      show.details = c("maximal", "minimal", "medium"))
```

Arguments

<code>x</code>	object of class ShowDetails, a class union of classes OptionalNumeric, OptionalMatrix, MatrixorFunction, Estimate, MCEstimate.
<code>digits</code>	unchanged w.r.t. default method of package base: a non-null value for 'digits' specifies the minimum number of significant digits to be printed in values. The default, 'NULL', uses 'getOption(digits)'. (For the interpretation for complex numbers see 'signif'.) Non-integer values will be rounded down, and only values greater than or equal to 1 and no greater than 22 are accepted.
<code>show.details</code>	a character, controlling the degree of detailedness of the output; currently the following values are permitted: "maximal", "minimal", "medium"; for the meaning for the actual class, confer to the corresponding class help file.

Details

This method provides sort of a "show with extra arguments", in form of a common print method for the mentioned S4 classes. Essentially this print method just temporarily sets the global options according to the optional arguments `digits` and `show.details`, calls `show` and then re-sets the options to their global settings.

Examples

```
## set options to maximal detailedness
show.old <- getdistrModOption("show.details")
distrModoptions("show.details" = "maximal")
## define a model
NS <- NormLocationScaleFamily(mean=2, sd=3)
## generate data out of this situation
x <- r(distribution(NS))(30)

## want to estimate mu/sigma, sigma^2
## -> new trafo slot:
trafo(NS) <- function(param){
  mu <- param["mean"]
  sd <- param["sd"]
```

```

fval <- c(mu/sd, sd^2)
nfval <- c("mu/sig", "sig^2")
names(fval) <- nfval
mat <- matrix(c(1/sd,0,-mu/sd^2,2*sd),2,2)
dimnames(mat) <- list(nfval,c("mean","sd"))
return(list(fval=fval, mat=mat))
}
print(param(NS))
print(param(NS), show.details = "minimal")
print(param(NS), show.details = "medium")
## Maximum likelihood estimator
res <- MLEstimator(x = x, ParamFamily = NS)
print(res) #equivalent to 'show(res)' or 'res'
print(res, digits = 4)
print(res, show.details = "minimal")
print(res, show.details = "medium")
distrModoptions("show.details" = show.old)

```

ProbFamily-class *Family of probability measures*

Description

Class of families of probability measures.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

name Object of class "character": name of the family.
distribution Object of class "Distribution": member of the family.
distrSymm Object of class "DistributionSymmetry": symmetry of distribution.
props Object of class "character": properties of the family.

Methods

name signature(object = "ProbFamily"): accessor function for slot name.
name<- signature(object = "ProbFamily"): replacement function for slot name.
distribution signature(object = "ProbFamily"): accessor function for slot distribution.
distrSymm signature(object = "ProbFamily"): accessor function for slot distrSymm.
props signature(object = "ProbFamily"): accessor function for slot props.
props<- signature(object = "ProbFamily"): replacement function for slot props.
addProp<- signature(object = "ProbFamily"): add a property to slot props.
r signature(object = "ProbFamily"): wrapped accessor to slot r of slot "Distribution".

d signature(object = "ProbFamily"): wrapped accessor to slot d of slot "Distribution".
p signature(object = "ProbFamily"): wrapped accessor to slot p of slot "Distribution".
q signature(object = "ProbFamily"): wrapped accessor to slot q of slot "Distribution".

QFNorm-class

Norm classes for norms based on quadratic forms

Description

Classes for norms based on quadratic forms

Objects from the Class

could be created by a call to new, but normally one would use the generating functions QFNorm, InfoNorm, and SelfNorm

Slots

name Object of class "character".
 fct Object of class "function".
 QuadForm Object of class "PosSemDefSymmMatrix".

Extends

"QFNorm" extends class "NormType", directly, and "InfoNorm" and "SelfNorm" each extend class "QFNorm", directly (and do not have extra slots).

Methods

QuadForm signature(object = "QFNorm"): accessor function for slot QuadForm.
QuadForm<- signature(object = "QFNorm"): replacement function for slot QuadForm.

qqplot

*Methods for Function qqplot in Package 'distrMod'***Description**

We generalize function `qqplot` from package `stats` to be applicable to distribution and probability model objects, as well as to estimate objects. In this context, `qqplot` produces a QQ plot of data (argument `x`) against a (model) distribution. If the second argument is of class `'Estimate'`, `qqplot` looks at the `estimate.call`-slot and checks whether it can use an argument `ParamFamily` to conclude on the model distribution. Graphical parameters may be given as arguments to `qqplot`. In all title and label arguments, if `withSubst` is `TRUE`, the following patterns are substituted:

```
"%C" class of argument x
"%A" deparsed argument x
"%D" time/date-string when the plot was generated
```

Usage

```
qqplot(x, y, ...)
## S4 method for signature 'ANY,UnivariateDistribution'
qqplot(x,y,
  n = length(x), withIdLine = TRUE,
  withConf = TRUE, withConf.pw = withConf, withConf.sim = withConf,
  plot.it = TRUE, datax = FALSE, xlab = deparse(substitute(x)),
  ylab = deparse(substitute(y)),
  ..., width = 10, height = 5.5, withSweave = getdistrOption("withSweave"),
  mfColRow = TRUE, n.CI = n, withLab = FALSE, lab.pts = NULL, which.lbs = NULL,
  which.Order = NULL, order.traf = NULL,
  col.IdL = "red", lty.IdL = 2, lwd.IdL = 2, alpha.CI = .95,
  exact.pCI = (n<100), exact.sCI = (n<100), nosym.pCI = FALSE,
  col.pCI = "orange", lty.pCI = 3, lwd.pCI = 2, pch.pCI = par("pch"),
  cex.pCI = par("cex"),
  col.sCI = "tomato2", lty.sCI = 4, lwd.sCI = 2, pch.sCI = par("pch"),
  cex.sCI = par("cex"), added.points.CI = TRUE,
  cex.pch = par("cex"), col.pch = par("col"),
  cex.lbl = par("cex"), col.lbl = par("col"), adj.lbl = par("adj"),
  alpha.trsp = NA, jit.fac = 0, jit.tol = .Machine$double.eps,
  check.NotInSupport = TRUE, col.NotInSupport = "red",
  with.legend = TRUE, legend.bg = "white",
  legend.pos = "topleft", legend.cex = 0.8,
  legend.pref = "", legend.postf = "", legend.alpha = alpha.CI,
  debug = FALSE, withSubst = TRUE)
## S4 method for signature 'ANY,ProbFamily'
```

```

qqplot(x, y,
  n = length(x), withIdLine = TRUE, withConf = TRUE,
  withConf.pw = withConf, withConf.sim = withConf,
  plot.it = TRUE, xlab = deparse(substitute(x)),
  ylab = deparse(substitute(y)), ...)
## S4 method for signature 'ANY,Estimate'
qqplot(x, y,
  n = length(x), withIdLine = TRUE, withConf = TRUE,
  withConf.pw = withConf, withConf.sim = withConf,
  plot.it = TRUE, xlab = deparse(substitute(x)),
  ylab = deparse(substitute(y)), ...)

```

Arguments

<code>x</code>	data to be checked for compatibility with distribution/model <code>y</code> .
<code>y</code>	object of class "UnivariateDistribution" or of class "ProbFamily".
<code>n</code>	numeric; assumed sample size (by default length of <code>x</code>).
<code>withIdLine</code>	logical; shall line $y = x$ be plotted in?
<code>withConf</code>	logical; shall confidence lines be plotted?
<code>withConf.pw</code>	logical; shall pointwise confidence lines be plotted?
<code>withConf.sim</code>	logical; shall simultaneous confidence lines be plotted?
<code>plot.it</code>	logical; shall be plotted at all (inherited from qqplot)?
<code>datax</code>	logical; shall data be plotted on x-axis?
<code>xlab</code>	x-label
<code>ylab</code>	y-label
<code>...</code>	further parameters for method <code>qqplot</code> with signature <code>ANY, UnivariateDistribution</code> or with function <code>plot</code>
<code>width</code>	width (in inches) of the graphics device opened
<code>height</code>	height (in inches) of the graphics device opened
<code>withSweave</code>	logical: if TRUE (for working with Sweave) no extra device is opened and height/width are not set
<code>mfColRow</code>	shall default partition in panels be used — defaults to TRUE
<code>n.CI</code>	numeric; number of points to be used for confidence interval
<code>withLab</code>	logical; shall observation labels be plotted in?
<code>lab.pt</code>	character or NULL; observation labels to be used
<code>which.lbs</code>	integer or NULL; which observations shall be labelled
<code>which.Order</code>	integer or NULL; which of the ordered (remaining) observations shall be labelled
<code>order.traf</code>	function or NULL; an optional trafo by which the observations are ordered (as <code>order(trafo(obs))</code>).
<code>col.IdL</code>	color for the identity line
<code>lty.IdL</code>	line type for the identity line

<code>lwd.IdL</code>	line width for the identity line
<code>alpha.CI</code>	confidence level
<code>exact.pCI</code>	logical; shall pointwise CIs be determined with exact Binomial distribution?
<code>exact.sCI</code>	logical; shall simultaneous CIs be determined with exact Kolmogorov distribution?
<code>nosym.pCI</code>	logical; shall we use (shortest) asymmetric CIs?
<code>col.pCI</code>	color for the pointwise CI
<code>lty.pCI</code>	line type for the pointwise CI
<code>lwd.pCI</code>	line width for the pointwise CI
<code>pch.pCI</code>	symbol for points (for discrete mass points) in pointwise CI
<code>cex.pCI</code>	magnification factor for points (for discrete mass points) in pointwise CI
<code>col.sCI</code>	color for the simultaneous CI
<code>lty.sCI</code>	line type for the simultaneous CI
<code>lwd.sCI</code>	line width for the simultaneous CI
<code>pch.sCI</code>	symbol for points (for discrete mass points) in simultaneous CI
<code>cex.sCI</code>	magnification factor for points (for discrete mass points) in simultaneous CI
<code>added.points.CI</code>	logical; should CIs be plotted through additional points (and not only through data points)?
<code>cex.pch</code>	magnification factor for the plotted symbols
<code>col.pch</code>	color for the plotted symbols
<code>cex.lbl</code>	magnification factor for the plotted observation labels
<code>col.lbl</code>	color for the plotted observation labels
<code>adj.lbl</code>	adj parameter for the plotted observation labels
<code>alpha.trsp</code>	alpha transparency to be added ex post to colors <code>col.pch</code> and <code>col.lbl</code> ; if one-dim and NA all colors are left unchanged. Otherwise, with usual recycling rules <code>alpha.trsp</code> gets shorted/prolongated to length the data-symbols to be plotted. Coordinates of this vector <code>alpha.trsp</code> with NA are left unchanged, while for the remaining ones, the alpha channel in rgb space is set to the respective coordinate value of <code>alpha.trsp</code> . The non-NA entries must be integers in [0,255] (0 invisible, 255 opaque).
<code>jit.fac</code>	jittering factor used for discrete distributions.
<code>jit.tol</code>	threshold for jittering: if distance between points is smaller than <code>jit.tol</code> , points are considered replicates.
<code>check.NotInSupport</code>	logical; shall we check if all x-quantiles lie in support(y)?
<code>col.NotInSupport</code>	logical; if preceding check TRUE color of x-quantiles if not in support(y)
<code>with.legend</code>	logical; shall a legend be plotted?
<code>legend.bg</code>	background color for the legend

legend.pos	position for the legend
legend.cex	magnification factor for the legend
legend.pref	character to be prepended to legend text
legend.postf	character to be appended to legend text
legend.alpha	nominal coverage probability
debug	logical; if TRUE additional output to debug confidence bounds.
withSubst	logical; if TRUE (default) pattern substitution for titles and axis labels is used; otherwise no substitution is used.

Details

qqplot signature(x = "ANY", y = "UnivariateDistribution"): produces a QQ plot of a dataset x against the theoretical quantiles of distribution y.

qqplot signature(x = "ANY", y = "ProbFamily"): produces a QQ plot of a dataset x against the theoretical quantiles of the model distribution of model y. Passed through the ... argument, all arguments valid for signature(x = "ANY", y = "UnivariateDistribution") are also valid for this signature.

qqplot signature(x = "ANY", y = "Estimate"): produces a QQ plot of a dataset x against the theoretical quantiles of the model distribution of the model that can be reconstructed from the estimator y; more specifically, it tries to get hand at the argument 'ParamFamily' of the estimator's call; if this is available, internally this model is shifted to the estimated parameter by a call to modifyModel, and then this shifted model is used in a call to the (x = "ANY", y = "UnivariateDistribution")-method. Passed through the ... argument, all arguments valid for signature(x = "ANY", y = "UnivariateDistribution") are also valid for this signature.

Value

A list of elements containing the information needed to compute the respective QQ plot, in particular it extends the elements of the return value of function `qqplot` from package `stats`, i.e., a list with components `x` and `y` for x and y coordinates of the plotted points; this list is of S3 class `c("qqplotInfo", "DiagnInfo")`, and more specifically it contains

x	The x coordinates of the points that were/would be plotted
y	The corresponding quantiles of the second distribution, <i>including NAs</i> .
xy.0	xy
y.0	y
datax	argument <code>datax</code> from the call.
withConf.pw	argument <code>withConf.pw</code> from the call.
withConf.sim	argument <code>withConf.sim</code> from the call.
alpha.CI	argument <code>alpha.CI</code> from the call.
col.pCI	argument <code>col.pCI</code> from the call.
lty.pCI	argument <code>lty.pCI</code> from the call.
lwd.pCI	argument <code>lwd.pCI</code> from the call.

pch.pCI	argument pch.pCI from the call.
cex.pCI	argument cex.pCI from the call.
col.sCI	argument col.sCI from the call.
lty.sCI	argument lty.sCI from the call.
lwd.sCI	argument lwd.sCI from the call.
pch.sCI	argument pch.sCI from the call.
cex.sCI	argument cex.sCI from the call.
n	argument n from the call.
exact.sCI	argument exact.sCI from the call.
exact.pCI	argument exact.pCI from the call.
nosym.pCI	argument nosym.pCI from the call.
with.legend	argument with.legend from the call.
legend.bg	argument legend.bg from the call.
legend.pos	argument legend.pos from the call.
legend.cex	argument legend.cex from the call.
legend.pref	argument legend.pref from the call.
legend.postf	argument legend.postf from the call.
legend.alpha	argument legend.alpha from the call.
debug	argument debug from the call.
args.stats.qqplot	the arguments of the call to mcl from the call.
withLab	argument withLab from the call to stats::qqplot from within this QQ plot method.
lbprep	the return value of the label preparation from within this function, i.e., a list with elements x0, y0, lab, col, cex, adj.
crit	A matrix with the lower and upper confidence bounds (computed by qqbounds).
err	logical vector of length 2.

(elements `crit` and `err` are taken from the return value(s) of `qqbounds`).

qqplot(x, mLE)

```

returnlevelplot

*Methods for Function returnlevelplot in Package 'distrMod'***Description**

We generalize the return level plot (which is one of the diagnostical plots provided package **ismev**, e.g., in function `gev.diag`), see also Coles' book below, to be applicable to distribution and probability model objects. In this context, `returnlevelplot` produces a rescaled QQ plot of data (argument `x`) against a (model) distribution. Graphical parameters may be given as arguments to `returnlevelplot`. In all title and label arguments, if `withSubst` is `TRUE`, the following patterns are substituted:

```

"%C" class of argument x
"%A" deparsed argument x
"%D" time/date-string when the plot was generated

```

Usage

```

returnlevelplot(x, y, ...)

    debug = FALSE, withSubst = TRUE)
## S4 method for signature 'ANY,ProbFamily'
returnlevelplot(x, y,
  n = length(x), withIdLine = TRUE, withConf = TRUE,
  withConf.pw = withConf, withConf.sim = withConf,
  plot.it = TRUE, xlab = deparse(substitute(x)),
  ylab = deparse(substitute(y)), ...)
## S4 method for signature 'ANY,Estimate'
returnlevelplot(x, y,
  n = length(x), withIdLine = TRUE, withConf = TRUE,
  withConf.pw = withConf, withConf.sim = withConf,
  plot.it = TRUE, xlab = deparse(substitute(x)),
  ylab = deparse(substitute(y)), ...)

```

Arguments

<code>x</code>	data to be checked for compatibility with distribution/model <code>y</code> .
<code>y</code>	object of class "UnivariateDistribution" or of class "ProbFamily".
<code>n</code>	numeric; assumed sample size (by default length of <code>x</code>).
<code>withIdLine</code>	logical; shall line $y = x$ be plotted in?
<code>withConf</code>	logical; shall confidence lines be plotted?
<code>withConf.pw</code>	logical; shall pointwise confidence lines be plotted?
<code>withConf.sim</code>	logical; shall simultaneous confidence lines be plotted?
<code>plot.it</code>	logical; shall be plotted at all (inherited from returnlevelplot)?
<code>datax</code>	logical; shall data be plotted on x-axis?
<code>MaxOrPOT</code>	a character string specifying whether it is used for block maxima ("Max") or for points over threshold ("POT"); must be one of "Max" (default) or "POT". You can specify just the initial letter.
<code>npv</code>	number of observations per year/block.
<code>threshold</code>	numerical; in case of <code>MaxOrPot=="POT"</code> , this captures the (removed) threshold. If it is NA, it is reconstructed from the distribution <code>y</code> .
<code>main</code>	Main title
<code>xlab</code>	x-label
<code>ylab</code>	y-label
<code>...</code>	further parameters for method <code>returnlevelplot</code> with signature <code>ANY,UnivariateDistribution</code> or with function <code>plot</code>
<code>width</code>	width (in inches) of the graphics device opened

<code>height</code>	height (in inches) of the graphics device opened
<code>withSweave</code>	logical: if TRUE (for working with Sweave) no extra device is opened and height/width are not set
<code>mfColRow</code>	shall default partition in panels be used — defaults to TRUE
<code>n.CI</code>	numeric; number of points to be used for confidence interval
<code>withLab</code>	logical; shall observation labels be plotted in?
<code>lab.pt</code>	character or NULL; observation labels to be used
<code>which.lbs</code>	integer or NULL; which observations shall be labelled
<code>which.Order</code>	integer or NULL; which of the ordered (remaining) observations shall be labelled
<code>order.traf</code>	function or NULL; an optional trafo by which the observations are ordered (as <code>order(trafo(obs))</code>).
<code>col.IdL</code>	color for the identity line
<code>lty.IdL</code>	line type for the identity line
<code>lwd.IdL</code>	line width for the identity line
<code>alpha.CI</code>	confidence level
<code>exact.pCI</code>	logical; shall pointwise CIs be determined with exact Binomial distribution?
<code>exact.sCI</code>	logical; shall simultaneous CIs be determined with exact Kolmogorov distribution?
<code>nosym.pCI</code>	logical; shall we use (shortest) asymmetric CIs?
<code>col.pCI</code>	color for the pointwise CI
<code>lty.pCI</code>	line type for the pointwise CI
<code>lwd.pCI</code>	line width for the pointwise CI
<code>pch.pCI</code>	symbol for points (for discrete mass points) in pointwise CI
<code>cex.pCI</code>	magnification factor for points (for discrete mass points) in pointwise CI
<code>col.sCI</code>	color for the simultaneous CI
<code>lty.sCI</code>	line type for the simultaneous CI
<code>lwd.sCI</code>	line width for the simultaneous CI
<code>pch.sCI</code>	symbol for points (for discrete mass points) in simultaneous CI
<code>cex.sCI</code>	magnification factor for points (for discrete mass points) in simultaneous CI
<code>added.points.CI</code>	logical; should CIs be plotted through additional points (and not only through data points)?
<code>cex.pch</code>	magnification factor for the plotted symbols
<code>col.pch</code>	color for the plotted symbols
<code>cex.lbl</code>	magnification factor for the plotted observation labels
<code>col.lbl</code>	color for the plotted observation labels
<code>adj.lbl</code>	adj parameter for the plotted observation labels

<code>alpha.trsp</code>	alpha transparency to be added ex post to colors <code>col.pch</code> and <code>col.lbl</code> ; if one-dim and NA all colors are left unchanged. Otherwise, with usual recycling rules <code>alpha.trsp</code> gets shorted/prolongated to length the data-symbols to be plotted. Coordinates of this vector <code>alpha.trsp</code> with NA are left unchanged, while for the remaining ones, the alpha channel in rgb space is set to the respective coordinate value of <code>alpha.trsp</code> . The non-NA entries must be integers in $[0,255]$ (0 invisible, 255 opaque).
<code>jit.fac</code>	jittering factor used for discrete distributions.
<code>jit.tol</code>	threshold for jittering: if distance between points is smaller than <code>jit.tol</code> , points are considered replicates.
<code>check.NotInSupport</code>	logical; shall we check if all x-quantiles lie in <code>support(y)</code> ?
<code>col.NotInSupport</code>	logical; if preceding check TRUE color of x-quantiles if not in <code>support(y)</code>
<code>with.legend</code>	logical; shall a legend be plotted?
<code>legend.bg</code>	background color for the legend
<code>legend.pos</code>	position for the legend
<code>legend.cex</code>	magnification factor for the legend
<code>legend.pref</code>	character to be prepended to legend text
<code>legend.postf</code>	character to be appended to legend text
<code>legend.alpha</code>	nominal coverage probability
<code>debug</code>	logical; if TRUE additional output to debug confidence bounds.
<code>withSubst</code>	logical; if TRUE (default) pattern substitution for titles and axis labels is used; otherwise no substitution is used.

Details

returnlevelplot signature(`x = "ANY"`, `y = "UnivariateDistribution"`): produces a return level plot of a dataset `x` against the theoretical quantiles of distribution `y`.

returnlevelplot signature(`x = "ANY"`, `y = "ProbFamily"`): produces a return level plot of a dataset `x` against the theoretical quantiles of the model distribution of model `y`. Passed through the `...` argument, all arguments valid for signature(`x = "ANY"`, `y = "UnivariateDistribution"`) are also valid for this signature.

returnlevelplot signature(`x = "ANY"`, `y = "Estimate"`): produces a return level plot of a dataset `x` against the theoretical quantiles of the model distribution of the model that can be reconstructed from the estimator `y`; more specifically, it tries to get hand at the argument 'ParamFamily' of the estimator's call; if this is available, internally this model is shifted to the estimated parameter by a call to `modifyModel`, and then this shifted model is used in a call to the (`x = "ANY"`, `y = "UnivariateDistribution"`)-method. Passed through the `...` argument, all arguments valid for signature(`x = "ANY"`, `y = "UnivariateDistribution"`) are also valid for this signature.

Value

As for function `returnlevelplot` from package **stats**: a list with components

<code>x</code>	The x coordinates of the points that were/would be plotted
<code>y</code>	The corresponding quantiles of the second distribution, <i>including NAs</i> .
<code>crit</code>	A matrix with the lower and upper confidence bounds (computed by <code>qqbounds</code>).
<code>err</code>	logical vector of length 2.

(elements `crit` and `err` are taken from the return value(s) of `qqbounds`).

Note

The confidence bands given in our version of the return level plot differ from the ones given in package **ismev**. We use non-parametric bands, hence also allow for non-parametric deviances from the model, whereas in in package **ismev** they are based on profiling, hence only check for variability within the parametric class.

RiskType-class	<i>Risk</i>
----------------	-------------

Description

Class of risks; e.g., estimator risks.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

`type` Object of class "character": type of risk.

Methods

type signature(object = "RiskType"): accessor function for slot `type`.

show signature(object = "RiskType")

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

SelfNorm	<i>Generating function for SelfNorm-class</i>
----------	---

Description

Generates an object of class "SelfNorm" — used for self-standardized influence curves.

Usage

```
SelfNorm()
```

Value

Object of class "SelfNorm"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

trafo-methods

Methods for function trafo in Package 'distrMod'

Description

Methods for function `trafo` in package **distrMod**; there are accessor (`trafo`) and replacement (`trafo<-`) versions.

Usage

```
trafo(object, param, ...)
## S4 method for signature 'Estimate,missing'
trafo(object,param)
## S4 method for signature 'ParamFamParameter,missing'
trafo(object,param)
## S4 method for signature 'ParamWithScaleAndShapeFamParameter,missing'
trafo(object,param)
## S4 method for signature 'ParamFamily,missing'
trafo(object,param)
## S4 method for signature 'ParamFamily,ParamFamParameter'
trafo(object,param)
## S4 method for signature 'Estimate,ParamFamParameter'
trafo(object,param)
trafo.fct(object)
trafo(object) <- value
```

Arguments

<code>object</code>	an object of either class <code>Estimate</code> , <code>ParamFamParameter</code> , <code>ParamFamily</code>
<code>param</code>	an object of class <code>ParamFamParameter</code> ; the parameter value at which to evaluate the transformation
<code>value</code>	a matrix or a function; if it is a matrix, dimensions must be consistent to the parametric setting; if it is function, it should take one argument <code>param</code> of class <code>ParamFamParameter</code> and return a list of length two with named components <code>fval</code> (the function value, see below) and <code>mat</code> (a matrix — with the same dimensions consistency conditions as above).
<code>...</code>	additional argument(s) for methods; not used so far.

Details

trafo is a slot of class ParamFamParameter, which in turn is a slot of class ParamFamily. It also sort of arises in class Estimate, i.e., all slots can be identified by the information contained in an instance thereof.

trafo realizes partial influence curves; i.e.; we are only interested in some possibly lower dimensional smooth (not necessarily linear or even coordinate-wise) aspect/transformation τ of the parameter θ .

To be coherent with the corresponding *nuisance* implementation, we make the following convention:

The full parameter θ is split up coordinate-wise in a main parameter θ' and a nuisance parameter θ'' (which is unknown, too, hence has to be estimated, but only is of secondary interest) and a fixed, known part θ''' .

Without loss of generality, we restrict ourselves to the case that transformation τ only acts on the main parameter θ' — if we want to transform the whole parameter, we only have to assume that both nuisance parameter θ'' and fixed, known part of the parameter θ''' have length 0.

To the implementation:

Slot trafo can either contain a (constant) matrix D_θ or a function

$$\tau: \Theta' \rightarrow \tilde{\Theta}, \quad \theta \mapsto \tau(\theta)$$

mapping main parameter θ' to some range $\tilde{\Theta}$.

If *slot value* trafo is a function, besides $\tau(\theta)$, it will also return the corresponding derivative matrix $\frac{\partial}{\partial \theta} \tau(\theta)$. More specifically, the return value of this function theta is a list with entries fval, the function value $\tau(\theta)$, and mat, the derivative matrix.

In case trafo is a matrix D , we interpret it as such a derivative matrix $\frac{\partial}{\partial \theta} \tau(\theta)$, and, correspondingly, $\tau(\theta)$ as the linear mapping $\tau(\theta) = D\theta$.

According to the signature, *method* trafo will return different return value types. For signature

Estimate,missing: it will return a list with entries fct, the function τ , and mat, the matrix $\frac{\partial}{\partial \theta} \tau(\theta)$. function τ will then return the list list(fval, mat) mentioned above.

Estimate,ParamFamParameter: as signature Estimate,missing.

ParamFamParameter,missing: it will just return the corresponding matrix.

ParamFamily,missing: is just wrapper to signature ParamFamParameter,missing.

ParamFamily,ParamFamParameter: as signature Estimate,missing.

Value

The return value depends on the signature. For trafo.fct, we return the corresponding function $\tau()$ (see below). For trafo, we have:

signature Estimate,missing:

a list of length two with components fct and mat (see below)

signature Estimate,ParamFamParameter:

a list of length two with components fct and mat (see below)

```
signature ParamFamParameter,missing:
    a matrix (see below)
signature ParamFamily,missing:
    a matrix (see below)
signature ParamFamily,ParamFamParameter:
    a list of length two with components fct and mat (see below)
```

Examples

```
## Gaussian location and scale
NS <- NormLocationScaleFamily(mean=2, sd=3)
## generate data out of this situation
x <- r(distribution(NS))(30)

## want to estimate mu/sigma, sigma^2
## -> new trafo slot:
trafo(NS) <- function(param){
  mu <- param["mean"]
  sd <- param["sd"]
  fval <- c(mu/sd, sd^2)
  nfval <- c("mu/sig", "sig^2")
  names(fval) <- nfval
  mat <- matrix(c(1/sd,0,-mu/sd^2,2*sd),2,2)
  dimnames(mat) <- list(nfval,c("mean","sd"))
  return(list(fval=fval, mat=mat))
}

## Maximum likelihood estimator
(res <- MLEstimator(x = x, ParamFamily = NS))
## confidence interval
confint(res)
```

trafoEst

Function trafoEst in Package 'distrMod'

Description

trafoEst takes a τ like function (compare [trafo-methods](#)) and transforms an existing estimator by means of this transformation.

Usage

```
trafoEst(fct, estimator)
```

Arguments

`fct` a τ like function, i.e., a function in the main part θ of the parameter returning a list `list(fval, mat)` where `fval` is the function value $\tau(\theta)$ of the transformation, and `mat`, its derivative matrix at θ .

`estimator` an object of class `Estimator`.

Details

The disadvantage of this proceeding is that the transformation is not accounted for in determining the estimate (e.g. in a corresponding optimality); it simply transforms an existing estimator, without reapplying it to data. This becomes important in optimally robust estimation.

Value

exactly the argument estimator, but with modified slots `estimate`, `asvar`, and `trafo`.

Examples

```
## Gaussian location and scale
NS <- NormLocationScaleFamily(mean=2, sd=3)
## generate data out of this situation
x <- r(distribution(NS))(30)

## want to estimate mu/sigma, sigma^2
## -> without new trafo slot:
mtrafo <- function(param){
  mu <- param["mean"]
  sd <- param["sd"]
  fval <- c(mu/sd, sd^2)
  nfval <- c("mu/sig", "sig^2")
  names(fval) <- nfval
  mat <- matrix(c(1/sd,0,-mu/sd^2,2*sd),2,2)
  dimnames(mat) <- list(nfval,c("mean","sd"))
  return(list(fval=fval, mat=mat))
}

## Maximum likelihood estimator in the original problem
res0 <- MLEstimator(x = x, ParamFamily = NS)
## transformation
res <- trafoEst(mtrafo, res0)
## confidence interval
confint(res)
```

trAsCov

Generating function for trAsCov-class

Description

Generates an object of class "trAsCov".

Usage

```
trAsCov()
```

Value

Object of class "trAsCov"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

 validParameter-methods

Methods for function validParameter in Package 'distrMod'

Description

Methods for function `validParameter` in package **distrMod** to check whether a new parameter (e.g. "proposed" by an optimization) is valid.

Usage

```
validParameter(object, ...)
## S4 method for signature 'ParamFamily'
validParameter(object, param)
## S4 method for signature 'L2ScaleUnion'
validParameter(object, param, tol=.Machine$double.eps)
## S4 method for signature 'L2ScaleFamily'
validParameter(object, param, tol=.Machine$double.eps)
## S4 method for signature 'L2LocationFamily'
validParameter(object, param)
## S4 method for signature 'L2LocationScaleFamily'
validParameter(object, param, tol=.Machine$double.eps)
## S4 method for signature 'BinomFamily'
validParameter(object, param, tol=.Machine$double.eps)
## S4 method for signature 'PoisFamily'
validParameter(object, param, tol=.Machine$double.eps)
## S4 method for signature 'L2ScaleShapeUnion'
validParameter(object, param, tol=.Machine$double.eps)
```

Arguments

<code>object</code>	an object of class <code>ParamFamily</code>
<code>param</code>	either a numeric vector or an object of class <code>ParamFamParameter</code>
<code>tol</code>	accuracy upto which the conditions have to be fulfilled
<code>...</code>	additional argument(s) for methods.

Details

method for signature

`ParamFamily` checks if all parameters are finite by `is.finite` if their length is between 1 and the joint length of main and nuisance parameter of `object`, and finally, if a call to `modifyParam(object)` with argument `param` would throw an error.

`L2ScaleUnion` checks if the parameter is finite by `is.finite`, and if it is strictly larger than 0 (upto argument `tol`).

`L2ScaleFamily` checks if the parameter length is 1, and otherwise uses `L2ScaleUnion`-method.

- L2LocationFamily checks if the parameter is finite by `is.finite`, if its length is 1
- L2LocationScaleFamily checks if the parameter length is 1 or 2 (e.g. if one features as nuisance parameter), and also uses L2ScaleUnion-method.
- BinomFamily checks if the parameter is finite by `is.finite`, if its length is 1, and if it is strictly larger than 0 and strictly smaller than 1 (upto argument `tol`)
- PoisFamily checks if the parameter is finite by `is.finite`, if its length is 1, and if it is strictly larger than 0 (upto argument `tol`)
- L2ScaleShapeUnion uses L2ScaleUnion-method, checks if parameter length is 1 or 2 (e.g. if one features as nuisance parameter), and if shape is strictly larger than 0 (upto argument `tol`)

Value

logical of length 1 — valid or not

Examples

```
NS <- NormLocationScaleFamily()
validParameter(NS, c(scale=0.1, loc=2))
validParameter(NS, c(scale=-0.1, loc=2))
validParameter(NS, c(scale=0, loc=2))
validParameter(NS, c(mean=2, sd=2))
```
