

# Package ‘moveWindSpeed’

October 19, 2016

**Title** Estimate Wind Speeds from Bird Trajectories

**Version** 0.1.0

**Description** Estimating wind speed from trajectories of individually tracked birds using a maximum likelihood approach.

**Depends** R (>= 3.0.0), methods, move

**Suggests** testthat, knitr, rmarkdown

**License** GPL

**LazyData** true

**RoxygenNote** 5.0.1

**Imports** Rcpp

**LinkingTo** Rcpp

**VignetteBuilder** knitr

**NeedsCompilation** yes

**Author** Bart Kranstauber [aut, cre],  
Rolf Weinzierl [aut]

**Maintainer** Bart Kranstauber <bart.kranstauber@ieu.uzh.ch>

**Repository** CRAN

**Date/Publication** 2016-10-19 13:07:36

## R topics documented:

getDefaultIsThermallingFunction . . . . .	2
getSamplingIsRegularFunction . . . . .	2
getWindEstimate . . . . .	3
getWindEstimates . . . . .	4
storks . . . . .	5

<b>Index</b>	<b>6</b>
--------------	----------

---

```
getDefaultIsThermallingFunction  
    getDefaultIsThermallingFunction
```

---

**Description**

`getDefaultIsThermallingFunction`

**Usage**

```
getDefaultIsThermallingFunction(totalAngle = 360)
```

**Arguments**

`totalAngle` the cumulative angle that is required to consider an trajectory thermaling

**Value**

a function is returned that based on a series of headings returns a logical value to indicate is a track is thermaling or not

**Examples**

```
fun<-getDefaultIsThermallingFunction(170)  
fun(1:160)  
fun(1:190)
```

---

```
getSamplingIsRegularFunction  
    getSamplingIsRegularFunction
```

---

**Description**

`getSamplingIsRegularFunction`

**Usage**

```
getSamplingIsRegularFunction(samplingIntervalSeconds)
```

**Arguments**

`samplingIntervalSeconds`  
the interval that is considered regular

**Value**

a function is returned that based on a series of timestamps decides if the segment is regular

**Examples**

```
fun<-getSamplingIsRegularFunction(10)
fun(Sys.time()+1:5)
fun(Sys.time()+c(0,10,20,30))
fun(Sys.time()+c(0,10,20,31))
```

---

getWindEstimate	<i>Estimate wind speed from a sample of ground speeds</i>
-----------------	---

---

**Description**

Estimate wind speed from a sample of ground speeds

**Usage**

```
getWindEstimate(groundSpeeds, phi, windStart = c(0, 0))

## S4 method for signature 'matrix,numeric'
getWindEstimate(groundSpeeds, phi, windStart = c(0,
  0))
```

**Arguments**

groundSpeeds	matrix with two columns representing the ground speeds.
phi	numeric of length one giving the auto correlation.
windStart	numeric of length 2 giving the wind speed where to optimize from.

**Value**

an list with parameter estimates

**Examples**

```
s<-seq(0,2*pi, .1)
set.seed(34)
getWindEstimate(cbind(4*cos(s)+3+rnorm(length(s)), 4*sin(s)+2+rnorm(length(s))),0)
getWindEstimate(cbind(4*cos(s)+3+rnorm(length(s),sd=.2), 4*sin(s)+2+rnorm(length(s),sd=.2)),0)
```

---

getWindEstimates	<i>Title</i>
------------------	--------------

---

## Description

Title

## Usage

```
getWindEstimates(data, timestamps, ...)

## S4 method for signature 'MoveStack,missing'
getWindEstimates(data, timestamps, ...)

## S4 method for signature 'Move,missing'
getWindEstimates(data, timestamps, ...)

## S4 method for signature 'data.frame,POSIXct'
getWindEstimates(data, timestamps,
  windowSize = 29, phi = 0.5, isFocalPoint = function(i, ts) { TRUE },
  isSamplingRegular = 1,
  hasVariationInHeadingFunction = getDefaultIsThermallingFunction(360),
  columnNamesWind = c("estimationSuccessful", "residualVarAirspeed", "windX",
    "windY", "windVarX", "windVarY", "windCovarXY", "windVarMax",
    "isThermalling"), ...)
```

## Arguments

data	Move object, MoveStack or data.frame containing wind speeds
timestamps	timestamps of the speed observations
...	other possible arguments currently nothing else is implemented
windowSize	a numeric vector of length 1 or 2, if length 1 it is the size of the focal window data will be assigned to the central location. If length 2 the window size is sum(windowSize)+1 and the first element is the number of location before the focal locations, the second is the number of locations after the focal location.
phi	todo
isFocalPoint	todo
isSamplingRegular	either a function that determines based on a vector of timestamps if the sampling interval is regular or a numeric value that corresponds to the time interval between observations in the dataset that is regular
hasVariationInHeadingFunction	todo
columnNamesWind	todo

**Value**

a Move object, dataframe or a MoveStack depending on input

**Examples**

```
data("storks")
# run example for reduced dataset
windEst<-getWindEstimates(storks[format(timestamps(storks), "%H")=="12",][[2:3]])
windEst<-spTransform(windEst, center=TRUE)
plot(windEst)
# only plot few arrows of estimates
s<-windEst$estimationSuccessful & format(timestamps(windEst), "%S")=='00'
# enlarge arrows 30 times
arrows(coordinates(windEst)[s,1],coordinates(windEst)[s,2],
        coordinates(windEst)[s,1]+ windEst$windX[s]*30,
        coordinates(windEst)[s,2]+windEst$windY[s]*30)
```

---

storks

*Example stork data.*

---

**Description**

A dataset containing location data of 6 juvenile storks on the 18th of august when migration just started

**Usage**

```
storks
```

**Format**

A MoveStack consisting of 22333 locations

**Source**

<http://www.movebank.org/>

**Examples**

```
data("storks")
```
