Package ‘devRate’

January 23, 2017

Type Package

Title Quantify Relationship Between Developmental Rate and Temperature in Ectotherms

Version 0.1.1

Date 2017-01-22

Author Francois Rebaudo [aut, cre], Quentin Struelens [aut]

Maintainer Francois Rebaudo <francois.rebaudo@ird.fr>

Description A set of functions to ease quantifying the relationship between developmental rate and temperature. The package comprises a set of models and estimated parameters borrowed from a literature review in ectotherms.

`analytis_77` *Analytis equation of development rate as a function of temperature.*

Description

Analytis, S. (1977) Uber die Relation zwischen biologischer Entwicklung und Temperatur bei phytopathogenen Pilzen. Journal of Phytopathology 90(1): 64-76.

Usage

```
analytis_77
```

Format

A list of eight elements describing the equation.

eq The equation as a formula object.

eqAlt The equation as a string.

name The equation name.

ref The equation reference.

refShort The equation reference shortened.

startVal The parameter values found in the literature with their references.

com An otional comment about the equation use.

id An id to identificate the equation.

Details

Equation: rT ~ aa * (T - Tmin)^bb * (Tmax - T)^cc

where rT is the development rate, T the temperature, Tmin the minimum temperature, Tmax the maximum temperature, and aa, bb, and cc constants.

Source

http://dx.doi.org/10.1111/j.1439-0434.1977.tb02886.x `bayoh_03` *Bayoh and Lindsay equation of development rate as a function of temperature.*

Description

Bayoh, M.N., Lindsay, S.W. (2003) Effect of temperature on the development of the aquatic stages of Anopheles gambiae sensu stricto (Diptera: Culicidae). Bulletin of entomological research 93(5): 375-81.

Usage

```
bayoh_03
```

Format

A list of eight elements describing the equation.

eq The equation as a formula object.

eqAlt The equation as a string.

name The equation name.

ref The equation reference.

refShort The equation reference shortened.

startVal The parameter values found in the literature with their references.

com An otional comment about the equation use.

id An id to identificate the equation.

Details

Equation: rT ~ aa + bb * T + cc * exp(T) + dd * exp(-T)

where rT is the development rate, T the temperature, and aa, bb, cc, and dd empirical constant parameters.

Source

beta_95 *Beta equation of development rate as a function of temperature.*

Description

Yin, X., Kropff, M.J., McLaren, G., and Visperas, R.M. (1995) A nonlinear model for crop development as a function of temperature. Agricultural and Forest Meteorology 77(1): 1-16.

Usage

```
beta_95
```

Format

A list of eight elements describing the equation.

eq The equation as a formula object.

eqAlt The equation as a string.

name The equation name.

ref The equation reference.

refShort The equation reference shortened.

startVal The parameter values found in the literature with their references.

com An otional comment about the equation use.

id An id to identificate the equation.

Details

Equation: rT ~ exp(mu) * (T - Tb)^aa * (Tc - T)^bb

where rT is the development rate, T the temperature, mu, aa, and bb the model parameters, Tb the base temperature, and Tc the ceiling temperature.

Source

http://dx.doi.org/10.1016/0168-1923(95)02236-Q `bieri1_83` *Bieri equation 1 of development rate as a function of temperature.*

Description

Bieri, M., Baumgartner, J., Bianchi, G., Delucchi, V., Arx, R. von. (1983) Development and fecundity of pea aphid (Acyrthosiphon pisum Harris) as affected by constant temperatures and by pea varieties. Mitteilungen der Schweizerischen Entomologischen Gesellschaft, 56, 163-171.

Kumar, S., and Kontodimas, D.C. (2012). Temperature-dependent development of Phenacoccus solenopsis under laboratory conditions. Entomologia Hellenica, 21, 25-38.

Usage

```
bieri1_83
```

Format

A list of eight elements describing the equation.

eq The equation as a formula object.

eqAlt The equation as a string.

name The equation name.

ref The equation reference.

refShort The equation reference shortened.

startVal The parameter values found in the literature with their references.

com An otional comment about the equation use.

id An id to identificate the equation.

Details

Equation: rT ~ aa * (T - Tmin) - (bb * exp(T - Tm))

where rT is the development rate, T the temperature, Tmin the minimum temperature, and aa, bb, and Tm fitted coefficients.

`briere1_99` *Briere et al equation 1 of development rate as a function of temperature.*

Description

Briere, J.F., Pracros, P., le Roux, A.Y. and Pierre, S. (1999) A novel rate model of temperature-dependent development for arthropods. Environmental Entomology, 28, 22-29.

Usage

```
briere1_99
```

Format

A list of eight elements describing the equation.

eq The equation as a formula object.

eqAlt The equation as a string.

name The equation name.

ref The equation reference.

refShort The equation reference shortened.

startVal The parameter values found in the literature with their references.

com An otional comment about the equation use.

id An id to identificate the equation.

Details

Equation: rT ~ aa * T * (T - Tmin) * (Tmax - T)^(1 / 2)

where rT is the development rate, T the temperature, Tmin the low temperature developmental threshold, Tmax the lethal temperature, and aa an empirical constant.

Source

http://dx.doi.org/10.1093/ee/28.1.22

`briere2_99`	*Briere et al equation 2 of development rate as a function of temperature.*

Description

Briere, J.F., Pracros, P., le Roux, A.Y. and Pierre, S. (1999) A novel rate model of temperature-dependent development for arthropods. Environmental Entomology, 28, 22-29.

Usage

```
briere2_99
```

Format

A list of eight elements describing the equation.

eq The equation as a formula object.

eqAlt The equation as a string.

name The equation name.

ref The equation reference.

refShort The equation reference shortened.

startVal The parameter values found in the literature with their references.

com An otional comment about the equation use.

id An id to identificate the equation.

Details

Equation: rT ~ aa * T * (T - Tmin) * (Tmax - T)^(1 / bb)

where rT is the development rate, T the temperature, Tmin the low temperature developmental threshold, Tmax the lethal temperature, and aa and bb empirical constants.

Source

http://dx.doi.org/10.1093/ee/28.1.22

`campbell_74` *Campbell et al. equation of development rate as a function of temperature.*

Description

Campbell, A., Frazer, B. D., Gilbert, N. G. A. P., Gutierrez, A. P., & Mackauer, M. (1974). Temperature requirements of some aphids and their parasites. Journal of applied ecology, 431-438.

Usage

```
campbell_74
```

Format

A list of eight elements describing the equation.

eq The equation as a formula object.

eqAlt The equation as a string.

name The equation name.

ref The equation reference.

refShort The equation reference shortened.

startVal The parameter values found in the literature with their references.

com An otional comment about the equation use.

id An id to identificate the equation.

Details

Equation: rT ~ aa + bb * T

where rT is the development rate, T the temperature, bb the slope, and aa the point at which the line crosses the rT axis when T = 0.

compDifDays — *Compute the inverse of number of days between dates*

Description

compDifDays computes the inverse of the difference between dates form a vector made of dates.

Usage

```
compDifDays(vecDates, dateFormat = "%d/%m/%y")
```

Arguments

`vecDates`	A vector with dates.
`dateFormat`	The format of dates (see `strptime`).

Value

A vector with the inverse of the difference between dates.

Examples

```
compDifDays(vecDates = c("28/12/15", "12/01/16", "25/01/16", "28/02/16", "15/03/16"))
compDifDays(vecDates = c("28/12/15", "12/01/14", "25/01/16", "28/02/16", "15/03/16"))
compDifDays(vecDates = c("28/12/15", "12/01/16", "25/01/16", "", ""))
```

compDifDaysDf — *Compute the inverse of number of days between dates from a data frame.*

Description

Compute the inverse of number of days between dates from a data frame.

Usage

```
compDifDaysDf(dfDates, dateFormatDf = "%d/%m/%y")
```

Arguments

`dfDates`	A data.frame with dates (samples in columns and dates in rows).
`dateFormatDf`	The format of dates (see `strptime`).

Value

A data.frame with the inverse of the difference between dates.

Examples

```
myDays <- data.frame(egg =  c("28/12/15", "28/12/15", "28/12/15", "28/12/15"),
                         larva1 = c("12/01/16", "12/01/16", "12/01/16", "13/01/16"),
                         larva2 = c("25/01/16", "26/01/16", "25/01/16", "29/01/16"),
                         pupa = c("12/02/16", "10/02/16", "14/02/16", "09/02/16"),
                         imago = c("28/02/16", "25/02/16", "27/02/16", "26/02/16"),
                         death = c("15/03/16", "12/03/16", "19/03/16", "20/03/16"))
compDifDaysDf(dfDates = myDays, dateFormat = "%d/%m/%y")
```

---

damos_08 *Simplified beta type equation of development rate as a function of temperature.*

Description

Damos, P.T., and Savopoulou-Soultani, M. (2008). Temperature-dependent bionomics and modeling of Anarsia lineatella (Lepidoptera: Gelechiidae) in the laboratory. Journal of economic entomology, 101(5), 1557-1567.

Usage

```
damos_08
```

Format

A list of eight elements describing the equation.

eq The equation as a formula object.

eqAlt The equation as a string.

name The equation name.

ref The equation reference.

refShort The equation reference shortened.

startVal The parameter values found in the literature with their references.

com An otional comment about the equation use.

id An id to identificate the equation.

Details

Equation: rT ~ aa * (bb - T / 10) * (T / 10)^cc rT ~ aa * (T - Tmin)^2 * (Tmax - T)

where rT is the development rate, T the temperature, and aa, bb, and cc empirical constant parameters.

Source

http://dx.doi.org/10.1093/jee/101.5.1557 `damos_11` *Inverse second-order polynomial equation of development rate as a function of temperature.*

Description

Damos, P., and Savopoulou-Soultani, M. (2011) Temperature-driven models for insect development and vital thermal requirements. Psyche: A Journal of Entomology, 2012.

Usage

```
damos_11
```

Format

A list of eight elements describing the equation.

eq The equation as a formula object.

eqAlt The equation as a string.

name The equation name.

ref The equation reference.

refShort The equation reference shortened.

startVal The parameter values found in the literature with their references.

com An otional comment about the equation use.

id An id to identificate the equation.

Details

Equation: rT ~ aa / (1 + bb * T + cc * T^2)

where rT is the development rate, T the temperature, and aa, bb, and cc empirical constant parameters.

Source

http://dx.doi.org/10.1155/2012/123405

davidson_44 *Davidson equation of development rate as a function of temperature.*

Description

Davidson, J. (1944). On the relationship between temperature and rate of development of insects at constant temperatures. The Journal of Animal Ecology:26-38.

Usage

```
davidson_44
```

Format

A list of eight elements describing the equation.

eq The equation as a formula object.

eqAlt The equation as a string.

name The equation name.

ref The equation reference.

refShort The equation reference shortened.

startVal The parameter values found in the literature with their references.

com An otional comment about the equation use.

id An id to identificate the equation.

Details

Equation: rT ~ K / (1 + exp(aa + bb * T))

where rT is the development rate, T the temperature, K the distance between the upper and lower asymptote of the curve, aa the relative position of the origin of the curve on the abscissa, bb the degree of acceleration of development of the life stage in relation to temperature.

Source

http://dx.doi.org/10.2307/1326

`devRate` *devRate: A package for quantifying the relationship between developmental rate and temperature in ectotherms.*

Description

The devRate package allows quantifying the relationships between developmental rate and temperature in ectotherm organisms.

Details

How to use the package

You can use the package:

- to get developmental rate curves as a function of temperature for a specific organism (hundred of examples from the literature are included in the package);

- to know wich equations exists and which are most used in the literature; and

- to relate developmental rate with temperature from your empirical data, using the equations from the package.

Installation instructions

install.packages("devRate")

Overview

The devRate package provides three categories of functions:

- to find developmental rate information about a specific organism (Order, Family, Genus, species): which equations were used and which are the asociated parameters (e.g., helpful to estimate starting values for your empirical data sets);

- to relate developmental rate and temperature; and

- to plot your empirical data sets and the associated fitted model, and/or to plot develpomental curves from the literature.

Author's affiliation: IRD, UMR EGCE, Univ.ParisSud-CNRS-IRD-Univ.ParisSaclay

---

`devRateEqList` *The list of all available equations of development rate as a function of temperature.*

Description

The list of all available equations of development rate as a function of temperature.

Usage

```
devRateEqList
```

Format

An object of class `list` of length 35.

`devRateFind` *Find models for species*

Description

Find models for species

Usage

```
devRateFind(orderSP = "", familySP = "", species = "")
```

Arguments

`orderSP`	Find models by Order.
`familySP`	Find models by Family.
`species`	Find models by species (Genus species).

Value

Nothing.

Examples

```
devRateFind(orderSP = "Lepidoptera")
devRateFind(familySP = "Gelechiidae")
devRateFind(species = "Tuta absoluta")
```

`devRateIBM` *Forecast ectotherm phenology as a function of temperature and developmental rate models*

Description

Forecast ectotherm phenology as a function of temperature and developmental rate models

Usage

```
devRateIBM(tempTS, timeStepTS, models, numInd = 100, stocha,
  timeLayEggs = 1)
```

Arguments

tempTS	The temperature time series (a vector).
timeStepTS	The time step of the temperature time series (a numeric).
models	The models for developmental rate (a list with objects of class nls).
numInd	The number of individuals for the simulation (an integer).
stocha	The standard deviation of a Normal distribution centered on develomental rate to create stochasticity among individuals (a numeric).
timeLayEggs	The delay between emergence of adults and the time where females lay eggs in time steps (a numeric).

Value

A list with three elements: the table of phenology for each individual, the models used (nls objects), and the time series for temperature.

Examples

```
rawDevEggs <- matrix(c(10, 0.031, 10, 0.039, 15, 0.047, 15, 0.059, 15.5, 0.066,
   13, 0.072, 16, 0.083, 16, 0.100, 17, 0.100, 20, 0.100, 20, 0.143, 25, 0.171,
   25, 0.200, 30, 0.200, 30, 0.180, 35, 0.001), ncol = 2, byrow = TRUE)

   stocha = 0.015,
   timeLayEggs = 1)
```

---

devRateIBMgen *Number of generations*

Description

Computes the number of generations from the individual-based model fit.

Usage

```
devRateIBMgen(ibm)
```

Arguments

ibm	The phenology model returned by devRateIBM function.

Value

The simulated number of generations.

Examples

```
rawDevEggs <- matrix(c(10, 0.031, 10, 0.039, 15, 0.047, 15, 0.059, 15.5, 0.066,

devRateIBMgen(ibm = forecastTsolanivora)
```

---

devRateIBMPlot *Plot phenology table*

Description

Plot phenology table

Usage

```
devRateIBMPlot(ibm, typeG = "density", threshold = 0.1)
```

Arguments

ibm	The phenology model returned by devRateIBM function.
typeG	The type of plot ("density" or "hist").
threshold	The threshold rate of individuals for being represented in a density plot (a numeric between 0 and 1).

Value

Nothing.

Examples

```
rawDevEggs <- matrix(c(10, 0.031, 10, 0.039, 15, 0.047, 15, 0.059, 15.5, 0.066,
   13, 0.072, 16, 0.083, 16, 0.100, 17, 0.100, 20, 0.100, 20, 0.143, 25, 0.171,
   25, 0.200, 30, 0.200, 30, 0.180, 35, 0.001), ncol = 2, byrow = TRUE)

forecastTsolanivora <- devRateIBM(
   tempTS = rnorm(n = 100, mean = 15, sd = 1),
   timeStepTS = 1,
   models = list(mEggs, mLarva, mPupa),
   numInd = 500,
   stocha = 0.015,
   timeLayEggs = 1)
devRateIBMPlot(ibm = forecastTsolanivora, typeG = "density", threshold = 0.1)
devRateIBMPlot(ibm = forecastTsolanivora, typeG = "hist")
```

---

devRateInfo *Display information about an equation*

Description

Display information about an equation

Usage

```
devRateInfo(eq)
```

Arguments

eq The name of the equation.

Value

Nothing.

Examples

```
devRateInfo(eq = davidson_44)
devRateInfo(eq = campbell_74)
devRateInfo(eq = taylor_81)
```

---

devRateMap *Predict development rate from a a map of temperatures*

Description

Create a map from a temperature matrix and the development rate curve

Usage

```
devRateMap(nlsDR, tempMap)
```

Arguments

nlsDR	The result returned by the devRateModel function.
tempMap	A matrix containing temperatures in degrees.

Details

The devRateMap function is designed for a single ecthoterm life stage, but the resulted matrix of development rate can be performed for each life stage in order to obtain the whole organism development. Input temperatures should preferably cover the orgnaism development period rather than the whole year.

Value

A matrix with development rates predicted from the model.

Examples

```
myT <- 5:15
myDev <- -0.05 + rnorm(n = length(myT), mean = myT, sd = 1) * 0.01
myNLS <- devRateModel(eq = campbell_74, temp = myT, devRate = myDev,
  startValues = list(aa = 0, bb = 0))
myMap <- devRateMap(nlsDR =  myNLS, tempMap = matrix(rnorm(100, mean = 12, sd = 2), ncol=10))
```

`devRateModel` *Compute non-linear regression*

Description

Determine the nonlinear least-squares estimates of the parameters of a nonlinear model, on the basis of the `nls` function from package `stats`.

Usage

```
devRateModel(eq, temp, devRate, startValues, ...)
```

Arguments

`eq`	The name of the equation.
`temp`	The temperature.
`devRate`	The developmental rate `(days)^-1`
`startValues`	Starting values for the regression.
`...`	Additional arguments for the `nls` function.

Details

`startValues` for equations by Stinner et al. 1974 and Lamb 1992 are composed of two equations: one for the temperatures below the optimal temperature and another for the tamperatures above the optimal temperature. For these equations, `startValues` should be a list of two lists, where the second element only contain starting estimates not specified in the first element, e.g., for Stinner et al.: `startValues <- list(list(C = 0.05, k1 = 5, k2 = -0.3), list(Topt = 30))`, and for Lamb 1992: `startValues <- list(list(Rm = 0.05, Tmax = 35, To = 15), list(T1 = 4))`

Value

An object of class `nls` (except for Stinner et al. 1974 and Lamb 1992 where the function returns a list of two objects of class `nls`).

Examples

```
myT <- 5:15
myDev <- -0.05 + rnorm(n = length(myT), mean = myT, sd = 1) * 0.01
myNLS <- devRateModel(eq = campbell_74, temp = myT, devRate = myDev,
  startValues = list(aa = 0, bb = 0))
myT <- seq(from = 0, to = 50, by = 10)
myDev <- c(0.001, 0.008, 0.02, 0.03, 0.018, 0.004)
myNLS <- devRateModel(eq = stinner_74, temp = myT, devRate = myDev,
  startValues = list(list(C = 0.05, k1 = 5, k2 = -0.3), list(Topt = 30)))
```

devRatePlot — *Plot the empirical points and the regression*

Description

Plot the empirical points and the regression

Usage

```
devRatePlot(eq, nlsDR, temp, devRate, rangeT = 10, optText = TRUE,
  spe = TRUE, ...)
```

Arguments

eq	The name of the equation.
nlsDR	The result returned by the devRateModel function.
temp	The temperature.
devRate	The developmental rate (days)^-1
rangeT	The range of temperatures over which the regression is plotted. This argument may be overwritten depending on the equation.
optText	A logical indcating wether the name of the eqaution should be written in the topright corner of the plot.
spe	A logical indicating if special plotting rules from literature should apply.
...	Aditional arguments for the plot.

Value

Nothing.

Examples

```
myT <- 5:15
myDev <- -0.05 + rnorm(n = length(myT), mean = myT, sd = 1) * 0.01
myNLS <- devRateModel(eq = campbell_74, temp = myT, devRate = myDev,
  startValues = list(aa = 0, bb = 0))
devRatePlot(eq = campbell_74, nlsDR = myNLS, temp = myT, devRate = myDev,
  spe = TRUE, pch = 16, lwd = 2, ylim = c(0, 0.10))
```

`devRatePlotInfo` *Plot parameter estimates from the literature*

Description

Plot parameter estimates from the literature

Usage

```
devRatePlotInfo(eq, sortBy = "genSp", stage = "all", ...)
```

Arguments

`eq`	The name of the equation.
`sortBy`	The filter to seperate species ("ordersp", "familysp, "genussp", "species", "genSp").
`stage`	The life stage of the organism ("all", "eggs", "L1", "L2", "L3", "L4", "L5", "larva", "pupa", "prepupa", "female", "male", ...)
`...`	Aditional arguments for the plot.

Value

Nothing.

Examples

```
devRatePlotInfo(eq = davidson_44, sortBy = "genSp", xlim = c(0,40), ylim = c(0,0.05))
devRatePlotInfo(eq = campbell_74, sortBy = "familysp", xlim = c(0,30), ylim = c(0,0.05))
devRatePlotInfo(eq = taylor_81, sortBy = "ordersp", xlim = c(-20,80), ylim = c(0,0.2))
```

`devRatePrint` *Report model output from the NLS fit*

Description

Provide a custom output of the NLS fit.

Usage

```
devRatePrint(myNLS, temp, devRate, doPlots = FALSE)
```

Arguments

`myNLS`	An object of class NLS
`temp`	The temperature
`devRate`	The development rate `(days)^-1`
`doPlots`	A boolean to get the residual plot (default = FALSE)

Value

A custom output of the NLS fit

Examples

```
myT <- 5:15
myDev <- -0.05 + rnorm(n = length(myT), mean = myT, sd = 1) * 0.01
myNLS <- devRateModel(eq = campbell_74, temp = myT, devRate = myDev,
  startValues = list(aa = 0, bb = 0))
devRatePrint(myNLS, temp = myT, devRate = myDev)

rawDevEggs <- matrix(c(10, 0.031, 10, 0.039, 15, 0.047, 15, 0.059, 15.5, 0.066,
   13, 0.072, 16, 0.083, 16, 0.100, 17, 0.100, 20, 0.100, 20, 0.143, 25, 0.171,
   25, 0.200, 30, 0.200, 30, 0.180, 35, 0.001), ncol = 2, byrow = TRUE)
mEggs <- devRateModel(eq = taylor_81, temp = rawDevEggs[,1], devRate = rawDevEggs[,2],
   startValues = list(Rm = 0.05, Tm = 30, To = 5))
devRatePrint(myNLS = mEggs, temp = rawDevEggs[, 1], devRate = rawDevEggs[, 2])
```

`harcourtYee_82` *Harcourt and Yee equation of development rate as a function of temperature.*

Description

Harcourt, D. and Yee, J. (1982) Polynomial algorithm for predicting the duration of insect life stages. Environmental Entomology, 11, 581-584.

Usage

```
harcourtYee_82
```

Format

A list of eight elements describing the equation.

eq The equation as a formula object.

eqAlt The equation as a string.

name The equation name.

ref The equation reference.

refShort The equation reference shortened.

startVal The parameter values found in the literature with their references.

id An id to identificate the equation.

Details

Equation: rT ~ (p25 * (T + 273.16)/298 * exp(aa/1.987 * (1/298 - 1/(T + 273.16)))) / (1 + exp(bb/1.987 * (1/cc - 1/(T + 273.16))))

where rT is the development rate, T the temperature, p25 the development rate at 25 degrees Celcius assuming no enzyme inactivation, aa the enthalpy of activation of the reaction that is catalyzed by the enzyme, bb the change in enthalpy associated with low temperature inactivation of the enzyme, cc the the temperature at which the enzyme is 1/2 active and 1/2 low temperature inactive, dd the cange in enthalpy associated with high temperature inactivation of the enzyme, and ee the temperature at which the enzyme is 1/2 active and 1/2 high temperature inactive.

`schoolfield_81` *Schoolfield et al. equation of development rate as a function of temperature.*

Description

Schoolfield, R., Sharpe, P. & Magnuson, C. (1981) Non-linear regression of biological temperature-dependent rate models based on absolute reaction-rate theory. Journal of theoretical biology, 88, 719-731.

Usage

```
schoolfield_81
```

Format

A list of eight elements describing the equation.

eq The equation as a formula object.

eqAlt The equation as a string.

name The equation name.

ref The equation reference.

refShort The equation reference shortened.

startVal The parameter values found in the literature with their references.

com An otional comment about the equation use.

id An id to identificate the equation.
