

# Package ‘glmmTMB’

February 20, 2017

**Title** Generalized Linear Mixed Models using Template Model Builder

**Version** 0.1.1

**Date** 2017-1-30

**Description** Fit linear and generalized linear mixed models with various extensions, including zero-inflation. The models are fitted using maximum likelihood estimation via ‘TMB’ (Template Model Builder). Random effects are assumed to be Gaussian on the scale of the linear predictor and are integrated out using the Laplace approximation. Gradients are calculated using automatic differentiation.

**License** AGPL-3

**Imports** methods, TMB (>= 1.7.6), lme4 (>= 1.1-10), Matrix, nlme

**LinkingTo** TMB, RcppEigen

**Suggests** knitr, testthat, MASS, lattice, ggplot2, mlmRev, bbmle, pscl, MCMCpack, coda, reshape2

**VignetteBuilder** knitr

---

compois	<i>Conway-Maxwell Poisson distribution parameterized by exact mean</i>
---------	--

---

**Description**

Conway-Maxwell Poisson distribution parameterized by exact mean

**Usage**

```
compois(link = "log")
```

**Arguments**

link (character) link function. Only "log" is implemented.

---

 epil2

*Seizure Counts for Epileptics - Extended*

---

## Description

Extended version of the epil dataset of the **MASS** package. The three transformed variables `Visit`, `Base`, and `Age` used by Booth et al. (2003) have been added to epil.

## Usage

```
epil2
```

## Format

A data frame with 236 observations on the following 12 variables:

`y` an integer vector.

`trt` a factor with levels "placebo" and "progabide".

`base` an integer vector.

`age` an integer vector.

`V4` an integer vector.

`subject` an integer vector.

`period` an integer vector.

`lbase` a numeric vector.

`lage` a numeric vector.

**Visit**  $(\text{rep}(1:4,59) - 2.5) / 5$ .

**Base**  $\log(\text{base}/4)$ .

**Age**  $\log(\text{age})$ .

## References

Booth, J.G., G. Casella, H. Friedl, and J.P. Hobert. (2003) Negative binomial loglinear mixed models. *Statistical Modelling* **3**, 179–191.

## Examples

```
epil2$subject <- factor(epil2$subject)
op <- options(digits=3)
(fm <- glmmTMB(y ~ Base*trt + Age + Visit + (Visit|subject),
              data=epil2, family=list(family="nbinom2",link="log")))
meths <- methods(class = class(fm))
if((Rv <- getRversion()) > "3.1.3") {
  (funs <- attr(meths, "info")[, "generic"])
  for(F in funs[is.na(match(funs, "getME"))]) {
```

```

    cat(sprintf("%s:\n-----\n", F))
    r <- tryCatch( get(F)(fm), error=identity)
    if (inherits(r, "error")) cat("** Error:", r$message, "\n")
    else tryCatch( print(r) )
    cat(sprintf("---end{%s}-----\n\n", F))
  }
}
options(op)

```

---

findReTrmClasses      *list of specials – taken from enum.R*

---

### Description

list of specials – taken from enum.R

### Usage

```
findReTrmClasses()
```

---

fixef      *Extract fixed-effects estimates*

---

### Description

Extract the fixed-effects estimates

### Usage

```
## S3 method for class 'glimmTMB'
fixef(object, ...)
```

### Arguments

object      any fitted model object from which fixed effects estimates can be extracted.  
 ...      optional additional arguments. Currently none are used in any methods.

### Details

Extract the estimates of the fixed-effects parameters from a fitted model.

### Value

a named, numeric vector of fixed-effects estimates.

**Examples**

```
data(sleepstudy, package = "lme4")
fixef(glmmTMB(Reaction ~ Days + (1|Subject) + (0+Days|Subject), sleepstudy))
```

---

genpois	<i>Generalized Poisson distribution</i>
---------	---

---

**Description**

Generalized Poisson distribution

**Usage**

```
genpois(link = "log")
```

**Arguments**

link (character) link function. Only "log" is implemented.

---

getCapabilities	<i>List model options that glmmTMB knows about</i>
-----------------	--

---

**Description**

List model options that glmmTMB knows about

**Usage**

```
getCapabilities(what = "all", check = FALSE)
```

**Arguments**

what (character) which type of model structure to report on ("all", "family", "link", "covstruct")  
 check (logical) do brute-force checking to test whether families are really implemented (only available for what="family")

**Value**

if check==FALSE, returns a vector of the names (or a list of name vectors) of allowable entries; if check==TRUE, returns a logical vector of working families

**Note**

these are all the options that are *defined* internally; they have not necessarily all been *implemented* (FIXME!)

---

getME.glmTMB	<i>Extract or Get Generalize Components from a Fitted Mixed Effects Model</i>
--------------	---

---

### Description

Extract or Get Generalize Components from a Fitted Mixed Effects Model

### Usage

```
## S3 method for class 'glmTMB'
getME(object, name = c("X", "Xzi", "Z", "Zzi", "Xd",
  "theta"), ...)
```

### Arguments

object	a fitted glmTMB object
name	of the component to be retrieved
...	ignored, for method compatibility

### See Also

[getME](#) Get generic and re-export:

---

getReStruc	<i>Calculate random effect structure Calculates number of random effects, number of parameters, blocksize and number of blocks. Mostly for internal use.</i>
------------	--

---

### Description

Calculate random effect structure Calculates number of random effects, number of parameters, blocksize and number of blocks. Mostly for internal use.

### Usage

```
getReStruc(reTrms, ss = NULL)
```

### Arguments

reTrms	random-effects terms list
ss	a character string indicating a valid covariance structure. Must be one of names(glmTMB:::valid_covs default is to use an unstructured variance-covariance matrix ("us") for all blocks).

**Value**

a list

blockNumTheta	number of variance covariance parameters per term
blockSize	size (dimension) of one block
blockReps	number of times the blocks are repeated (levels)
covCode	structure code

**Examples**

```
data(sleepstudy, package="lme4")
rt <- lme4::lFormula(Reaction~Days+(1|Subject)+(0+Days|Subject),
                    sleepstudy)$reTrms
rt2 <- lme4::lFormula(Reaction~Days+(Days|Subject),
                    sleepstudy)$reTrms
getReStruc(rt)
```

---

getXReTrms

---

*Create X and random effect terms from formula*

---

**Description**

Create X and random effect terms from formula

**Usage**

```
getXReTrms(formula, mf, fr, ranOK = TRUE, type = "")
```

**Arguments**

formula	current formula, containing both fixed & random effects
mf	matched call
fr	full model frame
ranOK	random effects allowed here?
type	label for model type

**Value**

a list composed of

X	design matrix for fixed effects
Z	design matrix for random effects
reTrms	output from <a href="#">mkReTrms</a> from <b>lme4</b>

glmmTMB

*Fit models with TMB***Description**

Fit models with TMB

**Usage**

```
glmmTMB(formula, data = NULL, family = gaussian(), ziformula = ~0,
         dispformula = ~1, weights = NULL, offset = NULL, se = TRUE,
         verbose = FALSE, debug = FALSE)
```

**Arguments**

formula	combined fixed and random effects formula, following lme4 syntax
data	data frame
family	family (variance/link function) information; see <a href="#">family</a> for details. As in <a href="#">glm</a> , family can be specified as (1) a character string referencing an existing family-construction function (e.g. "binomial"); (2) a symbol referencing such a function ('binomial'); or (3) the output of such a function ('binomial()'). In addition, for families such as betabinomial that are special to glmmTMB, family can be specified as (4) a list comprising the name of the distribution and the link function ('list(family="binomial",link="logit)').
ziformula	a <i>one-sided</i> (i.e., no response variable) formula for zero-inflation combining fixed and random effects: the default $\sim 0$ specifies no zero-inflation. Specifying $\sim .$ will set the right-hand side of the zero-inflation formula identical to the right-hand side of the main (conditional effects) formula; terms can also be added or subtracted. <b>Offset terms will automatically be dropped from the conditional effects formula.</b> The zero-inflation model uses a logit link.
dispformula	a <i>one-sided</i> formula for dispersion containing only fixed effects: the default $\sim 1$ specifies the standard dispersion given any family. The argument is ignored for families that do not have a dispersion parameter. For an explanation of the dispersion parameter for each family, see ( <a href="#">sigma</a> ). The dispersion model uses a log link. In Gaussian mixed models, $\text{dispformula}=\sim 0$ fixes the parameter to be 0, forcing variance into the random effects.
weights	weights, as in <a href="#">glm</a> . Only implemented for binomial and betabinomial families.
offset	offset
se	whether to return standard errors
verbose	logical indicating if some progress indication should be printed to the console.
debug	whether to return the preprocessed data and parameter objects, without fitting the model

## Details

- binomial models with more than one trial (i.e., not binary/Bernoulli) must be specified in the form `prob ~ ...`, `weights = N` rather than in the more typical two-column matrix (`cbind(successes, failures)~...`) form.
- in all cases `glmmTMB` returns maximum likelihood estimates - random effects variance-covariance matrices are not REML (so use `REML=FALSE` when comparing with `lme4::lmer`), and residual standard deviations (`sigma`) are not bias-corrected. Because the `df.residual` method for `glmmTMB` currently counts the dispersion parameter, one would need to multiply by `sqrt(nobs(fit)/(1+df.residual))` when comparing with `lm` ...

## Examples

```
(m1 <- glmmTMB(count~ mined + (1|site),
  zi=~mined,
  family=poisson, data=Salamanders))
summary(m1)

## Zero-inflated negative binomial model
(m2 <- glmmTMB(count~spp + mined + (1|site),
  zi=~spp + mined,
  family=nbinom2, Salamanders))

## Hurdle Poisson model
(m3 <- glmmTMB(count~spp + mined + (1|site),
  zi=~spp + mined,
  family=list(family="truncated_poisson", link="log"), Salamanders))

## Binomial model
data(cbpp, package="lme4")
(tmbm1 <- glmmTMB(incidence/size ~ period + (1 | herd), weights=size,
  data=cbpp, family=binomial))

## Dispersion model
sim1=function(nfac=40, nt=100, facsd=.1, tsd=.15, mu=0, residsd=1)
{
  dat=expand.grid(fac=factor(letters[1:nfac]), t= 1:nt)
  n=nrow(dat)
  dat$REfac=rnorm(nfac, sd= facsd)[dat$fac]
  dat$REt=rnorm(nt, sd= tsd)[dat$t]
  dat$x=rnorm(n, mean=mu, sd=residsd) + dat$REfac + dat$REt
  return(dat)
}
set.seed(101)
d1 = sim1(mu=100, residsd =10)
d2 = sim1(mu=200, residsd =5)
d1$sd="ten"
d2$sd="five"
dat = rbind(d1, d2)
m0 = glmmTMB(x~sd+(1|t), dispformula=~sd, dat)
fixef(m0)$disp
c(log(5^2), log(10^2)-log(5^2)) #expected dispersion model coefficients
```

---

nbinom2	<i>Family functions for glmmTMB</i>
---------	-------------------------------------

---

**Description**

Family functions for glmmTMB

**Usage**

```
nbinom2(link = "log")
```

```
nbinom1(link = "log")
```

**Arguments**

link (character) link function

**Value**

returns a list with (at least) components

family length-1 character vector giving the family name

link length-1 character vector specifying the link function

variance a function of either 1 (mean) or 2 (mean and dispersion parameter) arguments giving the predicted variance

---

numFactor	<i>Factor with numeric interpretable levels.</i>
-----------	--

---

**Description**

Create a factor with numeric interpretable factor levels.

**Usage**

```
numFactor(x, ...)
```

```
parseNumLevels(levels)
```

**Arguments**

x Vector, matrix or data.frame that constitute the coordinates.

... Additional vectors, matrices or data.frames that constitute the coordinates.

levels Character vector to parse into numeric values.

**Details**

Some `glmmTMB` covariance structures require extra information, such as temporal or spatial coordinates. `numFactor` allows to associate such extra information as part of a factor via the factor levels. The original numeric coordinates are recoverable without loss of precision using the function `parseNumLevels`. Factor levels are sorted coordinate wise from left to right: first coordinate is fastest running.

**Value**

Factor with specialized coding of levels.

**Examples**

```
## 1D example
numFactor(sample(1:5,20,TRUE))
## 2D example
coords <- cbind( sample(1:5,20,TRUE), sample(1:5,20,TRUE) )
(f <- numFactor(coords))
parseNumLevels(levels(f)) ## Sorted
## Used as part of a model.matrix
model.matrix( ~f )
## parseNumLevels( colnames(model.matrix( ~f )) )
## Error: 'Failed to parse numeric levels: (Intercept)'
parseNumLevels( colnames(model.matrix( ~ f-1 )) )
```

---

Owls

*Begging by Owl Nestlings*

---

**Description**

Begging by owl nestlings

**Usage**

```
data(Owls)
```

**Format**

The `Owls` data set is a data frame with 599 observations on the following variables:

`Nest` a factor describing individual nest locations

`FoodTreatment` (factor) food treatment: Deprived or Satiated

`SexParent` (factor) sex of provisioning parent: Female or Male

`ArrivalTime` a numeric vector

`SiblingNegotiation` a numeric vector

`BroodSize` brood size

`NegPerChick` number of negotiations per chick

**Note**

Access to data kindly provided by Alain Zuur

**Source**

Roulin, A. and L. Bersier (2007) Nestling barn owls beg more intensely in the presence of their mother than in the presence of their father. *Animal Behaviour* **74** 1099–1106. <http://www.sciencedirect.com/science/article/B6W9W-4PK8B6H-8/2/e43cfbaad4dc0bb2207adfc54a460c89>; <http://www.highstat.com/Book2/ZuurDataMixedModelling.zip>

**References**

Zuur, A. F., E. N. Ieno, N. J. Walker, A. A. Saveliev, and G. M. Smith (2009) *Mixed Effects Models and Extensions in Ecology with R*; Springer.

**Examples**

```
data(Owls, package = "glmmTMB")
require("lattice")
bwplot(reorder(Nest,NegPerChick) ~ NegPerChick | FoodTreatment:SexParent,
       data=Owls)
dotplot(reorder(Nest,NegPerChick) ~ NegPerChick| FoodTreatment:SexParent,
        data=Owls)
## Not run:
## Fit negative binomial model with "constant" Zero Inflation :
owls_nb1 <- glmmTMB(SiblingNegotiation ~ FoodTreatment*SexParent +
                  (1|Nest)+offset(log(BroodSize)),
                  family = list(family="nbinom1",link="log"),
                  zi = ~1, data=Owls)
owls_nb1_bs <- update(owls_nb1,
                    . ~ . - offset(log(BroodSize)) + log(BroodSize))
fixef(owls_nb1_bs)

## End(Not run)
```

---

predict.glmTMB

*prediction*

---

**Description**

prediction

**Usage**

```
## S3 method for class 'glmmTMB'
predict(object, newdata = NULL, se.fit = FALSE, re.form,
        allow.new.levels = FALSE, zitype = c("response", "conditional", "zprob"),
        debug = FALSE, ...)
```

**Arguments**

object	a glmTMB object
newdata	new data for prediction
se.fit	return the standard errors of the predicted values?
re.form	(not yet implemented) specify which random effects to condition on when predicting
allow.new.levels	(not yet implemented) allow previously unobserved levels in random-effects grouping variables?
zitype	for zero-inflated models, return expected value ("response": $\mu*(1-p)$ ), the mean of the conditional distribution ("conditional": $\mu$ ), or the probability of a structural zero ("zprob")?
debug	(logical) return the TMBStruc object that will be used internally for debuggin?
...	unused - for method compatibility

**Examples**

```
data(sleepstudy, package="lme4")
g0 <- glmTMB(Reaction~Days+(Days|Subject), sleepstudy)
predict(g0, sleepstudy)
```

---

print.VarCorr.glmTMB *Printing The Variance and Correlation Parameters of a glmTMB*

---

**Description**

Printing The Variance and Correlation Parameters of a glmTMB

**Usage**

```
## S3 method for class 'VarCorr.glmTMB'
print(x, digits = max(3, getOption("digits") - 2),
      comp = "Std.Dev.", formatter = format, ...)
```

**Arguments**

x	a result of <code>VarCorr(&lt;glmTMB&gt;)</code> .
digits	number of significant digits to use.
comp	a string specifying the component to format and print.
formatter	a <a href="#">function</a> .
...	optional further arguments, passed the next <code>print</code> method.

---

ranef.glmmTMB	<i>Extract Random Effects</i>
---------------	-------------------------------

---

### Description

Generic function to extract random effects from glmmTMB models, both for the conditional model and zero inflation.

### Usage

```
## S3 method for class 'glmmTMB'  
ranef(object, ...)
```

### Arguments

`object` a glmmTMB model.  
`...` some methods for this generic function require additional arguments.

### Value

Object of class `ranef.glmmTMB` with two components:

`conditional_model` a list of data frames, containing random effects for the conditional model.  
`zero_inflation` a list of data frames, containing random effects for the zero inflation.

### Note

When a model has no zero inflation, the default behavior of `ranef` is to simplify the printed format of the random effects. To show the full list structure, run `print(ranef(model), simplify=FALSE)`. In all cases, the full list structure is used to access the data frames (see example).

### See Also

[fixef.glmmTMB](#).

### Examples

```
data(sleepstudy, package="lme4")  
model <- glmmTMB(Reaction ~ Days + (1|Subject), sleepstudy)  
ranef(model)  
print(ranef(model), simplify=FALSE)  
ranef(model)$conditional_model$Subject
```

---

residuals.glmmTMB      *Compute residuals for a glmmTMB object*

---

### Description

Compute residuals for a glmmTMB object

### Usage

```
## S3 method for class 'glmmTMB'
residuals(object, type = c("response", "pearson"), ...)
```

### Arguments

object	a “glmmTMB” object
type	(character) residual type
...	ignored, for method compatibility

---

Salamanders      *Repeated counts of salamanders in streams*

---

### Description

A dataset containing counts of salamanders with site covariates and sampling covariates. Each of 23 sites were sampled 4 times. When using this data, please cite Price et al. (2016) as well as the the Dryad data package (Price et al. 2015).

### Usage

```
data(Salamanders)
```

### Format

A data frame with 644 observations on the following 10 variables:

**site** name of a location where repeated samples were taken  
**mined** factor indicating whether the site was affected by mountain top removal coal mining  
**cover** amount of cover objects in the stream (scaled)  
**sample** repeated sample  
**DOP** Days since precipitation (scaled)  
**Wtemp** water temperature (scaled)  
**DOY** day of year (scaled)  
**spp** abbreviated species name, possibly also life stage  
**count** number of observed salamanders

## References

## Examples

```
require("glmmTMB")
data(Salamanders)

zipm3 = glmmTMB(count~spp * mined + (1|site), zi=~spp * mined, Salamanders, family="poisson")
```

---

sigma.glmTMB

*Extract residual standard deviation or dispersion parameter*

---

## Description

For Gaussian models, sigma returns the value of the residual standard deviation; for other families, it returns the dispersion parameter, *however it is defined for that particular family*. See details for each family below.

## Usage

```
## S3 method for class 'glmmTMB'
sigma(object, ...)
```

## Arguments

object            a “glmmTMB” fitted object  
 ...                (ignored; for method compatibility)

## Details

The value returned varies by family:

**gaussian** returns the *maximum likelihood* estimate of the standard deviation (i.e., smaller than the results of `sigma(lm(...))`) by a factor of  $(n-1)/n$

**nbinom1** returns an overdispersion parameter (usually denoted  $\alpha$  as in Hardin and Hilbe (2007)); such that the variance equals  $\mu(1 + \alpha)$ .

**nbinom2** returns an overdispersion parameter (usually denoted  $\theta$  or  $k$ ); in contrast to most other families, larger  $\theta$  corresponds to a *lower* variance which is  $\mu(1 + \mu/\theta)$ .

**Gamma** Internally, glmTMB fits Gamma responses by fitting a mean and a shape parameter; sigma is estimated as  $(1/\sqrt{\text{shape}})$ , which will typically be close (but not identical to) that estimated by `stats:::sigma.default`, which uses `sqrt(deviance/df.residual)`

**beta** returns the value of  $\phi$ , where the conditional variance is  $\mu(1 - \mu)/(1 + \phi)$  (i.e., increasing  $\phi$  decreases the variance.) This parameterization follows Ferrari and Cribari-Neto (2004) (and the `betareg` package):

**betabinomial** This family uses the same parameterization (governing the Beta distribution that underlies the binomial probabilities) as `beta`.

**genpois** returns the value of  $\phi$ , where the variance is  $\mu\phi$

**compois** returns the value of  $1/\nu$ . When  $\nu = 1$ , `compois` is equivalent to the Poisson distribution. There is no closed form equation for the variance, but it is approximately undersdispersed when  $1/\nu < 1$  and approximately oversdispersed when  $1/\nu > 1$ . In this implementation,  $\mu$  is exactly the mean, which differs from the `COMPOissonReg` package (Sellers & Lotze 2015).

The most commonly used GLM families (`binomial`, `poisson`) have fixed dispersion parameters which are internally ignored.

---

simulate.glmTMB

*Simulate from a glmTMB fitted model*

---

## Description

Simulate from a glmTMB fitted model

## Usage

```
## S3 method for class 'glmTMB'
simulate(object, nsim = 1, seed = NULL, ...)
```

## Arguments

<code>object</code>	glmTMB fitted model
<code>nsim</code>	number of response lists to simulate. Defaults to 1.
<code>seed</code>	random number seed
<code>...</code>	extra arguments

**Details**

Random effects are also simulated from their estimated distribution. Currently, it is not possible to condition on estimated random effects.

**Value**

returns a list of vectors. The list has length `nsim`. Each simulated vector of observations is the same size as the vector of response variables in the original data set.

---

`vcov.glmmTMB`
*Calculate Variance-Covariance Matrix for a Fitted glmmTMB model*

---

**Description**

Calculate Variance-Covariance Matrix for a Fitted glmmTMB model

**Usage**

```
## S3 method for class 'glmmTMB'
vcov(object, full = FALSE, ...)
```

**Arguments**

<code>object</code>	a “glmmTMB” fit
<code>full</code>	return a full variance-covariance matrix?
<code>...</code>	ignored, for method compatibility

**Value**

By default (`full==FALSE`), a list of separate variance-covariance matrices for each model component (conditional, zero-inflation, dispersion). If `full==TRUE`, a single square variance-covariance matrix for *all* top-level model parameters (conditional, dispersion, and variance-covariance parameters)
