

Package ‘proteomics’

February 20, 2015

Version 0.2

Date 2014-11

Title Statistical Analysis of High Throughput Proteomics Data

Description Provides methods for making inference in isobaric labelled LC-MS/MS experiments, i.e. iTRAQ experiments. It provides a function that reasonably parses a CSV-export from Proteome Discoverer(TM) into a data frame that can be easily handled in R. Functions and methods are provided for quality control, filtering, norming, and the calculation of response variables for further analysis. The merging of multiple iTRAQ experiments with respect to a reference is also covered.

accum	<i>Response calculation</i>
-------	-----------------------------

Description

Calculates needed sample size accumulation from iTRAQ data which is given on spectrum level.

Usage

```
accum(dwide)
```

Arguments

dwide	iTRAQ data in wide format including columns corresponding to iTRAQ channels containing their intensities.
-------	---

addIonStatistics	<i>Summary statistics – Ion intensities per spectra</i>
------------------	---

Description

Summary statistics – Ion intensities per spectra

Usage

```
addIonStatistics(dwide)
```

Arguments

dwide	iTRAQ data in wide format including columns corresponding to iTRAQ channels containing their intensities.
-------	---

addLoadings	<i>Adjust for confounding – add an appropriate target</i>
-------------	---

Description

Adjust for confounding – add an appropriate target

Usage

```
addLoadings(dwide, byRef = F)
```

Arguments

dwide	iTRAQ data in wide format
byRef	should the average be calculated from the loading of the reference channel. Default is FALSE and this is recommended.

addRetentionAtApex *Summary statistics – Calculates retention time statistics at apex*

Description

Calculates different summary retention time statistics for each peptide (a subsequence of a protein including post translational modifications). The idea is that each peptide is supposed to have roughly the same retention time.

Usage

```
addRetentionAtApex(dwide, ...)
```

Arguments

dwide	iTRAQ data in wide format
...	Additional arguments passed for ddply

addRetentionIndexTimeStatistics
Summary statistics – Calculates index retention time statistics

Description

Summary statistics – Calculates index retention time statistics

Usage

```
addRetentionIndexTimeStatistics(dwide, ...)
```

Arguments

dwide	iTRAQ data in wide format
...	Additional arguments passed for ddply

adjustBy	<i>Adjust for confounding – Generic function for centring data</i>
----------	--

Description

This function calculates from given adjusting factors that compensate for possible confounding due the transformed values for the statistical analysis.

Usage

```
adjustBy(dwide, effect, ch)
```

Arguments

dwide	iTRAQ data in wide format.
effect	estimated effects which may yield to confounding.
ch	names of the channel columns.

Details

Can be used to performe custom adjustments. (Code not used anymore.)

adjusting	<i>Adjust for confounding – State of the art adjustments for confounding</i>
-----------	--

Description

Compensate for possible confounding due the transformed values for the statistical analysis.

Usage

```
adjusting(dwide)
```

Arguments

dwide	iTRAQ data in wide format.
-------	----------------------------

adjustOne	<i>Adjust for confounding – In one single experiment only</i>
-----------	---

Description

Simple code when only one iTRAQ-experiment has been performed. (Code not used anymore.)

Usage

```
adjustOne(dwide)
```

Arguments

dwide	iTRAQ data in wide format.
-------	----------------------------

avrgLoading	<i>Adjust for confounding – calculates the average loading</i>
-------------	--

Description

Adjust for confounding – calculates the average loading

Usage

```
avrgLoading(dwide)
```

Arguments

dwide	iTRAQ data in wide format
-------	---------------------------

channelResponses	<i>Response calculation</i>
------------------	-----------------------------

Description

From spectrum to protein level – Response variable calculation

Usage

```
channelResponses(dwide, acc)
```

Arguments

dwide	iTRAQ data in wide format including columns corresponding to iTRAQ channels containing their intensities.
acc	result of an accumulation of sample sizes

copyLoadings	<i>Adjust for confounding – copy loadings from one experiment to another</i>
--------------	--

Description

This is important when analysing enriched samples. Here, use the loading averages from the corresponding non-enriched sample.

Usage

```
copyLoadings(fromWide, toWide)
```

Arguments

fromWide	iTRAQ data in wide format
toWide	iTRAQ data in wide format

factoring	<i>Sample design – Generating multiple factor designs from one-dimensional factor</i>
-----------	---

Description

Making a multiple-factor ANOVA from the single channel variable of an iTRAQ experiment.

Usage

```
factoring(dwide, cvmat)
```

Arguments

dwide	iTRAQ data in wide format including columns corresponding to iTRAQ channels containing their intensities.
cvmat	a matrix that hold the information on which channel is mapped to which factor.

Details

This function uses a matrix convmat to convert the single channel into a full fledged multiple factor ANOVA.

Examples

```

channels <- c("X113", "X114", "X115", "X116", "X117", "X118", "X119") #, "X121")
typus     <- c(rep(c("A", "B", "C"), each=2), "reference")
treatment <- c(rep(c("I", "II"), 3), "mixed")
convmat   <- data.frame(channels=channels, typus=typus, treatment=treatment)
print(convmat)
## Not run: factoring(dwide, cvmat=convmat)

```

meetSelection

*Data parsing – from Proteom Discover v1.4***Description**

Has been tested with PD v1.4

Usage

```
meetSelection(dwide, ch, ref)
```

Arguments

dwide	raw data from a PD export.
ch	the column names which hold the reporter ion intensities.
ref	the column name which holds the reporter ion intensities of the reference channel.

Details

This is a rather neat function that allows to get data from an export from the software Proteom Discoverer into R and parsed into a reasonable data frame such one can work with it. It will also add a few statistics and create unique identifiers for all identified peptides. You may argue that this functionality alone is worth the import of the whole package.

Examples

```

## Not run:
bio1 <- read.csv("my-proteome-discoverer-v1.4-export-experiment-1.csv")
bio2 <- read.csv("my-proteome-discoverer-v1.4-export-experiment-2.csv")
run1 <- droplevels(bio1[bio1$Quan.Usage == "Used",])
run2 <- droplevels(bio2[bio2$Quan.Usage == "Used",])
channels <- c("X113", "X114", "X115", "X116", "X117", "X118", "X119", "X121")
reference <- c("X121")

run1 <- meetSelection(run1, channels, reference)
run2 <- meetSelection(run2, channels, reference)

run1$experiment <- factor(1, levels=1:2, labels=c("iTRAQ-1", "iTRAQ-2"))
run2$experiment <- factor(2, levels=1:2, labels=c("iTRAQ-1", "iTRAQ-2"))
runs <- rbind(run1, run2)

## End(Not run)

```

mergeFrames	<i>Merging multiple experiments</i>
-------------	-------------------------------------

Description

At the end each channel in each iTRAQ experiment can be uniquely identified by a barcode. If two channels of different experiments correspond to the same subject, the same barcode may be used and a method of combining these measurements be chosen.

Usage

```
mergeFrames(files, path, sampledesign)
```

Arguments

files	data frame of file names and corresponding ids.
path	leading to the files
sampledesign	data frame of ids, channelnames and corresponding barcodes.

norm2Reference	<i>Response calculation</i>
----------------	-----------------------------

Description

Norming the responses of a single iTRAQ to a given reference channel.

Usage

```
norm2Reference(dlong)
```

Arguments

dlong	iTRAQ data in long format.
-------	----------------------------

pAction *Plotting p-value distributions*

Description

Plotting p-value distributions

Usage

```
pAction(restest)
```

Arguments

restest result frame of test results

plotMePeptide *Plot interaction plots of peptides*

Description

Plot interaction plots of peptides

Usage

```
plotMePeptide(datP)
```

Arguments

datP subframe of peptide data

plotMeProtein *Plot interaction plots of proteins*

Description

Plot interaction plots of proteins

Usage

```
plotMeProtein(datP)
```

Arguments

datP subframe of protein data

pRetention *Plot Retention Time Statistics*

Description

Plot retention times with possible outliers

Usage

```
pRetention(rwide)
```

Arguments

rwide iTRAQ data in wide format with retention time information

Examples

```
## Not run:
iglobal <- addIonStatistics(pglobal)
rglobal <- addRetentionTimeStatistics(iglobal, .parallel=TRUE)
rglob$outlier <- with(rglob, abs(retention.atApex - retention) > 4)
p <- pRetention(rglobal)

p + geom_point(aes(retention.atApex, retention))
p + geom_point(aes(retention.atApex, retention-retention.atApex))
p + geom_point(aes(ppm, retention-retention.atApex))
p + geom_density(aes(x=ppm), alpha=.242)

## End(Not run)
```

pVioline *Plot Retention Time Statistics in violine form*

Description

Plot Retention Time Statistics in violine form

Usage

```
pVioline(dat, target)
```

Arguments

dat iTRAQ in log format
target of the norming

pVolcano *Volcano plot*

Description

Volcano plot

Usage

```
pVolcano(res, threshold, .foldchange = TRUE,  
          .plot = TRUE)
```

Arguments

res	result frame of test results
threshold	for biological reasonable effect
.foldchange	wheather results given in ratios or log-ratios
.plot	if true adds a plotting layer

responseStatistics *Summary statistics – Generic to calculate summary statistics*

Description

Calculates generic summary statistics based on a given formula.

Usage

```
responseStatistics(dwide, frm)
```

Arguments

dwide	iTRAQ data in wide format
frm	for example: frm <- value ~ protein + variable frm <- value ~ peptide + variable

selectByConfidence *Result filtering – Test for biological effect*

Description

The result file filtered by contains on the confidence intervals. This function will use these confidence intervals to filter out biological irrelevant effects.

Usage

```
selectByConfidence(res, threshold, foldchange = TRUE)
```

Arguments

res	Result file
threshold	Biologically reasonable threshold
foldchange	Is the threshold given a fold change or a log2-fold change. Default ist TRUE.

selectByEffect *Result filtering – Test for biological effect*

Description

Result filtering – Test for biological effect

Usage

```
selectByEffect(res, cutoff = 1)
```

Arguments

res	Result file
cutoff	the cutoff to be used in the selection

selectByFDR	<i>Result filtering</i>
-------------	-------------------------

Description

Result filtering

Usage

```
selectByFDR(res, fdr = 0.01)
```

Arguments

res	result frame of test results
fdr	fase discovery rate

testForPeptideEffect	<i>Data Analysis – Testing on peptide level</i>
----------------------	---

Description

Data Analysis – Testing on peptide level

Usage

```
testForPeptideEffect(dat, frm, conf.level, ...)
```

Arguments

dat	iTRAQ data in long format
frm	formal for the test
conf.level	confidence level
...	arguments understood by dply

testForProteinEffect *Data Analysis – Testing on protein level*

Description

Data Analysis – Testing on protein level

Usage

```
testForProteinEffect(dat, frm, conf.level, ...)
```

Arguments

dat	iTRAQ data in long format
frm	format for the test
conf.level	confidence level
...	arguments understood by ddply

testing *Data Analysis – Testing features with Tukey Honest Significant Differences*

Description

Data Analysis – Testing features with Tukey Honest Significant Differences

Usage

```
testing(dp, frm, conf.level)
```

Arguments

dp	iTRAQ data in long format
frm	format for the test
conf.level	confidence level

testingOneshot	<i>Data Analysis – Testing one feature without Tukey Honest Significant Differences</i>
----------------	---

Description

Data Analysis – Testing one feature without Tukey Honest Significant Differences

Usage

```
testingOneshot(model)
```

Arguments

model	ANOVA model of the corresponding fit
-------	--------------------------------------

testingTukey	<i>Data Analysis – Testing one feature with Tukey Honest Significant Differences</i>
--------------	--

Description

Data Analysis – Testing one feature with Tukey Honest Significant Differences

Usage

```
testingTukey(model, conf.level)
```

Arguments

model	ANOVA model of the corresponding fit
conf.level	confidence level

toAlpha	<i>Measuring stability – angle of loading vector</i>
---------	--

Description

Measuring stability by evaluating angle of loading vector from identity

Usage

```
toAlpha(dwide)
```

Arguments

dwide	iTRAQ data in wide format
-------	---------------------------

toProportions

Transformation – From intensity scales to density histograms

Description

Transformation – From intensity scales to density histograms

Usage

toProportions(dwide)

Arguments

dwide iTRAQ data in wide format
