

11: Ordination

John H Maindonald

August 20, 2015

Ideas and issues illustrated by the graphs in this vignette

Ordination is a generic name for methods for providing a low-dimensional view of points in multi-dimensional space, such that “similar” objects are near each other and dissimilar objects are separated. The plot(s) from an ordination in 2 or 3 dimensions may provide useful visual clues on clusters in the data and on outliers. The methods described here all use some form of multi-dimensional scaling (MDS)

1 Code for the Figures

```
fig11.1 <- function(){
  opar <- par(xpd=TRUE)
  if(!exists("aupoints")){
    cat("Trying to obtain audists from DAAG")
    if(!require(DAAG))return("'DAAG' must be installed")
    aupoints <- cmdscale(audists)
  }
  assign('aupoints', aupoints, pos=1)
  xlim <- range(aupoints[,1])
  xlim <- xlim + diff(xlim)*c(-0.05, 0.2)
  plot(aupoints, bty="n", xlab="", ylab="", xlim=xlim)
  labs <- rownames(aupoints)
  labpos <- rep(1, length(labs))
  labpos[labs%in%c("Cairns", "Melbourne")] <- 3
  labpos[labs=="Canberra"] <- 4
  text(aupoints, labels=labs, pos=labpos, xpd=TRUE)
  par(opar)
}
```

```
fig11.2A <- function(){
  if(!require(DAAG))return("'DAAG' must be installed")
```

```

if(!require(oz))return("Package 'oz' must be installed")
if(!exists('aupoints'))aupoints <- cmdscale(audists)
oz()
points(aulatlong, col="red", pch=16, cex=1.5)
latlong <- align2D(lat=aulatlong[,1], long=aulatlong[,2],
                     x1=aupoints[,1], x2 = aupoints[,2])
x <- with(latlong, as.vector(rbind(lat, fitlat, rep(NA,10))))
y <- with(latlong, as.vector(rbind(long, fitlong, rep(NA,10))))
lines(x, y, col="gray40", lwd=3)
}

```

```
