

On the usage of the `geepack`

Søren Højsgaard and Ulrich Halekoh

`geepack` version 1.2-0 as of 2014-09-13

1 Introduction

The primary reference for the `geepack` package is the Halekoh, U., Højsgaard, S., Yan, J. (2006) – paper in Journal of Statistical Software, see

```
> library(geepack)
> citation("geepack")

To cite geepack in publications use:

Højsgaard, S., Halekoh, U. & Yan J. (2006) The R Package geepack for
Generalized Estimating Equations Journal of Statistical Software, 15,
2, pp1--11

Yan, J. & Fine, J.P. (2004) Estimating Equations for Association
Structures Statistics in Medicine, 23, pp859--880.

Yan, J (2002) geepack: Yet Another Package for Generalized Estimating
Equations R-News, 2/3, pp12-14.
```

If you use `geepack` in your own work, please do cite the above reference.

This note contains a few extra examples. We illustrate the usage of a the `waves` argument and the `zcor` argument together with a fixed working correlation matrix for the `geeglm()` function. To illustrate these features we simulate some data suitable for a regression model.

```
> library(geepack)
> timeorder <- rep(1:5, 6)
> tvar <- timeorder + rnorm(length(timeorder))
> idvar <- rep(1:6, each=5)
> uuu <- rep(rnorm(6), each=5)
> yvar <- 1 + 2*tvar + uuu + rnorm(length(tvar))
> simdat <- data.frame(idvar, timeorder, tvar, yvar)
> head(simdat, 12)
```

	idvar	timeorder	tvar	yvar
1	1	1	0.4308348	0.9721636
2	1	2	0.4171669	1.5808820
3	1	3	2.3225641	7.1547640
4	1	4	5.5837173	11.9801894
5	1	5	5.6757944	12.8789759
6	2	1	-0.1963934	1.1967310
7	2	2	2.4591719	5.8145096
8	2	3	2.8922982	6.8448833
9	2	4	4.1328763	9.2357425
10	2	5	6.5851942	13.0100135
11	3	1	-0.8372539	-0.7312045
12	3	2	2.5806326	5.3786142

Notice that clusters of data appear together in `simdat` and that observations are ordered (according to `timeorder`) within clusters.

We can fit a model with an AR(1) error structure as

```

> mod1 <- geeglm(yvar~tvar, id=idvar, data=simdat, corstr="ar1")
> mod1

Call:
geeglm(formula = yvar ~ tvar, data = simdat, id = idvar, corstr = "ar1")

Coefficients:
(Intercept)      tvar
  1.820063      1.764176

Degrees of Freedom: 30 Total (i.e. Null);  28 Residual

Scale Link:              identity
Estimated Scale Parameters: [1] 1.362202

Correlation: Structure = ar1   Link = identity
Estimated Correlation Parameters:
      alpha
0.5504676

Number of clusters:  6   Maximum cluster size: 5

```

This works because observations are ordered according to time within each subject in the dataset.

2 Using the waves argument

If observations were not ordered according to cluster and time within cluster we would get the wrong result:

```

> set.seed(123)
> ## library(doBy)
> simdatPerm <- simdat[sample(nrow(simdat)),]
> ## simdatPerm <- orderBy(~idvar, simdatPerm)
> simdatPerm <- simdatPerm[order(simdatPerm$idvar),]
> head(simdatPerm)

  idvar timeorder   tvar   yvar
2     1         2 0.4171669 1.5808820
4     1         4 5.5837173 11.9801894
1     1         1 0.4308348  0.9721636
3     1         3 2.3225641  7.1547640
5     1         5 5.6757944 12.8789759
9     2         4 4.1328763  9.2357425

```

Notice that in `simdatPerm` data is ordered according to subject but the time ordering within subject is random.

Fitting the model as before gives

```

> mod2 <- geeglm(yvar~tvar, id=idvar, data=simdatPerm, corstr="ar1")
> mod2

Call:
geeglm(formula = yvar ~ tvar, data = simdatPerm, id = idvar,
        corstr = "ar1")

Coefficients:
(Intercept)      tvar
    1.650260    1.835375

Degrees of Freedom: 30 Total (i.e. Null);  28 Residual

Scale Link:              identity
Estimated Scale Parameters: [1] 1.324928

Correlation: Structure = ar1   Link = identity
Estimated Correlation Parameters:
alpha
0.5148134

Number of clusters:  6   Maximum cluster size: 5

```

Likewise if clusters do not appear contiguously in data we also get the wrong result (the clusters are not recognized):

```

> ## simdatPerm2 <- orderBy(~timeorder, data=simdat)
> simdatPerm2 <- simdat[order(simdat$timeorder),]
> geeglm(yvar~tvar, id=idvar, data=simdatPerm2, corstr="ar1")

Call:
geeglm(formula = yvar ~ tvar, data = simdatPerm2, id = idvar,
        corstr = "ar1")

Coefficients:
(Intercept)      tvar
    1.586836    1.863810

Degrees of Freedom: 30 Total (i.e. Null);  28 Residual

Scale Link:              identity
Estimated Scale Parameters: [1] 1.321515

Correlation: Structure = ar1   Link = identity
Estimated Correlation Parameters:
alpha
0

Number of clusters:  30   Maximum cluster size: 1

```

To obtain the right result we must give the `waves` argument:

```

> wav <- simdatPerm$timeorder
> wav

[1] 2 4 1 3 5 4 5 2 1 3 2 3 4 5 1 5 4 2 1 3 3 4 5 1 2 2 5 4 1 3

> mod3 <- geeglm(yvar~tvar, id=idvar, data=simdatPerm, corstr="ar1", waves=wav)
> mod3

Call:
geeglm(formula = yvar ~ tvar, data = simdatPerm, id = idvar,
        waves = wav, corstr = "ar1")

Coefficients:
(Intercept)      tvar
  1.820063      1.764176

Degrees of Freedom: 30 Total (i.e. Null);  28 Residual

Scale Link:              identity
Estimated Scale Parameters: [1] 1.362202

Correlation: Structure = ar1   Link = identity
Estimated Correlation Parameters:
      alpha
0.5504676

Number of clusters: 6   Maximum cluster size: 5

```

3 Using a fixed correlation matrix and the zcor argument

Suppose we want to use a fixed working correlation matrix:

```

> cor.fixed <- matrix(c(1, 0.5, 0.25, 0.125, 0.125,
+                      0.5, 1, 0.25, 0.125, 0.125,
+                      0.25, 0.25, 1, 0.5, 0.125,
+                      0.125, 0.125, 0.5, 1, 0.125,
+                      0.125, 0.125, 0.125, 0.125, 1), 5, 5)
> cor.fixed

      [,1] [,2] [,3] [,4] [,5]
[1,] 1.000 0.500 0.250 0.125 0.125
[2,] 0.500 1.000 0.250 0.125 0.125
[3,] 0.250 0.250 1.000 0.500 0.125
[4,] 0.125 0.125 0.500 1.000 0.125
[5,] 0.125 0.125 0.125 0.125 1.000

```

Such a working correlation matrix has to be passed to `geeglm()` as a vector in the `zcor` argument. This vector can be created using the `fixed2Zcor()` function:

```

> zcor <- fixed2Zcor(cor.fixed, id=simdatPerm$idvar, waves=simdatPerm$timeorder)
> zcor

[1] 0.125 0.500 0.250 0.125 0.125 0.500 0.125 0.250 0.125 0.125 0.125 0.125
[13] 0.125 0.500 0.125 0.125 0.125 0.500 0.250 0.250 0.125 0.125 0.125 0.500
[25] 0.500 0.125 0.250 0.125 0.125 0.125 0.125 0.125 0.125 0.125 0.125 0.125
[37] 0.500 0.500 0.250 0.250 0.500 0.125 0.250 0.250 0.125 0.125 0.125 0.125
[49] 0.125 0.500 0.125 0.125 0.500 0.250 0.125 0.125 0.125 0.125 0.500 0.250

```

Notice that `zcor` contains correlations between measurements within the same cluster. Hence if a cluster contains only one observation, then there will be generated no entry in `zcor` for that cluster. Now we can fit the model with:

```
> mod4 <- geeglm(yvar~tvar, id=idvar, data=simdatPerm, corstr="fixed", zcor=zcor)
> mod4

Call:
geeglm(formula = yvar ~ tvar, data = simdatPerm, id = idvar,
        zcor = zcor, corstr = "fixed")

Coefficients:
(Intercept)          tvar
  1.775079      1.805614

Degrees of Freedom: 30 Total (i.e. Null); 28 Residual

Scale Link:          identity
Estimated Scale Parameters: [1] 1.335053

Correlation: Structure = fixed Link = identity
Estimated Correlation Parameters:
alpha:1
      1

Number of clusters: 6 Maximum cluster size: 5
```
