

Package ‘WeightedCluster’

June 20, 2017

Version 1.2-1

Date 2017-06-20

Title Clustering of Weighted Data

Depends R (>= 3.0.0), TraMineR (>= 2.0-6), cluster

Imports utils, RColorBrewer

Suggests RUnit, knitr, isotone, vegan, lattice

SystemRequirements C++11

VignetteBuilder knitr

Description Clusters state sequences and weighted data. It provides an optimized weighted PAM algorithm as well as functions for aggregating replicated cases, computing cluster quality measures for a range of clustering solutions and plotting clusters of state sequences.

License GPL (>= 2)

URL <http://mephisto.unige.ch/weightedcluster>

NeedsCompilation yes

as.clustrange

Build a clustrange object to compare different clustering solutions.

Description

Build a clustrange object to compare different clustering solutions.

Usage

```
as.clustrange(object, diss, weights=NULL, R=1, samplesize=NULL, ...)
## S3 method for class 'twins'
as.clustrange(object, diss, weights=NULL, R=1, samplesize=NULL, ncluster=20, ...)
## S3 method for class 'hclust'
as.clustrange(object, diss, weights=NULL, R=1, samplesize=NULL, ncluster=20, ...)
## S3 method for class 'clustrange'
plot(x, stat="noCH", legendpos="bottomright",
      norm="none", withlegend=TRUE, lwd=1, col=NULL, ylab="Indicators",
      xlab="N clusters", conf.int=0.9, ci.method="none", ci.alpha=.3, line="t0", ...)
```

Arguments

object	The object to convert such as a data.frame.
diss	A dissimilarity matrix or a dist object (see dist).
weights	Optional numerical vector containing weights.
R	Optional number of bootstrap that can be used to build confidence intervals.
samplesize	Size of bootstrap sample. Default to sum of weights.
ncluster	Integer. Maximum number of cluster. The range will include all clustering solution starting from two to ncluster.
x	A clustrange object to be plotted.
stat	Character. The list of statistics to plot or "noCH" to plot all statistics except "CH" and "CHsq" or "all" for all statistics. See wcClusterQuality for a list of possible values. It is also possible to use "RHC" to plot the quality measure 1-HC. Unlike HC, RHC should be maximized as all other quality measures.
legendpos	Character. legend position, see legend .
norm	Character. Normalization method of the statistics can be one of "none" (no normalization), "range" (given as (value -min)/(max-min), "zscore" (adjusted by mean and standard deviation) or "zscoremed" (adjusted by median and median of the difference to the median).
withlegend	Logical. If FALSE, the legend is not plotted.
lwd	Numeric. Line width, see par .
col	A vector of line colors, see par . If NULL, a default set of color is used.
xlab	x axis label.
ylab	y axis label.

<code>conf.int</code>	Confidence to build the confidence interval (default: 0.9).
<code>ci.method</code>	Method used to build the confidence interval (only if bootstrap has been used, see R above). One of "none" (do not plot confidence interval), "norm" (based on normal approximation), "perc" (based on percentile.)
<code>ci.alpha</code>	alpha color value used to plot the interval.
<code>line</code>	Which value should be plotted by the line? One of "t0" (value for actual sample), "mean" (average over all bootstraps), "median"(median over all bootstraps).
<code>...</code>	Additional parameters passed to/from methods.

Details

`as.clustrange` convert objects to `clustrange` objects. `clustrange` objects contains a list of clustering solution with associated statistics and can be used to find the optimal clustering solution. If object is a `data.frame` or a `matrix`, each column should be a clustering solution to be evaluated. If object is an `hclust` or `twins` objects (i.e. hierarchical clustering output, see [hclust](#), [diana](#) or [agnes](#)), the function compute all clustering solution ranging from two to `ncluster` and compute the associated statistics.

Value

An object of class `clustrange` with the following elements:

`clustering`: A `data.frame` of all clustering solutions.

`stats`: A `matrix` containing the clustering statistics of each cluster solution.

See Also

See also [wckMedRange](#), [wcClusterQuality](#).

Examples

```
data(mvad)
## Aggregating state sequence
aggMvad <- wcAggregateCases(mvad[, 17:86], weights=mvad$weight)

## Creating state sequence object
mvad.seq <- seqdef(mvad[aggMvad$aggIndex, 17:86], weights=aggMvad$aggWeights)

## Compute distance using Hamming distance
diss <- seqdist(mvad.seq, method="HAM")

## Ward clustering
wardCluster <- hclust(as.dist(diss), method="ward", members=aggMvad$aggWeights)

## Computing clustrange from Ward clustering
wardRange <- as.clustrange(wardCluster, diss=diss,
weights=aggMvad$aggWeights, ncluster=15)

## Plot all statistics (standardized)
```

```
plot(wardRange, stat="all", norm="zscoremed", lwd=3)

## Plot HC, RHC and ASW
plot(wardRange, stat=c("HC", "RHC", "ASWw"), norm="zscore", lwd=3)
```

as.seqtree

Convert a hierarchical clustering object to a seqtree object.

Description

Convert a hierarchical clustering object to a seqtree object which can then be displayed using [seqtreedisplay](#).

Usage

```
as.seqtree(object, seqdata, diss, weighted=TRUE, ...)
## S3 method for class 'twins'
as.seqtree(object, seqdata, diss, weighted=TRUE, ncluster, ...)
## S3 method for class 'hclust'
as.seqtree(object, seqdata, diss, weighted=TRUE, ncluster, ...)
```

Arguments

object	An object to be converted to a seqtree .
seqdata	State sequence object.
diss	A dissimilarity matrix or a dist object (see dist)
weighted	Logical. If TRUE, weights of the seqdata object are taken to build the tree.
ncluster	Maximum number of cluster. The tree will be builded until this number of cluster.
...	Additional parameters passed to/from methods.

Details

By default `as.seqtree` try to convert the object to a `data.frame` assuming that it contains a list of nested clustering solutions. Be aware that `seqtree` and `as.seqtree` only support binary splits.

If object is an `hclust` or `twins` objects (i.e. hierarchical clustering output, see [hclust](#), [diana](#) or [agnes](#)), the function returns a `seqtree` object reproducing the agglomerative schedule.

Value

A [seqtree](#) object.

Examples

```

data(mvad)
## Aggregating state sequence
aggMvad <- wcAggregateCases(mvad[, 17:86], weights=mvad$weight)

## Creating state sequence object
mvad.seq <- seqdef(mvad[aggMvad$aggIndex, 17:86], weights=aggMvad$aggWeights)

## COmpute distance using Hamming distance
diss <- seqdist(mvad.seq, method="HAM")

## Ward clustering
wardCluster <- hclust(as.dist(diss), method="ward", members=aggMvad$weight)

st <- as.seqtrees(wardCluster, seqdata=mvad.seq, diss=diss, weighted=TRUE, ncluster=10)

print(st)

## You typically want to run (You need to install GraphViz before)
## seqtreedisplay(st, type="d", border=NA)

```

seqclustname

Automatic labeling of cluster using sequence medoids

Description

This function automatically name the cluster using the sequence medoid of each cluster.

Usage

```
seqclustname(seqdata, group, diss, weighted = TRUE, perc = FALSE)
```

Arguments

seqdata	State sequence object (see seqdef).
group	A vector of clustering membership.
diss	a dissimilarity matrix or a dist object.
weighted	Logical. If TRUE, weights of the seqdata object are taken to find the medoids.
perc	Logical. If TRUE, the percentage of sequences in each cluster is added to the label of each group.

Value

A factor of clustering membership. The labels are defined using sequences medoids and optionally percentage of case in each cluster.

Examples

```

data(mvad)
## Aggregating state sequence
aggMvad <- wcAggregateCases(mvad[, 17:86], weights=mvad$weight)

## Creating state sequence object
mvad.seq <- seqdef(mvad[aggMvad$aggIndex, 17:86], weights=aggMvad$aggWeights)
## Computing Hamming distance between sequence
diss <- seqdist(mvad.seq, method="HAM")

## KMedoids using PAMonce method (clustering only)
clust5 <- wckMedoids(diss, k=5, weights=aggMvad$aggWeights)

clust5.labels <- seqclustname(mvad.seq, clust5$clustering, diss=diss, perc=TRUE)
seqdplot(mvad.seq, group=clust5.labels)

```

wcAggregateCases	<i>Aggregate identical cases.</i>
------------------	-----------------------------------

Description

Function to aggregate identical cases.

Usage

```

wcAggregateCases(x, weights = NULL, ...)
## S3 method for class 'data.frame'
wcAggregateCases(x, weights=NULL, ...)
## S3 method for class 'matrix'
wcAggregateCases(x, weights=NULL, ...)
## S3 method for class 'wcAggregateCases'
print(x, ...)

```

Arguments

x	The object to aggregate.
weights	Numeric. An optional case weights vector.
...	Optional additional arguments.

Value

A wcAggregateCases object with the following components:

aggIndex Index of the unique cases in the original object data.

aggWeights Aggregated case weights

disaggIndex Index of the original object data in the unique cases.

disaggWeights Original weights used.

Examples

```
data(mvad)
## Taking only the father unemployment and
## success at the end of compulsory schooling.
myData <- mvad[ , c("funemp", "gcse5eq")]
## Computing aggregated cases informations
ac <- wcAggregateCases(myData, weights=mvad$weight)
print(ac)
## Retrieving unique cases in the original data set
uniqueData <- myData[ac$aggIndex, ]
## Table from original data
table.orig <- xtabs(mvad$weight~funemp+gcse5eq, data=myData)

## Table from aggregated data
table.agg <- xtabs(ac$aggWeights~funemp+gcse5eq, data=uniqueData)

## Both table are equal, no information is lost
## (only the call command is different)
all(table.orig == table.agg)
```

wcClusterQuality	<i>Cluster quality statistics</i>
------------------	-----------------------------------

Description

Compute several quality statistics of a given clustering solution.

Usage

```
wcClusterQuality(diss, clustering, weights = NULL)
```

Arguments

diss	A dissimilarity matrix or a dist object (see dist)
clustering	Factor. A vector of clustering membership.
weights	optional numerical vector containing weights.

Details

Compute several quality statistics of a given clustering solution. See value for details.

Value

A list with two elements stats and ASW:

stats with the following statistics:

- PBC** Point Biserial Correlation. Correlation between the given distance matrix and a distance which equal to zero for individuals in the same cluster and one otherwise.
- HG** Hubert's Gamma. Same as previous but using Kendall's Gamma coefficient.
- HGSD** Hubert's Gamma (Somers'D). Same as previous but using Somers' D coefficient.
- ASW** Average Silhouette width (observation).
- ASWw** Average Silhouette width (weighted).
- CH** Calinski-Harabasz index (Pseudo F statistics computed from distances).
- R2** Share of the discrepancy explained by the clustering solution.
- CHsq** Calinski-Harabasz index (Pseudo F statistics computed from *squared* distances).
- R2sq** Share of the discrepancy explained by the clustering solution (computed using *squared* distances).
- HC** Hubert's C coefficient.

ASW: The Average Silhouette Width of each cluster, one column for each ASW measure.

Examples

```
data(mvad)
## Aggregating state sequence
aggMvad <- wcAggregateCases(mvad[, 17:86], weights=mvad$weight)

## Creating state sequence object
mvad.seq <- seqdef(mvad[aggMvad$aggIndex, 17:86], weights=aggMvad$aggWeights)
## Computing Hamming distance between sequence
diss <- seqdist(mvad.seq, method="HAM")

## KMedoids using PAMonce method (clustering only)
clust5 <- wckMedoids(diss, k=5, weights=aggMvad$aggWeights, cluster.only=TRUE)

## Compute the silhouette of each observation
qual <- wcClusterQuality(diss, clust5, weights=aggMvad$aggWeights)

print(qual)
```

wcCmpCluster

Automatic comparison of clustering methods.

Description

Automatically compute different clustering solutions and associated quality measures to help identifying the best one.

Usage

```

wcCmpCluster(diss, weights = NULL, maxcluster, method = "all", pam.combine = TRUE)
## S3 method for class 'clustringfamily'
print(x, max.rank=1, ...)
## S3 method for class 'clustringfamily'
summary(object, max.rank=1, ...)
## S3 method for class 'clustringfamily'
plot(x, group="stat", method="all", pam.combine=FALSE,
      stat="noCH", norm="none", withlegend=TRUE, lwd=1, col=NULL, legend.prop=NA,
      rows=NA, cols=NA, main=NULL, xlab="", ylab="", ...)

```

Arguments

diss	A dissimilarity matrix or a dist object (see dist).
weights	Optional numerical vector containing weights.
maxcluster	Integer. Maximum number of cluster. The range will include all clustering solution starting from two to ncluster.
method	A vector of hierarchical clustering methods to compute or "all" for all methods. Possible values include "ward", "single", "complete", "average", "mcquitty", "median", "centroid" (using hclust), "pam" (using wcKMedRange), "diana" (only for unweighted datasets using diana), "beta.flexible" (only for unweighted datasets using agnes)
pam.combine	Logical. Should we try all combinations of hierarchical and PAM clustering?
x	A clustringfamily object to plot or print
object	A clustringfamily object to summarize
max.rank	Integer. The different number of solution to print/summarize
group	One of "stat" or "method". If "stat", plots are grouped by statistics, otherwise by clustering methods.
stat	Character. The list of statistics to plot or "noCH" to plot all statistics except "CH" and "CHsq" or "all" for all statistics. See wcClusterQuality for a list of possible values. It is also possible to use "RHC" to plot the quality measure 1-HC. Unlike HC, RHC should be maximized as all other quality measures.
norm	Character. Normalization method of the statistics can be one of "none" (no normalization), "range" (given as (value -min)/(max-min), "zscore" (adjusted by mean and standard deviation) or "zscoremed" (adjusted by median and median of the difference to the median).
withlegend	Logical. If FALSE, the legend is not plotted.
lwd	Numeric. Line width, see par .
col	A vector of line colors, see par . If NULL, a default set of color is used.
legend.prop	When withlegend=TRUE, sets the proportion of the graphic area used for plotting the legend. Default value is set according to the place (bottom or right of the graphic area) where the legend is plotted. Values from 0 to 1.
rows, cols	optional arguments to arrange plots.

`xlab` x axis label.
`ylab` y axis label.
`main` main title of the plot.
`...` Additionnal parameters passed to [lines](#).

Value

An object of class `clustringfamily` with the following elements:

Method name: the results of [as.clustrange](#) objects under each method name (see argument `method` for a list of possible values)

allstats: A matrix containing the clustering statistics for each cluster solution and method.

param: The parameters set when the function was called.

See Also

See Also [as.clustrange](#)

Examples

```

data(mvad)

#Creating state sequence object
mvad.seq <- seqdef(mvad[, 17:86])

# Compute distance using Hamming distance
diss <- seqdist(mvad.seq, method="HAM")

#Ward clustering
allClust <- wcCmpCluster(diss, maxcluster=15, method=c("average", "pam", "beta.flexible"),
                        pam.combine=FALSE)

summary(allClust, max.rank=3)

##Plot PBC, RHC and ASW
plot(allClust, stat=c("PBC", "RHC", "ASW"), norm="zscore", lwd=2)

##Plot PBC, RHC and ASW grouped by cluster method
plot(allClust, group="method", stat=c("PBC", "RHC", "ASW"), norm="zscore", lwd=2)

```

wcKMedoids

K-Medoids or PAM clustering of weighted data.

Description

K-Medoids or PAM clustering of weighted data.

Usage

```
wckMedoids(diss, k, weights=NULL, npass = 1, initialclust=NULL,
method="PAMonce", cluster.only = FALSE, debuglevel=0)
```

Arguments

<code>diss</code>	A dissimilarity matrix or a <code>dist</code> object (see dist).
<code>k</code>	Integer. The number of cluster.
<code>weights</code>	Numeric. Optional numerical vector containing case weights.
<code>npass</code>	Integer. Number of random start solution to test.
<code>initialclust</code>	An integer vector, a factor, an "hclust" or a "twins" object. Can be either the index of the initial medoids (length should equal to <code>k</code>) or a vector specifying an initial clustering solution (length should then be equal to the number of observation.). If <code>initialclust</code> is an "hclust" or a "twins" object, then the initial clustering solution is taken from the hierarchical clustering in <code>k</code> groups.
<code>method</code>	Character. One of "KMedoids", "PAM" or "PAMonce" (default). See details.
<code>cluster.only</code>	Logical. If FALSE, the quality of the retained solution is computed.
<code>debuglevel</code>	Integer. If greater than zero, print some debugging messages.

Details

K-Medoids algorithms aim at finding the best partition of the data in a `k` predefined number of groups. Based on a dissimilarity matrix, those algorithms seeks to minimize the (weighted) sum of distance to the medoid of each group. The medoid is defined as the observation that minimize the sum of distance to the other observations of this group. The function `wckMedoids` support three differents algorithms specified using the `method` argument:

"KMedoids" Start with a random solution and then iteratively adapt the medoids using an algorithm similar to `kmeans`. Part of the code is inspired (but completely rewritten) by the C clustering library (see de Hoon et al. 2010). If you use this solution, you should set `npass>1` to try several solution.

"PAM" See `pam` in the `cluster` library. This code is based on the one available in the `cluster` library (Maechler et al. 2011). The advantage over the previous method is that it try to minimize a global criteria instead of a local one.

"PAMonce" Same as previous but with two optimizations. First, the optimization presented by Reynolds et al. 2006. Second, only evaluate possible swap if the dissimilarity is greater than zero. This algorithm is used by default.

`wckMedoids` works differently according to the `diss` argument. It may be faster using a matrix but require more memory (since all distances are stored twice). All combination between `method` and `diss` argument are possible, except for the "PAM" algorithm were only distance matrix may be used (use the "PAMonce" algorithm instead).

Value

An integer vector with the index of the medoids associated with each observation.

Examples

```
data(mvad)
## Aggregating state sequence
aggMvad <- wcAggregateCases(mvad[, 17:86], weights=mvad$weight)

## Creating state sequence object
mvad.seq <- seqdef(mvad[aggMvad$aggIndex, 17:86], weights=aggMvad$aggWeights)
## Computing Hamming distance between sequence
diss <- seqdist(mvad.seq, method="HAM")

## K-Medoids
clust5 <- wckMedoids(diss, k=5, weights=aggMvad$aggWeights)

## clust5$clustering contains index number of each medoids
## Those medoids are
unique(clust5$clustering)

## Print the medoids sequences
print(mvad.seq[unique(clust5$clustering), ], informat="SPS")

## Some info about the clustering
print(clust5)

## Plot sequences according to clustering solution.
seqdplot(mvad.seq, group=clust5$clustering)
```

wckMedRange

Compute [wckMedoids](#) clustering for different number of clusters.

Description

Compute [wckMedoids](#) clustering for different number of clusters.

Usage

```
wckMedRange(diss, kval, weights=NULL, R=1, samplesize=NULL, ...)
```

Arguments

diss	A dissimilarity matrix or a dist object (see dist).
kvals	A numeric vector containing the number of cluster to compute.
weights	Numeric. Optional numerical vector containing case weights.
R	Optional number of bootstrap that can be used to build confidence intervals.
samplesize	Size of bootstrap sample. Default to sum of weights.
...	Additional parameters passed to wckMedoids .

Details

Compute a clustrange object using the [wckMedoids](#) method. clustrange objects contains a list of clustering solution with associated statistics and can be used to find the optimal clustering solution.

See [as.clustrange](#) for more details.

See Also

See [as.clustrange](#).

Examples

```
data(mvad)
## Aggregating state sequence
aggMvad <- wcAggregateCases(mvad[, 17:86], weights=mvad$weight)

## Creating state sequence object
mvad.seq <- seqdef(mvad[aggMvad$aggIndex, 17:86], weights=aggMvad$aggWeights)

## Compute distance using Hamming distance
diss <- seqdist(mvad.seq, method="HAM")

## Pam clustering
pamRange <- wckMedRange(diss, 2:15)

## Plot all statistics (standardized)
plot(pamRange, stat="all", norm="zscoremed", lwd=3)

## Plotting sequences in 3 groups
seqdplot(mvad.seq, group=pamRange$clustering$cluster3)
```

wcSilhouetteObs

Compute the silhouette of each object using weighted data.

Description

Compute the silhouette of each object using weighted data.

Usage

```
wcSilhouetteObs(diss, clustering, weights = NULL, measure="ASW")
```

Arguments

diss	A dissimilarity matrix or a dist object (see dist)
clustering	Factor. A vector of clustering membership.
weights	optional numerical vector containing weights.
measure	"ASW" or "ASWw", the measure of the silhouette. See the WeightedCluster vignettes .

Details

See the [silhouette](#) function in the [cluster](#) package for a detailed explanation of the silhouette.

Value

A numeric vector containing the silhouette of each observation.
