

Package ‘vegetable’

February 8, 2018

Version 0.1.1

Encoding UTF-8

Date 2018-01-01

Title Handling Vegetation Data Sets

Author Miguel Alvarez <kamapu78@gmail.com>

Maintainer Miguel Alvarez <kamapu78@gmail.com>

Depends R(>= 3.0.0), taxlist

Imports foreign, methods, plotKML, qdapRegex, sp, vegdata

Suggests devtools, vegan

LazyData true

Description Import and handling data from vegetation-plot databases, especially data stored in 'Turboveg' (<<https://www.synbiosys.alterra.nl/turboveg>>). Also import/export routines for exchange of data with 'Juice' (<<http://www.sci.muni.cz/botany/juice>>) are implemented.

License GPL (>= 2)

aggregate

Aggregating information into a data frame.

Description

This function aggregates information contained in [vegetable](#) objects to a summarizing data frame.

Usage

```
## S4 method for signature 'formula'
aggregate(x, data, FUN, use_nas=TRUE, ...)
```

Arguments

x	A formula indicating the variables used for the summary.
data	Either a data frame or an object of class vegtable .
FUN	Function used to aggregate values.
use_nas	Logical value indicating whether NA's should be included in categorical variables or not.
...	Further arguments passed to the function aggregate .

Details

This function works in a similar way as [crosstable](#).

Value

An object of class [data.frame](#).

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

See Also

[aggregate](#).

Examples

```
## Example follows
```

as.list	<i>Coerce an S4 object to a list.</i>
---------	---------------------------------------

Description

Coercion used to explore content in S4 objects.

Usage

```
## S4 method for signature 'vegtable'  
as.list(x, ...)  
  
## S4 method for signature 'coverconvert'  
as.list(x, ...)
```

Arguments

x	an object of class coverconvert or vegtable .
...	further arguments passed from or to other methods.

Details

S4 objects will be coerced to lists, where each slot in the input object becomes a member of the output list. This way allows to explore content and solve problems when validity checks fail.

Value

An object of class `list`.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
## Importing 'Easplist' from taxlist
library(taxlist)
data(Easplist)

## Head of slot 'taxonNames'
class(Easplist)
head(Easplist@taxonNames)

## The same after coercing to list
Easplist <- as.list(Easplist)
class(Easplist)
head(Easplist$taxonNames)
```

braun_blanquet-data *Conversion of Braun-Blanquet codes to cover percentage.*

Description

Cover values conversion as `coverconvert` object.

Usage

```
data(braun_blanquet)
```

Format

An object of class `coverconvert`.

Details

Object of class `coverconvert` contains conversion tables usually from a categorical variable (a cover scale) to a numerical one (equivalent percentage cover value). cover values are stored as range for each level in the scale (minimum and maximum cover value).

See Also

[coverconvert](#), [transform](#).

Examples

```
library(vegetable)
data(braun_blanquet)

## Quick displays
names(braun_blanquet)
summary(braun_blanquet)
summary(braun_blanquet$b_bdds)
```

clean	<i>Clean orphaned records in vegetable object.</i>
-------	--

Description

Delete entries in slots header and species orphaned by manipulation of slots.

Usage

```
## S4 method for signature 'vegetable'
clean(object, times=2, ...)
```

Arguments

object	A vegetable object.
times	Numeric value indicating how many times should be the cleaning be repeated.
...	Further arguments passed from or to other methods.

Details

Orphaned records generated by modifications in some slots may cause a loss on the validity of [vegetable](#) objects. This function should be applied to optimise the allocated size of a [vegetable](#) object, as well. Since running cleaning only once does not assure the deletion of all orphaned entries, it is recommended to run it at least twice. This repetition of cleaning is controlled by the argument 'times'.

Value

A clean [vegetable](#) object.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegtable)
data(Kenya_veg)

## Direct manipulation of slot header generates an invalid object
Kenya_veg@header <- Kenya_veg@header[1:50,]
summary(Kenya_veg)

## Now apply cleaning
Kenya_veg <- clean(Kenya_veg)
summary(Kenya_veg)
```

coverconvert-class *Cover conversion tables.*

Description

Cover conversion tables for [vegtable](#) objects.

Details

This class implements conversions from different cover scales in percentage cover. For transformations to percentage cover, the function [transform](#) should be than used.

Slots

value List containing the levels of each scale.

conversion List with the respective start and end cut levels for the scale levels.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

See Also

[tv2coverconvert](#), [braun_blanquet](#).

Examples

```
library(vegtable)
showClass("coverconvert")

## Add a custom scale
Scale <- new("coverconvert")
Scale$my_scale <- list(
  value=factor(c("low", "medium", "high"), levels=c("low", "medium", "high")),
  conversion=c(0, 50, 75, 100))
summary(Scale)
```

`crosstable`*Generating cross tables from database lists.*

Description

This function is generating cross tables, which are the most common format used by statistical packages analysing vegetation data (e.g. [vegan](#)).

Usage

```
## S4 method for signature 'formula,data.frame'  
crosstable(formula, data, FUN, na_to_zero=FALSE,  
use_nas=TRUE, ...)
```

```
## S4 method for signature 'formula,vegetable'  
crosstable(formula, data, FUN, na_to_zero=FALSE,  
use_nas=TRUE, ...)
```

Arguments

<code>formula</code>	A formula indicating the variables used in the cross table.
<code>data</code>	Either a data frame or an object of class vegetable .
<code>FUN</code>	Function used to aggregate values.
<code>na_to_zero</code>	A logical value indicating whether zeros should be inserted into empty cells or not.
<code>use_nas</code>	Logical value indicating whether NAs should be considered as levels for categorical variables or not.
<code>...</code>	Further arguments passed to the function aggregate .

Details

Most applications and displays of vegetation data use preferentially the cross table format. For convenience, the formula has the form 'abundance ~ plot + species + ...'. Additional variables used for rows (...) can be for instance the layers.

For objects of class [vegetable](#), the formula can also include variables from the species list (for example 'AcceptedName', 'AuthorName') or even taxon traits.

Value

An object of class [data.frame](#).

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegetable)

## load Kenya_veg and subset to reference 2331 (Bronner 1990)
data(Kenya_veg)
Kenya_veg <- subset(Kenya_veg, REFERENCE == 2331, slot="header")

## transform cover to percentage
Kenya_veg <- transform(Kenya_veg, to="cover_perc", rule="middle")

## cross table of the first 5 plots
Cross <- crosstable(cover_perc ~ ReleveID + AcceptedName + AuthorName,
  Kenya_veg[1:5,], mean, na_to_zero=TRUE)
head(Cross)
```

df2vegetable

Convert a data frame into a vegetable object.

Description

Conversion of a data frame containing a crosstable of abundance or cover of species in single plots.

Usage

```
df2vegetable(x, species, layer, ...)
```

Arguments

x	A data frame formatted for a taxlist object.
species	Numeric or integer indicating the position of the column with species names.
layer	Numeric or integer indicating the position of the column with layers.
...	Further arguments passed from or to other methods.

Details

This function coerces a data frame containing a vegetation cross table into a [vegetable](#) object. The input data frame 'x' may include information on the layers or not.

Value

A [vegetable](#) object.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
## Creating data set 'dune_veg'
library(vegtable)
library(vegan)

## Load data from vegan
data(dune)
data(dune.env)

## Conversion to vegtable
dune_veg <- data.frame(species=colnames(dune), t(dune), stringsAsFactors=FALSE,
                      check.names=FALSE)
dune_veg <- df2vegtable(dune_veg, species=1)

summary(dune_veg)

## Adding environmental variables
dune.env$ReleveID <- as.integer(rownames(dune.env))
header(dune_veg) <- dune.env

summary(dune_veg)
```

dune_veg-data

Dutch Dune Meadows.

Description

Data set from the package [vegan](#), converted to a [vegtable](#) object.

Usage

```
data(dune_veg)
```

Format

An object of class [vegtable](#).

Source

Original data were imported from [dune](#).

References

Jongman RHG, ter Braak CJE, van Tongeren OFR (1987). *Data analysis in community and landscape ecology*. Pudoc, Wageningen, NL.

Examples

```
library(vegetable)
data(dune_veg)
summary(dune_veg)
```

 Extract

Select or replace elements in objects.

Description

Methods for quick access to slot 'header' of [vegetable](#) objects or for access to single cover scales in [coverconvert](#) objects. Also replacement methods are implemented.

Usage

```
## S4 method for signature 'vegetable'
x$name

## S4 method for signature 'vegetable'
x[i, j, ..., drop=FALSE]

## S4 method for signature 'coverconvert'
x$name
```

Arguments

x	Object of class vegetable .
...	Further arguments passed to or from other methods.
name	A name to access.
i, j	Indices for access.
drop	A logical value passed to Extract .

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegetable)
data(Kenya_veg)

## Range of latitude values in database
range(Kenya_veg$LATITUDE)

## Summary of countries
summary(Kenya_veg$COUNTRY)
summary(droplevels(Kenya_veg$COUNTRY))
```

```
## First 5 samples
summary(Kenya_veg[1:5,])
```

header	<i>Retrieve or replace slot header in 'vegetable' objects.</i>
--------	--

Description

Retrieve or replace the content of slot 'header' in `vegetable` objects.

Usage

```
## S4 method for signature 'vegetable'
header(x, ...)

header(x) <- value
```

Arguments

x	Object of class <code>vegetable</code> .
value	Data frame to be set as slot header.
...	Further arguments passed to or from other methods.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegetable)
data(Kenya_veg)

head(header(Kenya_veg))
```

Kenya_veg-data	<i>Vegetation-Plots from Kenya.</i>
----------------	-------------------------------------

Description

A subset of `SWEA-Dataveg` including five references providing plots collected in Kenya.

Usage

```
data(Kenya_veg)
```

Format

An object of class `vegetable`.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>), Michael Curran (<currmi01@gmail.com>).

Examples

```
library(vegetable)
data(Kenya_veg)
summary(Kenya_veg)
```

make_cocktail

Produce a Cocktail classification.

Description

Classification of `vegetable` objects according to **Cocktail** algorithms.

Usage

```
## S4 method for signature 'shaker,vegetable'
make_cocktail(shaker, vegetable, which, cover,
syntax="Syntax", FUN=sum, ...)
```

Arguments

shaker	An object of class shaker containing the respective cocktail definitions.
vegetable	An object of class vegetable containing the vegetation observations to be classified.
which	Integer or character indicating the definition to be applied for classification.
cover	Name of the cover variable in <code>vegetable</code> .
syntax	Character value indicating the name of the retrieved variable including the final classification of plots.
FUN	Function used for merging multiple occurrence of species in a single plot.
...	Further arguments passed from or to other methods.

Details

Cocktail algorithms are logical functions selecting plots according to either occurrence of species groups and cover values of single species. A group will be declared as occurring in a plot when at least a half of its members is present in the plot.

This function inserts single columns with logical values indicating whether a plot is classified in the vegetation unit or not. An additional column (name provided in argument 'syntax') compile all vegetation units, indicating with a '+' symbol those plots classified in more than one vegetation unit. When only a part of the formulas will be used, it should be specified by the argument 'which'.

Value

A data frame corresponding to the slot 'header' of input object 'vegetable', including the results of Cocktail classification for the respective plots.

See Also

[shaker](#), [vegetable](#), [Wetlands](#).

Examples

```

library(vegetable)

## Example from Alvarez (2017)
data(Wetlands)

Wetlands_veg@header <- make_cocktail(Wetlands, Wetlands_veg, cover="percen")
summary(as.factor(Wetlands_veg@header$Syntax))

## Same but only for two vegetation units
data(Wetlands)
Wetlands_veg@header <- make_cocktail(Wetlands, Wetlands_veg,
which=c("HY1", "HY2"), cover="percen")
summary(as.factor(Wetlands_veg@header$Syntax))

```

merge_taxa	<i>Merge concepts.</i>
------------	------------------------

Description

Merge taxon concepts form into single ones.

Usage

```

## S4 method for signature 'vegetable,numeric,missing'
merge_taxa(object, concepts, level, ...)

## S4 method for signature 'vegetable,missing,character'
merge_taxa(object, concepts, level, ...)

```

Arguments

object	Object of class vegetable .
concepts	Numeric (integer) vector including taxon concepts to be merged.
level	Character value indicating the level to which the taxa have to be merged.
...	Further arguments passed to merge_taxa ('taxlist' method).

Details

This method is applied to a function defined in the package [taxlist](#) and only modify the slot 'species' in the input 'object'.

Value

An object of class [vegetable](#).

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegetable)
data(Kenya_veg)

## Merge Olea capensis into one
summary(subset(Kenya_veg@species, grepl("Olea capensis", TaxonName),
slot="names"), "all")
Kenya_veg <- merge_taxa(Kenya_veg, c(52041,50432,50235))

## Check Olea capensis again
summary(subset(Kenya_veg@species, grepl("Olea capensis", TaxonName),
slot="names"), "all")
```

names	<i>Retrieve names of vegetable and coverconvert objects.</i>
-------	--

Description

Quick access to column names in slot header and names of conversion codes.

Usage

```
## S4 method for signature 'coverconvert'
names(x)

## S4 method for signature 'vegetable'
names(x)

## S4 method for signature 'vegetable'
dimnames(x)
```

Arguments

x An object of class [vegetable](#) or [coverconvert](#).

Details

These methods provide a quick display of the contents in [coverconvert](#) and [vegetable](#) objects.

Value

Either a vector or a list (in the case of 'dimnames') with the names of variables.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegtable)
data(Kenya_veg)

## All possibilities shown in 'Usage'
names(Kenya_veg@coverconvert)
names(Kenya_veg)
dimnames(Kenya_veg)
```

read_juice *Importing 'Juice' tables.*

Description

This function imports vegetation tables exported from 'Juice' (<http://www.sci.muni.cz/botany/juice>).

Usage

```
read_juice(file, encoding="LATIN-1", sep=";", na="", ...)
```

Arguments

file	Character value indicating the name of the file exported from 'Juice'.
encoding	Argument passed to readLines .
sep	Separator used to split rows into columns.
na	Character used as not available values.
...	Further arguments passed to readLines .

Details

For a properly import, you may strictly follow the export steps in 'Juice':

- Menu File -> Export -> Table -> to Spreadsheet Format File
- Check the option Export covers in %

In the header (see **Value**), the first column (juice_nr) corresponds to the plot number assigned by 'Juice' at import, while the column db_nr is the number originally assigned to the plot (e.g. 'Turboveg' ID).

Value

A list with two elements:

cross_table A data frame of species by plot.

header A data frame with header data.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegetable)

## Installed 'Juice' version of 'Wetlands_veg'
Veg <- file.path(path.package("vegetable"), "juice", "Wetlands_juice.txt")
Veg <- read_juice(Veg)
names(Veg)
```

```
set_pseudo,set_group,set_formula
      Set slots in shaker objects.
```

Description

Building [shaker](#) objects for Cocktail classifications.

Usage

```
## S4 method for signature 'shaker,taxlist,character'
set_pseudo(shaker, companion, pseudo,
pseudo_id, authority=FALSE, enc_cont="latin1", enc_gr="utf8", ...)

## S4 method for signature 'shaker,vegetable,character'
set_pseudo(shaker, companion, pseudo, ...)

## S4 method for signature 'shaker,taxlist,character'
set_group(shaker, companion, group,
group_id, authority=FALSE, enc_cont="latin1", enc_gr="utf8", ...)

## S4 method for signature 'shaker,vegetable,character'
set_group(shaker, companion, group, ...)

## S4 method for signature 'shaker,taxlist,character'
set_formula(shaker, companion, formula,
formula_id, authority=FALSE, enc_cont="latin1", enc_gr="utf8", ...)
```

```
## S4 method for signature 'shaker,vegetable,character'
set_formula(shaker, companion, formula,
...)
```

Arguments

shaker	Object of class shaker to be modified.
companion	Either a taxlist or a vegetable object.
pseudo,group	Character vector with names of taxa included in a pseudo-species or a species group.
formula	Character vector including a formula as definition of a vegetation unit.
pseudo_id,group_id,formula_id	Character value as name of the pseudo-species, species group or defined vegetation unit.
authority	Logical value indicating whether author names should be included in the taxon name or not.
enc_cont,enc_gr	Encodings used for special characters.
...	Further arguments passes from or to other methods.

Details

These functions are implemented for constructing or complementing [shaker](#) objects. Note that construction of those objects will always require a 'companion' object, which is either an object of class [taxlist](#) or [vegetable](#).

Value

A [shaker](#) object.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

See Also

[shaker](#), [make_cocktail](#).

Examples

```
library(vegetable)
data(Wetlands)

## Construct the 'shaker' object anew
Wetlands <- new("shaker")

## Set a pseudo-species
Wetlands <- set_pseudo(Wetlands, Wetlands_veg, c("Cyperus latifolius",
"Cyperus exaltatus"))
```

```
## Set a species group
Wetlands <- set_group(Wetlands, Wetlands_veg, group_id="Cyperus papyrus",
group=c(
  "Cyperus papyrus",
  "Cyclosorus interruptus",
  "Lepistemon owariense"))

## Set a formula
Wetlands <- set_formula(Wetlands, Wetlands_veg, formula_id="HE1",
formula="groups:'Cyperus papyrus' | species:'Cyperus papyrus > 50'")

## Summaries
summary(Wetlands)
summary(Wetlands, Wetlands_veg)
```

shaker-class

Class containing Cocktail algorithms.

Description

Objects used for collecting Cocktail definitions.

Details

These objects work as **expert systems** for recognition of defined vegetation units among plots of a [vegetable](#) object. A 'shaker' object will be always dependent on a [vegetable](#) object, which is called 'companion'. Since modifications in the companion may affect the functionality of the 'shaker' object, it will be recommended to create the last during a session by a source script instead of recycling them from old R images.

Slots

- pseudos** List containing IDs of taxa that will be merged into pseudo-species.
- groups** List containing IDs of taxa belonging to the same Cocktail group.
- dominants** data frame including lists of species used as dominant species in Cocktail algorithms, as well as operators and cover values used in the formulas.
- formulas** List with formulas that will be used as definitions for vegetation units.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

See Also

[set_pseudo](#), [set_group](#), [set_formula](#), [make_cocktail](#).

Examples

```
library(vegetable)
showClass("shaker")
```

subset	<i>Subset functions for vegetable objects.</i>
--------	--

Description

Produce subsets of [vegetable](#) objects.

Usage

```
## S4 method for signature 'vegetable'
subset(x, subset, slot="header", keep_children=FALSE,
keep_parents=FALSE, ...)
```

Arguments

x	A vegetable object for subset.
subset	Logical vector or operation for subset.
slot	Slot to be applied for subset.
keep_children	Argument passed to subset .
keep_parents	Argument passed to subset .
...	Further arguments passed from or to other methods.

Details

This function generate subsets of [vegetable](#) objects through logical operations. Such operations can be applied either to the plots, or the relations, which are the main slots in that class.

This method can be referred to the slot species the same way as [subset](#), then the rest of the data will include only references to the subset of species list.

Value

A S4 object of class [vegetable](#).

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegtable)
data(dune_veg)
summary(dune_veg)

## Select plots used as pastures
Pastures <- subset(dune_veg, Use == "Pasture", slot="header")
summary(Pastures)
```

summary	<i>Summary method for vegtable objects.</i>
---------	---

Description

Display summaries for [vegtable](#) objects.

Usage

```
## S4 method for signature 'vegtable'
summary(object, units="Kb", ...)

## S4 method for signature 'coverconvert'
summary(object, ...)

## S4 method for signature 'shaker'
summary(object, companion, authority=FALSE, ...)
```

Arguments

object	Object to be summarized.
units	Units used for object size (passed to format).
companion	Companion object (either a taxlist or a vegtable object).
authority	Logical value indicating whether authors should be displayed or not.
...	further arguments to be passed to or from other methods.

Details

Those methods are implemented for objects of the classes [vegtable](#), [coverconvert](#) and [shaker](#).

The method for class 'vegtable' retrieves the metadata, the size of the object, its validity and additional statistics on the content of input object.

For objects of class [shaker](#), the function 'summary' will either retrieve general statistics when 'companion' is missing, or a more detailed display when accompanied by a [taxlist](#) or [vegtable](#) object.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegtable)

## Summary for 'vegtable' objects
data(Wetlands)
summary(Wetlands_veg)

## Summary for 'coverconvert' objects
data(braun_blanquet)
summary(braun_blanquet)

## Summary for 'shaker' objects (alone and with companion)
summary(Wetlands)
summary(Wetlands, Wetlands_veg)
```

transform	<i>Convert cover scales to percent cover.</i>
-----------	---

Description

Convert values of a categorical cover scale to percentage values.

Usage

```
## S4 method for signature 'character,coverconvert'
transform(x, conversion, from=NULL,
rule="top", zeroto=0.1, ...)

## S4 method for signature 'factor,coverconvert'
transform(x, conversion, ...)

## S4 method for signature 'vegtable,missing'
transform(x, to, replace=FALSE, rule="top",
zeroto=0.1, ...)
```

Arguments

x	Either a factor or character vector, or a vegtable object.
conversion	An object of class coverconvert .
from	Scale name of values in 'x' as character value.
to	Name of the column in slot 'samples' for writing converted values.
replace	Logical value indicating whether existing cover values should be replaced or not.

rule	Rule applied for the conversion (see details).
zeroto	Value used to replace levels with bottom at 0% cover.
...	Further arguments passed from or to other methods.

Details

This function requires as input a [coverconvert](#) object which contains the conversion tables.

In the case of [vegtable](#) objects, the conversion is already embedded in the slot 'coverconvert'.

Three rules are implemented for transformation, either 'top' (values transformed to the top of the range), 'middle' (transformation at the midpoint), and 'bottom' (conversion at the lowest value of the range). In the later case, transformation ranges starting at 0% of cover can be set to a different value by the argument 'zeroto'.

When 'replace=FALSE', existing values of cover in the [vegtable](#) object will be maintained. Since there is not a standard naming of cover values, in the transformation the name of cover variable should be indicated in the argument 'to'.

Value

Either a vector or a [vegtable](#) object.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegtable)
data(Kenya_veg)

## Check the available scales
summary(Kenya_veg@coverconvert)

## Conversion by default 'top' rule
Kenya_veg <- transform(Kenya_veg, to="percent")
summary(as.factor(Kenya_veg@samples$percent))

## Conversion by 'middle' rule
Kenya_veg <- transform(Kenya_veg, to="percent", rule="middle", replace=TRUE)
summary(as.factor(Kenya_veg@samples$percent))

## Conversion by 'bottom' rule
Kenya_veg <- transform(Kenya_veg, to="percent", rule="bottom", replace=TRUE)
summary(as.factor(Kenya_veg@samples$percent))
```

tv2coverconvert *Importing conversion tables from 'Turboveg' databases.*

Description

This function reads the content of cover conversion tables stored in 'Turboveg' and attempts to reformat them in a more comprehensive structure.

Usage

```
tv2coverconvert(file, as.is=TRUE)
```

Arguments

`file` A connection to a DBF file containing conversion table in 'Turboveg'.
`as.is` A logical value passed to [read.dbf](#)

Details

This function is used by [tv2vegetable](#) to import the respective conversion table from 'Turboveg' databases. Note that conversion tables in 'Turboveg' have only stored the middle point for each cover class in a scale, thus it will be recommended to rebuild the 'coverconvert' slot or use [braun_blanquet](#).

Value

A [coverconvert](#) object.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

See Also

[tv2vegetable](#), [read.dbf](#).

Examples

```
library(vegetable)

## Installed 'Turboveg' version of "Fujiwara et al. (2014)"
TV_Home <- file.path(path.package("vegetable"), "tv_data", "popup", "Swea")
Table <- tv2coverconvert(file.path(TV_Home, "tvscale.dbf"))

## First scale have to be deleted from conversion table
Table@value <- Table@value[-1]
Table@conversion <- Table@conversion[-1]
summary(Table)
```

```
## Compare the 'Turboveg' version with a vegetable version
data(braun_blanquet)
summary(Table$br_b1)
summary(braun_blanquet$br_b1)
```

tv2vegetable

Import vegetation data from a 'Turboveg' databases.

Description

tv2vegetable imports vegetation data sets from 'Turboveg' data bases.

Usage

```
tv2vegetable(db, tv_home=tv.home(), skip_empty_relations=TRUE, skip_scale,
clean=TRUE)
```

Arguments

db	Name of 'Turboveg' data base as character value.
tv_home	'Turboveg' installation path as character value.
skip_empty_relations	Logical value indicating whether empty relations may be excluded from imported database or not.
skip_scale	Character value indicating scales to be excluded in slot 'coverconvert'.
clean	Logical value indicating whether output object should be cleaned or not.

Details

Import function for 'Turboveg' databases into an object of class [vegetable](#). Most of the contents of 'Turboveg' databases are included in DBF files and therefore imported by the function [read.dbf](#). The automatic setting of database path will be done by the function [tv.home](#) but it can be customised by the argument 'tv_home'.

The species list will be imported by using the function [tv2taxlist](#) and therefore formatted as a [taxlist](#) object. Similarly, conversion tables will be handled as [coverconvert](#) objects.

Empty columns in the header will be deleted in the imported object.

Value

A [vegetable](#) object.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

See Also

[tv2taxlist](#), [tv2coverconvert](#), [tv.home](#).

Examples

```
library(vegtable)

## Installed 'Turboveg' version of 'Fujiwara et al. (2014)'
TV_Home <- file.path(path.package("vegtable"), "tv_data")
Veg <- tv2vegtable("Fujiwara_2014", TV_Home)
summary(Veg)
```

used_synonyms	<i>Retrieve synonyms used in the data set.</i>
---------------	--

Description

Plots records are rather linked to plant names than plant taxon concepts. This function provides a quick report about synonyms used in a data set (a [vegtable](#) object) and their respective accepted name.

Usage

```
## S4 method for signature 'vegtable'
used_synonyms(x, ...)
```

Arguments

x A [vegtable](#) object.

... Further arguments to be passed from or to another methods.

Details

This function will only retrieve synonyms that are used in plot records.

Value

A data frame with following columns:

SynonymsID Usage ID of synonyms.

Synonym The synonym itself.

SynonymAuthor Author of synonym.

TaxonConceptID ID of the taxon concept.

AcceptedNameID Usage ID of the accepted name.

AcceptedName The respective accepted name.

AcceptedNameAuthor The author of the accepted name.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

See Also

[accepted_name](#).

Examples

```
library(vegetable)
data(Kenya_veg)

## Synonyms used in the Kenya_veg
Synonyms <- used_synonyms(Kenya_veg)
head(Synonyms)
```

vegetable-class	<i>Class vegetable.</i>
-----------------	-------------------------

Description

Class holding vegetation-plot data sets. Designed to content all information stored in ‘Turboveg’ databases in just one object.

Details

This class was designed to include information of relevés, header data and species in just one object. Objects can be created by calls of the form `new("vegetable", ...)`.

Slots

description A named character vector containing metadata.

samples A data frame with samples list.

header A data frame with plots data.

species Species list as a [taxlist](#) object.

layers A list including strata within samples as data frames.

relations A list including popup lists as data frames.

coverconvert A scale conversion object of class [coverconvert](#).

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

See Also

[tv2vegetable](#).

Examples

```
library(vegetable)
showClass("vegetable")
```

vegetable2kml	<i>Mapping of plot observations.</i>
---------------	--------------------------------------

Description

This function is a wrapper of [kml](#) producing and displaying KML files.

Usage

```
## S4 method for signature 'data.frame'
vegetable2kml(obj, file, coords=~ Longitude + Latitude,
              srs=CRS("+proj=longlat +datum=WGS84"))

## S4 method for signature 'vegetable'
vegetable2kml(obj, file, coords=~ LONGITUDE + LATITUDE,
              srs=CRS("+proj=longlat +datum=WGS84"))
```

Arguments

obj	Input object containing coordinate values.
file	Character value with the name of output file (including file extension).
coords	Either a character vector or a formula indicating the names of coordinate values.
srs	Spatial reference system as proj4string.

Details

Georeferenced plots can be quickly displayed in [Google Earth](#) using this function.

Value

A KML file, which will be automatically opened in [Google Earth](#).

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegetable)
data(Kenya_veg)

## Plots containing Podocarpus observations
Kenya_veg@species <- subset(Kenya_veg@species, grepl("Podocarpus", TaxonName),
slot="names")

Kenya_veg <- subset(Kenya_veg, TaxonUsageID %in%
Kenya_veg@species@taxonNames$TaxonUsageID, slot="samples")

## Not run: vegetable2kml(Kenya_veg, "Podocarpus.kml")
```

vegetable_stat

General statistics from vegetable objects.

Description

This function calculates general statistics of local ‘Turboveg’ databases as required by GIVD (Global Index of Vegetation-Plot Databases, <http://botanik3.botanik.uni-greifswald.de/givd/>).

Usage

```
vegetable_stat(vegetable)
```

Arguments

vegetable An object of class `vegetable`.

Details

This function is based on a script delivered by GIVD for summarising statistics required in the descriptions of databases (see meta data in the page of the Global Index for Vegetation-Plot Databases).

Author(s)

GIVD. Adapted by Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegetable)
data(Kenya_veg)

## Statistics for GIVD
vegetable_stat(Kenya_veg)
```

veg_relation	<i>Retrieve or replace relations in vegetable objects.</i>
--------------	--

Description

Tables providing information about levels of categorical variables in the header of a ‘Turboveg’ database are called ‘popups’ in ‘Turboveg’, but ‘relations’ in [vegetable](#). Such variables will be converted into factors in the slot ‘header’ according to the levels and their sorting in the respective relation.

Usage

```
## S4 method for signature 'vegetable,character'  
veg_relation(vegetable, relation, ...)  
  
veg_relation(vegetable, relation) <- value
```

Arguments

vegetable	An object of class vegetable .
relation	A character value indicating the veg_relation to be retrieved or replaced.
value	A data frame containing the new veg_relation.
...	Further arguments to be passed among methods.

Value

This function retrieves and object of class ‘data.frame’. In the replacement method, an object of class [vegetable](#) including ‘value’ in the slot ‘relations’.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegetable)  
data(Kenya_veg)  
  
## overview of references  
veg_relation(Kenya_veg, "REFERENCE")
```

Wetlands-data	<i>Vegetation-plots from Tanzania.</i>
---------------	--

Description

A subset of **SWEA-Dataveg** with plots sampled in Tanzania.

Usage

```
data(Wetlands)
```

Format

An object of class **shaker** ('Wetlands') and the respective companion as **vegetable** object ('Wetlands_veg').

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>), Michael Curran (<currmi01@gmail.com>).

Source

<http://www.givd.info/ID/AF-00-006>.

References

Alvarez M (2017). Classification of aquatic and semi-aquatic vegetation in two East African sites: Cocktail definitions and syntaxonomy. *Phytocoenologia*.

Examples

```
library(vegetable)
data(Wetlands)

summary(Wetlands)
summary(Wetlands_veg)
```

write_juice	<i>Exporting Tables for 'Juice'.</i>
-------------	--------------------------------------

Description

This function produce txt files as inport formats for 'Juice' (<http://www.sci.muni.cz/botany/juice/>).

Usage

```
## S4 method for signature 'vegetable,character,formula'
write_juice(data, file, formula,
header=c("COUNTRY","REFERENCE"), coords=c("LONGITUDE","LATITUDE"), FUN, ...)
```

Arguments

data	An object of class vegetable .
file	Character value indicating the name of output files (without file extension).
formula	A formula passed to crosstable .
header	Variables of header to be exported.
coords	Names of coordinate variables in header of 'data'.
FUN	Function passed to crosstable .
...	Further arguments passed to the function crosstable .

Details

This function produces two output files to be imported into a 'Juice' file: A vegetation table produced by [crosstable](#) and a header table. Both tables share the file name plus a suffix (table for the vegetation table and header for the header).

For the import in 'Juice', you may start with the table following in the menu 'File -> Import -> Table -> from Spreadsheet File (e.g. EXCEL Table)' and then follow the wizard. You further import the header table following in the menu 'File -> Import -> Header Data -> From Comma Delimited File'. Notice that the vegetation is a semi-colon delimited file, while the header is a comma delimited file.

Author(s)

Miguel Alvarez (<kamapu78@gmail.com>).

Examples

```
library(vegetable)
data(Kenya_veg)

## Only first 20 observations
Kenya_veg <- Kenya_veg[1:20,]
## Not run:
write_juice(Kenya_veg, "SWEA", FUN=mean)

## End(Not run)
```
