# Package 'aws.s3'

April 11, 2018

Type Package
Title 'AWS S3' Client Package
<b>Version</b> 0.3.11
<b>Date</b> 2018-04-09
<b>Description</b> A simple client package for the Amazon Web Services ('AWS') Simple Storage Service ('S3') 'REST' 'API' <a href="https://aws.amazon.com/s3/">https://aws.amazon.com/s3/</a> >.
License GPL (>= 2)
<pre>URL https://github.com/cloudyr/aws.s3</pre>
<pre>BugReports https://github.com/cloudyr/aws.s3/issues</pre>
<b>Imports</b> utils, tools, httr, xml2 (> 1.0.0), base64enc, digest, aws.signature (>= 0.3.7)
Suggests testthat, datasets
RoxygenNote 6.0.1
NeedsCompilation no
Author Thomas J. Leeper [aut, cre] ( <a href="https://orcid.org/0000-0003-4097-6326">https://orcid.org/0000-0003-4097-6326</a> ),  Boettiger Carl [ctb],  Andrew Martin [ctb],  Mark Thompson [ctb],  Tyler Hunt [ctb],  Steven Akins [ctb],  Bao Nguyen [ctb],  Thierry Onkelinx [ctb]

# Description

AWS S3 Client Package

# **Details**

A simple client package for the Amazon Web Services (AWS) Simple Storage Service (S3) REST API.

bucketlist 3

### Author(s)

Thomas J. Leeper <thosjleeper@gmail.com>

bucketlist

List Buckets

### **Description**

List buckets as a data frame

# Usage

```
bucketlist(add_region = FALSE, ...)
bucket_list_df(add_region = FALSE, ...)
```

# **Arguments**

 ${\sf add\_region}$ 

A logical (by default FALSE) indicating whether to add "Region" column to the output data frame. This simply induces a loop over get\_location for each

bucket.

... Additional arguments passed to s3HTTP.

### **Details**

bucketlist performs a GET operation on the base s3 endpoint and returns a list of all buckets owned by the authenticated sender of the request. If authentication is successful, this function provides a list of buckets available to the authenticated user. In this way, it can serve as a "hello world!" function, to confirm that one's authentication credentials are working correctly.

bucket\_list\_df and bucketlist are identical.

### Value

A data frame of buckets.

#### References

**API** Documentation

#### See Also

```
get_bucket, get_object
```

4 copy\_object

bucket_exists	Bucket exists?

# **Description**

Check whether a bucket exists and is accessible with the current authentication keys.

# Usage

```
bucket_exists(bucket, ...)
```

# **Arguments**

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

... Additional arguments passed to s3HTTP.

### Value

TRUE if bucket exists and is accessible, else FALSE.

#### References

### **API** Documentation

copy\_object

Copy Objects

# Description

Copy objects between S3 buckets

# Usage

```
copy_object(from_object, to_object = from_object, from_bucket, to_bucket,
  headers = list(), ...)
copy_bucket(from_bucket, to_bucket, ...)
```

# **Arguments**

from_object	A character string containing the name the object you want to copy.
to_object	A character string containing the name the object should have in the new bucket.
from_bucket	A character string containing the name of the bucket you want to copy from.
to_bucket	A character string containing the name of the bucket you want to copy into.
headers	List of request headers for the REST call.
	Additional arguments passed to s3HTTP.

delete\_bucket 5

# **Details**

copy\_object copies an object from one bucket to another without bringing it into local memory. For copy\_bucket, all objects from one bucket are copied to another (limit 1000 objects). The same keys are used in the old bucket as in the new bucket.

### Value

Something...

#### References

**API** Documentation

delete\_bucket

Delete Bucket

# **Description**

Deletes an S3 bucket.

# Usage

```
delete_bucket(bucket, ...)
```

# Arguments

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

... Additional arguments passed to s3HTTP.

#### Value

TRUE if successful, FALSE otherwise.

### References

**API Documentation** 

delete\_object

# Description

Deletes one or more objects from an S3 bucket.

# Usage

```
delete_object(object, bucket, quiet = TRUE, ...)
```

# Arguments

object	Character string with the object key, or an object of class "s3_object". In most cases, if object is specified as the latter, bucket can be omitted because the bucket name will be extracted from "Bucket" slot in object.
bucket	Character string with the name of the bucket, or an object of class "s3_bucket".
quiet	A logical indicating whether (when object is a list of multiple objects), to run the operation in "quiet" mode. Ignored otherwise. See API documentation for details.
	Additional arguments passed to s3HTTP.

# **Details**

object can be a single object key, an object of class "s3\_object", or a list of either.

# Value

TRUE if successful, otherwise an object of class  $aws\_error$  details if not.

# References

**API Documentation** 

# See Also

```
put_object
```

delete\_website 7

delete\_website

Bucket Website configuration

# Description

Get/Put/Delete the website configuration for a bucket.

### Usage

```
delete_website(bucket, ...)
put_website(bucket, request_body, ...)
get_website(bucket, ...)
```

# **Arguments**

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

Additional arguments passed to s3HTTP.

request\_body A character string containing an XML request body, as defined in the specifica-

tion in the API Documentation.

### Value

For put\_website and get\_website, a list containing the website configuration, if one has been set. For delete\_website: TRUE if successful, FALSE otherwise. An aws\_error object may be returned if the request failed.

### References

API Documentation: PUT website API Documentation: GET website API Documentation: DELETE website

getobject Deprecated

# Description

These functions are deprecated.

8 get\_acceleration

### Usage

```
getobject(...)
saveobject(...)
headobject(...)
copyobject(...)
copybucket(...)
putbucket(...)
putbucket(...)
deleteobject(...)
deletebucket(...)
```

# **Arguments**

. . . Arguments passed to updated versions of each function.

get\_acceleration

**Bucket Acceleration** 

# Description

Get/Put acceleration settings or retrieve acceleration status of a bucket.

# Usage

```
get_acceleration(bucket, ...)
put_acceleration(bucket, status = c("Enabled", "Suspended"), ...)
```

### **Arguments**

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

Additional arguments passed to s3HTTP.

Status Character string specifying whether acceleration should be "Enabled" or "Suspended".

get\_acl 9

#### **Details**

Transfer acceleration is a AWS feature that enables potentially faster file transfers to and from S3, particularly when making cross-border transfers (such as from a European client location to the 'us-east-1' S3 region). Acceleration must be enabled before it can be used. Once enabled, accelerate = TRUE can be passed to any aws.s3 function via s3HTTP. get\_acceleration returns the acceleration status of a bucket; put\_acceleration enables or suspends acceleration.

#### Value

For get\_acceleration: If acceleration has never been enabled or suspend, the value is NULL. Otherwise, the status is returned (either "Enabled" or "Suspended"). For put\_acceleration: If acceleration has never been enabled or suspend, the value is NULL.

#### References

API Documentation: PUT Bucket accelerate API Documentation: GET Bucket accelerate

### **Examples**

```
## Not run:
b <- bucketlist()
get_acceleration(b[[1]])
put_acceleration(b[[1]], "Enabled")
get_acceleration(b[[1]])
put_acceleration(b[[1]], "Suspended")
## End(Not run)</pre>
```

get\_acl

Get or put bucket/object ACLs

### Description

Access Control Lists (ACLs) control access to buckets and objects. These functions retrieve and modify ACLs for either objects or buckets.

# Usage

```
get_acl(object, bucket, ...)
put_acl(object, bucket, body, ...)
```

#### **Arguments**

object Character string with the object key, or an object of class "s3\_object". In most

cases, if object is specified as the latter, bucket can be omitted because the

bucket name will be extracted from "Bucket" slot in object.

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

10 get\_bucket

... Additional arguments passed to s3HTTP.

body A character string containing an XML-formatted ACL.

### **Details**

get\_acl retrieves an XML-formatted ACL for either an object (if specified) or a bucket (if specified).

### Value

For get\_acl a character string containing an XML-formatted ACL. For put\_acl: if successful, TRUE.

get\_bucket

List bucket contents

# **Description**

List the contents of an S3 bucket as either a list or data frame

# Usage

```
get_bucket(bucket, prefix = NULL, delimiter = NULL, max = NULL,
    marker = NULL, parse_response = TRUE, ...)

get_bucket_df(bucket, prefix = NULL, delimiter = NULL, max = NULL,
    marker = NULL, ...)
```

# **Arguments**

bucket	Character string with the name of the bucket, or an object of class "s3_bucket".
prefix	Character string that limits the response to keys that begin with the specified prefix
delimiter	Character string used to group keys. Read the AWS doc for more detail.
max	Integer indicating the maximum number of keys to return. The function will recursively access the bucket in case max > 1000. Use max = Inf to retrieve all objects.
marker	Character string that pecifies the key to start with when listing objects in a bucket. Amazon S3 returns object keys in alphabetical order, starting with key after the marker in order.
parse_response	logical, should we attempt to parse the response?
	Additional arguments passed to s3HTTP.

get\_bucketname 11

#### **Details**

From the AWS doc: "This implementation of the GET operation returns some or all (up to 1000) of the objects in a bucket. You can use the request parameters as selection criteria to return a subset of the objects in a bucket." The max and marker arguments can be used to retrieve additional pages of results. Values from a call are store as attributes

### Value

get\_bucket returns a list of objects in the bucket (with class "s3\_bucket"), while get\_bucket\_df returns a data frame (the only difference is the application of the as.data.frame() method to the list of bucket contents. If max is greater than 1000, multiple API requests are executed and the attributes attached to the response object reflect only the final request.

#### References

**API** Documentation

### See Also

```
bucketlist, get_object
```

### **Examples**

```
## Not run:
    # basic usage
    b <- bucketlist()
    get_bucket(b[1,1])
    get_bucket_df(b[1,1])

# bucket names with dots
    ## this (default) should work:
    get_bucket("this.bucket.has.dots", url_style = "path")
    ## this probably wont:
    #get_bucket("this.bucket.has.dots", url_style = "virtual")

## End(Not run)</pre>
```

get\_bucketname

**Utility Functions** 

# Description

Some utility functions for working with S3 objects and buckets

12 get\_bucket\_policy

### Usage

```
get_bucketname(x, ...)
## S3 method for class 'character'
get_bucketname(x, ...)
## S3 method for class 's3_bucket'
get_bucketname(x, ...)
## S3 method for class 's3_object'
get_bucketname(x, ...)
```

### **Arguments**

x An object.
... Ignored.

#### Value

get\_bucketname returns a character string.

# **Description**

Get/Put/Delete the bucket access policy for a bucket.

### Usage

```
get_bucket_policy(bucket, parse_response = TRUE, ...)
put_bucket_policy(bucket, policy, ...)
delete_bucket_policy(bucket, ...)
```

# **Arguments**

```
bucket Character string with the name of the bucket, or an object of class "s3_bucket".

parse_response A logical indicating whether to return the response as is, or parse and return as a list. Default is FALSE.

Additional arguments passed to s3HTTP.

policy A character string containing a bucket policy.
```

get\_cors 13

### **Details**

Bucket policies regulate who has what access to a bucket and its contents. The header argument can be used to specify "canned" policies and put\_bucket\_policy can be used to specify a more complex policy. The AWS Policy Generator can be useful for creating the appropriate JSON policy structure.

### Value

For get\_policy: A character string containing the JSON representation of the policy, if one has been set. For delete\_policy and put\_policy: TRUE if successful, FALSE otherwise.

### References

API Documentation API Documentation AWS Policy Generator

get\_cors CORS

# Description

Get/Put/Delete the cross origin resource sharing configuration information for a bucket.

### Usage

```
get_cors(bucket, ...)
put_cors(bucket, ...)
delete_cors(bucket, ...)
```

### **Arguments**

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

... Additional arguments passed to s3HTTP.

#### Value

For get\_cors: A list with cors configuration and rules. For delete\_cors: TRUE if successful, FALSE otherwise.

#### References

API Documentation: PUT cors API Documentation: GET cords API Documentation: DELETE cors

get\_encryption

get_encryption	Bucket encryption	

### **Description**

Get/Put/Delete bucket-level encryption settings.

# Usage

```
get_encryption(bucket, ...)
put_encryption(bucket, algorithm = c("AES256", "KMS"), kms_arn = NULL, ...)
delete_encryption(bucket, ...)
```

### **Arguments**

bucket	Character string with the name of the bucket, or an object of class "s3_bucket".
	Additional arguments passed to s3HTTP.
algorithm	A character string specifying whether to use "AES256" or "KMS" encryption.
kms_arn	If algorithm = "KMS", a KMS ARN.

# **Details**

get\_encryption returns the default encryption of a bucket; put\_encryption sets the default encryption. delete\_encryption deletes the encryption status.

#### Value

For get\_encryption: if encryption has never been set, the value is NULL. Otherwise, the encryption type is returned as a charater string. For put\_encryption or delete\_encryption: a logical TRUE

# References

API Documentation API Documentation

# Examples

```
## Not run:
    # example bucket
    put_bucket("mybucket")

# set and check encryption
    put_encryption("mybucket", "AES256")
    get_encryption("mybucket")

# delete encryption
    delete_encryption("mybucket")
```

get\_lifecycle 15

```
## End(Not run)
```

# Description

Get/Put/Delete the lifecycle configuration information for a bucket.

# Usage

```
get_lifecycle(bucket, ...)
put_lifecycle(bucket, request_body, ...)
delete_lifecycle(bucket, ...)
```

### **Arguments**

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

Additional arguments passed to s3HTTP.

A character string containing an XML request body, as defined in the specification in the API Documentation.

### Value

For get\_lifecycle: a list with lifecycle configuration, if it has been configured. For delete\_lifecycle: TRUE if successful, FALSE otherwise.

### References

API Documentation: PUT lifecycle API Documentation: GET lifecycle API Documentation: DELETE lifecycle

get\_notification

get\_location

**Bucket** location

# Description

Get the AWS region location of bucket.

# Usage

```
get_location(bucket, ...)
```

# Arguments

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

... Additional arguments passed to s3HTTP.

#### Value

A character string containing the region, if one has been set.

### References

**API Documentation** 

 ${\tt get\_notification}$ 

Notifications

# Description

Get/put the notification configuration for a bucket.

### Usage

```
get_notification(bucket, ...)
put_notification(bucket, request_body, ...)
```

# **Arguments**

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

... Additional arguments passed to s3HTTP.

request\_body A character string containing an XML request body, as defined in the specifica-

tion in the API Documentation.

get\_object 17

### Value

A list containing the notification configuration, if one has been set.

#### References

API Documentation: GET API Documentation: PUT

get\_object Get object

# **Description**

Retrieve an object from an S3 bucket

# Usage

```
get_object(object, bucket, headers = list(), parse_response = FALSE, ...)
save_object(object, bucket, file = basename(object), headers = list(),
    overwrite = TRUE, ...)
head_object(object, bucket, ...)
```

# **Arguments**

object	Character string with the object key, or an object of class "s3_object". In most cases, if object is specified as the latter, bucket can be omitted because the bucket name will be extracted from "Bucket" slot in object.
bucket	Character string with the name of the bucket, or an object of class "s3_bucket".
headers	List of request headers for the REST call.
parse_response	Passed through to s3HTTP, as this function requires a non-default setting. There is probably no reason to ever change this.
	Additional arguments passed to s3HTTP.
file	An R connection, or file name specifying the local file to save the object into.
overwrite	A logical indicating whether to overwrite file. Passed to write_disk. Default is TRUE.

### **Details**

get\_object retrieves an object into memory as a raw vector. save\_object saves an object to a local file. head\_object checks whether an object exists by executing an HTTP HEAD request; this can be useful for checking object headers such as "content-length" or "content-type".

Some users may find the raw vector response format of get\_object unfamiliar. The object will also carry attributes, including "content-type", which may be useful for deciding how to subsequently process the vector. Two common strategies are as follows. For text content types, running

18 get\_object

charToRaw may be the most useful first step to make the response human-readable. Alternatively, converting the raw vector into a connection using rawConnection may also be useful, as that can often then be passed to parsing functions just like a file connection would be.

#### Value

If file = NULL, a raw object. Otherwise, a character string containing the file name that the object is saved to.

### References

API Documentation: GET Object

API Documentation: GET Object torrent

API Document: HEAD Object

### See Also

```
get_bucket, put_object, delete_object
```

### **Examples**

```
## Not run:
 # get an object in memory
 ## create bucket
 b <- put_bucket("myexamplebucket")</pre>
 ## save a dataset to the bucket
 s3save(mtcars, bucket = b, object = "mtcars")
 obj <- get_bucket(b)</pre>
 ## get the object in memory
 x <- get_object(obj[[1]])</pre>
 load(rawConnection(x))
  "mtcars" %in% ls()
 # save an object locally
 y <- save_object(obj[[1]], file = object[[1]][["Key"]])</pre>
 y %in% dir()
 # return object using 'S3 URI' syntax
 get_object("s3://myexamplebucket/mtcars")
 # return parts of an object
 ## use 'Range' header to specify bytes
 get_object(object = obj[[1]], headers = list('Range' = 'bytes=1-120'))
## End(Not run)
```

get\_replication 19

# Description

Get/Delete the replication configuration for a bucket.

# Usage

```
get_replication(bucket, ...)
put_replication(bucket, request_body, ...)
delete_replication(bucket, ...)
```

# **Arguments**

bucket	Character string with the name of the bucket, or an object of class "s3_bucket".
	Additional arguments passed to s3HTTP.
request_body	A character string containing an XML request body, as defined in the specification in the API Documentation.

#### **Details**

get\_replication gets the current replication policy. delete\_replication deletes the replication
policy for a bucket.

# Value

For get\_replication: A list containing the replication configuration, if one has been set. For delete\_replication: TRUE if successful, FALSE otherwise.

### References

API Documentation: PUT replication API Documentation: GET replication API Documentation: DELETE replication

20 get\_tagging

get\_requestpayment requestPayment

### **Description**

Get/Put the requestPayment subresource for a bucket.

# Usage

```
get_requestpayment(bucket, ...)
put_requestpayment(bucket, ...)
```

### **Arguments**

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

... Additional arguments passed to s3HTTP.

# Value

A list containing the requestPayment information, if set.

### References

**API Documentation** 

get\_tagging

Bucket tagging

# **Description**

Get/delete the tag set for a bucket.

# Usage

```
get_tagging(bucket, ...)
put_tagging(bucket, tags = list(), ...)
delete_tagging(bucket, ...)
```

# **Arguments**

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

Additional arguments passed to s3HTTP.

A list containing key-value pairs of tag names and values.

get\_torrent 21

### Value

A list containing the tag set, if one has been set. For delete\_tagging: TRUE if successful, FALSE otherwise.

#### References

API Documentation: PUT tagging API Documentation: GET tagging API Documentation: DELETE tagging

# **Examples**

```
## Not run:
  put_tagging("mybucket", tags = list(foo = "1", bar = "2"))
  get_tagging("mybucket")
  delete_tagging("mybucket")
## End(Not run)
```

get\_torrent

Get object torrent

### **Description**

Retrieves a Bencoded dictionary (BitTorrent) for an object from an S3 bucket.

# Usage

```
get_torrent(object, bucket, ...)
```

# **Arguments**

object Character string with the object key, or an object of class "s3\_object". In most cases, if object is specified as the latter, bucket can be omitted because the bucket name will be extracted from "Bucket" slot in object.

Character string with the name of the bucket, or an object of class "s3\_bucket".

Additional arguments passed to s3HTTP.

### Value

Something.

#### References

**API** Documentation

22 get\_versions

get\_uploads

Multipart uploads

# **Description**

Get a list of multipart uploads for a bucket.

# Usage

```
get_uploads(bucket, ...)
```

# **Arguments**

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

Additional arguments passed to s3HTTP.

#### Value

A list containing the multipart upload information.

### References

**API** Documentation

get\_versions

**Bucket versions** 

# **Description**

Get/Put versioning settings or retrieve versions of bucket objects.

#### Usage

```
get_versions(bucket, ...)
get_versioning(bucket, ...)
put_versioning(bucket, status = c("Enabled", "Suspended"), ...)
```

# Arguments

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

Additional arguments passed to s3HTTP.

Status Character string specifying whether versioning should be "Enabled" or "Sus-

pended".

put\_bucket 23

### **Details**

get\_versioning returns the versioning status of a bucket; put\_versioning sets the versioning status. get\_versions returns information about bucket versions.

#### Value

For get\_versioning: If versioning has never been enabled or suspend, the value is NULL. Otherwise, the status is returned (either "Enabled" or "Suspended"). For put\_versioning: If versioning has never been enabled or suspend, the value is NULL. Otherwise, the status is returned (either "Enabled" or "Suspended"). For get\_versions: A list.

# References

API Documentation API Documentation

# Examples

```
## Not run:
  put_versioning("mybucket")
  get_versioning("mybucket")
  get_versions("mybucket")
## End(Not run)
```

put\_bucket

Create bucket

# **Description**

Creates a new S3 bucket.

# Usage

```
put_bucket(bucket, region = Sys.getenv("AWS_DEFAULT_REGION"),
    acl = c("private", "public-read", "public-read-write", "aws-exec-read",
    "authenticated-read", "bucket-owner-read", "bucket-owner-full-control"),
    headers = list(), ...)
```

### **Arguments**

bucket	Character string with the name of the bucket, or an object of class "s3_bucket".
region	A character string containing the AWS region. If missing, defaults to value of environment variable AWS_DEFAULT_REGION.
acl	A character string indicating a "canned" access control list. By default all bucket contents and objects therein are given the ACL "private". This can later be viewed using get_acl and modified using put_acl.
headers	List of request headers for the REST call.
	Additional arguments passed to s3HTTP.

24 put\_object

### **Details**

Bucket policies regulate who has what access to a bucket and its contents. The header argument can beused to specify "canned" policies and put\_bucket\_policy can be used to specify a more complex policy. The AWS Policy Generator can be useful for creating the appropriate JSON policy structure.

#### Value

TRUE if successful.

#### References

API Documentation AWS Policy Generator

# See Also

bucketlist, get\_bucket, delete\_bucket, put\_object, put\_encryption, put\_versioning

### **Examples**

```
## Not run:
   put_bucket("examplebucket")

# set a "canned" ACL to, e.g., make bucket publicly readable
   put_bucket("examplebucket", headers = list(`x-amz-acl` = "public-read")

## End(Not run)
```

put\_object

Put object

# Description

Puts an object into an S3 bucket

# Usage

```
put_object(file, object, bucket, multipart = FALSE, acl = c("private",
   "public-read", "public-read-write", "aws-exec-read", "authenticated-read",
   "bucket-owner-read", "bucket-owner-full-control"), headers = list(), ...)
put_folder(folder, bucket, ...)
```

put\_object 25

# **Arguments**

file	A character string containing the filename (or full path) of the file you want to upload to S3. Alternatively, an raw vector containing the file can be passed directly, in which case object needs to be specified explicitly.
object	A character string containing the name the object should have in S3 (i.e., its "object key"). If missing, the filename is used.
bucket	Character string with the name of the bucket, or an object of class "s3_bucket".
multipart	A logical indicating whether to use multipart uploads. See <a href="http://docs.aws.amazon.com/AmazonS3/latest/dev/mpuoverview.html">http://docs.aws.amazon.com/AmazonS3/latest/dev/mpuoverview.html</a> . If file is less than 100 MB, this is ignored.
acl	A character string indicating a "canned" access control list. By default all bucket contents and objects therein are given the ACL "private". This can later be viewed using get_acl and modified using put_acl.
headers	List of request headers for the REST call.
	Additional arguments passed to s3HTTP.
folder	A character string containing a folder name. (A trailing slash is not required.)

#### **Details**

This provide a generic interface for sending files (or serialized, in-memory representations thereof) to S3. Some convenience wrappers are provided for common tasks: e.g., s3save and s3saveRDS.

Note that S3 is a flat file store. So there is no folder hierarchy as in a traditional hard drive. However, S3 allows users to create pseudo-folders by prepending object keys with foldername/. The put\_folder function is provided as a high-level convenience function for creating folders. This is not actually necessary as objects with slashes in their key will be displayed in the S3 web console as if they were in folders, but it may be useful for creating an empty directory (which is possible in the web console).

# Value

If successful, TRUE.

 put_object(rawConnectionValue(x), object = "s3://myexamplebucketname/mtcars.csv")
 close(x)
 # read the object back from S3
 read.csv(text = rawToChar(get_object(object = "s3://myexamplebucketname/mtcars.csv")))
## End(Not run)
```

s3HTTP

S3 HTTP Requests

### Description

This is the workhorse function for executing API requests for S3.

# Usage

```
s3HTTP(verb = "GET", bucket = "", path = "", query = NULL,
headers = list(), request_body = "", write_disk = NULL,
accelerate = FALSE, dualstack = FALSE, parse_response = TRUE,
check_region = TRUE, url_style = c("path", "virtual"),
base_url = Sys.getenv("AWS_S3_ENDPOINT", "s3.amazonaws.com"),
verbose = getOption("verbose", FALSE), region = NULL, key = NULL,
secret = NULL, session_token = NULL, use_https = TRUE, ...)
```

### **Arguments**

verb

A character string containing an HTTP verb, defaulting to "GET".

bucket	A character string with the name of the bucket, or an object of class "s3_bucket". If the latter and a region can be inferred from the bucket object attributes, then that region is used instead of region.
path	A character string with the name of the object to put in the bucket (sometimes called the object or 'key name' in the AWS documentation.)
query	Any query arguments, passed as a named list of key-value pairs.
headers	A list of request headers for the REST call.
request_body	A character string containing request body data.
write_disk	If verb = "GET", this is, Ootionally, an argument like write_disk to write the result directly to disk.
accelerate	A logical indicating whether to use AWS transfer acceleration, which can produce significant speed improvements for cross-country transfers. Acceleration only works with buckets that do not have dots in bucket name.
dualstack	A logical indicating whether to use "dual stack" requests, which can resolve to either IPv4 or IPv6. See http://docs.aws.amazon.com/AmazonS3/latest/dev/dual-stack-endpoints.html.
parse_response	A logical indicating whether to return the response as is, or parse and return as a list. Default is TRUE.
check_region	A logical indicating whether to check the value of region against the apparent bucket region. This is useful for avoiding (often confusing) out-of-region errors. Default is TRUE.
url_style	A character string specifying either "path" (the default), or "virtual"-style S3 URLs.
base_url	A character string specifying the base URL for the request. There is no need to set this, as it is provided only to generalize the package to (potentially) support S3-compatible storage on non-AWS servers. The easiest way to use S3-compatible storage is to set the AWS_S3_ENDPOINT environment variable.
verbose	A logical indicating whether to be verbose. Default is given by options("verbose").
region	A character string containing the AWS region. Ignored if region can be inferred from bucket. If missing, defaults to "us-east-1".
key	A character string containing an AWS Access Key ID. If missing, defaults to value stored in environment variable AWS_ACCESS_KEY_ID.
secret	A character string containing an AWS Secret Access Key. If missing, defaults to value stored in environment variable AWS_SECRET_ACCESS_KEY.
session_token	Optionally, a character string containing an AWS temporary Session Token. If missing, defaults to value stored in environment variable AWS_SESSION_TOKEN.
use_https	Optionally, a logical indicating whether to use HTTPS requests. Default is TRUE.
	Additional arguments passed to an HTTP request function. such as GET.

# Details

This is mostly an internal function for executing API requests. In almost all cases, users do not need to access this directly.

28 s3save

# Value

the S3 response, or the relevant error.

oad
-----

# Description

Save/load R object(s) to/from S3

# Usage

```
s3save(..., object, bucket, envir = parent.frame(), opts = NULL)
s3save_image(object, bucket, opts = NULL)
s3load(object, bucket, envir = parent.frame(), ...)
```

# Arguments

	For s3save, one or more R objects to be saved via save and uploaded to S3. For s3load, see opts.
object	For s3save, a character string of the name of the object you want to save to. For s3load, a character string of the name of the object you want to load from S3.
bucket	Character string with the name of the bucket, or an object of class "s3_bucket".
envir	For s3save, an R environment to save objects from; for s3load, the environment to load objects into. Default is the parent.frame() from which the function is called.
opts	Additional arguments passed to s3HTTP.

# Value

For s3save, a logical, invisibly. For s3load, NULL invisibly.

s3saveRDS

saveRDS/readRDS

# Description

Serialization interface to read/write R objects to S3

# Usage

```
s3saveRDS(x, object = paste0(as.character(substitute(x)), ".rds"), bucket,
  compress = TRUE, ...)
s3readRDS(object, bucket, ...)
```

# Arguments

X	For s3saveRDS, a single R object to be saved via saveRDS and uploaded to S3. x is analogous to the object argument in saveRDS.
object	Character string with the object key, or an object of class "s3_object". In most cases, if object is specified as the latter, bucket can be omitted because the bucket name will be extracted from "Bucket" slot in object.
bucket	Character string with the name of the bucket, or an object of class "s3_bucket".
compress	A logical. See saveRDS.
	Additional arguments passed to s3HTTP.

30 s3source

### **Details**

Note that early versions of s3saveRDS from aws.s3 <= 0.2.4 unintentionally serialized objects to big endian format (due to defaults in serialize. This can create problems when attempting to read these files using readRDS. The function attempts to catch the issue and read accordingly, but may fail. The solution used internally is unserialize(memDecompress(get\_object(), "gzip"))

### Value

For s3saveRDS, a logical. For s3readRDS, an R object.

put_object("example.R", object = "example.R", bucket = b)
get_bucket(b)

# source the code from the bucket
s3source(object = "example.R", bucket = b, echo = TRUE)

# cleanup
unlink("example.R")
delete_object(object = "example.R", bucket = b)
delete_bucket("myexamplebucket")

## End(Not run)</pre>
```

s3sync

S3 file sync

# **Description**

Sync files/directories to/from S3

# Usage

```
s3sync(files = dir(recursive = TRUE), bucket, direction = c("upload",
   "download"), verbose = TRUE, ...)
```

32 s3sync

#### **Arguments**

files A character vector specifying relative paths to files to be synchronized. The default is all files in the working directory and subdirectories.

bucket Character string with the name of the bucket, or an object of class "s3\_bucket".

direction A character vector specifying whether to "upload" and/or "download" files. By

default, s3sync is two-way, uploading any files missing from the bucket and

downloading any objects missing from the local directory.

verbose A logical indicating whether to be verbose (the default is TRUE).

... Additional arguments passed to s3HTTP.

#### **Details**

s3sync synchronizes specified files to an S3 bucket. This works best if a local directory (and its subdirectories) correspond directly to the contents of an S3 bucket. If the bucket does not exist, it is created. Similarly, if local directories do not exist (corresponding to leading portions of object keys), they are created, recursively. Object keys are generated based on files and local files are named (and organized into directories) based on object keys. A slash is interpreted as a directory level. Local objects are copied to S3 and S3 objects are copied locally. This copying is performed conditionally. Objects existing locally but not in S3 are uploaded using put\_object. Objects existing in S3 but not locally, are saved using save\_object. If objects exist in both places, the MD5 checksum for each is compared; when identical, no copying is performed. If the checksums differ, local files are replaced with the bucket version if the local file is older and the S3 object is replaced if the local file is newer. If checksums differ but modified times match (which seems unlikely), a warning is issued.

#### Value

A logical.

s3write\_using 33

02wri+0	ucina
s3write	using

Custom read and write

# Description

Read/write objects from/to S3 using a custom function

# Usage

```
s3write_using(x, FUN, ..., object, bucket, opts = NULL)
s3read_using(FUN, ..., object, bucket, opts = NULL)
```

# Arguments

X	For s3write_using, a single R object to be saved via the first argument to FUN and uploaded to S3.
FUN	For s3write_using, a function to which x and a file path will be passed (in that order).
	Additional arguments to FUN
object	Character string with the object key, or an object of class "s3_object". In most cases, if object is specified as the latter, bucket can be omitted because the bucket name will be extracted from "Bucket" slot in object.
bucket	Character string with the name of the bucket, or an object of class "s3_bucket".
opts	Optional additional arguments passed to put_object or save_object, respectively.

# Value

For s3write\_using, a logical, invisibly. For s3read\_using, the output of FUN applied to the file from object.
