

Package ‘gRim’

March 31, 2017

Version 0.2-0

Title Graphical Interaction Models

Author Søren Højsgaard <sorenh@math.aau.dk>

Maintainer Søren Højsgaard <sorenh@math.aau.dk>

Description Provides the following types of models: Models for for contingency tables (i.e. log-linear models) Graphical Gaussian models for multivariate normal data (i.e. covariance selection models) Mixed interaction models.

Index **29**

| | |
|---------|---|
| CGstats | <i>Mean, covariance and counts for grouped data</i> |
|---------|---|

Description

CGstats provides what corresponds to calling `cov.wt` on different strata of data where the strata are defined by the combinations of factors in data.

Usage

```
CGstats(object, varnames = NULL, homogeneous = TRUE, simplify = TRUE)
```

Arguments

| | |
|--------------------------|--|
| <code>object</code> | A dataframe. |
| <code>varnames</code> | Names of variables to be used. |
| <code>homogeneous</code> | Logical; if TRUE a common covariance matrix is reported. |
| <code>simplify</code> | Logical; if TRUE the result will be presented in a simpler form. |

Value

A list whose form depends on the type of input data and the `varnames`.

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

See Also

[cov.wt](#)

Examples

```

data(milkcomp)
# milkcomp <- subset(milkcomp, (treat %in% c("a","b")) & (lactime %in% c("t1", "t2")))
# milkcomp <- milkcomp[,-1]
# milkcomp$treat <- factor(milkcomp$treat)
# milkcomp$lactime <- factor(milkcomp$lactime)

CGstats(milkcomp)
CGstats(milkcomp, c(1,2))
CGstats(milkcomp, c("lactime", "treat"))
CGstats(milkcomp, c(3,4))
CGstats(milkcomp, c("fat", "protein"))

CGstats(milkcomp, c(2,3,4), simplify=FALSE)
CGstats(milkcomp, c(2,3,4), homogeneous=FALSE)
CGstats(milkcomp, c(2,3,4), simplify=FALSE, homogeneous=FALSE)

```

ciTest-array

Test for conditional independence in a contingency table

Description

Test for conditional independence in a contingency table represented as an array.

Usage

```

ciTest_table(x, set = NULL, statistic = "dev", method = "chisq",
  adjust.df = TRUE, slice.info = TRUE, L = 20, B = 200, ...)

```

Arguments

| | |
|------------|---|
| x | An array of counts with named dimnames. |
| set | A specification of the test to be made. The tests are of the form u and v are independent conditionally on S where u and v are variables and S is a set of variables. See 'details' for details about specification of set. |
| statistic | Possible choices of the test statistic are "dev" for deviance and "X2" for Pearson's X^2 statistic. |
| method | Method of evaluating the test statistic. Possible choices are "chisq", "mc" (for Monte Carlo) and "smc" for sequential Monte Carlo. |
| adjust.df | Logical. Should degrees of freedom be adjusted for sparsity? |
| slice.info | Logical. Should slice info be stored in the output? |
| L | Number of extreme cases as stop criterion if method is "smc" (sequential Monte Carlo test); ignored otherwise. |

B Number (maximum) of simulations to make if method is "mc" or "smc" (Monte Carlo test or sequential Monte Carlo test); ignored otherwise.

... Additional arguments.

Details

set can be 1) a vector or 2) a right-hand sided formula in which variables are separated by '+'. In either case, it is tested if the first two variables in the set are conditionally independent given the remaining variables in set. (Notice an abuse of the '+' operator in the right-hand sided formula: The order of the variables does matter.)

If set is NULL then it is tested whether the first two variables are conditionally independent given the remaining variables.

Value

An object of class 'citest' (which is a list).

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

Examples

```
data(lizard)

## lizard is has named dimnames
names( dimnames( lizard ))
## checked with
is.named.array( lizard )

## Testing for conditional independence:
# the following are all equivalent:
ciTest(lizard, set=~diam + height + species)
# ciTest(lizard, set=c("diam", "height", "species"))
# ciTest(lizard, set=1:3)
# ciTest(lizard)
# (The latter because the names in lizard are as given above.)

## Testing for marginal independence
ciTest(lizard, set=~diam + height)
ciTest(lizard, set=1:2)

## Getting slice information:
ciTest(lizard, set=c("diam", "height", "species"), slice.info=TRUE)$slice

## Do Monte Carlo test instead of usual likelihood ratio test. Different
```

```
# options:

# 1) Do B*10 simulations divided equally over each slice:
ciTest(lizard, set=c("diam", "height", "species"), method="mc", B=400)
# 2) Do at most B*10 simulations divided equally over each slice, but stop
# when at most L extreme values are found
ciTest(lizard, set=c("diam", "height", "species"), method="smc", B=400)
```

ciTest-general

Generic function for conditional independence test

Description

Generic function for conditional independence test. Specializes to specific types of data.

Usage

```
ciTest(x, set = NULL, ...)
```

Arguments

| | |
|-----|---|
| x | An object for which a test for conditional independence is to be made. See 'details' for valid types of x. |
| set | A specification of the test to be made. The tests are of the form u and v are independent conditionally on S where u and v are variables and S is a set of variables. See 'details' for details about specification of set. |
| ... | Additional arguments to be passed on to other methods. |

Details

x can be 1) a table, 2) a dataframe whose columns are numerics and factors or 3) a list with components cov and n.obs.

set can be 1) a vector or 2) a right-hand sided formula in which variables are separated by '+'. In either case, it is tested if the first two variables in the set are conditionally independent given the remaining variables in set. (Notice an abuse of the '+' operator in the right-hand sided formula: The order of the variables does matter.)

Value

An object of class 'citest' (which is a list).

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

See Also

[ciTest.table](#), [ciTest_table](#), [ciTest.data.frame](#), [ciTest_df](#), [ciTest.list](#), [ciTest_mvn](#), [chisq.test](#)

Examples

```
## contingency table:
data(reinis)
## dataframe with only numeric variables:
data(carpass)
## dataframe with numeric variables and factors:
data(milkcomp1)

ciTest(cov.wt(carpass, method='ML'), set=~Fat11 + Meat11 + Fat12)
ciTest(reinis, set=~smo + phy + sys)
ciTest(milkcomp1, set=~tre + fat + pro)
```

ciTest_df

Test for conditional independence in a dataframe

Description

Test for conditional independence in a dataframe.

Usage

```
ciTest_df(x, set = NULL, ...)
```

Arguments

| | |
|-----|---|
| x | A dataframe. |
| set | A specification of the test to be made. The tests are of the form u and v are independent conditionally on S where u and v are variables and S is a set of variables. See 'details' for details about specification of set. |
| ... | Additional arguments. |

Details

set can be 1) a vector or 2) a right-hand sided formula in which variables are separated by '+'. In either case, it is tested if the first two variables in the set are conditionally independent given the remaining variables in set. (Notice an abuse of the '+' operator in the right-hand sided formula: The order of the variables does matter.)

If set is NULL then it is tested whether the first two variables are conditionally independent given the remaining variables.

If set consists only of factors then `x[, set]` is converted to a contingency table and the test is made in this table using `ciTest_table()`.

If set consists only of numeric values and integers then `x[, set]` is converted to a list with components `cov` and `n.obs` by calling `cov.wt(x[, set], method='ML')`. This list is then passed on to `ciTest_mvn()` which makes the test.

Value

An object of class 'citest' (which is a list).

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

| | |
|------------|--|
| ciTest_mvn | <i>Test for conditional independence in the multivariate normal distribution</i> |
|------------|--|

Description

Test for conditional independence in the multivariate normal distribution.

Usage

```
ciTest_mvn(x, set = NULL, statistic = "DEV", ...)
```

Arguments

| | |
|------------------------|---|
| <code>x</code> | A list with elements <code>cov</code> and <code>n.obs</code> (such as returned from calling <code>cov.wt()</code> on a dataframe. See examples below.) |
| <code>set</code> | A specification of the test to be made. The tests are of the form u and v are independent conditionally on S where u and v are variables and S is a set of variables. See 'details' for details about specification of <code>set</code> . |
| <code>statistic</code> | The test statistic to be used, valid choices are "DEV" and "F". |
| <code>...</code> | Additional arguments |

Details

set can be 1) a vector or 2) a right-hand sided formula in which variables are separated by '+'. In either case, it is tested if the first two variables in the set are conditionally independent given the remaining variables in set. (Notice an abuse of the '+' operator in the right-hand sided formula: The order of the variables does matter.)

If set is NULL then it is tested whether the first two variables are conditionally independent given the remaining variables.

x must be a list with components cov and n.obs such as returned by calling cov.wt(, method='ML') on a dataframe.

Value

An object of class 'citest' (which is a list).

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

See Also

[ciTest](#) [ciTest.table](#), [ciTest_table](#), [ciTest.data.frame](#), [ciTest_df](#), [ciTest.list](#), [ciTest_mvn](#), [chisq.test](#)

```
data(carcass)
ciTest(cov.wt(carcass, method='ML'), set=~Fat11+Meat11+Fat12)
ciTest_mvn(cov.wt(carcass, method='ML'), set=~Fat11+Meat11+Fat12)
```

ciTest_ordinal

A function to compute Monte Carlo and asymptotic tests of conditional independence for ordinal and/or nominal variables.

Description

The function computes tests of independence of two variables, say u and v, given a set of variables, say S. The deviance, Wilcoxon, Kruskal-Wallis and Jonkheere-Terpstra tests are supported. Asymptotic and Monte Carlo p-values are computed.

Usage

```
ciTest_ordinal(x, set = NULL, statistic = "dev", N = 0, ...)
```

Arguments

| | |
|-----------|--|
| x | A dataframe or table. |
| set | The variable set (u,v,S), given either as an integer vector of the column numbers of a dataframe or dimension numbers of a table, or as a character vector with the corresponding variable or dimension names. |
| statistic | Either "deviance", "wilcoxon", "kruskal" or "jt". |
| N | The number of Monte Carlo samples. If N<=0 then Monte Carlo p-values are not computed. |
| ... | Additional arguments, currently not used |

Details

The deviance test is appropriate when u and v are nominal; Wilcoxon, when u is binary and v is ordinal; Kruskal-Wallis, when u is nominal and v is ordinal; Jonckheere-Terpstra, when both u and v are ordinal.

Value

A list including the test statistic, the asymptotic p-value and, when computed, the Monte Carlo p-value.

| | |
|--------------|---------------------|
| P | Asymptotic p-value |
| montecarlo.P | Monte Carlo p-value |

```

cmod

Graphical Gaussian model

Description

Specification of graphical Gaussian model. The 'c' in the name cmod refers to that it is a (graphical) model for 'c'ontinuous variables

Usage

```
cmod(formula, data, marginal = NULL, fit = TRUE, details = 0)
```

Arguments

| | |
|----------|--|
| formula | Model specification in one of the following forms: 1) a right-hand sided formula, 2) as a list of generators, 3) an undirected graph (represented either as a graphNEL object or as an adjacency matrix). Notice that there are certain model specification shortcuts, see Section 'details' below |
| data | Data in one of the following forms: 1) A dataframe or 2) a list with elements cov and n.obs (such as returned by the cov.wt() function.) |
| marginal | Should only a subset of the variables be used in connection with the model specification shortcuts |
| fit | Should the model be fitted. |
| details | Control the amount of output; for debugging purposes. |

Details

The independence model can be specified as $\sim.^1$ and the saturated model as $\sim.^{..}$. The marginal argument can be used for specifying the independence or saturated models for only a subset of the variables.

Value

An object of class cModel (a list)

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

See Also

[dmod](#), [mmod](#), [ggmfit](#)

Examples

```
## Graphical Gaussian model
data(carcass)
cm1 <- cmod(~ .^., data=carcass)

## Stepwise selection based on BIC
cm2 <- backward(cm1, k=log(nrow(carcass)))

## Stepwise selection with fixed edges
cm3 <- backward(cm1, k=log(nrow(carcass)),
  fixin=matrix(c("LeanMeat", "Meat11", "Meat12", "Meat13", "LeanMeat", "Fat11", "Fat12", "Fat13"),
    ncol=2))
```

dmod

Log-linear model

Description

Specification of log-linear (graphical) model. The 'd' in the name dmod refers to that it is a (graphical) model for 'd'iscrete variables

Usage

```
dmod(formula, data, marginal = NULL, interactions = NULL, fit = TRUE,
  details = 0)
```

Arguments

| | |
|---------|---|
| formula | Model specification in one of the following forms: 1) a right-hand sided formula, 2) as a list of generators, 3) an undirected graph (represented either as a graphNEL object or as an adjacency matrix). Notice that there are certain model specification shortcuts, see Section 'details' below. |
| data | Either a table or a dataframe. In the latter case, the dataframe will be coerced to a table. See 'details' below. |

| | |
|--------------|--|
| marginal | Should only a subset of the variables be used in connection with the model specification shortcuts |
| interactions | A number given the highest order interactions in the model, see Section 'details' below. |
| fit | Should the model be fitted. |
| details | Control the amount of output; for debugging purposes. |
| ... | Additional arguments; currently no used. |

Details

The independence model can be specified as $\sim.^1$ and the saturated model as $\sim.^.$. Setting e.g. `interactions=3` implies that there will be at most three factor interactions in the model.

Data can be specified as a table of counts or as a dataframe. If data is a dataframe then it will be converted to a table (using `xtabs()`). This means that if the dataframe contains numeric values then the you can get a very sparse and high dimensional table. When a dataframe contains numeric values it may be worthwhile to discretize data using the `cut()` function.

The `marginal` argument can be used for specifying the independence or saturated models for only a subset of the variables. When `marginal` is given the corresponding marginal table of data is formed and used in the analysis (notice that this is different from the behaviour of `loglin()` which uses the full table).

The `triangulate()` method for discrete models (`dModel` objects) will for a model look at the dependence graph for the model.

Value

An object of class `dModel`.

Søren Højsgaard, <sorenh@math.aau.dk>

See Also

[cmod](#), [mmod](#)

Examples

```
## Graphical log-linear model
data(reinis)
dm1 <- dmod(~ .^., reinis)
dm2 <- backward(dm1, k=2)
dm3 <- backward(dm1, k=2, fixin=list(c("family", "phys", "systol")))
## At most 3-factor interactions
dm1<-dmod(~ .^., data=reinis, interactions=3)
```

| | |
|--------------|----------------|
| dModel-class | Class "dModel" |
|--------------|----------------|

Description

Setting formal classes for dModel, cModel and mModel objects

Objects from the Class

A virtual Class: No objects may be created from it.

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

Examples

```
showClass("dModel")
```

| | |
|-----------|---|
| effloglin | <i>Fitting Log-Linear Models by Message Passing</i> |
|-----------|---|

Description

Fit log-linear models to multidimensional contingency tables by Iterative Proportional Fitting.

Usage

```
effloglin(table, margin, fit = FALSE, eps = 0.01, iter = 20,
  print = TRUE)
```

Arguments

| | |
|--------|--|
| table | A contingency table |
| margin | A generating class for a hierarchical log-linear model |
| fit | If TRUE, the fitted values are returned. |
| eps | Convergence limit; see 'details' below. |
| iter | Maximum number of iterations allowed |
| print | If TRUE, iteration details are printed. |

Details

The function differs from `loglin` in that 1) data can be given in the form of a list of sufficient marginals and 2) the model is fitted only on the cliques of the triangulated interaction graph of the model. This means that the full table is not fitted, which means that `effloglin` is efficient (in terms of storage requirements). However `effloglin` is implemented entirely in R and is therefore slower than `loglin`.

Value

A list.

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

See Also

[loglin](#)

Examples

```
data(reinis)
glist <-list(c("smoke", "mental"), c("mental", "phys"), c("phys", "systol"
), c("systol", "smoke"))

stab <- lapply(glist, function(gg) tableMargin(reinis, gg))
fv3 <- effloglin(stab, glist, print=FALSE)
```

getEdges

Find edges in a graph and edges not in an undirected graph.

Description

Returns the edges of a graph (or edges not in a graph) where the graph can be either a `graphNEL` object, a list of generators or an adjacency matrix.

Usage

```
getEdges(object, type = "unrestricted", ingraph = TRUE, discrete = NULL,
...)
```

Arguments

| | |
|----------|--|
| object | An object representing a graph; either a generator list, a graphNEL object or an adjacency matrix. |
| type | Either "unrestricted" or "decomposable" |
| ingraph | If TRUE the result is the edges in the graph; if FALSE the result is the edges not in the graph. |
| discrete | This argument is relevant only if object specifies a marked graph in which some vertices represent discrete variables and some represent continuous variables. |
| ... | Additional arguments; currently not used. |

Details

When ingraph=TRUE: If type="decomposable" then getEdges() returns those edges e for which the graph with e removed is decomposable.

When ingraph=FALSE: Likewise, if type="decomposable" then getEdges() returns those edges e for which the graph with e added is decomposable.

The functions getInEdges() and getOutEdges() are just wrappers for calls to getEdges().

The workhorses are getInEdgesMAT() and getOutEdgesMAT() and these work on adjacency matrices.

Regarding the argument discrete, please see the documentation of [mcsmarked](#).

Value

A $p * 2$ matrix with edges.

Note

These functions work on undirected graphs. The behaviour is undocumented for directed graphs.

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

See Also

[edgeList](#), [nonEdgeList](#), [mcsmarked](#)

Examples

```
gg      <- ug(~a:b:d + a:c:d + c:e)
glist  <- getCliques(gg)
adjmat <- as.adjMAT(gg)

#### On a glist
getEdges(glist)
getEdges(glist, type="decomposable")
```

```

# Deleting (a,d) would create a 4-cycle

getEdges(glist, ingraph=FALSE)
getEdges(glist,type="decomposable", ingraph=FALSE)
# Adding (e,b) would create a 4-cycle

#### On a graphNEL
getEdges(gg)
getEdges(gg,type="decomposable")
# Deleting (a,d) would create a 4-cycle

getEdges(gg, ingraph=FALSE)
getEdges(gg,type="decomposable", ingraph=FALSE)
# Adding (e,b) would create a 4-cycle

#### On an adjacency matrix
getEdges(adjmat)
getEdges(adjmat,type="decomposable")
# Deleting (a,d) would create a 4-cycle

getEdges(adjmat, ingraph=FALSE)
getEdges(adjmat,type="decomposable", ingraph=FALSE)
# Adding (e,b) would create a 4-cycle

## Marked graphs; vertices a,b are discrete; c,d are continuous
UG <- ug(~a:b:c + b:c:d)
disc <- c("a","b")
getEdges(UG)
getEdges(UG, discrete=disc)
## Above: same results; there are 5 edges in the graph

getEdges(UG, type="decomposable")
## Above: 4 edges can be removed and will give a decomposable graph
##(only removing the edge (b,c) would give a non-decomposable model)

getEdges(UG, type="decomposable", discrete=c("a","b"))
## Above: 3 edges can be removed and will give a strongly decomposable
## graph. Removing (b,c) would create a 4--cycle and removing (a,b)
## would create a forbidden path; a path with only continuous vertices
## between two discrete vertices.

```

ggmfit

Iterative proportional fitting of graphical Gaussian model

Description

Fit graphical Gaussian model by iterative proportional fitting.

Usage

```
ggmfit(S, n.obs, glist, start = NULL, eps = 1e-12, iter = 1000,
       details = 0, ...)
```

Arguments

| | |
|---------|--|
| S | Empirical covariance matrix |
| n.obs | Number of observations |
| glist | Generating class for model (a list) |
| start | Initial value for concentration matrix |
| eps | Convergence criterion |
| iter | Maximum number of iterations |
| details | Controlling the amount of output. |
| ... | Optional arguments; currently not used |

Details

ggmfit is based on a C implementation. ggmfitr is implemented purely in R (and is provided mainly as a benchmark for the C-version).

Value

A list with

| | |
|------|--|
| lrt | Likelihood ratio statistic (-2logL) |
| df | Degrees of freedom |
| logL | log likelihood |
| K | Estimated concentration matrix (inverse covariance matrix) |

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

| | |
|--------------|---|
| ghk2phkParms | <i>Conversion between different parametrizations of mixed interaction models.</i> |
|--------------|---|

Description

Functions to convert between canonical parametrization (g,h,K), moment parametrization (p,m,S) and mixed parametrization (p,h,K).

Usage

```
ghk2phkParms(parms)
```

Arguments

| | |
|-------|---|
| parms | Parameters of a mixed interaction model |
|-------|---|

Value

Parameters of a mixed interaction model.

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

| | |
|----------------|---|
| iModel-general | <i>General functions related to iModels</i> |
|----------------|---|

Description

General functions related to iModels

Usage

```

## S3 method for class 'iModel'
logLik(object, ...)

## S3 method for class 'iModel'
extractAIC(fit, scale, k = 2, ...)

## S3 method for class 'iModel'
summary(object, ...)

## S3 method for class 'iModelsummary'
print(x, ...)

## S3 method for class 'iModel'
formula(x, ...)

## S3 method for class 'iModel'
terms(x, ...)

## S3 method for class 'dModel'
isGraphical(x)

## S3 method for class 'dModel'
isDecomposable(x)

modelProperties(object)

## S3 method for class 'dModel'
modelProperties(object)

```

Arguments

| | |
|----------------|---|
| object, fit, x | An iModel object. |
| ... | Currently unused. |
| scale | Unused (and irrelevant for these models) |
| k | Weight of the degrees of freedom in the AIC formula |

loglinDim

Return the dimension of a log-linear model

Description

Return the dimension of a log-linear model given by the generating class 'glist'. If the model is decomposable and adjusted dimension can be found.

Usage

```
loglinGenDim(glist, tableinfo)
loglinDecDim(glist, tableinfo, adjust=TRUE)
```

Arguments

| | |
|------------------------|--|
| <code>glist</code> | Generating class (a list) for a log-linear model. See 'details' below. |
| <code>tableinfo</code> | Specification of the levels of the variables. See 'details' below. |
| <code>adjust</code> | Should model dimension be adjusted for sparsity of data (only available for decomposable models) |

Details

`glist` can be either a list of vectors with variable names or a list of vectors of variable indices.

`tableinfo` can be one of three different things.

- 1) A contingency table (a table).
- 2) A list with the names of the variables and their levels (such as one would get if calling `dimnames` on a table).
- 3) A vector with the levels. If `glist` is a list of vectors with variable names, then the entries of the vector `tableinfo` must be named.

If the model is decomposable it `loglinDecDim` is to be preferred over `loglinGenDim` as the former is much faster.

Setting `adjust=TRUE` will force `loglinDecDim` to calculate a dimension which is adjusted for sparsity of data. For this to work, `tableinfo` *MUST* be a table.

Value

A numeric.

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

See Also

[dmod](#), [glm](#), [loglm](#)

Examples

```
## glist contains variable names and tableinfo is a named vector:
loglinGenDim(list(c("a","b"),c("b","c")), c(a=4,b=7,c=6))

## glist contains variable names and tableinfo is not named:
loglinGenDim(list(c(1,2),c(2,3)), c(4,7,6))

## For decomposable models:
loglinDecDim(list(c("a","b"),c("b","c")), c(a=4,b=7,c=6),adjust=FALSE)
```

`mmod`*Mixed interaction model.*

Description

A mixed interaction model is a model (often with conditional independence restrictions) for a combination of discrete and continuous variables.

Usage

```
mmod(formula, data, marginal = NULL, fit = TRUE, details = 0)
```

Arguments

| | |
|-----------------------|--|
| <code>formula</code> | A right hand sided formula specifying the model. |
| <code>data</code> | Data (a dataframe) |
| <code>marginal</code> | A possible subsets of columns of data; useful when formula contains model specification shortcuts. |
| <code>fit</code> | Currently not used |
| <code>details</code> | For printing debugging information |

Value

An object of class `mModel` and the more general class `iModel`.

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

Examples

```
### FIXME: To be written
```

`modify_glist`*Modify generating class for a graphical/hierarchical model*

Description

Modify generating class for a graphical/hierarchical model by 1) adding edges, 2) deleting edges, 3) adding terms and 4) deleting terms.

Usage

```
modify_glist(glist, items, details = 0)
```

Arguments

| | |
|----------------------|---|
| <code>glist</code> | A list of vectors where each vector is a generator of the model. |
| <code>items</code> | A list with edges / terms to be added and deleted. See section 'details' below. |
| <code>details</code> | Control the amount of output (for debugging purposes). |

Details

The `items` is a list with named entries as `list(add.edge=, drop.edge=, add.term=, drop.term=)`

Not all entries need to be in the list. The corresponding actions are carried out in the order in which they appear in the list.

See section 'examples' below for examples.

Notice that the operations do not in general commute: Adding an edge which is already in a generating class and then removing the edge again does not give the original generating class.

Value

A generating class for the modified model. The elements of the list are character vectors.

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

See Also

[cmod](#), [dmod](#), [mmod](#)

Examples

```
glist <- list(c(1,2,3),c(2,3,4))

## Add edges
modify_glist(glist, items=list(add.edge=c(1,4)))
modify_glist(glist, items=list(add.edge=~1:4))
```

```

## Add terms
modify_glist(glist, items=list(add.term=c(1,4)))
modify_glist(glist, items=list(add.term=~1:4))

## Notice: Only the first term is added as the second is already
## in the model.
modify_glist(glist, items=list(add.term=list(c(1,4),c(1,3))))
modify_glist(glist, items=list(add.term=~1:4 + 1:3))

## Notice: Operations are carried out in the order given in the
## items list and hence we get different results:
modify_glist(glist, items=list(drop.edge=c(1,4), add.edge=c(1,4)))
modify_glist(glist, items=list(add.edge=c(1,4), drop.edge=c(1,4)))

```

stepwise

Stepwise model selection in (graphical) interaction models

Description

Stepwise model selection in (graphical) interaction models

Usage

```

## S3 method for class 'iModel'
stepwise(object, criterion = "aic", alpha = NULL,
         type = "decomposable", search = "all", steps = 1000, k = 2,
         direction = "backward", fixin = NULL, fixout = NULL, details = 0,
         trace = 2, ...)

backward(object, criterion = "aic", alpha = NULL, type = "decomposable",
         search = "all", steps = 1000, k = 2, fixin = NULL, details = 1,
         trace = 2, ...)

forward(object, criterion = "aic", alpha = NULL, type = "decomposable",
         search = "all", steps = 1000, k = 2, fixout = NULL, details = 1,
         trace = 2, ...)

```

Arguments

| | |
|-----------|---|
| object | An iModel model object |
| criterion | Either "aic" or "test" (for significance test) |
| alpha | Critical value for deeming an edge to be significant/ insignificant. When criterion="aic", alpha defaults to 0; when criterion="test", alpha defaults to 0.05. |
| type | Type of models to search. Either "decomposable" or "unrestricted". If type="decomposable" and the initial model is decomposable, then the search is among decomposable models only. |

| | |
|-----------|---|
| search | Either 'all' (greedy) or 'headlong' (search edges randomly; stop when an improvement has been found). |
| steps | Maximum number of steps. |
| k | Penalty term when criterion="aic". Only k=2 gives genuine AIC. |
| direction | Direction for model search. Either "backward" or "forward". |
| fixin | Matrix (p x 2) of edges. If those edges are in the model, they are not considered for removal. |
| fixout | Matrix (p x 2) of edges. If those edges are not in the model, they are not considered for addition. |
| details | Controls the level of printing on the screen. |
| trace | For debugging only |
| ... | Further arguments to be passed on to testdelete (for testInEdges) and testadd (for testOutEdges). |

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

Examples

```
data(reinis)
## The saturated model
m1 <- dmod(~.^., data=reinis)
m2 <- stepwise(m1)
m2
```

testadd

Test addition of edge to graphical model

Description

Performs a test of addition of an edge to a graphical model (an iModel object).

Usage

```
testadd(object, edge, k = 2, details = 1, ...)
```

Arguments

| | |
|---------|---|
| object | A model; an object of class iModel. |
| edge | An edge; either as a vector or as a right hand sided formula. |
| k | Penalty parameter used when calculating change in AIC |
| details | The amount of details to be printed; 0 surpresses all information |
| ... | Further arguments to be passed on to the underlying functions for testing; that is to CItable and CImvn |

Details

Let M_0 be the model and $e=u,v$ be an edge and let M_1 be the model obtained by adding e to M_0 . If M_1 is decomposable AND e is contained in one clique C only of M_1 then the test is carried out in the C -marginal model. In this case, and if the model is a log-linear model then the degrees of freedom is adjusted for sparsity.

Value

A list

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

[testdelete](#)

Examples

```
## ## ## testadd
## ## ##

## ## Discrete model
## ##
data(reinis)
## A decomposable model
##
mf <- ~smoke:phys:mental + smoke:systol:mental
object <- dmod(mf, data=reinis)
testadd(object,c("systol","phys"))

## A non-decomposable model
##
mf <- ~smoke:phys + phys:mental + smoke:systol + systol:mental
object <- dmod(mf, data=reinis)
testadd(object, c("phys", "systol"))
```

```
## ## Continuous model
## ##
data(math)
## A decomposable model
##
mf <- ~me:ve:al + al:an
object <- cmod(mf, data=math)
testadd(object, c("me", "an"))

## A non-decomposable model
##
mf <- ~me:ve + ve:al + al:an + an:me
object <- cmod(mf, data=math)
testadd(object, c("me", "al"))
```

testdelete

Test deletion of edge from an interaction model

Description

Tests if an edge can be deleted from an interaction model.

Usage

```
testdelete(object, edge, k = 2, details = 1, ...)
```

Arguments

| | |
|---------|---|
| object | A model; an object of class iModel. |
| edge | An edge in the model; either as a right-hand sided formula or as a vector |
| k | Penalty parameter used when calculating change in AIC |
| details | The amount of details to be printed; 0 suppresses all information |
| ... | Further arguments to be passed on to the underlying functions for testing; that is to CItable and CImvn |

Details

If the model is decomposable and the edge is contained in one clique only then the test is made in the marginal model given by that clique. In that case, if the model is a log-linear model then degrees of freedom are adjusted for sparsity

Value

A list.

testdelete(object, c("me", "al"))
```

testInEdges; testOutEdges

Test edges in graphical models with p-value/AIC value

Description

Test edges in graphical models with p-value/AIC value. The models must iModels.

Usage

```
testInEdges(object, edgeMAT=NULL, criterion = "aic", k = 2,
  alpha = NULL, headlong = FALSE, details = 1, ...)
testOutEdges(object, edgeMAT=NULL, criterion = "aic", k = 2,
  alpha = NULL, headlong = FALSE, details = 1, ...)
```

Arguments

| | |
|-----------|--|
| object | An iModel model object |
| edgeMAT | A p * 2 matrix with edges |
| criterion | Either "aic" or "test" (for significance test) |
| k | Penalty term when criterion="aic". Only k=2 gives genuine AIC. |
| alpha | Critical value for deeming an edge to be significant/ insignificant. When criterion="aic", alpha defaults to 0; when criterion="test", alpha defaults to 0.05. |
| headlong | If TRUE then testing will stop once a model improvement has been found. |
| details | Controls the level of printing on the screen. |
| ... | Further arguments to be passed on to testdelete (for testInEdges) and testadd (for testOutEdges). |

Value

A matrix.
