

Package ‘ROptEstOld’

February 19, 2015

Version 0.9.2

Date 2013-09-12

Title Optimally robust estimation - old version

Description Optimally robust estimation using S4 classes and methods. Old version still needed for current versions of ROptRegTS and RobRex.

Depends R(>= 2.14.0), methods, distr(>= 2.5.2), distrEx(>= 2.4),
RandVar(>= 0.9.2), evd

asBias

Generating function for asBias-class

Description

Generates an object of class "asBias".

Usage

```
asBias()
```

Value

Object of class "asBias"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.

Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

See Also

[asBias-class](#)

Examples

```
asBias()  
  
## The function is currently defined as  
function(){ new("asBias") }
```

`asBias-class`*Standardized Asymptotic Bias*

Description

Class of standardized asymptotic bias; i.e., the neighborhood radius is omitted respectively, set to 1.

Objects from the Class

Objects can be created by calls of the form `new("asBias", ...)`. More frequently they are created via the generating function `asBias`.

Slots

`type`: Object of class "character": "asymptotic bias".

Extends

Class "asRisk", directly.
Class "RiskType", by class "asRisk".

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.
Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

[asRisk-class](#), [asBias](#)

Examples

```
new("asBias")
```

asCov *Generating function for asCov-class*

Description

Generates an object of class "asCov".

Usage

```
asCov()
```

Value

Object of class "asCov"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.

Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

See Also

Examples

```
asCov()  
  
## The function is currently defined as  
function(){ new("asCov") }
```

asCov-class *Asymptotic covariance*

Description

Class of asymptotic covariance.

Objects from the Class

Objects can be created by calls of the form `new("asCov", ...)`. More frequently they are created via the generating function `asCov`.

Slots

type: Object of class "character": "asymptotic covariance".

Extends

Class "asRisk", directly.

Class "RiskType", by class "asRisk".

Methods

No methods defined with class "asCov" in the signature.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.

Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

Examples

```
new("asCov")
```

asGRisk-class

Convex asymptotic risk

Description

Class of special convex asymptotic risks.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

type: Object of class "character".

Extends

Class "asRisk", directly.
Class "RiskType", by class "asRisk".

Methods

No methods defined with class "asGRisk" in the signature.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

asHampel

Generating function for asHampel-class

Description

Generates an object of class "asHampel".

Usage

```
asHampel(bound = Inf)
```

Arguments

bound positive real: bias bound

Value

Object of class asHampel

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

- Hampel et al. (1986) *Robust Statistics. The Approach Based on Influence Functions*. New York: Wiley.
- Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.
- Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

[asHampel-class](#)

Examples

```
asHampel()

## The function is currently defined as
function(bound = Inf){ new("asHampel", bound = bound) }
```

asHampel-class	<i>Asymptotic Hampel risk</i>
----------------	-------------------------------

Description

Class of asymptotic Hampel risk which is the trace of the asymptotic covariance subject to a given bias bound (bound on gross error sensitivity).

Objects from the Class

Objects can be created by calls of the form `new("asHampel", ...)`. More frequently they are created via the generating function `asHampel`.

Slots

type: Object of class "character": "trace of asymptotic covariance for given bias bound".

bound: Object of class "numeric": given positive bias bound.

Extends

Class "asRisk", directly.

Class "RiskType", by class "asRisk".

Methods

bound signature(object = "asHampel"): accessor function for slot bound.

show signature(object = "asHampel")

asMSE-class

Asymptotic mean square error

Description

Class of asymptotic mean square error.

Objects from the Class

Objects can be created by calls of the form `new("asMSE", ...)`. More frequently they are created via the generating function `asMSE`.

Slots

type: Object of class "character": "asymptotic mean square error".

Extends

Class "asGRisk", directly.
Class "asRisk", by class "asGRisk".
Class "RiskType", by class "asGRisk".

Methods

No methods defined with class "asMSE" in the signature.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

`asUnOvShoot`*Generating function for asUnOvShoot-class*

Description

Generates an object of class "asUnOvShoot".

Usage

```
asUnOvShoot(width = 1.960)
```

Arguments

`width` positive real: half the width of given confidence interval.

Value

Object of class "asUnOvShoot"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Rieder, H. (1980) Estimates derived from robust tests. *Ann. Stats.* **8**: 106–115.

Examples

```
asUnOvShoot()  
  
## The function is currently defined as  
function(width = 1.960){ new("asUnOvShoot", width = width) }
```

asUnOvShoot-class *Asymptotic under-/overshoot probability*

Description

Class of asymptotic under-/overshoot probability.

Objects from the Class

Objects can be created by calls of the form `new("asUnOvShoot", ...)`. More frequently they are created via the generating function `asUnOvShoot`.

Slots

`type`: Object of class "character": "asymptotic under-/overshoot probability".

`width`: Object of class "numeric": half the width of given confidence interval.

Extends

Class "asGRisk", directly.

Class "asRisk", by class "asGRisk".

Class "RiskType", by class "asGRisk".

Methods

`width` signature(object = "asUnOvShoot"): accessor function for slot width.

`show` signature(object = "asUnOvShoot")

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Rieder, H. (1980) Estimates derived from robust tests. *Ann. Stats.* **8**: 106–115.

Examples

```
new("asUnOvShoot")
```

`BinomFamily`*Generating function for Binomial families*

Description

Generates an object of class "L2ParamFamily" which represents a Binomial family where the probability of success is the parameter of interest.

Usage

```
BinomFamily(size = 1, prob = 0.5, trafo)
```

Arguments

<code>size</code>	number of trials
<code>prob</code>	probability of success
<code>trafo</code>	matrix: transformation of the parameter

Details

The slots of the corresponding L2 differentiable parameteric family are filled.

Value

Object of class "L2ParamFamily"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

checkL2deriv(B1)
```

`checkIC`*Generic Function for Checking ICs*

Description

Generic function for checking centering and Fisher consistency of ICs.

Usage

```
checkIC(IC, L2Fam, ...)
```

Arguments

IC	object of class "IC"
L2Fam	L2-differentiable family of probability measures.
...	additional parameters

Details

The precisions of the centering and the Fisher consistency are computed.

Value

The maximum deviation from the IC properties is returned.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.

Examples

```
IC1 <- new("IC")  
checkIC(IC1)
```

`checkL2deriv`*Generic function for checking L2-derivatives*

Description

Generic function for checking the L2-derivative of an L2-differentiable family of probability measures.

Usage

```
checkL2deriv(L2Fam, ...)
```

Arguments

L2Fam	L2-differentiable family of probability measures
...	additional parameters

Details

The precisions of the centering and the Fisher information are computed.

Value

The maximum deviation is returned.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.

Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

See Also

[L2ParamFamily-class](#)

Examples

```
F1 <- new("L2ParamFamily")
checkL2deriv(F1)
```

ContIC

*Generating function for ContIC-class***Description**

Generates an object of class "ContIC"; i.e., an influence curves η of the form

$$\eta = (A\Lambda - a) \min(1, b/|A\Lambda - a|)$$

with clipping bound b , centering constant a and standardizing matrix A . Λ stands for the L2 derivative of the corresponding L2 differentiable parametric family which can be created via CallL2Fam.

Usage

```
ContIC(name, CallL2Fam = call("L2ParamFamily"),
       Curve = EuclRandVarList(RealRandVariable(Map = c(function(x){x}),
                                                Domain = Reals()))),
       Risks, Infos, clip = Inf, cent = 0, stand = as.matrix(1),
       lowerCase = NULL, neighborRadius = 0)
```

Arguments

name	object of class "character".
CallL2Fam	object of class "call": creates an object of the underlying L2-differentiable parametric family.
Curve	object of class "EuclRandVarList"
Risks	object of class "list": list of risks; cf. RiskType-class .
Infos	matrix of characters with two columns named method and message: additional informations.
clip	positive real: clipping bound.
cent	real: centering constant
stand	matrix: standardizing matrix
lowerCase	optional constant for lower case solution.
neighborRadius	radius of the corresponding (unconditional) contamination neighborhood.

Value

Object of class "ContIC"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

- Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.
- Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

Examples

```
IC1 <- ContIC()
plot(IC1)
```

ContIC-class

Influence curve of contamination type

Description

Class of (partial) influence curves of contamination type; i.e., influence curves η of the form

$$\eta = (A\Lambda - a) \min(1, b/|A\Lambda - a|)$$

with clipping bound b , centering constant a and standardizing matrix A . Λ stands for the L2 derivative of the corresponding L2 differentiable parametric family created via the call in the slot `CallL2Fam`.

Objects from the Class

Objects can be created by calls of the form `new("ContIC", ...)`. More frequently they are created via the generating function `ContIC`, respectively via the method `generateIC`.

Slots

- `CallL2Fam`: object of class "call": creates an object of the underlying L2-differentiable parametric family.
- `name`: object of class "character"
- `Curve`: object of class "EuclRandVarList"
- `Risks`: object of class "list": list of risks; cf. [RiskType-class](#).
- `Infos`: object of class "matrix" with two columns named `method` and `message`: additional informations.
- `clip`: object of class "numeric": clipping bound.
- `cent`: object of class "numeric": centering constant.
- `stand`: object of class "matrix": standardizing matrix.
- `lowerCase`: object of class "OptionalNumeric": optional constant for lower case solution.
- `neighborRadius`: object of class "numeric": radius of the corresponding (unconditional) contamination neighborhood.

Extends

Class "IC", directly.
 Class "InfluenceCurve", by class "IC".

Methods

CallL2Fam<- signature(object = "ContIC"): replacement function for slot CallL2Fam.
cent signature(object = "ContIC"): accessor function for slot cent.
cent<- signature(object = "ContIC"): replacement function for slot cent.
clip signature(object = "ContIC"): accessor function for slot clip.
clip<- signature(object = "ContIC"): replacement function for slot clip.
stand signature(object = "ContIC"): accessor function for slot stand.
stand<- signature(object = "ContIC"): replacement function for slot stand.
lowerCase signature(object = "ContIC"): accessor function for slot lowerCase.
lowerCase<- signature(object = "ContIC"): replacement function for slot lowerCase.
neighborRadius signature(object = "ContIC"): accessor function for slot neighborRadius.
neighborRadius<- signature(object = "ContIC"): replacement function for slot neighborRadius.
generateIC signature(neighbor = "ContNeighborhood", L2Fam = "L2ParamFamily"): generate an object of class "ContIC". Rarely called directly.
show signature(object = "ContIC")

```

ContNeighborhood *Generating function for ContNeighborhood-class*

Description

Generates an object of class "ContNeighborhood".

Usage

```
ContNeighborhood(radius = 0)
```

Arguments

radius non-negative real: neighborhood radius.

Value

Object of class "ContNeighborhood"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.

Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

## The function is currently defined as
function(radius = 0){
  new("ContNeighborhood", radius = radius)
}
```

ContNeighborhood-class

Contamination Neighborhood

Description

Class of (unconditional) contamination neighborhoods.

Objects from the Class

Objects can be created by calls of the form `new("ContNeighborhood", ...)`. More frequently they are created via the generating function `ContNeighborhood`.

Slots

`type`: Object of class "character": "(uncond.) convex contamination neighborhood".

`radius`: Object of class "numeric": neighborhood radius.

Extends

Class "UncondNeighborhood", directly.

Class "Neighborhood", by class "UncondNeighborhood".

Methods

No methods defined with class "ContNeighborhood" in the signature.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.

Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

See Also

[ContNeighborhood](#), [UncondNeighborhood-class](#)

Examples

```
new("ContNeighborhood")
```

evalIC	<i>Generic function for evaluating ICs</i>
--------	--------------------------------------------

Description

Generic function for evaluating ICs.

Usage

```
evalIC(IC, x)
```

Arguments

IC	object of class "IC"
x	numeric vector or matrix

Details

The list of random variables contained in the slot Curve is evaluated at x.

Value

In case x is numeric a vector and in case x is matrix a matrix is returned.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

- Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.
- Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

[IC-class](#)

EvenSymmetric *Generating function for EvenSymmetric-class*

Description

Generates an object of class "EvenSymmetric".

Usage

```
EvenSymmetric(SymmCenter = 0)
```

Arguments

SymmCenter numeric: center of symmetry

Value

Object of class "EvenSymmetric"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[EvenSymmetric-class](#), [FunctionSymmetry-class](#)

Examples

```
EvenSymmetric()

## The function is currently defined as
function(SymmCenter = 0){
  new("EvenSymmetric", SymmCenter = SymmCenter)
}
```

EvenSymmetric-class *Class for Even Functions*

Description

Class for even functions.

Objects from the Class

Objects can be created by calls of the form `new("EvenSymmetric")`. More frequently they are created via the generating function `EvenSymmetric`.

Slots

type: Object of class "character": contains "even function"
SymmCenter: Object of class "numeric": center of symmetry

Extends

Class "FunctionSymmetry", directly.
Class "Symmetry", by class "FunctionSymmetry".

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[EvenSymmetric](#), [FunctionSymmetry-class](#)

Examples

```
new("EvenSymmetric")
```

ExpScaleFamily

Generating function for exponential scale families

Description

Generates an object of class "L2ParamFamily" which represents an exponential scale family.

Usage

```
ExpScaleFamily(rate = 1, trafo)
```

Arguments

rate	rate
trafo	matrix: optional transformation of the parameter

Details

The slots of the corresponding L2 differentiable parameteric family are filled. The scale parameter corresponds to $1/\text{rate}$.

Value

Object of class "L2ParamFamily"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

See Also

[L2ParamFamily-class](#), [Exp-class](#)

Examples

(E1 <- ExpScaleFamily())  
plot(E1)  
Map(L2deriv(E1)[[1]])  
checkL2deriv(E1)
```

fiBias

Generating function for fiBias-class

Description

Generates an object of class "fiBias".

Usage

```
fiBias()
```

Value

Object of class "fiBias"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Ruckdeschel, P. and Kohl, M. (2005) How to approximate the finite sample risk of M-estimators.

See Also

Examples

```
fiBias()  
  
## The function is currently defined as  
function(){ new("fiBias") }
```

fiBias-class	<i>Finite-sample Bias</i>
--------------	---------------------------

Description

Class of finite-sample bias.

Objects from the Class

Objects can be created by calls of the form `new("fiBias", ...)`. More frequently they are created via the generating function `fiBias`.

Slots

`type`: Object of class "character": "finite-sample bias".

Extends

Class "fiRisk", directly.
Class "RiskType", by class "fiRisk".

Methods

No methods defined with class "fiBias" in the signature.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Ruckdeschel, P. and Kohl, M. (2005) How to approximate the finite sample risk of M-estimators.

```

fiHampel-class

Finite-sample Hampel risk

Description

Class of finite-sample Hampel risk which is the trace of the finite-sample covariance subject to a given bias bound (bound on gross error sensitivity).

Objects from the Class

Objects can be created by calls of the form `new("fiHampel", ...)`. More frequently they are created via the generating function `fiHampel`.

Slots

type: Object of class "character": "trace of finite-sample covariance for given bias bound".

bound: Object of class "numeric": given positive bias bound.

Extends

Class "fiRisk", directly.

Class "RiskType", by class "fiRisk".

Methods

bound signature(object = "fiHampel"): accessor function for slot bound.

show signature(object = "fiHampel")

Author(s)

```

`fiMSE-class`*Finite-sample mean square error*

Description

Class of asymptotic mean square error.

Objects from the Class

Objects can be created by calls of the form `new("fiMSE", ...)`. More frequently they are created via the generating function `fiMSE`.

Slots

`type`: Object of class "character": "finite-sample mean square error".

Extends

Class "fiRisk", directly.
Class "RiskType", by class "fiRisk".

Methods

No methods defined with class "fiMSE" in the signature.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

fiUnOvShoot	<i>Generating function for fiUnOvShoot-class</i>
-------------	--------------------------------------------------

Description

Generates an object of class "fiUnOvShoot".

Usage

```
fiUnOvShoot(width = 1.960)
```

Arguments

width positive real: half the width of given confidence interval.

Value

Object of class "fiUnOvShoot"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

FixRobModel

Generating function for FixRobModel-class

Description

Generates an object of class "FixRobModel".

Usage

```
FixRobModel(center = ParamFamily(), neighbor = ContNeighborhood())
```

Arguments

center object of class "ProbFamily"
neighbor object of class "UncondNeighborhood"

Value

Object of class "FixRobModel"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.

FunctionSymmetry-class

Class of Symmetries for Functions

Description

Class of symmetries for functions.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

type: Object of class "character": describes type of symmetry.

SymmCenter: Object of class "OptionalNumeric": center of symmetry.

Extends

Class "Symmetry", directly.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[Symmetry-class](#), [OptionalNumeric-class](#)

FunSymmList

Generating function for FunSymmList-class

Description

Generates an object of class "FunSymmList".

Usage

```
FunSymmList(...)
```

Arguments

... Objects of class "FunctionSymmetry" which shall form the list of symmetry types.

Value

Object of class "FunSymmList"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[FunSymmList-class](#)

Examples

```
FunSymmList(NonSymmetric(), EvenSymmetric(SymmCenter = 1),
            OddSymmetric(SymmCenter = 2))

## The function is currently defined as
function (...){
  new("FunSymmList", list(...))
}
```

FunSymmList-class *List of Symmetries for a List of Functions*

Description

Create a list of symmetries for a list of functions

Objects from the Class

Objects can be created by calls of the form `new("FunSymmList", ...)`. More frequently they are created via the generating function `FunSymmList`.

Slots

.Data: Object of class "list". A list of objects of class "FunctionSymmetry".

Extends

Class "list", from data part.
Class "vector", by class "list".

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[FunctionSymmetry-class](#)

Examples

```
new("FunSymmList", list(NonSymmetric(), EvenSymmetric(SymmCenter = 1),  
                        OddSymmetric(SymmCenter = 2)))
```

GammaFamily *Generating function for Gamma families*

Description

Generates an object of class "L2ParamFamily" which represents a Gamma family.

Usage

```
GammaFamily(scale = 1, shape = 1, trafo)
```

Arguments

scale	positive real: scale parameter
shape	positive real: shape parameter
trafo	matrix: transformation of the parameter

Details

The slots of the corresponding L2 differentiable parameteric family are filled.

Value

Object of class "L2ParamFamily"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

FisherInfo(G1)
checkL2deriv(G1)
distrExOptions("EupperTruncQuantile" = 0) # default
```

generateIC

Generic function for the generation of influence curves

Description

This function is rarely called directly. It is used by other functions to create objects of class "IC".

Usage

```
generateIC(neighbor, L2Fam, ...)
```

Arguments

neighbor Object of class "Neighborhood".
 L2Fam L2-differentiable family of probability measures.
 ... additional parameters

Value

Object of class "IC"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

 getAsRisk

Generic Function for Computation of Asymptotic Risks

Description

Generic function for the computation of asymptotic risks. This function is rarely called directly. It is used by other functions.

Usage

```
getAsRisk(risk, L2deriv, neighbor, ...)

## S4 method for signature 'asMSE,UnivariateDistribution,Neighborhood'
getAsRisk(risk, L2deriv, neighbor, clip, cent, stand, trafo)

## S4 method for signature 'asMSE,EuclRandVariable,Neighborhood'
getAsRisk(risk, L2deriv, neighbor, clip, cent, stand, trafo)

## S4 method for signature 'asBias,UnivariateDistribution,ContNeighborhood'
getAsRisk(risk, L2deriv, neighbor, trafo)

## S4 method for signature 'asBias,UnivariateDistribution,TotalVarNeighborhood'
getAsRisk(risk, L2deriv, neighbor, trafo)
```

```

## S4 method for signature 'asBias,RealRandVariable,ContNeighborhood'
getAsRisk(risk, L2deriv, neighbor, Distr, L2derivDistrSymm, trafo,
          z.start, A.start, maxiter, tol)

## S4 method for signature 'asCov,UnivariateDistribution,ContNeighborhood'
getAsRisk(risk, L2deriv, neighbor, clip, cent, stand)

## S4 method for signature 'asCov,UnivariateDistribution,TotalVarNeighborhood'
getAsRisk(risk, L2deriv, neighbor, clip, cent, stand)

## S4 method for signature 'asCov,RealRandVariable,ContNeighborhood'
getAsRisk(risk, L2deriv, neighbor, Distr, clip, cent, stand)

## S4 method for signature 'trAsCov,UnivariateDistribution,UncondNeighborhood'
getAsRisk(risk, L2deriv, neighbor, clip, cent, stand)

## S4 method for signature 'trAsCov,RealRandVariable,ContNeighborhood'
getAsRisk(risk, L2deriv, neighbor, Distr, clip, cent, stand)

## S4 method for signature
## 'asUnOvShoot,UnivariateDistribution,UncondNeighborhood'
getAsRisk(risk, L2deriv, neighbor, clip, cent, stand, trafo)

```

Arguments

risk	object of class "asRisk".
L2deriv	L2-derivative of some L2-differentiable family of probability distributions.
neighbor	object of class "Neighborhood".
...	additional parameters.
clip	optimal clipping bound.
cent	optimal centering constant.
stand	standardizing matrix.
trafo	matrix: transformation of the parameter.
Distr	object of class "Distribution".
L2derivDistrSymm	object of class "DistrSymmList".
z.start	initial value for the centering constant.
A.start	initial value for the standardizing matrix.
maxiter	the maximum number of iterations
tol	the desired accuracy (convergence tolerance).

Value

The asymptotic risk is computed.

Methods

risk = "asMSE", L2deriv = "UnivariateDistribution", neighbor = "Neighborhood": computes asymptotic mean square error in methods for function getInfRobIC.

risk = "asMSE", L2deriv = "EuclRandVariable", neighbor = "Neighborhood": computes asymptotic mean square error in methods for function getInfRobIC.

risk = "asBias", L2deriv = "UnivariateDistribution", neighbor = "ContNeighborhood": computes standardized asymptotic bias in methods for function getInfRobIC.

risk = "asBias", L2deriv = "UnivariateDistribution", neighbor = "TotalVarNeighborhood": computes standardized asymptotic bias in methods for function getInfRobIC.

risk = "asBias", L2deriv = "RealRandVariable", neighbor = "ContNeighborhood": computes standardized asymptotic bias in methods for function getInfRobIC.

risk = "asCov", L2deriv = "UnivariateDistribution", neighbor = "ContNeighborhood": computes asymptotic covariance in methods for function getInfRobIC.

risk = "asCov", L2deriv = "UnivariateDistribution", neighbor = "TotalVarNeighborhood": computes asymptotic covariance in methods for function getInfRobIC.

risk = "asCov", L2deriv = "RealRandVariable", neighbor = "ContNeighborhood": computes asymptotic covariance in methods for function getInfRobIC.

risk = "trAsCov", L2deriv = "UnivariateDistribution", neighbor = "UncondNeighborhood": computes trace of asymptotic covariance in methods for function getInfRobIC.

risk = "trAsCov", L2deriv = "RealRandVariable", neighbor = "ContNeighborhood": computes trace of asymptotic covariance in methods for function getInfRobIC.

risk = "asUnOvShoot", L2deriv = "UnivariateDistribution", neighbor = "UncondNeighborhood": computes asymptotic under-/overshoot risk in methods for function getInfRobIC.

getFiRisk

Generic Function for Computation of Finite-Sample Risks

Description

Generic function for the computation of finite-sample risks. This function is rarely called directly. It is used by other functions.

Usage

```
getFiRisk(risk, Distr, neighbor, ...)
```

```
## S4 method for signature 'fiUnOvShoot, Norm, ContNeighborhood'
```

```
getFiRisk(risk, Distr, neighbor,
          clip, stand, sampleSize, Algo, cont)
```

```
## S4 method for signature 'fiUnOvShoot, Norm, TotalVarNeighborhood'
```

```
getFiRisk(risk, Distr, neighbor,
          clip, stand, sampleSize, Algo, cont)
```

Arguments

risk	object of class "RiskType".
Distr	object of class "Distribution".
neighbor	object of class "Neighborhood".
...	additional parameters.
clip	positive real: clipping bound
stand	standardizing constant/matrix.
sampleSize	integer: sample size.
Algo	"A" or "B".
cont	"left" or "right".

Details

The computation of the finite-sample under-/overshoot risk is based on FFT. For more details we refer to Section 11.3 of Kohl (2005).

Value

The finite-sample risk is computed.

Methods

risk = "fiUnOvShoot", Distr = "Norm", neighbor = "ContNeighborhood" computes finite-sample under-/overshoot risk in methods for function getFixRobIC.

risk = "fiUnOvShoot", Distr = "Norm", neighbor = "TotalVarNeighborhood" computes finite-sample under-/overshoot risk in methods for function getFixRobIC.

getFixClip

Generic Function for the Computation of the Optimal Clipping Bound

Description

Generic function for the computation of the optimal clipping bound in case of robust models with fixed neighborhoods. This function is rarely called directly. It is used to compute optimally robust ICs.

Usage

```
getFixClip(clip, Distr, risk, neighbor, ...)
```

```
## S4 method for signature 'numeric, Norm, fiUnOvShoot, ContNeighborhood'  
getFixClip(clip, Distr, risk, neighbor)
```

```
## S4 method for signature 'numeric, Norm, fiUnOvShoot, TotalVarNeighborhood'  
getFixClip(clip, Distr, risk, neighbor)
```

Arguments

clip	positive real: clipping bound
Distr	object of class "Distribution".
risk	object of class "RiskType".
neighbor	object of class "Neighborhood".
...	additional parameters.

Value

The optimal clipping bound is computed.

Methods

clip = "numeric", Distr = "Norm", risk = "fiUnOvShoot", neighbor = "ContNeighborhood"
optimal clipping bound for finite-sample under-/overshoot risk.

clip = "numeric", Distr = "Norm", risk = "fiUnOvShoot", neighbor = "TotalVarNeighborhood"
optimal clipping bound for finite-sample under-/overshoot risk.

Author(s)

getFixRobIC

Generic Function for the Computation of Optimally Robust ICs

Description

Generic function for the computation of optimally robust ICs in case of robust models with fixed neighborhoods. This function is rarely called directly.

Usage

```
getFixRobIC(Distr, risk, neighbor, ...)
```

```
## S4 method for signature 'Norm,fiUnOvShoot,UncondNeighborhood'
getFixRobIC(Distr, risk, neighbor,
             sampleSize, upper, maxiter, tol, warn, Algo, cont)
```

Arguments

Distr	object of class "Distribution".
risk	object of class "RiskType".
neighbor	object of class "Neighborhood".
...	additional parameters.
sampleSize	integer: sample size.
upper	upper bound for the optimal clipping bound.

maxiter	the maximum number of iterations.
tol	the desired accuracy (convergence tolerance).
warn	logical: print warnings.
Algo	"A" or "B".
cont	"left" or "right".

Value

The optimally robust IC is computed.

Methods

Distr = "Norm", risk = "fUnOvShoot", neighbor = "UncondNeighborhood" computes the optimally robust influence curve for one-dimensional normal location and finite-sample under/overshoot risk.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

getIneffDiff

Generic Function for the Computation of Inefficiency Differences

Description

Generic function for the computation of inefficiency differences. This function is rarely called directly. It is used to compute the radius minimax IC and the least favorable radius.

Usage

```
getIneffDiff(radius, L2Fam, neighbor, risk, ...)

## S4 method for signature 'numeric,L2ParamFamily,UncondNeighborhood,asMSE'
getIneffDiff(radius, L2Fam, neighbor, risk, loRad, upRad,
             loRisk, upRisk, z.start = NULL, A.start = NULL, upper.b, MaxIter, eps, warn)
```

Arguments

radius	neighborhood radius.
L2Fam	L2-differentiable family of probability measures.
neighbor	object of class "Neighborhood".
risk	object of class "RiskType".
...	additional parameters
loRad	the lower end point of the interval to be searched.
upRad	the upper end point of the interval to be searched.
loRisk	the risk at the lower end point of the interval.
upRisk	the risk at the upper end point of the interval.
z.start	initial value for the centering constant.
A.start	initial value for the standardizing matrix.
upper.b	upper bound for the optimal clipping bound.
MaxIter	the maximum number of iterations
eps	the desired accuracy (convergence tolerance).
warn	logical: print warnings.

Value

The inefficiency difference between the left and the right margin of a given radius interval is computed.

Methods

radius = "numeric", L2Fam = "L2ParamFamily", neighbor = "UncondNeighborhood", risk = "asMSE":
 computes difference of asymptotic MSE–inefficiency for the boundaries of a given radius interval.

getInfCent	<i>Generic Function for the Computation of the Optimal Centering Constant/Lower Clipping Bound</i>
------------	----------------------------------------------------------------------------------------------------

Description

Generic function for the computation of the optimal centering constant (contamination neighborhoods) respectively, of the optimal lower clipping bound (total variation neighborhood). This function is rarely called directly. It is used to compute optimally robust ICs.

Usage

```
getInfCent(L2deriv, neighbor, ...)

## S4 method for signature 'UnivariateDistribution,ContNeighborhood'
getInfCent(L2deriv, neighbor, clip, cent, tol.z, symm, trafo)

## S4 method for signature 'UnivariateDistribution,TotalVarNeighborhood'
getInfCent(L2deriv, neighbor, clip, cent, tol.z, symm, trafo)

## S4 method for signature 'RealRandVariable,ContNeighborhood'
getInfCent(L2deriv, neighbor, Distr, z.comp, stand, cent, clip)
```

Arguments

L2deriv	L2-derivative of some L2-differentiable family of probability measures.
neighbor	object of class "Neighborhood".
...	additional parameters.
Distr	distribution of L2-differentiable family.
clip	optimal clipping bound.
cent	optimal centering constant.
stand	standardizing matrix.
tol.z	the desired accuracy (convergence tolerance).
symm	logical: indicating symmetry of L2deriv.
trafo	matrix: transformation of the parameter.
z.comp	logical vector: indication which components of the centering constant have to be computed.

Value

The optimal centering constant is computed.

Methods

L2deriv = "UnivariateDistribution", neighbor = "ContNeighborhood" computation of optimal centering constant.

L2deriv = "UnivariateDistribution", neighbor = "TotalVarNeighborhood" computation of optimal lower clipping bound.

L2deriv = "RealRandVariable", neighbor = "ContNeighborhood" computation of optimal centering constant.

getInfClip

Generic Function for the Computation of the Optimal Clipping Bound

Description

Generic function for the computation of the optimal clipping bound in case of infinitesimal robust models. This function is rarely called directly. It is used to compute optimally robust ICs.

Usage

```
getInfClip(clip, L2deriv, risk, neighbor, ...)

## S4 method for signature
## 'numeric,UnivariateDistribution,asMSE,ContNeighborhood'
getInfClip(clip, L2deriv, risk, neighbor, cent, symm, trafo)

## S4 method for signature
## 'numeric,UnivariateDistribution,asMSE,TotalVarNeighborhood'
getInfClip(clip, L2deriv, risk, neighbor, cent, symm, trafo)

## S4 method for signature 'numeric,EuclRandVariable,asMSE,ContNeighborhood'
getInfClip(clip, L2deriv, risk, neighbor, Distr, stand, cent, trafo)

## S4 method for signature
## 'numeric,UnivariateDistribution,asUnOvShoot,UncondNeighborhood'
getInfClip(clip, L2deriv, risk, neighbor, cent, symm, trafo)
```

Arguments

clip	positive real: clipping bound
L2deriv	L2-derivative of some L2-differentiable family of probability measures.
risk	object of class "RiskType".
neighbor	object of class "Neighborhood".
...	additional parameters.
cent	optimal centering constant.
stand	standardizing matrix.
Distr	object of class "Distribution".
symm	logical: indicating symmetry of L2deriv.
trafo	matrix: transformation of the parameter.

Value

The optimal clipping bound is computed.

Methods

clip = "numeric", L2deriv = "UnivariateDistribution", risk = "asMSE", neighbor = "ContNeighborhood"
optimal clipping bound for asymptotic mean square error.

clip = "numeric", L2deriv = "UnivariateDistribution", risk = "asMSE", neighbor = "TotalVarNeighborhood"
optimal clipping bound for asymptotic mean square error.

clip = "numeric", L2deriv = "EuclRandVariable", risk = "asMSE", neighbor = "ContNeighborhood"
optimal clipping bound for asymptotic mean square error.

clip = "numeric", L2deriv = "UnivariateDistribution", risk = "asUnOvShoot", neighbor = "UncondNeighborhood"
optimal clipping bound for asymptotic under-/overshoot risk.

getInfGamma *Generic Function for the Computation of the Optimal Clipping Bound*

Description

Generic function for the computation of the optimal clipping bound. This function is rarely called directly. It is called by getInfClip to compute optimally robust ICs.

Usage

```
getInfGamma(L2deriv, risk, neighbor, ...)

## S4 method for signature 'UnivariateDistribution,asMSE,ContNeighborhood'
getInfGamma(L2deriv, risk, neighbor, cent, clip)

## S4 method for signature
## 'UnivariateDistribution,asGRisk,TotalVarNeighborhood'
getInfGamma(L2deriv, risk, neighbor, cent, clip)

## S4 method for signature 'RealRandVariable,asMSE,ContNeighborhood'
getInfGamma(L2deriv, risk, neighbor, Distr, stand, cent, clip)

## S4 method for signature
## 'UnivariateDistribution,asUnOvShoot,ContNeighborhood'
getInfGamma(L2deriv, risk, neighbor, cent, clip)
```

Arguments

L2deriv	L2-derivative of some L2-differentiable family of probability measures.
risk	object of class "RiskType".
neighbor	object of class "Neighborhood".
...	additional parameters
cent	optimal centering constant.
clip	optimal clipping bound.
stand	standardizing matrix.
Distr	object of class "Distribution".

Details

The function is used in case of asymptotic G-risks; confer Ruckdeschel and Rieder (2004).

Methods

L2deriv = "UnivariateDistribution", risk = "asMSE", neighbor = "ContNeighborhood" used by getInfClip.

L2deriv = "UnivariateDistribution", risk = "asGRisk", neighbor = "TotalVarNeighborhood" used by getInfClip.

L2deriv = "RealRandVariable", risk = "asMSE", neighbor = "ContNeighborhood" used by getInfClip.

L2deriv = "UnivariateDistribution", risk = "asUnOvShoot", neighbor = "ContNeighborhood" used by getInfClip.

getInfRobIC

Generic Function for the Computation of Optimally Robust ICs

Description

Generic function for the computation of optimally robust ICs in case of infinitesimal robust models. This function is rarely called directly.

Usage

```
getInfRobIC(L2deriv, risk, neighbor, ...)
```

```
## S4 method for signature 'UnivariateDistribution,asCov,ContNeighborhood'
getInfRobIC(L2deriv, risk, neighbor, Finfo, trafo)
```

```
## S4 method for signature 'UnivariateDistribution,asCov,TotalVarNeighborhood'
getInfRobIC(L2deriv, risk, neighbor, Finfo, trafo)
```

```
## S4 method for signature 'RealRandVariable,asCov,ContNeighborhood'
```

```

getInfRobIC(L2deriv, risk, neighbor, Distr, Finfo, trafo)

## S4 method for signature 'UnivariateDistribution,asBias,ContNeighborhood'
getInfRobIC(L2deriv, risk, neighbor, symm, Finfo, trafo,
            upper, maxiter, tol, warn)

## S4 method for signature 'UnivariateDistribution,asBias,TotalVarNeighborhood'
getInfRobIC(L2deriv, risk, neighbor, symm, Finfo, trafo,
            upper, maxiter, tol, warn)

## S4 method for signature 'RealRandVariable,asBias,ContNeighborhood'
getInfRobIC(L2deriv, risk, neighbor, Distr, DistrSymm, L2derivSymm,
            L2derivDistrSymm, Finfo, z.start, A.start, trafo, upper, maxiter, tol, warn)

## S4 method for signature 'UnivariateDistribution,asHampel,UncondNeighborhood'
getInfRobIC(L2deriv, risk, neighbor, symm, Finfo, trafo,
            upper, maxiter, tol, warn)

## S4 method for signature 'RealRandVariable,asHampel,ContNeighborhood'
getInfRobIC(L2deriv, risk, neighbor, Distr, DistrSymm, L2derivSymm,
            L2derivDistrSymm, Finfo, trafo, z.start, A.start, upper, maxiter, tol, warn)

## S4 method for signature 'UnivariateDistribution,asGRisk,UncondNeighborhood'
getInfRobIC(L2deriv, risk, neighbor, symm, Finfo, trafo,
            upper, maxiter, tol, warn)

## S4 method for signature 'RealRandVariable,asGRisk,ContNeighborhood'
getInfRobIC(L2deriv, risk, neighbor, Distr, DistrSymm, L2derivSymm,
            L2derivDistrSymm, Finfo, trafo, z.start, A.start, upper, maxiter, tol, warn)

## S4 method for signature
## 'UnivariateDistribution,asUnOvShoot,UncondNeighborhood'
getInfRobIC(L2deriv, risk, neighbor, symm, Finfo, trafo,
            upper, maxiter, tol, warn)

```

Arguments

L2deriv	L2-derivative of some L2-differentiable family of probability measures.
risk	object of class "RiskType".
neighbor	object of class "Neighborhood".
...	additional parameters.
Distr	object of class "Distribution".
symm	logical: indicating symmetry of L2deriv.
DistrSymm	object of class "DistributionSymmetry".
L2derivSymm	object of class "FunSymmList".
L2derivDistrSymm	object of class "DistrSymmList".

Finfo	Fisher information matrix.
z.start	initial value for the centering constant.
A.start	initial value for the standardizing matrix.
trafo	matrix: transformation of the parameter.
upper	upper bound for the optimal clipping bound.
maxiter	the maximum number of iterations.
tol	the desired accuracy (convergence tolerance).
warn	logical: print warnings.

Value

The optimally robust IC is computed.

Methods

L2deriv = "UnivariateDistribution", risk = "asCov", neighbor = "ContNeighborhood" computes the classical optimal influence curve for L2 differentiable parametric families with unknown one-dimensional parameter.

L2deriv = "UnivariateDistribution", risk = "asCov", neighbor = "TotalVarNeighborhood" computes the classical optimal influence curve for L2 differentiable parametric families with unknown one-dimensional parameter.

L2deriv = "RealRandVariable", risk = "asCov", neighbor = "ContNeighborhood" computes the classical optimal influence curve for L2 differentiable parametric families with unknown k -dimensional parameter ($k > 1$) where the underlying distribution is univariate.

L2deriv = "UnivariateDistribution", risk = "asBias", neighbor = "ContNeighborhood" computes the bias optimal influence curve for L2 differentiable parametric families with unknown one-dimensional parameter.

L2deriv = "UnivariateDistribution", risk = "asBias", neighbor = "TotalVarNeighborhood" computes the bias optimal influence curve for L2 differentiable parametric families with unknown one-dimensional parameter.

L2deriv = "RealRandVariable", risk = "asBias", neighbor = "ContNeighborhood" computes the bias optimal influence curve for L2 differentiable parametric families with unknown k -dimensional parameter ($k > 1$) where the underlying distribution is univariate.

L2deriv = "UnivariateDistribution", risk = "asHampel", neighbor = "UncondNeighborhood" computes the optimally robust influence curve for L2 differentiable parametric families with unknown one-dimensional parameter.

L2deriv = "RealRandVariable", risk = "asHampel", neighbor = "ContNeighborhood" computes the optimally robust influence curve for L2 differentiable parametric families with unknown k -dimensional parameter ($k > 1$) where the underlying distribution is univariate.

L2deriv = "UnivariateDistribution", risk = "asGRisk", neighbor = "UncondNeighborhood" computes the optimally robust influence curve for L2 differentiable parametric families with unknown one-dimensional parameter.

L2deriv = "RealRandVariable", risk = "asGRisk", neighbor = "ContNeighborhood" computes the optimally robust influence curve for L2 differentiable parametric families with unknown k -dimensional parameter ($k > 1$) where the underlying distribution is univariate.

L2deriv = "UnivariateDistribution", risk = "asUnOvShoot", neighbor = "UncondNeighborhood"
 computes the optimally robust influence curve for one-dimensional L2 differentiable parametric families and asymptotic under-/overshoot risk.

getInfStand

Generic Function for the Computation of the Standardizing Matrix

Description

Generic function for the computation of the standardizing matrix which takes care of the Fisher consistency of the corresponding IC. This function is rarely called directly. It is used to compute optimally robust ICs.

Usage

```
getInfStand(L2deriv, neighbor, ...)
```

```
## S4 method for signature 'UnivariateDistribution,ContNeighborhood'  
getInfStand(L2deriv, neighbor, clip, cent, trafo)
```

```
## S4 method for signature 'UnivariateDistribution,TotalVarNeighborhood'  
getInfStand(L2deriv, neighbor, clip, cent, trafo)
```

```
## S4 method for signature 'RealRandVariable,ContNeighborhood'  
getInfStand(L2deriv, neighbor, Distr, A.comp, stand, clip, cent, trafo)
```

Arguments

L2deriv	L2-derivative of some L2-differentiable family of probability measures.
neighbor	object of class "Neighborhood"
...	additional parameters

clip	optimal clipping bound.
cent	optimal centering constant.
stand	standardizing matrix.
Distr	object of class "Distribution".
trafo	matrix: transformation of the parameter.
A.comp	matrix: indication which components of the standardizing matrix have to be computed.

Value

The standardizing matrix is computed.

Methods

L2deriv = "UnivariateDistribution", neighbor = "ContNeighborhood" computes standardizing matrix.

L2deriv = "UnivariateDistribution", neighbor = "TotalVarNeighborhood" computes standardizing matrix.

L2deriv = "RealRandVariable", neighbor = "ContNeighborhood" computes standardizing matrix.

getRiskIC

Generic function for the computation of a risk for an IC

Description

Generic function for the computation of a risk for an IC.

Usage

```

getRiskIC(IC, risk, neighbor, L2Fam, ...)

## S4 method for signature 'IC,asCov,missing,missing'
getRiskIC(IC, risk, tol = .Machine$double.eps^0.25)

## S4 method for signature 'IC,asCov,missing,L2ParamFamily'
getRiskIC(IC, risk, L2Fam, tol = .Machine$double.eps^0.25)

## S4 method for signature 'IC,trAsCov,missing,missing'
getRiskIC(IC, risk, tol = .Machine$double.eps^0.25)

## S4 method for signature 'IC,trAsCov,missing,L2ParamFamily'
getRiskIC(IC, risk, L2Fam, tol = .Machine$double.eps^0.25)

## S4 method for signature 'IC,asBias,ContNeighborhood,missing'
getRiskIC(IC, risk, neighbor, tol = .Machine$double.eps^0.25)

## S4 method for signature 'IC,asBias,ContNeighborhood,L2ParamFamily'
getRiskIC(IC, risk, neighbor, L2Fam, tol = .Machine$double.eps^0.25)

## S4 method for signature 'IC,asBias,TotalVarNeighborhood,missing'
getRiskIC(IC, risk, neighbor, tol = .Machine$double.eps^0.25)

## S4 method for signature 'IC,asBias,TotalVarNeighborhood,L2ParamFamily'
getRiskIC(IC, risk, neighbor, L2Fam, tol = .Machine$double.eps^0.25)

## S4 method for signature 'IC,asMSE,UncondNeighborhood,missing'
getRiskIC(IC, risk, neighbor, tol = .Machine$double.eps^0.25)

## S4 method for signature 'IC,asMSE,UncondNeighborhood,L2ParamFamily'
getRiskIC(IC, risk, neighbor, L2Fam, tol = .Machine$double.eps^0.25)

## S4 method for signature 'TotalVarIC,asUnOvShoot,UncondNeighborhood,missing'
getRiskIC(IC, risk, neighbor)

## S4 method for signature 'IC,fiUnOvShoot,ContNeighborhood,missing'
getRiskIC(IC, risk, neighbor, sampleSize, Algo = "A", cont = "left")

## S4 method for signature 'IC,fiUnOvShoot,TotalVarNeighborhood,missing'
getRiskIC(IC, risk, neighbor, sampleSize, Algo = "A", cont = "left")

```

Arguments

IC	object of class "InfluenceCurve"
risk	object of class "RiskType".
neighbor	object of class "Neighborhood".

L2Fam	object of class "L2ParamFamily".
...	additional parameters
tol	the desired accuracy (convergence tolerance).
sampleSize	integer: sample size.
Algo	"A" or "B".
cont	"left" or "right".

Details

To make sure that the results are valid, it is recommended to include an additional check of the IC properties of IC using checkIC.

Value

The risk of an IC is computed.

Methods

IC = "IC", risk = "asCov", neighbor = "missing", L2Fam = "missing" asymptotic covariance of IC.

IC = "IC", risk = "asCov", neighbor = "missing", L2Fam = "L2ParamFamily" asymptotic covariance of IC under L2Fam.

IC = "IC", risk = "trAsCov", neighbor = "missing", L2Fam = "missing" asymptotic covariance of IC.

IC = "IC", risk = "trAsCov", neighbor = "missing", L2Fam = "L2ParamFamily" asymptotic covariance of IC under L2Fam.

IC = "IC", risk = "asBias", neighbor = "ContNeighborhood", L2Fam = "missing" asymptotic bias of IC under convex contaminations.

IC = "IC", risk = "asBias", neighbor = "ContNeighborhood", L2Fam = "L2ParamFamily" asymptotic bias of IC under convex contaminations and L2Fam.

IC = "IC", risk = "asBias", neighbor = "TotalVarNeighborhood", L2Fam = "missing" asymptotic bias of IC in case of total variation neighborhoods.

IC = "IC", risk = "asBias", neighbor = "TotalVarNeighborhood", L2Fam = "L2ParamFamily" asymptotic bias of IC under L2Fam in case of total variation neighborhoods.

IC = "IC", risk = "asMSE", neighbor = "UncondNeighborhood", L2Fam = "missing" asymptotic mean square error of IC.

IC = "IC", risk = "asMSE", neighbor = "UncondNeighborhood", L2Fam = "L2ParamFamily" asymptotic mean square error of IC under L2Fam.

IC = "TotalVarIC", risk = "asUnOvShoot", neighbor = "UncondNeighborhood", L2Fam = "missing" asymptotic under-/overshoot risk of IC.

IC = "IC", risk = "fiUnOvShoot", neighbor = "ContNeighborhood", L2Fam = "missing" finite-sample under-/overshoot risk of IC.

IC = "IC", risk = "fiUnOvShoot", neighbor = "TotalVarNeighborhood", L2Fam = "missing" finite-sample under-/overshoot risk of IC.

Note

This generic function is still under construction.

Gumbel

Generating function for Gumbel-class

Description

Generates an object of class "Gumbel".

Usage

```
Gumbel(loc = 0, scale = 1)
```

Arguments

loc real number: location parameter of the Gumbel distribution.
scale positive real number: scale parameter of the Gumbel distribution

Value

Object of class "Gumbel"

Note

The class "Gumbel" is based on the code provided by the package **evd**.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[Gumbel-class](#), [rgumbel](#)

Examples

```
(G1 <- Gumbel(loc = 1, scale = 2))
plot(G1)
loc(G1)
scale(G1)
loc(G1) <- -1
scale(G1) <- 2
plot(G1)

E(Gumbel()) # Euler's constant
E(G1, function(x){x^2})

## The function is currently defined as
function(loc = 0, scale = 1){
  new("Gumbel", loc = loc, scale = scale)
}
```

Gumbel-class

Gumbel distribution

Description

The Gumbel cumulative distribution function with location parameter $\text{loc} = \mu$ and scale parameter $\text{scale} = \sigma$ is

$$F(x) = \exp(-\exp[-(x - \mu)/\sigma])$$

for all real x , where $\sigma > 0$; c.f. `rgumbel`. This distribution is also known as extreme value distribution of type I; confer Chapter~22 of Johnson et al. (1995).

Usage

```
E(object, fun, cond, ...)
## S4 method for signature 'Gumbel,missing,missing'
E(object, low = NULL, upp = NULL, ...)
var(x, ...)
## S4 method for signature 'Gumbel'
var(x, ...)
skewness(x, ...)
## S4 method for signature 'Gumbel'
skewness(x, ...)
kurtosis(x, ...)
```

```
## S4 method for signature 'Gumbel'
kurtosis(x, ...)
```

Arguments

object	object of class "Distribution"
fun	if missing the (conditional) expectation is computed else the (conditional) expectation of fun is computed.
cond	if not missing the conditional expectation given cond is computed.
low	lower bound of integration range.
upp	upper bound of integration range.
x	object of class "UnivariateDistribution"
...	additional arguments to fun

Objects from the Class

Objects can be created by calls of the form `new("Gumbel", loc, scale)`. More frequently they are created via the generating function `Gumbel`.

Slots

img Object of class "Reals".

param Object of class "GumbelParameter".

r rgumbel

d dgumbel

p pgumbel

q qgumbel

gaps (numeric) matrix or NULL

.withArith logical: used internally to issue warnings as to interpretation of arithmetics

.withSim logical: used internally to issue warnings as to accuracy

.logExact logical: used internally to flag the case where there are explicit formulae for the log version of density, cdf, and quantile function

.lowerExact logical: used internally to flag the case where there are explicit formulae for the lower tail version of cdf and quantile function

Symmetry object of class "DistributionSymmetry"; used internally to avoid unnecessary calculations.

Extends

Class "AbscontDistribution", directly.

Class "UnivariateDistribution", by class "AbscontDistribution".

Class "Distribution", by class "AbscontDistribution".

Methods

initialize signature(.Object = "Gumbel"): initialize method.

loc signature(object = "Gumbel"): wrapped access method for slot loc of slot param.

scale signature(x = "Gumbel"): wrapped access method for slot scale of slot param.

loc<- signature(object = "Gumbel"): wrapped replace method for slot loc of slot param.

scale<- signature(x = "Gumbel"): wrapped replace method for slot scale of slot param.

+ signature(e1 = "Gumbel", e2 = "numeric"): result again of class "Gumbel"; exact.

***** signature(e1 = "Gumbel", e2 = "numeric"): result again of class "Gumbel"; exact.

E signature(object = "Gumbel", fun = "missing", cond = "missing"): exact evaluation of expectation using explicit expressions.

var signature(x = "Gumbel"): exact evaluation of expectation using explicit expressions.

skewness signature(x = "Gumbel"): exact evaluation of expectation using explicit expressions.

kurtosis signature(x = "Gumbel"): exact evaluation of expectation using explicit expressions.

median signature(x = "Gumbel"): exact evaluation of expectation using explicit expressions.

IQR signature(x = "Gumbel"): exact evaluation of expectation using explicit expressions.

Note

This class is based on the code provided by the package **evd**.

scale(G1) <- 2
plot(G1)
```

GumbelLocationFamily *Generating function for Gumbel location families*

Description

Generates an object of class "L2ParamFamily" which represents a Gumbel location family.

Usage

```
GumbelLocationFamily(loc = 0, scale = 1, trafo)
```

Arguments

loc	location parameter
scale	scale parameter
trafo	matrix: transformation of the parameter

Details

The slots of the corresponding L2 differentiable parameteric family are filled.

Value

Object of class "L2ParamFamily"

Author(s)

checkL2deriv(G1)
distrExOptions("ElowerTruncQuantile" = 0) # default
```

GumbelParameter-class *Parameter of Gumbel distributions*

Description

The class of the parameter of Gumbel distributions.

Objects from the Class

Objects can be created by calls of the form `new("GumbelParameter", ...)`.

Slots

loc real number: location parameter of a Gumbel distribution.

scale positive real number: scale parameter of a Gumbel distribution.

name default name is "parameter of a Gumbel distribution".

Extends

Class "Parameter", directly.

Class "OptionalParameter", by class "Parameter".

Methods

loc signature(object = "GumbelParameter"): access method for slot loc.

scale signature(x = "GumbelParameter"): access method for slot scale.

loc<- signature(object = "GumbelParameter"): replace method for slot loc.

scale<- signature(x = "GumbelParameter"): replace method for slot scale.

```

IC

Generating function for IC-class

Description

Generates an object of class "IC".

Usage

```
IC(name, Curve = EuclRandVarList(RealRandVariable(Map = list(function(x){x}),
                                                    Domain = Reals())),
  Risks, Infos, CallL2Fam = call("L2ParamFamily"))
```

Arguments

name	Object of class "character".
CallL2Fam	object of class "call": creates an object of the underlying L2-differentiable parametric family.
Curve	object of class "EuclRandVarList".
Risks	object of class "list": list of risks; cf. RiskType-class .
Infos	matrix of characters with two columns named method and message: additional informations.

Value

Object of class "IC"

}

```

 IC-class

Influence curve

Description

Class of (partial) influence curves.

Objects from the Class

Objects can be created by calls of the form `new("IC", ...)`. More frequently they are created via the generating function `IC`.

Slots

CallL2Fam: Object of class "call": creates an object of the underlying L2-differentiable parametric family.

name: Object of class "character".

Curve: Object of class "EuclRandVarList".

Risks: Object of class "list": list of risks; cf. [RiskType-class](#).

Infos: Object of class "matrix" with two columns named `method` and `message`: additional informations.

Extends

Class "InfluenceCurve", directly.

Methods

CallL2Fam signature(object = "IC"): accessor function for slot CallL2Fam.

CallL2Fam<- signature(object = "IC"): replacement function for slot CallL2Fam.

checkIC signature(IC = "IC", L2Fam = "missing"): check centering and Fisher consistency of IC assuming the L2-differentiable parametric family which can be generated via the slot CallL2Fam of IC.

checkIC signature(IC = "IC", L2Fam = "L2ParamFamily"): check centering and Fisher consistency of IC assuming the L2-differentiable parametric family L2Fam.

evalIC signature(IC = "IC", x = "numeric"): evaluate IC at x.

evalIC signature(IC = "IC", x = "matrix"): evaluate IC at the rows of x.

infoPlot signature(object = "IC"): Plot absolute and relative information of IC.

plot signature(x = "IC")

show signature(object = "IC")

InfluenceCurve-class *Influence curve*

Description

Class of influence curves (functions).

Objects from the Class

Objects can be created by calls of the form `new("InfluenceCurve", ...)`. More frequently they are created via the generating function `InfluenceCurve`.

Slots

name: object of class "character"

Curve: object of class "EuclRandVarList"

Risks: object of class "list": list of risks; cf. [RiskType-class](#).

Infos: object of class "matrix" with two columns named `method` and `message`: additional informations.

Methods

name signature(object = "InfluenceCurve"): accessor function for slot name.

name<- signature(object = "InfluenceCurve"): replacement function for slot name.

Curve signature(object = "InfluenceCurve"): accessor function for slot Curve.

Map signature(object = "InfluenceCurve"): accessor function for slot Map of slot Curve.

Domain signature(object = "InfluenceCurve"): accessor function for slot Domain of slot Curve.

Range signature(object = "InfluenceCurve"): accessor function for slot Range of slot Curve.

Infos signature(object = "InfluenceCurve"): accessor function for slot Infos.

Infos<- signature(object = "InfluenceCurve"): replacement function for slot Infos.

addInfo<- signature(object = "InfluenceCurve"): function to add an information to slot Infos.

Risks signature(object = "InfluenceCurve"): accessor function for slot Risks.

Risks<- signature(object = "InfluenceCurve"): replacement function for slot Risks.

addRisk<- signature(object = "InfluenceCurve"): function to add a risk to slot Risks.

show signature(object = "InfluenceCurve")

infoPlot

Plot absolute and relative information

Description

Plot absolute and relative information of influence curves.

Usage

```
infoPlot(object)
```

Arguments

object object of class "InfluenceCurve"

Details

Absolute information is defined as the square of the length of an IC. The relative information is defined as the absolute information of one component with respect to the absolute information of the whole IC; confer Section 8.1 of Kohl (2005).

InfRobModel-class	<i>Robust model with infinitesimal (unconditional) neighborhood</i>
-------------------	---------------------------------------------------------------------

Description

Class of robust models with infinitesimal (unconditional) neighborhoods; i.e., the neighborhood is shrinking at a rate of \sqrt{n} .

Objects from the Class

Objects can be created by calls of the form `new("InfRobModel", ...)`. More frequently they are created via the generating function `InfRobModel`.

Slots

`center`: Object of class "ProbFamily".

`neighbor`: Object of class "UncondNeighborhood".

Extends

Class "RobModel", directly.

Methods

`neighbor<-` signature(object = "InfRobModel"): replacement function for slot `neighbor<-`

`show` signature(object = "InfRobModel")

ksEstimator	<i>Generic Function for the Computation of the Kolmogorov Minimum Distance Estimator</i>
-------------	------------------------------------------------------------------------------------------

Description

Generic function for the computation of the Kolmogorov(-Smirnov) minimum distance estimator.

Usage

```
ksEstimator(x, distribution, ...)

## S4 method for signature 'numeric,Binom'
ksEstimator(x, distribution, param, eps = .Machine$double.eps^0.5)

## S4 method for signature 'numeric,Pois'
ksEstimator(x, distribution, param, eps = .Machine$double.eps^0.5)

## S4 method for signature 'numeric,Norm'
ksEstimator(x, distribution, param, eps = .Machine$double.eps^0.5)

## S4 method for signature 'numeric,Lnorm'
ksEstimator(x, distribution, param, eps = .Machine$double.eps^0.5)

## S4 method for signature 'numeric,Gumbel'
ksEstimator(x, distribution, param, eps = .Machine$double.eps^0.5)

## S4 method for signature 'numeric,Exp'
ksEstimator(x, distribution, param, eps = .Machine$double.eps^0.5)

## S4 method for signature 'numeric,Gammad'
ksEstimator(x, distribution, param, eps = .Machine$double.eps^0.5)
```

Arguments

x	sample
distribution	object of class "Distribution"
...	additional parameters
param	name of the unknown parameter. If missing all parameters of the corresponding distribution are estimated.
eps	the desired accuracy (convergence tolerance).

Details

In case of discrete distributions the Kolmogorov distance is computed and the parameters which lead to the minimum distance are returned. In case of absolutely continuous distributions `ks.test` is called and the parameters which minimize the corresponding test statistic are returned.

Value

The Kolmogorov minimum distance estimator is computed. Returns a list with components named like the parameters of distribution.

Methods

x = "numeric", distribution = "Binom" Binomial distributions.

x = "numeric", distribution = "Pois" Poisson distributions.

x = "numeric", distribution = "Norm" Normal distributions.

x = "numeric", distribution = "Lnorm" Lognormal distributions.

x = "numeric", distribution = "Gumbel" Gumbel distributions.

x = "numeric", distribution = "Exp" Exponential distributions.

x = "numeric", distribution = "Gamma" Gamma distributions.

```

L2ParamFamily

*Generating function for L2ParamFamily-class***Description**

Generates an object of class "L2ParamFamily".

Usage

```
L2ParamFamily(name, distribution = Norm(), distrSymm,
              main = 0, nuisance, trafo, param, props = character(0),
              L2deriv = EuclRandVarList(RealRandVariable(list(function(x) {x}),
                                                         Domain = Reals()))),
              L2derivSymm, L2derivDistr, L2derivDistrSymm, FisherInfo)
```

Arguments

name	character string: name of the family
distribution	object of class "Distribution": member of the family
distrSymm	object of class "DistributionSymmetry": symmetry of distribution.
main	numeric vector: main parameter
nuisance	numeric vector: nuisance parameter
trafo	matrix: transformation of the parameter
param	object of class "ParamFamParameter": parameter of the family
props	character vector: properties of the family
L2deriv	object of class "EuclRandVariable": L2 derivative of the family
L2derivSymm	object of class "FunSymmList": symmetry of the maps contained in L2deriv
L2derivDistr	object of class "UnivarDistrList": distribution of L2deriv
L2derivDistrSymm	object of class "DistrSymmList": symmetry of the distributions contained in L2derivDistr
FisherInfo	object of class "PosDefSymmMatrix": Fisher information of the family

Details

If name is missing, the default "L2 differentiable parametric family of probability measures" is used. In case distrSymm is missing it is set to NoSymmetry(). If param is missing, the parameter is created via main, nuisance and trafo as described in [ParamFamParameter](#). In case L2derivSymm is missing, it is filled with an object of class FunSymmList with entries NonSymmetric(). In case L2derivDistr is missing, it is computed via imageDistr. If L2derivDistrSymm is missing, it is set to an object of class DistrSymmList with entries NoSymmetry(). In case FisherInfo is missing, it is computed from L2deriv using E.

Value

Object of class "L2ParamFamily"

L2ParamFamily-class *L2 differentiable parametric family*

Description

Class of L2 differentiable parametric families.

Objects from the Class

Objects can be created by calls of the form `new("L2ParamFamily", ...)`. More frequently they are created via the generating function `L2ParamFamily`.

Slots

name: object of class "character": name of the family.

distribution: object of class "Distribution": member of the family.

distrSymm: Object of class "DistributionSymmetry": symmetry of distribution.

param: object of class "ParamFamParameter": parameter of the family.

props: object of class "character": properties of the family.

L2deriv: object of class "EuclRandVariable": L2 derivative of the family.

L2derivSymm: object of class "FunSymmList": symmetry of the maps included in L2deriv.

L2derivDistr: object of class "UnivarDistrList": list which includes the distribution of L2deriv.

L2derivDistrSymm: object of class "DistrSymmList": symmetry of the distributions included in L2derivDistr.

FisherInfo: object of class "PosDefSymmMatrix": Fisher information of the family.

Extends

Class "ParamFamily", directly.
 Class "ProbFamily", by class "ParamFamily".

Methods

L2deriv signature(object = "L2ParamFamily"): accessor function for L2deriv.
L2derivSymm signature(object = "L2ParamFamily"): accessor function for L2derivSymm.
L2derivDistr signature(object = "L2ParamFamily"): accessor function for L2derivDistr.
L2derivDistrSymm signature(object = "L2ParamFamily"): accessor function for L2derivDistrSymm.
FisherInfo signature(object = "L2ParamFamily"): accessor function for FisherInfo.
checkL2deriv signature(object = "L2ParamFamily"): check centering of L2deriv and compute precision of Fisher information.
E signature(object = "L2ParamFamily", fun = "EuclRandVariable", cond = "missing"): expectation of fun under the distribution of object.
E signature(object = "L2ParamFamily", fun = "EuclRandMatrix", cond = "missing"): expectation of fun under the distribution of object.
E signature(object = "L2ParamFamily", fun = "EuclRandVarList", cond = "missing"): expectation of fun under the distribution of object.
plot signature(x = "L2ParamFamily"): plot of distribution and L2deriv.

leastFavorableRadius *Generic Function for the Computation of Least Favorable Radii*

Description

Generic function for the computation of least favorable radii.

Usage

```
leastFavorableRadius(L2Fam, neighbor, risk, ...)
```

```
## S4 method for signature 'L2ParamFamily,UncondNeighborhood,asGRisk'
leastFavorableRadius(L2Fam, neighbor, risk, rho, upRad = 1,
  z.start = NULL, A.start = NULL, upper = 100, maxiter = 100,
  tol = .Machine$double.eps^0.4, warn = FALSE)
```

Arguments

L2Fam	L2-differentiable family of probability measures.
neighbor	object of class "Neighborhood".
risk	object of class "RiskType".
...	additional parameters
upRad	the upper end point of the radius interval to be searched.
rho	The considered radius interval is: $[r\rho, r/\rho]$ with $\rho \in (0, 1)$.
z.start	initial value for the centering constant.
A.start	initial value for the standardizing matrix.
upper	upper bound for the optimal clipping bound.
maxiter	the maximum number of iterations
tol	the desired accuracy (convergence tolerance).
warn	logical: print warnings.

Value

The least favorable radius and the corresponding inefficiency are computed.

Methods

L2Fam = "L2ParamFamily", neighbor = "UncondNeighborhood", risk = "asGRisk" computation of the least favorable radius.

```

LnormScaleFamily

Generating function for lognormal scale families

Description

Generates an object of class "L2ParamFamily" which represents a lognormal scale family.

Usage

```
LnormScaleFamily(meanlog = 0, sdlog = 1, trafo)
```

Arguments

meanlog	mean of the distribution on the log scale
sdlog	standard deviation of the distribution on the log scale
trafo	matrix: transformation of the parameter

Details

The slots of the corresponding L2 differentiable parameteric family are filled.

Value

Object of class "L2ParamFamily"

locMEstimator

Generic function for the computation of location M estimators

Description

Generic function for the computation of location M estimators.

Usage

```
locMEstimator(x, IC, ...)

## S4 method for signature 'numeric,InfluenceCurve'
locMEstimator(x, IC, eps = .Machine$double.eps^0.5)
```

Arguments

x	sample
IC	object of class "InfluenceCurve"
...	additional parameters
eps	the desired accuracy (convergence tolerance).

Value

Returns a list with component

loc	M estimator of location
-----	-------------------------

Methods

x = "numeric", IC = "InfluenceCurve" univariate location.

lowerCaseRadius	<i>Computation of the lower case radius</i>
-----------------	---------------------------------------------

Description

The lower case radius is computed; confer Subsection 2.1.2 in Kohl (2005).

Usage

```
lowerCaseRadius(L2Fam, neighbor, risk, ...)
```

Arguments

L2Fam	L2 differentiable parametric family
neighbor	object of class "Neighborhood"
risk	object of class "RiskType"
...	additional parameters

Value

lower case radius

Methods

L2Fam = "L2ParamFamily", neighbor = "ContNeighborhood", risk = "asMSE" lower case radius for risk "asMSE" in case of "ContNeighborhood".

L2Fam = "L2ParamFamily", neighbor = "TotalVarNeighborhood", risk = "asMSE" lower case radius for risk "asMSE" in case of "TotalVarNeighborhood".

oneStepEstimator *Generic function for the computation of one-step estimators*

Description

Generic function for the computation of one-step estimators.

Usage

```
oneStepEstimator(x, IC, start)
```

Arguments

x	sample
IC	object of class "InfluenceCurve"
start	initial estimate

Details

Given an initial estimation start, a sample x and an influence curve IC the corresponding one-step estimator is computed

Value

The one-step estimation is computed.

Methods

x = "numeric", IC = "InfluenceCurve", start = "numeric" univariate samples.

x = "numeric", IC = "InfluenceCurve", start = "list" univariate samples.

x = "matrix", IC = "InfluenceCurve", start = "numeric" multivariate samples.

x = "matrix", IC = "InfluenceCurve", start = "list" multivariate samples.

optIC

Generic function for the computation of optimally robust ICs

Description

Generic function for the computation of optimally robust ICs.

Usage

```

optIC(model, risk, ...)

## S4 method for signature 'L2ParamFamily,asCov'
optIC(model, risk)

## S4 method for signature 'InfRobModel,asRisk'
optIC(model, risk, z.start = NULL, A.start = NULL, upper = 1e4,
       maxiter = 50, tol = .Machine$double.eps^0.4, warn = TRUE)

## S4 method for signature 'InfRobModel,asUnOvShoot'
optIC(model, risk, upper = 1e4, maxiter = 50,
       tol = .Machine$double.eps^0.4, warn = TRUE)

## S4 method for signature 'FixRobModel,fiUnOvShoot'
optIC(model, risk, sampleSize, upper = 1e4, maxiter = 50,
       tol = .Machine$double.eps^0.4, warn = TRUE, Algo = "A", cont = "left")

```

Arguments

model	probability model.
risk	object of class "RiskType".
...	additional parameters.
z.start	initial value for the centering constant.
A.start	initial value for the standardizing matrix.
upper	upper bound for the optimal clipping bound.
maxiter	the maximum number of iterations.
tol	the desired accuracy (convergence tolerance).
warn	logical: print warnings.
sampleSize	integer: sample size.
Algo	"A" or "B".
cont	"left" or "right".

Details

In case of the finite-sample risk "fiUnOvShoot" one can choose between two algorithms for the computation of this risk where the least favorable contamination is assumed to be left or right of some bound. For more details we refer to Section 11.3 of Kohl (2005).

Value

Some optimally robust IC is computed.

Methods

model = "L2ParamFamily", risk = "asCov" computes classical optimal influence curve for L2 differentiable parametric families.

model = "InfRobModel", risk = "asRisk" computes optimally robust influence curve for robust models with infinitesimal neighborhoods and various asymptotic risks.

model = "InfRobModel", risk = "asUnOvShoot" computes optimally robust influence curve for robust models with infinitesimal neighborhoods and asymptotic under-/overshoot risk.

model = "FixRobModel", risk = "fiUnOvShoot" computes optimally robust influence curve for robust models with fixed neighborhoods and finite-sample under-/overshoot risk.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

## classical optimal IC
IC0 <- optIC(model = B, risk = asCov())
plot(IC0) # plot IC
checkIC(IC0, B)
```

optRisk

Generic function for the computation of the minimal risk

Description

Generic function for the computation of the optimal (i.e., minimal) risk for a probability model.

Usage

```

optRisk(model, risk, ...)

## S4 method for signature 'InfRobModel,asRisk'
optRisk(model, risk, z.start = NULL, A.start = NULL, upper = 1e4,
         maxiter = 50, tol = .Machine$double.eps^0.4, warn = TRUE)

## S4 method for signature 'FixRobModel,fiUnOvShoot'
optRisk(model, risk, sampleSize, upper = 1e4, maxiter = 50,
         tol = .Machine$double.eps^0.4, warn = TRUE, Algo = "A", cont = "left")

```

Arguments

model	probability model
risk	object of class RiskType
...	additional parameters
z.start	initial value for the centering constant.
A.start	initial value for the standardizing matrix.
upper	upper bound for the optimal clipping bound.
maxiter	the maximum number of iterations
tol	the desired accuracy (convergence tolerance).
warn	logical: print warnings.
sampleSize	integer: sample size.
Algo	"A" or "B".
cont	"left" or "right".

Details

In case of the finite-sample risk "fiUnOvShoot" one can choose between two algorithms for the computation of this risk where the least favorable contamination is assumed to be left or right of some bound. For more details we refer to Section 11.3 of Kohl (2005).

Value

The minimal risk is computed.

Methods

model = "L2ParamFamily", risk = "asCov" asymptotic covariance of L2 differentiable parametric family.

model = "InfRobModel", risk = "asRisk" asymptotic risk of a infinitesimal robust model.

model = "FixRobModel", risk = "fiUnOvShoot" finite-sample under-/overshoot risk of a robust model with fixed neighborhood.

optRisk(model = NormLocationScaleFamily(), risk = asCov())
```

ParamFamily

Generating function for ParamFamily-class

Description

Generates an object of class "ParamFamily".

Usage

```
ParamFamily(name, distribution = Norm(), distrSymm, main = 0,
            nuisance, trafo, param, props = character(0))
```

Arguments

name	character string: name of family
distribution	object of class "Distribution": member of the family
distrSymm	object of class "DistributionSymmetry": symmetry of distribution.
main	numeric vector: main parameter
nuisance	numeric vector: nuisance parameter
trafo	matrix: transformation of the parameters
param	object of class "ParamFamParameter": parameter of the family
props	character vector: properties of the family

Details

If name is missing, the default “parametric family of probability measures” is used. In case distrSymm is missing it is set to NoSymmetry(). If param is missing, the parameter is created via main, nuisance and trafo as described in [ParamFamParameter](#).

Value

Object of class "ParamFamily"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[ParamFamily-class](#)

Examples

```
F1 <- ParamFamily()
plot(F1)

## The function is currently defined as
function(name, distribution = Norm(), main = 0, nuisance,
         trafo, param, props = character(0)){
  if(missing(name))
    name <- "parametric family of probability measures"
  if(missing(distrSymm)) distrSymm <- NoSymmetry()
  if(missing(param))
    param <- ParamFamParameter(name = paste("parameter of", name),
                               main = main, nuisance = nuisance, trafo = trafo)
  return(new("ParamFamily", name = name, distribution = distribution,
            distrSymm = distrSymm, param = param, props = props))
}
```

ParamFamily-class *Parametric family of probability measures.*

Description

Class of parametric families of probability measures.

Objects from the Class

Objects can be created by calls of the form `new("ParamFamily", ...)`. More frequently they are created via the generating function `ParamFamily`.

Slots

param: Object of class "ParamFamParameter": parameter of the family.

name: Object of class "character": name of the family.

distribution: Object of class "Distribution": member of the family.

distrSymm: Object of class "DistributionSymmetry": symmetry of distribution.

props: Object of class "character": properties of the family.

Extends

Class "ProbFamily", directly.

Methods

main signature(object = "ParamFamily"): wrapped accessor function for slot main of slot param.

nuisance signature(object = "ParamFamily"): wrapped accessor function for slot nuisance of slot param.

trafo signature(object = "ParamFamily"): wrapped accessor function for slot trafo of slot param.

param signature(object = "ParamFamily"): accessor function for slot param.

plot signature(x = "ParamFamily"): plot of slot distribution.

show signature(object = "ParamFamily")

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

[Distribution-class](#)

Examples

```
F1 <- new("ParamFamily") # prototype
plot(F1)
```

ParamFamParameter *Generating function for ParamFamParameter-class*

Description

Generates an object of class "ParamFamParameter".

Usage

```
ParamFamParameter(name, main = numeric(0), nuisance, trafo)
```

Arguments

name	character string: name of parameter
main	numeric vector: main parameter
nuisance	numeric vector: nuisance parameter
trafo	matrix: transformation of the parameter

Details

If name is missing, the default "parameter of a parametric family of probability measures" is used. If nuisance is missing, the nuisance parameter is set to NULL. The number of columns of trafo have to be equal and the number of rows have to be not larger than the sum of the lengths of main and nuisance. If trafo is missing, no transformation to the parameter is applied; i.e., trafo is set to an identity matrix.

Value

Object of class "ParamFamParameter"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

See Also

[ParamFamParameter-class](#)

Examples

```
ParamFamParameter(main = 0, nuisance = 1, trafo = diag(c(1,2)))

## The function is currently defined as
function(name, main = numeric(0), nuisance, trafo){
  if(missing(name))
    name <- "parameter of a parametric family of probability measures"
  if(missing(nuisance))
    nuisance <- NULL
```

```

    if(missing(trafo))
      trafo <- diag(length(main)+length(nuisance))

    return(new("ParamFamParameter", name = name, main = main,
              nuisance = nuisance, trafo = trafo))
  }

```

 ParamFamParameter-class

Parameter of a parametric family of probability measures

Description

Class of the parameter of parametric families of probability measures.

Objects from the Class

Objects can be created by calls of the form `new("ParamFamParameter", ...)`. More frequently they are created via the generating function `ParamFamParameter`.

Slots

main: Object of class "numeric": main parameter.

nuisance: Object of class "OptionalNumeric": optional nuisance parameter.

trafo: Object of class "matrix": transformation of the parameter.

name: Object of class "character": name of the parameter.

Extends

Class "Parameter", directly.

Class "OptionalParameter", by class "Parameter".

Methods

main signature(object = "ParamFamParameter"): accessor function for slot main.

main<- signature(object = "ParamFamParameter"): replacement function for slot main.

nuisance signature(object = "ParamFamParameter"): accessor function for slot nuisance.

nuisance<- signature(object = "ParamFamParameter"): replacement function for slot nuisance.

trafo signature(object = "ParamFamParameter"): accessor function for slot trafo.

trafo<- signature(object = "ParamFamParameter"): replacement function for slot trafo.

length signature(x = "ParamFamParameter"): sum of the lengths of main and nuisance.

show signature(object = "ParamFamParameter")

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

PoisFamily

Generating function for Poisson families

Description

Generates an object of class "L2ParamFamily" which represents a Poisson family.

Usage

```
PoisFamily(lambda = 1, trafo)
```

Arguments

lambda	positive mean
trafo	matrix: transformation of the parameter

Details

The slots of the corresponding L2 differentiable parameteric family are filled.

Value

Object of class "L2ParamFamily"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

ProbFamily-class *Family of probability measures*

Description

Class of families of probability measures.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

name: Object of class "character": name of the family.

distribution: Object of class "Distribution": member of the family.

distrSymm: Object of class "DistributionSymmetry": symmetry of distribution.

props: Object of class "character": properties of the family.

Methods

name signature(object = "ProbFamily"): accessor function for slot name.

name<- signature(object = "ProbFamily"): replacement function for slot name.

distribution signature(object = "ProbFamily"): accessor function for slot distribution.

distrSymm signature(object = "ProbFamily"): accessor function for slot distrSymm.

props signature(object = "ProbFamily"): accessor function for slot props.

props<- signature(object = "ProbFamily"): replacement function for slot props.

addProp<- signature(object = "ProbFamily"): add a property to slot props.

[Distribution-class](#)

radiusMinimaxIC	<i>Generic function for the computation of the radius minimax IC</i>
-----------------	----------------------------------------------------------------------

Description

Generic function for the computation of the radius minimax IC.

Usage

```
radiusMinimaxIC(L2Fam, neighbor, risk, ...)

## S4 method for signature 'L2ParamFamily,UncondNeighborhood,asGRisk'
radiusMinimaxIC(L2Fam, neighbor, risk,
                loRad, upRad, z.start = NULL, A.start = NULL, upper = 1e5,
                maxiter = 100, tol = .Machine$double.eps^0.4, warn = FALSE)
```

Arguments

L2Fam	L2-differentiable family of probability measures.
neighbor	object of class "Neighborhood".
risk	object of class "RiskType".
...	additional parameters.
loRad	the lower end point of the interval to be searched.
upRad	the upper end point of the interval to be searched.
z.start	initial value for the centering constant.
A.start	initial value for the standardizing matrix.
upper	upper bound for the optimal clipping bound.
maxiter	the maximum number of iterations
tol	the desired accuracy (convergence tolerance).
warn	logical: print warnings.

Value

The radius minimax IC is computed.

Methods

L2Fam = "L2ParamFamily", neighbor = "UncondNeighborhood", risk = "asGRisk": computation of the radius minimax IC for an L2 differentiable parametric family.

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

```

RiskType-class	<i>Risk</i>
----------------	-------------

Description

Class of risks; e.g., estimator risks.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

type: Object of class "character": type of risk.

Methods

type signature(object = "RiskType"): accessor function for slot type.

show signature(object = "RiskType")

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

RobModel-class	<i>Robust model</i>
----------------	---------------------

Description

Class of robust models. A robust model consists of family of probability measures center and a neighborhood neighbor about this family.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

center: Object of class "ProbFamily"

neighbor: Object of class "Neighborhood"

Methods

center signature(object = "RobModel"): accessor function for slot center.

center<- signature(object = "RobModel"): replacement function for slot center.

neighbor signature(object = "RobModel"): accessor function for slot neighbor.

neighbor<- signature(object = "RobModel"): replacement function for slot neighbor.

ROptEstOldConstants *Built-in Constants in package ROptEstOld*

Description

Constants built into **ROptEstOld**.

Usage

EULERMASCHERONICCONSTANT
 APERYCONSTANT

Details

ROptEstOld has a small number of built-in constants.

The following constants are available:

- EULERMASCHERONICCONSTANT: the Euler Mascheroni constant

$$\gamma = -\Gamma'(1)$$

given in <http://mathworld.wolfram.com/Euler-MascheroniConstant.html> (48);

- APERYCONSTANT: the Apéry constant

$$\zeta(3) = \frac{5}{2} \left(\sum_{k \geq 1} \frac{(-1)^{k-1}}{k^3 \binom{2k}{k}} \right)$$

as given in <http://mathworld.wolfram.com/AperysConstant.html>, equation (8);

These are implemented as variables in the **ROptEstOld** name space taking appropriate values.

Examples

EULERMASCHERONICCONSTANT
 APERYCONSTANT

TotalVarIC *Generating function for TotalVarIC-class*

Description

Generates an object of class "TotalVarIC"; i.e., an influence curves η of the form

$$\eta = c \vee A\Lambda \wedge d$$

with lower clipping bound c , upper clipping bound d and standardizing matrix A . Λ stands for the L2 derivative of the corresponding L2 differentiable parametric family which can be created via CallL2Fam.

Usage

```
TotalVarIC(name, CallL2Fam = call("L2ParamFamily"),
            Curve = EuclRandVarList(RealRandVariable(Map = c(function(x) {x}),
                                                    Domain = Reals()))),
            Risks, Infos, clipLo = -Inf, clipUp = Inf, stand = as.matrix(1),
            lowerCase = NULL, neighborRadius = 0)
```

Arguments

name	object of class "character".
CallL2Fam	object of class "call": creates an object of the underlying L2-differentiable parametric family.
Curve	object of class "EuclRandVarList".
Risks	object of class "list": list of risks; cf. RiskType-class .
Infos	matrix of characters with two columns named method and message: additional informations.
clipLo	negative real: lower clipping bound.
clipUp	positive real: lower clipping bound.
stand	matrix: standardizing matrix
lowerCase	optional constant for lower case solution.
neighborRadius	radius of the corresponding (unconditional) contamination neighborhood.

Value

Object of class "TotalVarIC"

Author(s)

Matthias Kohl <Matthias.Kohl@stamats.de>

References

Rieder, H. (1994) *Robust Asymptotic Statistics*. New York: Springer.
 Kohl, M. (2005) *Numerical Contributions to the Asymptotic Theory of Robustness*. Bayreuth: Dissertation.

Examples

```
IC1 <- TotalVarIC()
plot(IC1)
```

TotalVarIC-class *Influence curve of total variation type*

Description

Class of (partial) influence curves of total variation type. i.e., an influence curves η of the form

$$\eta = c \vee A\Lambda \wedge d$$

with lower clipping bound c , upper clipping bound d and standardizing matrix A . Λ stands for the L2 derivative of the corresponding L2 differentiable parametric family which can be created via CallL2Fam.

Objects from the Class

Objects can be created by calls of the form `new("TotalVarIC", ...)`. More frequently they are created via the generating function `TotalVarIC`, respectively via the method `generateIC`.

Slots

CallL2Fam: object of class "call": creates an object of the underlying L2-differentiable parametric family.

name: object of class "character".

Curve: object of class "EuclRandVarList".

Risks: object of class "list": list of risks; cf. [RiskType-class](#).

Infos: object of class "matrix" with two columns named `method` and `message`: additional informations.

clipLo: object of class "numeric": lower clipping bound.

clipUp: object of class "numeric": upper clipping bound.

stand: object of class "matrix": standardizing matrix.

lowerCase object of class "OptionalNumeric": optional constant for lower case solution.

neighborRadius: object of class "numeric": radius of the corresponding (unconditional) contamination neighborhood.

Extends

Class "IC", directly.

Class "InfluenceCurve", by class "IC".

Methods

CallL2Fam<- signature(object = "TotalVarIC"): replacement function for slot CallL2Fam.
clipLo signature(object = "TotalVarIC"): accessor function for slot clipLo.
clipLo<- signature(object = "TotalVarIC"): replacement function for slot clipLo.
clipUp signature(object = "TotalVarIC"): accessor function for slot clipUp.
clipUp<- signature(object = "TotalVarIC"): replacement function for slot clipUp.
stand signature(object = "TotalVarIC"): accessor function for slot stand.
stand<- signature(object = "TotalVarIC"): replacement function for slot stand.
neighborRadius signature(object = "TotalVarIC"): accessor function for slot neighborRadius.
neighborRadius<- signature(object = "TotalVarIC"): replacement function for slot neighborRadius.
generateIC signature(neighbor = "TotalVarNeighborhood", L2Fam = "L2ParamFamily"): generate an object of class "TotalVarIC". Rarely called directly.
show signature(object = "TotalVarIC")
