

Package ‘FuzzyR’

March 24, 2017

Type Package

Title Fuzzy Logic Toolkit for R

Version 2.1

Date 2017-03-24

Author Jon Garibaldi, Chao Chen, Tajul Razak

Maintainer Jon Garibaldi <fuzzyr@cs.nott.ac.uk>

Depends R (>= 3.0.0)

Imports splines, shiny, plyr

Description Design and simulate fuzzy logic systems using Type 1 Fuzzy Logic.

This toolkit includes with graphical user interface (GUI) and an adaptive neuro-fuzzy inference system (ANFIS). This toolkit is a continuation from the previous package ('FuzzyToolkitUoN'). Produced by the Intelligent Modelling & Analysis Group, University of Nottingham.

License GPL (>= 2)

addmf	<i>Insert a membership function.</i>
-------	--------------------------------------

Description

Adds a membership function to a variable of a fis object.

Usage

```
addmf(fis, varType, varIndex, mfName, mfType, mfParams)
```

Arguments

<code>fis</code>	A fis structure is to be provided.
<code>varType</code>	Should be either 'input' or 'output', which relates to the type of variable (stored on the existing fis structure) that the membership function will be added to.
<code>varIndex</code>	Should be an integer value representing the index value of the input or output variable that the membership function will be added to (base 1).
<code>mfName</code>	Membership function name to be declared, for example (Poor,Good)
<code>mfType</code>	Membership function type to be declared, for example (trimf, trapmf)
<code>mfParams</code>	The value of membership function.

Value

A fis structure with the new membership function added.

Examples

```
fis <- newfis('tipper')
fis <- addvar(fis, 'input', 'service', c(0, 10))
fis <- addmf(fis, 'input', 1, 'poor', 'gaussmf', c(1.5, 0))
```

addrule	<i>Inserts a rule</i>
---------	-----------------------

Description

Adds a rule to a fis object.

Usage

```
addrule(fis, ruleList)
```

Arguments

fis	A fis structure is to be provided.
ruleList	A vector of length $m + n + 2$, where m is the number of input variables of a fis. Each column in 'm' has a number which refers to the membership function of that input variable. Columns under 'n' refer to an output variable of a fis, where the value refers to the membership function of that output variable. Finally, the '2' remaining columns refer to the weight to be applied to the rule ($m + n + 1$) and the fuzzy operator for the rule's antecedent (1 = AND, 2 = OR).

Details

For example, if one has a fis with 2 input variables, and 1 output variable, each of which have 3 membership functions (the amount of membership functions need not be the same). The following rule: 1 3 2 1 2 will mean $m = 2$ (for 2 input variables), $n = 1$ (for 1 output variable), and the last 2 columns represent weight and fuzzy operator for the rule's antecedent respectively.

The first column refers to the first input variable's membership function at index 1.

The second column refers to the second input variable's membership function at index 2.

The third column refers to the first output variable's membership function at index 3.

The fourth column refers to the weight to be applied to the rule.

The fifth column refers to the fuzzy operator for the rule's antecedent (in this case it represents 'OR').

Value

A fis structure with the new rule added.

Examples

```
fis <- tipper()
ruleList <- rbind(c(1,1,1,1,2), c(2,0,2,1,1), c(3,2,3,1,2))
fis <- addrule(fis, ruleList)
```

addvar	<i>Insert a variable</i>
--------	--------------------------

Description

Adds an input or output variable to a fis object.

Usage

```
addvar(fis, varType, varName, varBounds, method = NULL, params = NULL)
```

Arguments

fis	A fis must be provided.
varType	Should be either 'input' or 'output' which represents the type of variable to be created and added.
varName	A string representing the name of the variable.
varBounds	Also known as the 'range', this should be a vector giving a range for the variable, such as 1:10.
method	fuzzification or defuzzification method
params	the required parameters for the corresponding fuzzification or defuzzification method. For example, the required parameters for gbell.fuzzification are c(a,b)

Value

A fis with the new variable added.

Examples

```
fis <- newfis('tipper')
fis <- addvar(fis, 'input', 'service', c(0, 10))
```

anfis.builder *ANFIS model builder*

Description

To build an ANFIS model from an existing FIS model

Usage

```
anfis.builder(fis)
```

Arguments

`fis` A fuzzy inference system model initialised by `newfis`.

Value

An ANFIS model

Author(s)

Chao Chen

References

An extended ANFIS architecture and its learning properties for type-1 and interval type-2 models
<https://doi.org/10.1109/FUZZ-IEEE.2016.7737742>

Examples

```
fis <- anfis.tipper()  
anfis <- anfis.builder(fis)
```

anfis.dE.d01 *anfis.dE.dO1*

Description

to calculate the derivatives of output error with respect to output.L1.

Usage

```
anfis.dE.d01(anfis, output.L1, de.do2, do2.do1)
```

Arguments

anfis	The given ANFIS model
output.L1	The output of nodes in Layer 1
de.do2	The derivatives of output error with respect to output.L2
do2.do1	The derivatives of output.L2 with respect to output.L1.

Details

This function is not recommended for external use, but can be used for debugging or learning.

Value

The derivatives of output error with respect to output.L1.

Author(s)

Chao Chen

anfis.dE.d02

anfis.dE.dO2

Description

to calculate the derivatives of output error with respect to output.L2.

Usage

```
anfis.dE.d02(de.do3, do3.do2)
```

Arguments

de.do3	The derivatives of output error with respect to output.L3
do3.do2	The derivatives of output.L3 with respect to output.L2.

Details

This function is not recommended for external use, but can be used for debugging or learning.

Value

The derivatives of output error with respect to output.L2.

Author(s)

Chao Chen

 anfis.dE.d03

anfis.dE.dO3

Description

to calculate the derivatives of output error with respect to output.L3.

Usage

```
anfis.dE.d03(de.do4, do4.do3, output.L3)
```

Arguments

de.do4	The derivatives of output error with respect to output.L4
do4.do3	The derivatives of output.L4 with respect to output.L3.
output.L3	The output of nodes in Layer 3.

Details

This function is not recommended for external use, but can be used for debugging or learning.

Value

The derivatives of output error with respect to output.L3.

Author(s)

Chao Chen

 anfis.dE.d04

anfis.dE.dO4

Description

to calculate the derivatives of output error with respect to output.L4.

Usage

```
anfis.dE.d04(anfis, de.do5, do5.do4)
```

Arguments

anfis	The given ANFIS model
de.do5	The derivatives of output error with respect to output.L5
do5.do4	The derivatives of output.L5 with respect to output.L4.

Details

This function is not recommended for external use, but can be used for debugging or learning.

Value

The derivatives of output error with respect to output.L4.

Author(s)

Chao Chen

anfis.dE.d05

anfis.dE.dO5

Description

To calculate the derivatives of output error with respect to output.L5. NOTE: currently, only single output in L5 is supported

Usage

```
anfis.dE.d05(output.L5, y)
```

Arguments

output.L5	the model outputs
y	the target outputs

Details

This function is not recommended for external use, but can be used for debugging or learning.

Value

The derivatives of output error with respect to output.L5

Author(s)

Chao Chen

anfis.dE.dP1 *anfis.dE.dP1*

Description

To calculate the derivatives of output error with respect to parameters in Layer 1.

Usage

```
anfis.dE.dP1(anfis, de.do1, input.stack)
```

Arguments

anfis	The given ANFIS model
de.do1	The derivatives of output error with respect to output.L1
input.stack	The input data pairs.

Details

This function is not recommended for external use, but can be used for debugging or learning.

Value

The derivatives of output error with respect to parameters in Layer 1.

Author(s)

Chao Chen

anfis.dE.dP1.gbellmf *anfis.dE.dP1.gbellmf*

Description

To calculate the derivatives of E versus mf.params.L1 for gbellmf: $1 / (1 + (((x - c)/a)^2)^b)$ NOTE: only singleton fuzzification is supported

Usage

```
anfis.dE.dP1.gbellmf(de.do1, x, mf.params)
```

Arguments

de.do1	The derivatives of output error with respect to output.L1
x	The crisp input
mf.params	parameters for membership functions

Details

This function is not recommended for external use, but can be used for debugging or learning.

Author(s)

Chao Chen

anfis.dE.dP1.it2gbellmf
anfis.dE.dP1.it2gbellmf

Description

to calculate the derivatives of E versus mf.params.L1 for it2gbellmf NOTE: only singleton fuzzification is supported

Usage

anfis.dE.dP1.it2gbellmf(de.do1, x, mf.params)

Arguments

<i>de.do1</i>	The derivatives of output error with respect to output.L1
<i>x</i>	The crisp input
<i>mf.params</i>	parameters for membership functions

Details

This function is not recommended for external use, but can be used for debugging or learning.

Author(s)

Chao Chen

anfis.dE.dP4 *anfis.dE.dP4*

Description

To calculate the derivatives of output error with respect to parameters in Layer 4.

Usage

```
anfis.dE.dP4(anfis, de.do4, output.L3, input.stack)
```

Arguments

anfis	The given ANFIS model
de.do4	The derivatives of output error with respect to output.L4
output.L3	The output of nodes in Layer 3
input.stack	The input data pairs.

Details

This function is not recommended for external use, but can be used for debugging or learning.

Value

The derivatives of output error with respect to parameters in Layer 4.

Author(s)

Chao Chen

anfis.dMF.dP.gbellmf *anfis.dMF.dP.gbellmf*

Description

to calculate the derivatives of membership grades with respect to its parameters

Usage

```
anfis.dMF.dP.gbellmf(x, mf.params)
```

Arguments

x	The crisp input
mf.params	parameters for membership functions

Details

This function is not recommended for external use, but can be used for debugging or learning.

Author(s)

Chao Chen

anfis.d02.d01

anfis.dO2.dO1

Description

To calculate the derivatives of output.L2 with respect to output.L1.

Usage

```
anfis.d02.d01(anfis, output.L2, output.L1)
```

Arguments

anfis	The given ANFIS model
output.L2	The output of nodes in Layer 2
output.L1	The output of nodes in Layer 1

Details

This function is not recommended for external use, but can be used for debugging or learning.

Value

The derivatives of output.L2 with respect to output.L1. `do2[j].do1[i] <- do2.do1[[i]][[which(fan.out==j)]]`

Author(s)

Chao Chen

 anfis.d03.d02

anfis.d03.d02

Description

To calculate the derivatives of output.L3 with respect to output.L2.

Usage

```
anfis.d03.d02(anfis, output.L2, output.L2.which)
```

Arguments

anfis	The given ANFIS model
output.L2	The output of nodes in Layer 2
output.L2.which	A list of matrix indicating which output (w.lower, w.upper) in layer 2 should be used by the ekm algorithm

Details

This function is not recommended for external use, but can be used for debugging or learning.

Value

The derivatives of output.L3 with respect to output.L2. $do3.left[j].do2[i] <- do3.do2[[i]][[1]][[j]]$

Author(s)

Chao Chen

 anfis.d04.d03

anfis.d04.d03

Description

To calculate the derivatives of output.L4 with respect to output.L3.

Usage

```
anfis.d04.d03(output.L4, output.L4.mf)
```

Arguments

output.L4	The output of nodes in Layer 4
output.L4.mf	The membership grades of the membership functions of nodes in Layer 4

Details

This function is not recommended for external use, but can be used for debugging or learning.

Value

The derivatives of output.L4 with respect to output.L3.

Author(s)

Chao Chen

anfis.d05.d04

anfis.d05.d04

Description

To calculate the derivatives of output.L5 with respect to output.L4. NOTE: currently, only single output in L5 is supported

Usage

anfis.d05.d04(output.L4)

Arguments

output.L4 The output of nodes in Layer 4.

Details

This function is not recommended for external use, but can be used for debugging or learning.

Value

The derivatives of output.L5 with respect to output.L4.

Author(s)

Chao Chen

anfis.eval *ANFIS evaluator*

Description

To evaluate a ANFIS model with input data

Usage

```
anfis.eval(anfis, input.stack)
```

Arguments

anfis	The given ANFIS model
input.stack	The input data

Value

The output of the anfis for given input data.

Author(s)

Chao Chen

Examples

```
fis <- anfis.tipper()
anfis <- anfis.builder(fis)
data.num <- 5
input.num <- length(fis$input)
input.stack <- matrix(rnorm(data.num*input.num), ncol=input.num)
y <- matrix(rnorm(data.num))
data.trn <- cbind(input.stack, y)
anfis.eval(anfis, input.stack)
```

anfis.L1.eval *The evaluator for nodes in Layer 1*

Description

To evaluate the antecedent layer (L1) of anfis

Usage

```
anfis.L1.eval(anfis, output.LI, input.stack)
```

Arguments

<code>anfis</code>	The given ANFIS model
<code>output.LI</code>	The output of nodes in Layer I
<code>input.stack</code>	The input data

Details

This function is not recommended for external use, but can be used for debugging or learning. See the source code of [anfis.eval](#) for usage.

Value

The output of nodes in Layer 1

Author(s)

Chao Chen

<code>anfis.L2.eval</code>	<i>The evaluator for nodes in Layer 2</i>
----------------------------	---

Description

To evaluate the nodes in Layer 2 of the given ANFIS model

Usage

```
anfis.L2.eval(anfis, output.L1)
```

Arguments

<code>anfis</code>	The given ANFIS model
<code>output.L1</code>	The output of nodes in Layer 1

Details

This function is not recommended for external use, but can be used for debugging or learning. See the source code of [anfis.eval](#) for usage.

Value

The output of nodes in Layer 2

Author(s)

Chao Chen

anfis.L2.which	<i>L2.which</i>
----------------	-----------------

Description

To determine which output (w.lower, w.upper) to be used by the ekm algorithm

Usage

```
anfis.L2.which(anfis, output.L2, output.L4.mf)
```

Arguments

anfis	The given ANFIS model
output.L2	The output of nodes in Layer 2
output.L4.mf	The linear membership grades of nodes in Layer 4

Details

This function is not recommended for external use, but can be used for debugging or learning. See the source code of [anfis.eval](#) for usage.

Value

A list of matrix indicating which output (w.lower, w.upper) in layer 2 should be used by the ekm algorithm

Author(s)

Chao Chen

anfis.L3.eval	<i>The evaluator for nodes in Layer 3</i>
---------------	---

Description

To evaluate the nodes in Layer 3 of the given ANFIS model

Usage

```
anfis.L3.eval(anfis, output.L2, output.L2.which)
```

Arguments

anfis	The given ANFIS model
output.L2	The output of nodes in Layer 2
output.L2.which	A list of matrix indicating which output (w.lower, w.upper) in layer 2 should be used by the ekm algorithm

Details

This function is not recommended for external use, but can be used for debugging or learning. See the source code of [anfis.eval](#) for usage.

Value

The output of nodes in Layer 3

Author(s)

Chao Chen

anfis.L4.eval	<i>The evaluator for nodes in Layer 4</i>
---------------	---

Description

To evaluate the nodes in Layer 4

Usage

```
anfis.L4.eval(output.L3, output.L4.mf)
```

Arguments

output.L3	The output of nodes in Layer 3
output.L4.mf	The membership grades of the membership functions of nodes in Layer 4

Details

This function is not recommended for external use, but can be used for debugging or learning. See the source code of [anfis.eval](#) for usage.

Value

The output of nodes in Layer 4

Author(s)

Chao Chen

anfis.L4.mf.eval *The evaluator for membership functions of nodes in Layer 1*

Description

To evaluate the membership functions of nodes in Layer 4

Usage

```
anfis.L4.mf.eval(anfis, input.stack)
```

Arguments

anfis	The given ANFIS model
input.stack	The input data

Details

This function is not recommended for external use, but can be used for debugging or learning. See the source code of [anfis.eval](#) for usage.

Value

The membership grades of the membership functions of nodes in Layer 4

Author(s)

Chao Chen

anfis.L5.eval *The evaluator for nodes in Layer 5*

Description

To evaluate the nodes in Layer 5

Usage

```
anfis.L5.eval(output.L4)
```

Arguments

output.L4	The output of nodes in Layer 4
-----------	--------------------------------

Details

This function is not recommended for external use, but can be used for debugging or learning. See the source code of [anfis.eval](#) for usage.

Value

The output of nodes in Layer 5

Author(s)

Chao Chen

anfis.LI.eval	<i>The evaluator for nodes in Layer I</i>
---------------	---

Description

To evaluate the input Layer (LI) of anfis

Usage

```
anfis.LI.eval(anfis, input.stack)
```

Arguments

anfis	The given ANFIS model
input.stack	The input data

Details

This function is not recommended for external use, but can be used for debugging or learning. See the source code of [anfis.eval](#) for usage.

Value

The output of nodes in Layer I

Author(s)

Chao Chen

anfis.optimise *ANFIS optimiser*

Description

To optimise the performance of a given ANFIS model by learning the parameters in L1 and L4.

Usage

```
anfis.optimise(anfis, data.trn, data.chk = NULL, epoch.total = 100,
  stepsize = 0.1, rate.inc = 1.1, rate.dec = 0.9, method = c("gradient",
  "lse"), err.log = F, online = 0, lambda = 1, opt.by = "err.opt")
```

Arguments

anfis	The given ANFIS model
data.trn	The input and output data pairs as training data
data.chk	The input and output data pairs as checking (validation) data
epoch.total	The total training epochs.
stepsize	The initial stepsize
rate.inc	increasing rate of the stepsize
rate.dec	decreasing rate of the stepsize
method	The learning algorithms for Layer 1 and Layer 4 respectively. default method=c("gradient", "lse")
err.log	T or F, the flag indicate whether to save the error log.
online	0 – batch; 1 – online; 2 – semi-online
lambda	The forgetting rate for the LSE algorithm
opt.by	To optimise the ANFIS model by: err.opt – optimisation error; err.trn – training error; err.chk – checking (validation) error.

Value

The optimised ANFIS model.

Author(s)

Chao Chen

References

An extended ANFIS architecture and its learning properties for type-1 and interval type-2 models
<http://eprints.nottingham.ac.uk/33465/>

Examples

```

fis <- anfis.tipper()
anfis <- anfis.builder(fis)
data.num <- 5
input.num <- length(fis$input)
input.stack <- matrix(rnorm(data.num*input.num), ncol=input.num)
y <- matrix(rnorm(data.num))
data.trn <- cbind(input.stack, y)
anfis.eval(anfis, input.stack)
anfis.final <- anfis.optimise(anfis, data.trn, epoch.total=500,
                             stepsize=0.01, rate.inc=1.1, rate.dec=0.9)

```

anfis.plotmf

Plot membership functions for an ANFIS object

Description

Plots a 2D graph of all membership functions from the specified variable which must be part of an anfis object.

Usage

```

anfis.plotmf(anfis, varType, varIndex, xx = NULL, timelimit = 0,
             xlab = NULL, ylab = NULL, main = NULL)

```

Arguments

anfis	Requires an existing anfis as an argument.
varType	Can be either 'input' or 'output', representing the type of variable.
varIndex	A numerical integer, representing the index of the input or output variable whose membership functions shall be plotted (base 1).
xx	primary inputs for extra lines
timelimit	for perturbation
xlab	X axis label using font, size and color
ylab	Y axis label, same font attributes as xlab
main	The main title (on top)

Value

A two dimensional graph displaying all the membership functions of a given variable.

Examples

```

fis <- anfis.tipper()
anfis <- anfis.builder(fis)
data.num <- 5
input.num <- length(fis$input)
input.stack <- matrix(rnorm(data.num*input.num), ncol=input.num)
y <- matrix(rnorm(data.num))
data.trn <- cbind(input.stack, y)
anfis.eval(anfis, input.stack)
anfis.final <- anfis.optimise(anfis, data.trn, epoch.total=500,
                             stepsize=0.01, rate.inc=1.1, rate.dec=0.9)

anfis.plotmf(anfis, 'input', 1)
anfis.plotmf(anfis.final, 'input', 1)

```

anfis.tipper	<i>Produces an example fis object which can be used for ANFIS.</i>
--------------	--

Description

A function used primarily for example purposes, it creates a fis with two input (service & food), output variables (tip) and their membership functions.

Usage

```
anfis.tipper()
```

Value

A fis is return

Examples

```

fis <- anfis.tipper()

```

defuzz	<i>Defuzzify a set of values.</i>
--------	-----------------------------------

Description

Defuzzifies a given set of values using a specified range and defuzzification type producing a crisp value.

Usage

```
defuzz(x, mf, type)
```

Arguments

x	The range to be applied in the function (numeric vector).
mf	The values to be applied in the function (numeric vector).
type	The defuzzification method type, which should be either 'centroid', 'bisector', 'mom', 'som' or 'lom'.

Value

Returns a defuzzified crisp value (double).

Examples

```
Crisp_value = defuzz(1:10, c(1.5, 5), "centroid")
```

evalfis	<i>Evaluate a Fuzzy Inference System (fis)</i>
---------	--

Description

Returns an evaluated crisp value for a given fis structure.

Usage

```
evalfis(input_stack, fis)
```

Arguments

input_stack	A matrix representing the input stack, number of inputs (columns) by number of outputs (rows).
fis	A fis must be provided.

Value

Returns a matrix of evaluated values.

Examples

```
Input_data <- matrix((1:2),1,2)
fis <- tipper()
evalfis(Input_data, fis)
```

`evalmf`*Evaluate fuzzy membership function*

Description

To obtain the corresponding membership grade(s) for the crisp input(s) `x`

Usage

```
evalmf(...)
```

Arguments

... This function has accepted these arguments namely; `x`, `mf.type`, `mf.params` and `mf`. See the explanation on details section.

Details

This function involved such as these arguments:

`x` - A generic element of `U`, which is the universe of discourse for a fuzzy set

`mf.type` - The type of fuzzy membership function

`mf.params` - The parameters for the given type of membership function

`mf` - the membership function generated by [genmf](#)

This function can be used in two ways in order to obtain the membership grade(s) (see the examples section) :

1. `evalmf(x, mf.type, mf.params)`
2. `evalmf(x, mf)`

Value

Membership grade(s)

Author(s)

Chao Chen

Examples

```
evalmf(5, mf.type=gbellmf, mf.params=c(1,2,3))
evalmf(1:10, mf.type=gbellmf, mf.params=c(1,2,3))

mf <- genmf('gbellmf', c(1,2,3))
evalmf(5, mf)
evalmf(1:10, mf)
```

evalmftype	<i>Evaluate fuzzy membership function with membership function type and parameters</i>
------------	--

Description

To obtain the corresponding membership grade(s) for crisp input(s) x

Usage

```
evalmftype(x, mf.type, mf.params)
```

Arguments

x	A generic element of U, which is the universe of discourse for a fuzzy set
mf.type	The member function type
mf.params	The parameters for a member function

Value

Membership grade(s)

Author(s)

Chao Chen

Examples

```
evalmftype(5, mf.type=gbellmf, mf.params=c(1,2,3))
evalmftype(1:10, mf.type=gbellmf, mf.params=c(1,2,3))
```

fis.builder	<i>TSK FIS builder</i>
-------------	------------------------

Description

To build a one-output TSK FIS by automatically generating the input membership functions and the fuzzy rules

Usage

```
fis.builder(x.range, input.num, input.mf.num, input.mf.type,
  rule.num = prod(input.mf.num), rule.which = NULL,
  defuzzMethod = "default", params.ante, params.conse)
```

Arguments

x.range	a vector/matrix as the range of input(s)
input.num	the number of inputs
input.mf.num	a list of the number of membership functions for all inputs
input.mf.type	designed for different membership function types, however, currently, 'T1' for gbellmf, else 'it2gbellmf'
rule.num	the number of rules
rule.which	selected rules to be used in the full rule list, for example, c(1,2,3) specify the first three rules
defuzzMethod	"default"
params.ante	parameter settings for initialising antecedent membership functions
params.conse	parameter settings for initialising consequent membership functions

Author(s)

Chao Chen

fuzzy.firing

Fuzzy rule firing

Description

To get the firing strength for the given input fuzzification membership function and the antecedent membership function in the domain of [lower, upper]

Usage

```
fuzzy.firing(operator, x.mf, ante.mf, lower, upper)
```

Arguments

operator	t-norm operator
x.mf	the fuzzy input membership function
ante.mf	the antecedent membership function
lower	lower bound of the input
upper	upper bound of the input

Value

the rule firing strength

Author(s)

Chao Chen

Examples

```
x.mf <- x.fuzzification(gbell.fuzzification, 3, c(1,2))
ante.mf <- genmf(gbellmf, c(1,2,6))
firing.strength <- fuzzy.firing(min, x.mf, ante.mf, lower=0, upper=10)
firing.strength
```

fuzzy.optimise	<i>Fuzzy optimisation</i>
----------------	---------------------------

Description

to get an approximation of the maximum membership grade for a given membership function in the domain of [lower, upper]

Usage

```
fuzzy.optimise(fuzzy.mf, lower, upper)
```

Arguments

fuzzy.mf	fuzzy member function
lower	lower bound of the input
upper	upper bound of the input

Value

an approximation of the maximum membership grade in the given domain

Author(s)

Chao Chen

Examples

```
mf <- genmf(gbellmf, c(1,2,3))
x <- seq(4, 5, by=0.01)
max(evalmf(x, mf))
fuzzy.optimise(mf, 4, 5)
```

fuzzy.t *Fuzzy t-norm/t-conorm operation*

Description

To conduct t-norm or t-conorm operation for given fuzzy member functions

Usage

```
fuzzy.t(operator, ...)
```

Arguments

operator The supported t-norm/t-conorm operators are min, prod, max
... fuzzy membership functions

Value

A membership function, which is the t-norm/t-conorm of membership functions

Author(s)

Chao Chen

Examples

```
mf1 <- genmf(gbellmf, c(1,2,3))
mf2 <- genmf(gbellmf, c(4,5,6))
mf3 <- fuzzy.t(max, mf1, mf2)
tmp1 <- evalmf(1:10, mf1)
tmp2 <- evalmf(1:10, mf2)
tmp3 <- evalmf(1:10, mf3)
identical(tmp3, pmax(tmp1, tmp2))
tmp3
```

fuzzy.tconorm *Fuzzy t-conorm*

Description

To conduct t-conorm operation for given fuzzy member functions

Usage

```
fuzzy.tconorm(operator, ...)
```

Arguments

operator The t-conorm operator such as max
 ... fuzzy membership functions

Value

A membership function, which is the t-conorm of membership functions

Author(s)

Chao Chen

Examples

```
mf1 <- genmf(gbellmf, c(1,2,3))
mf2 <- genmf(gbellmf, c(4,5,6))
mf3 <- fuzzy.tconorm(max, mf1, mf2)
tmp1 <- evalmf(1:10, mf1)
tmp2 <- evalmf(1:10, mf2)
tmp3 <- evalmf(1:10, mf3)
identical(tmp3, pmax(tmp1, tmp2))
tmp3
```

fuzzy.tnorm

Fuzzy tnorm

Description

To conduct t-norm operation for given fuzzy member functions

Usage

```
fuzzy.tnorm(operator, ...)
```

Arguments

operator The t-norm operator such as min, prod
 ... fuzzy membership functions

Value

A membership function, which is the t-norm of membership functions

Author(s)

Chao Chen

Examples

```
mf1 <- genmf(gbellmf, c(1,2,3))
mf2 <- genmf(gbellmf, c(4,5,6))
mf3 <- fuzzy.tnorm(prod, mf1, mf2)
tmp1 <- evalmf(1:10, mf1)
tmp2 <- evalmf(1:10, mf2)
tmp3 <- evalmf(1:10, mf3)
identical(tmp3, tmp1*tmp2)
tmp3
```

fuzzyr.accuracy *Fuzzy Accuracy*

Description

This function is to provide performance indicators by using eight different accuracy measures including a new measure UMBRAE.

Usage

```
fuzzyr.accuracy(f, y, f.ref = 0, scale.mase = NULL)
```

Arguments

f	A vector of forecasting values produced by a model to be evaluated.
y	A vector of observed values.
f.ref	A vector of forecasting values produced by a benchmark method to be compared.
scale.mase	A single value which is the scaling factor of the measure MASE.

Value

A vector of results by each measure.

Author(s)

Chao Chen

References

A new accuracy measure based on bounded relative error for time series forecasting <http://dx.doi.org/10.1371/journal.pone.0174202>

Examples

```
f <- rnorm(10)
y <- rnorm(10)
fuzzyr.accuracy(f, y)
```

fuzzyr.match.fun	<i>fuzzyr.match.fun</i>
------------------	-------------------------

Description

This is a modification of the original match.fun, where parent.frame(2) is changed to parent.env(environment()).

Usage

```
fuzzyr.match.fun(FUN, descend = TRUE)
```

Arguments

FUN	item to match as function: a function, symbol or character string.
descend	logical; control whether to search past non-function objects.

Details

See [match.fun](#).

gbell.fuzzification	<i>Gaussian bell fuzzification</i>
---------------------	------------------------------------

Description

To generate a fuzzy membership function based on Gaussian bell fuzzification for the given crisp input x

Usage

```
gbell.fuzzification(x, mf.params)
```

Arguments

x	the crisp input, which will be the parameter c for a gaussian bell membership function
mf.params	the parameters c(a, b) for a gaussian bell membership function

Value

The gbell MF centred at the crisp point x

Author(s)

Chao Chen

Examples

```
mf <- gbell.fuzzification(3, c(1,2))
# This is the same as:
mf <- genmf('gbellmf', c(1,2,3))

evalmf(1:10, mf)
```

gbellmf*Gaussian bell membership function*

Description

To specify a gaussian bell membership function with a pair of particular parameters

Usage

```
gbellmf(mf.params)
```

Arguments

`mf.params` The parameters $c(a, b, c)$ for a gaussian bell membership function

Details

This is not an external function. It should be used through [genmf](#).

Value

The gaussian bell membership function of x for a given pair of parameters, where x is a generic element of U , which is the universe of discourse of a fuzzy set X

Author(s)

Chao Chen

Examples

```
mf <- gbellmf(c(1,2,3))
# This is the same as:
mf <- genmf('gbellmf', c(1,2,3))

evalmf(5, mf)
```

genmf *Fuzzy membership function generator*

Description

To generate the corresponding membership function $f(x)$, also called fuzzy set, according to type and parameters

Usage

```
genmf(mf.type, mf.params)
```

Arguments

mf.type	The membership function type
mf.params	The parameters for a membership function

Details

Built-in membership function types are: 'gbellmf', 'it2gbellmf', 'singletonmf', 'linearmf', 'gaussmf', 'trapmf', 'trimf'.

mf.params for

- 'gbellmf' is $c(a, b, c)$, where a denotes the width, b is usually positive and c locates the center of the curve.
- 'it2gbellmf' is $c(a.lower, a.upper, b, c)$, where $a.upper > a.lower$ when $b > 0$ and $a.upper < a.lower$ when $b < 0$
- 'singletonmf' is $c(c)$, where c is the location where the membership grade is 1.
- 'linearmf' is $c(\dots)$, which are the coefficients of the linear membership function.
- 'gaussmf' is $c(sig, c)$, which are the parameters for $\exp(-(x - c)^2 / (2 * sig^2))$.
- 'trapmf' is $c(a, b, c, d)$, where a and d locate the "feet" of the trapezoid and b and c locate the "shoulders".
- 'trimf' is $c(a, b, c)$, where a and c locate the "feet" of the triangle and b locates the peak.

Note that users are able to define their own membership functions.

Value

The desired type of membership function $f(x)$, where x is a generic element of U , which is the universe of discourse for a fuzzy set

Author(s)

Chao Chen

Examples

```
mf <- genmf('gbellmf', c(1,2,3))
evalmf(1:10, mf)
```

gensurf*Produce a graphical evaluated fuzzy inference system.*

Description

Produces a three dimensional graphical view of a specific fis object. This function is only works for FIS structures with 3 variables. It will only work for 2 inputs, and 1 output.

Usage

```
gensurf(fis, ix1 = 1, ix2 = 2, ox1 = 1)
```

Arguments

<code>fis</code>	A fis must be provided.
<code>ix1</code>	Optional input (1)
<code>ix2</code>	Optional input (2)
<code>ox1</code>	Optional output

Value

A three dimensional graphical model generated from the fis and other optional parameters.

Examples

```
fis <- tipper()
gensurf(fis)
```

 km.da

km.da

Description

A Direct Approach for Determining the Switch Points in the Karnik-Mendel Algorithm.

Usage

```
km.da(wl, wr, f, maximum = F, w.which = F, sorted = F, k.which = F)
```

Arguments

wl	A vector of lower membership grades.
wr	A vector of upper membership grades.
f	A vector of the primary values in the discrete universe of discourse X.
maximum	T, to calculate the maximum centroid; F, to calculate the minimum centroid.
w.which	T, to show which membership grade to be used to calculate maximum/minimum centroid for each primary value.
sorted	T, to indicate that the primary values have already been put in ascending order.
k.which	T, to show the index of the switch point selected by the algorithm.

Value

w.which=T, a two-column matrix indicating which membership grades to be used; w.which=F and k.which=T, a vector of the centroid and the switch point; w.which=F and k.which=F, a single value of the centroid.

Author(s)

Chao Chen

References

A Direct Approach for Determining the Switch Points in the Karnik-Mendel Algorithm.

Examples

```
wr <- runif(100, 0, 1)
wl <- wr * runif(100, 0, 1)
f <- abs(runif(100, 0, 1))
f <- sort(f)
km.da(wl, wr, f)
```

linearmf	<i>Linear membership function</i>
----------	-----------------------------------

Description

To specify a 1st order linear membership function with given parameters

Usage

```
linearmf(mf.params)
```

Arguments

mf.params The linear parameters, which is a vector of the size of input numbers plus 1

Value

A linear membership function

Author(s)

Chao Chen

newfis	<i>Create a fis using newfis function</i>
--------	---

Description

Creates a fis object.

Usage

```
newfis(fisName, fisType = "mamdani", andMethod = "min", orMethod = "max",
    impMethod = "min", aggMethod = "max", defuzzMethod = "centroid")
```

Arguments

fisName	String representing the fis name.
fisType	Type of the fis, default is 'mamdani'.
andMethod	The AND method for the fis, default is 'min'.
orMethod	The OR method for the fis, default is 'max'.
impMethod	The implication method for the fis, default is 'min'.
aggMethod	The aggregation method for the fis, default is 'max'.
defuzzMethod	The defuzzification method for the fis, default is 'centroid'.

Value

A new fis structure.

Examples

```
fis <- newfis("fisName")
```

plotmf

Plots a 2D graph of all membership functions in a variable.

Description

Plots a 2D graph of all membership functions from the specified variable which must be part of a fis object.

Usage

```
plotmf(fis, varType, varIndex, xx = NULL, timelimit = 0, xlab = NULL,
       ylab = NULL, main = NULL)
```

Arguments

fis	Requires an existing fis as an argument.
varType	Can be either 'input' or 'output', representing the type of variable.
varIndex	A numerical integer, representing the index of the input or output variable whose membership functions shall be plotted (base 1).
xx	primary inputs for extra lines
timelimit	for perturbation
xlab	X axis label using font, size and color
ylab	Y axis label, same font attributes as xlab
main	The main title (on top)

Value

A two dimensional graph displaying all the membership functions of a given variable.

Examples

```
fis <- tipper()
plotmf(fis, "input", 1)
```

readfis *Read a fis object from a .fis file.*

Description

Reads a fis object from a file with the .fis extension, and converts it into a data structure to be used within the environment.

Usage

```
readfis(fileName)
```

Arguments

fileName Should be an absolute path given as a string to the file to be read, with escaped backslashes.

Value

A fis structure with its values generated from that of the files.

showfis *Show a fis object.*

Description

Shows a fis and all its data in an ordered format on the console.

Usage

```
showfis(fis)
```

Arguments

fis Requires a fis structure to be displayed.

Value

Returned the organised text regarding the fis is output to console.

Examples

```
fis <- tipper()
showfis(fis)
```

`showGUI`*Show a Graphic User Interface of fis object*

Description

Show a Graphic User Interface to display membership function plots for input and output, rules and evaluate the fis.

Usage

```
showGUI(fis)
```

Arguments

`fis` Requires a fis structure to display a GUI.

Details

This function is purposed to display all the membership plots and rules of fis object in Graphic User Interface (GUI). It also provide a function to evaluate the fis object.

`showGUI(fis)` will display the GUI of fis object.

Value

Return the GUI to display membership function for input and output together with rules.

Author(s)

Tajul Razak

Examples

```
fis <- tipper()
fis <- showGUI(fis)
```

showrule *Showing rule from fis object*

Description

All the rule is showing from fis object

Usage

```
showrule(fis)
```

Arguments

fis A fis must be provided.

Value

Show the total of rules inside fis object

Examples

```
fis <- tipper()
ruleList <- rbind(c(1,1,1,1,2), c(2,0,2,1,1), c(3,2,3,1,2))
fis <- addrule(fis, ruleList)
showrule(fis)
```

singleton.fuzzification
Singleton Fuzzification

Description

To generate a fuzzy membership function based on singleton fuzzification for the given crisp input x

Usage

```
singleton.fuzzification(x, mf.params)
```

Arguments

x the crisp input
mf.params not used, singleton fuzzification does not need additional parameters

Value

The singleton MF at the crisp point x

Author(s)

Chao Chen

Examples

```
mf <- singleton.fuzzification(3)
evalmf(1:10, mf)
```

`singletonmf`*Singleton membership function*

Description

To specify a singleton membership function at the particular point

Usage

```
singletonmf(mf.params)
```

Arguments

`mf.params` the particular singleton point

Details

This is not an external function. It should be used through [genmf](#).

Value

The singleton membership function of x at the particular point, where x is a generic element of U , which is the universe of discourse of a fuzzy set X

Author(s)

Chao Chen

Examples

```
mf <- singletonmf(3)
# This is the same as:
mf <- genmf('singletonmf', 3)

evalmf(1:10, mf)
```

tipper	<i>Produces an example fis object for Waiter-Tipping.</i>
--------	---

Description

A function used primarily for example purposes, it creates a fis with two input (service & food), output variables (tip) and their membership functions.

Usage

```
tipper()
```

Value

A fis is return

Examples

```
fis <- tipper()
```

tipperGUI	<i>Graphic User Interface for Waiter-Tipping</i>
-----------	--

Description

Graphic User Interface for Waiter-Tipping to display the membership function (input & output) and rules.

Usage

```
tipperGUI()
```

Value

Return graphic user interface for Waiter-Tipping

Author(s)

Tajul Razak

Examples

```
fis <- tipperGUI()
```

`tipperGUI2`*Graphic User Interface for Waiter-Tipping (another style)*

Description

Another style of Graphic User Interface for Waiter-Tipping to display the membership function (input & output) and rules.

Usage

```
tipperGUI2()
```

Value

Return graphic user interface for Waiter-Tipping

Author(s)

Tajul Razak

Examples

```
fis <- tipperGUI2()
```

`x.fuzzification`*Fuzzification*

Description

To convert the crisp input x to a fuzzy membership function with specified fuzzification method

Usage

```
x.fuzzification(fuzzification.method, x, mf.params)
```

Arguments

`fuzzification.method`

The fuzzification method

`x`

The required parameters for a fuzzification method

`mf.params`

The parameters for a membership function

Value

The corresponding fuzzy membership function

Author(s)

Chao Chen

Examples

```
x <- 3
mf <- x.fuzzification(gbell.fuzzification, x, c(1,2))
# This is the same as:
mf <- genmf(gbellmf, c(1,2,x))

evalmf(1:10, mf)
```
