Package 'ggformula'

August 3, 2018

Title Formula Interface to the Grammar of Graphics

Description Provides a formula interface to 'ggplot2' graphics.

Type Package

Version 0.9.0

License MIT + file LICENSE

LazyData TRUE

LazyLoad TRUE

Depends R (>= 3.1), ggplot2 (>= 3.0), ggstance (>= 0.3.1)

Imports mosaicCore, rlang, magrittr, tibble, stringr, tidyr, grid

Suggests dplyr, lattice, mosaic, mosaicModel, mosaicData, testthat, vdiffr, knitr, rmarkdown, lubridate, survival, broom, scales, maps, maptools, rgeos, sf, purrr, ggthemes

VignetteBuilder knitr

RoxygenNote 6.1.0

Encoding UTF-8

R topics documented:

`gf_abline` *Reference lines – horizontal, vertical, and diagonal.*

Description

These functions create layers that display lines described i various ways. Unlike most of the plotting functions in `ggformula`, these functions do not take a formula as input for describing positional attributes of the plot.

Usage

```
gf_abline(object = NULL, gformula = NULL, data = NULL, slope,
  intercept, color, size, linetype, alpha, xlab, ylab, title, subtitle,
  caption, show.legend = NA, show.help = NULL, inherit = FALSE,
  environment = parent.frame(), ...)

gf_hline(object = NULL, gformula = NULL, data = NULL, yintercept,
  color, size, linetype, alpha, xlab, ylab, title, subtitle, caption,
  show.legend = NA, show.help = NULL, inherit = FALSE,
  environment = parent.frame(), ...)

gf_vline(object = NULL, gformula = NULL, data = NULL, xintercept,
  color, size, linetype, alpha, xlab, ylab, title, subtitle, caption,
  show.legend = NA, show.help = NULL, inherit = FALSE,
  environment = parent.frame(), ...)

gf_coefline(object = NULL, coef = NULL, model = NULL, ...)
```

Arguments

`object`	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
`gformula`	Must be `NULL`.
`data`	The data to be displayed in this layer. There are three options: If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.

	A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created. A `function` will be called with a single argument, the plot data. The return value must be a `data.frame.`, and will be used as the layer data.
`slope`	Parameters that control the position of the line. If these are set, `data`, `mapping` and `show.legend` are overridden.
`intercept`	Parameters that control the position of the line. If these are set, `data`, `mapping` and `show.legend` are overridden.
`color`	A color or a formula used for mapping color.
`size`	A numeric size or a formula used for mapping size.
`linetype`	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
`alpha`	Opacity (0 = invisible, 1 = opaque).
`xlab`	Label for x-axis. See also `gf_labs()`.
`ylab`	Label for y-axis. See also `gf_labs()`.
`title`	Title, sub-title, and caption for the plot. See also `gf_labs()`.
`subtitle`	Title, sub-title, and caption for the plot. See also `gf_labs()`.
`caption`	Title, sub-title, and caption for the plot. See also `gf_labs()`.
`show.legend`	logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.
`show.help`	If `TRUE`, display some minimal help.
`inherit`	A logical indicating whether default attributes are inherited.
`environment`	An environment in which to look for variables not found in `data`.
`...`	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with `attribute = value`, (b) ggplot2 aesthetics to be mapped with `attribute = ~ expression`, or (c) attributes of the layer as a whole, which are set with `attribute = value`.
`yintercept`	Parameters that control the position of the line. If these are set, `data`, `mapping` and `show.legend` are overridden.
`xintercept`	Parameters that control the position of the line. If these are set, `data`, `mapping` and `show.legend` are overridden.
`coef`	A numeric vector of coefficients.
`model`	A model from which to extract coefficients.

Examples

```
mtcars2 <- df_stats( wt ~ cyl, data = mtcars, median_wt = median)
gf_point(wt ~ hp, size = ~ wt, color = ~ cyl, data = mtcars) %>%
  gf_abline(slope = ~ 0, intercept = ~ median_wt, color = ~ cyl, data = mtcars2)

gf_point(wt ~ hp, size = ~ wt, color = ~ cyl, data = mtcars) %>%
  gf_abline(slope = 0, intercept = 3, color = "green", data = NA)

gf_point(wt ~ hp, size = ~ wt, color = ~ cyl, data = mtcars) %>%
  gf_hline(yintercept = ~ median_wt, color = ~ cyl, data = mtcars2)

gf_point(mpg ~ hp, color = ~ cyl, size = ~ wt, data = mtcars) %>%
  gf_abline(color="red", slope = -0.10, intercept = 35)

gf_point(mpg ~ hp, color = ~ cyl, size = ~ wt, data = mtcars) %>%
  gf_abline(color = "red", slope = ~ slope, intercept = ~ intercept,
  data = data.frame(slope = -0.10, intercept = 33:35))

# We can set the color of the guidelines while mapping color in other layers
gf_point(mpg ~ hp, color = ~ cyl, size = ~ wt, data = mtcars) %>%
  gf_hline(color = "navy", yintercept = c(20, 25), data = NA) %>%
  gf_vline(color = "brown", xintercept = c(200, 300), data = NA)

# If we want to map the color of the guidelines, it must work with the
# scale of the other colors in the plot.
gf_point(mpg ~ hp, size = ~ wt, data = mtcars, alpha = 0.3) %>%
  gf_hline(color = ~ "horizontal", yintercept = ~ c(20, 25), data = NA) %>%
  gf_vline(color = ~ "vertical", xintercept = ~ c(100, 200, 300), data = NA)

gf_point(mpg ~ hp, size = ~ wt, color = ~ factor(cyl), data = mtcars, alpha = 0.3) %>%
  gf_hline(color = "orange", yintercept = 20, data = NA) %>%
  gf_vline(color = ~ c("4", "6", "8"), xintercept = ~ c(80, 120, 250), data = NA)

gf_point(mpg ~ hp, size = ~ wt, color = ~ factor(cyl), data = mtcars, alpha = 0.3) %>%
  gf_hline(color = "orange", yintercept = 20, data = NA) %>%
  gf_vline(color = c("green", "red", "blue"), xintercept = c(80, 120, 250), data = NA)

# reversing the layers requires using inherit = FALSE
gf_hline(color = "orange", yintercept = 20, data = NA) %>%
  gf_vline(color = ~ c("4", "6", "8"), xintercept = ~ c(80, 120, 250), data = NA) %>%
  gf_point(mpg ~ hp, size = ~ wt, color = ~ factor(cyl), data = mtcars, alpha = 0.3,
    inherit = FALSE)
```

---

gf_area *Formula interface to geom_area()*

Description

For each x value, geom_ribbon displays a y interval defined by ymin and ymax. geom_area is a special case of geom_ribbon, where the ymin is fixed to 0.

Usage

```
gf_area(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, xlab, ylab, title, subtitle, caption,
  geom = "area", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `y ~ x`. Faceting can be achieved by including `|` in the formula.
data	The data to be displayed in this layer. There are three options: If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`. A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created. A `function` will be called with a single argument, the plot data. The return value must be a `data.frame.`, and will be used as the layer data.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also `gf_labs()`.
ylab	Label for y-axis. See also `gf_labs()`.
title	Title, sub-title, and caption for the plot. See also `gf_labs()`.
subtitle	Title, sub-title, and caption for the plot. See also `gf_labs()`.
caption	Title, sub-title, and caption for the plot. See also `gf_labs()`.
geom	A character string naming the geom used to make the layer.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If `TRUE`, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.

environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

ggplot2::geom_area()

Examples

```
if (require(dplyr) && require(mosaicData)) {
  Temps <- Weather %>%
    filter(city == "Chicago", year == 2016, month <= 4)
  gf_linerange(low_temp + high_temp  ~ date, color = ~ high_temp, data = Temps)
  gf_ribbon(low_temp + high_temp ~ date, data = Temps, color = "navy", alpha = 0.3)
  gf_area(high_temp ~ date, data = Temps, color = "navy", alpha = 0.3)

  gf_ribbon(low_temp + high_temp ~ date, data = Weather, alpha = 0.3) %>%
    gf_facet_grid(city ~ .)

  gf_linerange(low_temp + high_temp ~ date, color = ~ high_temp, data = Weather) %>%
    gf_facet_grid(city ~ .) %>%
    gf_refine(scale_colour_gradientn(colors = rev(rainbow(5))))
}
```

---

gf_ash *Average Shifted Histograms*

Description

An ASH plot is the average over all histograms of a fixed bin width. geom_ash() and gf_ash() provide ways to create ASH plots using **ggplot2** or **ggformula**.

Usage

```
gf_ash(object = NULL, gformula = NULL, data = NULL, alpha, color,
  group, linetype, size, xlab, ylab, title, subtitle, caption,
  geom = "line", stat = "ash", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)

stat_ash(mapping = NULL, data = NULL, geom = "line",
  position = "identity", na.rm = FALSE, show.legend = NA,
  inherit.aes = TRUE, binwidth = NULL, adjust = 1, ...)

geom_ash(mapping = NULL, data = NULL, stat = "ash",
  position = "identity", na.rm = FALSE, show.legend = NA,
  inherit.aes = TRUE, binwidth = NULL, adjust = 1, ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape ~x or y ~ x. y may be stat(density) or stat(count) or stat(ndensity) or stat(ncount). Faceting can be achieved by including | in the formula.
data	A data frame with the variables to be plotted.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.
mapping	set of aesthetic mappings created by aes() or aes_().
na.rm	If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
inherit.aes	A logical indicating whether default aesthetics are inherited.
binwidth	the width of the histogram bins. If NULL (the default) the binwidth will be chosen so that approximately 10 bins cover the data. adjust can be used to to increase or decrease binwidth.
adjust	a numeric adjustment to binwidth. Primarily useful when binwidth is not specified. Increasing adjust makes the plot smoother.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in `gformula`. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form `attribute = value` or mapped using arguments of the form `attribute = ~ expression`.

In formulas of the form `A | B`, `B` will be used to form facets using `facet_wrap()` or `facet_grid()`. This provides an alternative to `gf_facet_wrap()` and `gf_facet_grid()` that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of `gformula`. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

See Also

`geom_histogram()`, `link{gf_histogram}()`.

Examples

```
gf_ash(~Sepal.Length, color = ~ Species, data = iris)
gf_ash(~Sepal.Length, color = ~ Species, data = iris, binwidth = 0.3)
gf_ash(~Sepal.Length, color = ~ Species, data = iris, adjust = 2)
ggplot(faithful, aes(x = eruptions)) +
  geom_histogram(aes(y = stat(density)),
    fill = "lightskyblue", colour = "gray50", alpha = 0.2) +
  geom_ash(colour = "red") +
  geom_ash(colour = "forestgreen", adjust = 2) +
  geom_ash(colour = "navy", adjust = 1/2) +
  theme_minimal()
```

---

gf_bar *Formula interface to geom_bar()*

Description

There are two types of bar charts: `geom_bar` makes the height of the bar proportional to the number of cases in each group (or if the `weight` aesthetic is supplied, the sum of the weights). If you want the heights of the bars to represent values in the data, use geom_col instead. `geom_bar` uses `stat_count` by default: it counts the number of cases at each `x` position. `geom_col` uses `stat_identity`: it leaves the data as is.

Usage

```
gf_bar(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, width = NULL, xlab, ylab, title, subtitle,
  caption, geom = "bar", stat = "count", position = "stack",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)

gf_counts(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, width = NULL, binwidth = NULL, xlab,
  ylab, title, subtitle, caption, geom = "bar", stat = "count",
  position = "stack", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)

gf_props(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, xlab, ylab = "proportion", title,
  subtitle, caption, geom = "bar", stat = "count",
  position = "stack", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)

gf_percents(object = NULL, gformula = NULL, data = NULL, alpha,
  color, fill, group, linetype, size, xlab, ylab = "percent", title,
  subtitle, caption, geom = "bar", stat = "count",
  position = "stack", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)

gf_countsh(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, width = NULL, binwidth = NULL, xlab,
  ylab, title, subtitle, caption, geom = "barh", stat = "counth",
  position = "stackv", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)

gf_colh(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, width = NULL, binwidth = NULL, xlab,
  ylab, title, subtitle, caption, geom = "colh", stat = "identity",
  position = "stackv", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)

gf_propsh(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, xlab = "proportion", ylab, title,
  subtitle, caption, geom = "barh", stat = "counth",
  position = "stackv", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)

gf_percentsh(object = NULL, gformula = NULL, data = NULL, alpha,
  color, fill, group, linetype, size, xlab = "percent", ylab, title,
  subtitle, caption, geom = "barh", stat = "counth",
  position = "stackv", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula, typically with shape ~ x. (y ~ x is also possible, but typically using one of gf_col(), gf_props(), or gf_percents() is preferable to using this formula shape.) Faceting can be achieved by including | in the formula.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
width	Width of the bars.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	Override the default connection between geom_bar and stat_count.
stat	Override the default connection between geom_bar and stat_count.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.
binwidth	geom_bar no longer has a binwidth argument - if you use it you'll get an warning telling to you use geom_histogram() instead.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in `gformula`. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form `attribute = value` or mapped using arguments of the form `attribute = ~ expression`.

In formulas of the form `A | B`, `B` will be used to form facets using `facet_wrap()` or `facet_grid()`. This provides an alternative to `gf_facet_wrap()` and `gf_facet_grid()` that is terser and may feel more familiar to users of **lattice**.

  }
}
```

gf_bin2d *Formula interface to geom_bin2d()*

Description

geom_bin2d() uses ggplot2::stat_bin2d() to bin the data before using gf_tile() to display the results.

Usage

```
gf_bin2d(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, xlab, ylab, title, subtitle, caption,
  geom = "tile", stat = "bin2d", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape y ~ x. Faceting can be achieved by including | in the formula.
data	A data frame with the variables to be plotted.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.

show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments.   gf_blank((c(0,3)) ~ (c(-2,7)))
```

---

gf_boxplot *Formula interface to geom_boxplot()*

Description

The boxplot compactly displays the distribution of a continuous variable. It visualises five summary statistics (the median, two hinges and two whiskers), and all "outlying" points individually.

Usage

```
gf_boxplot(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, coef, outlier.color = NULL,
  outlier.fill = NULL, outlier.shape = 19, outlier.size = 1.5,
  outlier.stroke = 0.5, outlier.alpha = NULL, notch = FALSE,
  notchwidth = 0.5, varwidth = FALSE, xlab, ylab, title, subtitle,
  caption, geom = "boxplot", stat = "boxplot", position = "dodge",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `y ~ x`. Faceting can be achieved by including `|` in the formula.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
coef	Length of the whiskers as multiple of IQR. Defaults to 1.5.
outlier.color	Default aesthetics for outliers. Set to NULL to inherit from the aesthetics used for the box. In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence. Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.
outlier.fill	Default aesthetics for outliers. Set to NULL to inherit from the aesthetics used for the box.

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

`outlier.shape` Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

`outlier.size` Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

`outlier.stroke` Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

`outlier.alpha` Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

`notch` If `FALSE` (default) make a standard box plot. If `TRUE`, make a notched box plot. Notches are used to compare groups; if the notches of two boxes do not overlap, this suggests that the medians are significantly different.

notchwidth	For a notched box plot, width of the notch relative to the body (default 0.5)
varwidth	If FALSE (default) make a standard box plot. If TRUE, boxes are drawn with widths proportional to the square-roots of the number of observations in the groups (possibly weighted, using the weight aesthetic).
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	Use to override the default connection between geom_boxplot and stat_boxplot.
stat	Use to override the default connection between geom_boxplot and stat_boxplot.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

  gf_boxploth(substance ~ age, data = HELPrct, color = ~ sex,
    position = position_dodgev(height = 0.9))
}
```

`gf_col` *Formula interface to geom_col()*

Description

There are two types of bar charts: `geom_bar` makes the height of the bar proportional to the number of cases in each group (or if the `weight` aesthetic is supplied, the sum of the weights). If you want the heights of the bars to represent values in the data, use geom_col instead. `geom_bar` uses `stat_count` by default: it counts the number of cases at each x position. `geom_col` uses `stat_identity`: it leaves the data as is.

Usage

```
gf_col(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, xlab, ylab, title, subtitle, caption,
  geom = "col", stat = "identity", position = "stack",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `y ~ x`. Faceting can be achieved by including `|` in the formula.
data	A data frame with the variables to be plotted.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also `gf_labs()`.
ylab	Label for y-axis. See also `gf_labs()`.
title	Title, sub-title, and caption for the plot. See also `gf_labs()`.
subtitle	Title, sub-title, and caption for the plot. See also `gf_labs()`.
caption	Title, sub-title, and caption for the plot. See also `gf_labs()`.
geom	A character string naming the geom used to make the layer.
stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
show.legend	A logical indicating whether this layer should be included in the legends. `NA`, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If `TRUE`, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in `data`.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with `attribute = value`, (b) ggplot2 aesthetics to be mapped with `attribute = ~ expression`, or (c) attributes of the layer as a whole, which are set with `attribute = value`.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in `gformula`. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form `attribute = value` or mapped using arguments of the form `attribute = ~ expression`.

In formulas of the form `A | B`, `B` will be used to form facets using `facet_wrap()` or `facet_grid()`. This provides an alternative to `gf_facet_wrap()` and `gf_facet_grid()` that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of `gformula`. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

See Also

`ggplot2::geom_col()`

Examples

```
SomeData <- data.frame(
  group = LETTERS[1:3],
  count = c(20, 25, 18)
)
gf_col(count ~ group, data = SomeData)

# A Pareto chart

if(require(dplyr) && require(mosaicData)) {
  HELPrct %>%
    group_by(substance) %>%
    summarise(count = n()) %>%
    ungroup() %>%
    dplyr::arrange(-count) %>%
    mutate(
      cumcount = cumsum(count),
      substance = reorder(substance, - count)
    ) %>%
    gf_col(count ~ substance, fill = "skyblue") %>%
    gf_point(cumcount ~ substance) %>%
    gf_line(cumcount ~ substance, group = 1) %>%
    gf_refine(
      scale_y_continuous(sec.axis = sec_axis( ~ . /nrow(HELPrct)))
    )
  }
```

gf_contour *Formula interface to geom_contour()*

Description

ggplot2 can not draw true 3d surfaces, but you can use geom_contour and geom_tile() to visualise 3d surfaces in 2d. To be a valid surface, the data must contain only a single row for each unique combination of the variables mapped to the x and y aesthetics. Contouring tends to work best when x and y form a (roughly) evenly spaced grid. If your data is not evenly spaced, you may want to interpolate to a grid before visualising.

Usage

```
gf_contour(object = NULL, gformula = NULL, data = NULL, xlab, ylab,
  title, subtitle, caption, geom = "contour", stat = "contour",
  position = "identity", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape y ~ x. Faceting can be achieved by including | in the formula.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	The geometric object to use display the data
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of gformula. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

ggplot2::geom_contour(), gf_density_2d()

Examples

```
gf_density_2d(eruptions ~ waiting, data = faithful, alpha = 0.5, color = "navy") %>%
  gf_contour(density ~ waiting + eruptions, data = faithfuld, bins = 10, color = "red")
```

---

gf_count *Formula interface to geom_count()*

Description

This is a variant geom_point() that counts the number of observations at each location, then maps the count to point area. It useful when you have discrete data and overplotting.

Usage

```
gf_count(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, shape, size, stroke, xlab, ylab, title, subtitle, caption,
  geom = "point", stat = "sum", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `y ~ x`. Faceting can be achieved by including `|` in the formula.
data	A data frame with the variables to be plotted.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
shape	An integer or letter shape or a formula used for mapping shape.
size	A numeric size or a formula used for mapping size.
stroke	A numeric size of the border or a formula used to map stroke.
xlab	Label for x-axis. See also `gf_labs()`.
ylab	Label for y-axis. See also `gf_labs()`.
title	Title, sub-title, and caption for the plot. See also `gf_labs()`.
subtitle	Title, sub-title, and caption for the plot. See also `gf_labs()`.
caption	Title, sub-title, and caption for the plot. See also `gf_labs()`.
geom	A character string naming the geom used to make the layer.
stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
show.legend	A logical indicating whether this layer should be included in the legends. `NA`, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If `TRUE`, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in `data`.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with `attribute = value`, (b) ggplot2 aesthetics to be mapped with `attribute = ~ expression`, or (c) attributes of the layer as a whole, which are set with `attribute = value`.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in `gformula`. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form `attribute = value` or mapped using arguments of the form `attribute = ~ expression`.

In formulas of the form `A | B`, `B` will be used to form facets using `facet_wrap()` or `facet_grid()`. This provides an alternative to `gf_facet_wrap()` and `gf_facet_grid()` that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of `gformula`. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

`ggplot2::geom_count()`

Examples

```
# Best used in conjunction with scale_size_area which ensures that
# counts of zero would be given size 0. Doesn't make much difference
# here because the smallest count is already close to 0.

gf_count(hwy ~ cty, data = mpg, alpha = 0.5) %>%
  gf_refine(scale_size_area())
```

---

gf_crossbar *Formula interface to geom_crossbar()*

Description

Various ways of representing a vertical interval defined by `x`, `ymin` and `ymax`. Each case draws a single graphical object.

Usage

```
gf_crossbar(object = NULL, gformula = NULL, data = NULL, alpha,
  color, group, linetype, size, fatten = 2.5, xlab, ylab, title,
  subtitle, caption, geom = "crossbar", stat = "identity",
  position = "identity", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)

gf_crossbarh(object = NULL, gformula = NULL, data = NULL, alpha,
  color, group, linetype, size, fatten = 2.5, xlab, ylab, title,
  subtitle, caption, geom = "crossbarh", stat = "identity",
  position = "identity", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `y + ymin + ymax ~ x`. Faceting can be achieved by including `|` in the formula.
data	The data to be displayed in this layer. There are three options: If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`. A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created. A `function` will be called with a single argument, the plot data. The return value must be a `data.frame.`, and will be used as the layer data.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
fatten	A multiplicative factor used to increase the size of the middle bar in `geom_crossbar()` and the middle point in `geom_pointrange()`.
xlab	Label for x-axis. See also `gf_labs()`.
ylab	Label for y-axis. See also `gf_labs()`.
title	Title, sub-title, and caption for the plot. See also `gf_labs()`.
subtitle	Title, sub-title, and caption for the plot. See also `gf_labs()`.
caption	Title, sub-title, and caption for the plot. See also `gf_labs()`.
geom	A character string naming the geom used to make the layer.
stat	The statistical transformation to use on the data for this layer, as a string.

position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

  gf_facet_grid( ~ sex)
}
```

---

gf_curve *Formula interface to geom_curve()*

Description

geom_segment draws a straight line between points (x, y) and (xend, yend). geom_curve draws a curved line. See the underlying drawing function grid::curveGrob() for the parameters that control the curve.

Usage

```
gf_curve(object = NULL, gformula = NULL, data = NULL, alpha, color,
  group, linetype, size, curvature = 0.5, angle = 90, ncp = 5,
  arrow = NULL, lineend = "butt", xlab, ylab, title, subtitle, caption,
  geom = "curve", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape y + yend ~ x + xend.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot().

	A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
curvature	A numeric value giving the amount of curvature. Negative values produce left-hand curves, positive values produce right-hand curves, and zero produces a straight line.
angle	A numeric value between 0 and 180, giving an amount to skew the control points of the curve. Values less than 90 skew the curve towards the start point and values greater than 90 skew the curve towards the end point.
ncp	The number of control points used to draw the curve. More control points creates a smoother curve.
arrow	specification for arrow heads, as created by arrow().
lineend	Line end style (round, butt, square).
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in `gformula`. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form `attribute = value` or mapped using arguments of the form `attribute = ~ expression`.

In formulas of the form `A | B`, `B` will be used to form facets using `facet_wrap()` or `facet_grid()`. This provides an alternative to `gf_facet_wrap()` and `gf_facet_grid()` that is terser and may feel more familiar to users of **lattice**.

gf_point(mpg ~ wt, data = mtcars) %>%
  gf_curve(y1 + y2 ~ x1 + x2, data = D, color = "navy") %>%
  gf_segment(y1 + y2 ~ x1 + x2, data = D, color = "red")
```

---

gf_density *Formula interface to stat_density()*

Description

Computes and draws a kernel density estimate, which is a smoothed version of the histogram and is a useful alternative when the data come from an underlying smooth distribution. The only difference between `gf_dens()` and `gf_density()` is the default geom used to show the density curve: `gf_density()` uses an area geom (which can be filled). `gf_dens()` using a line geom (which cannot be filled).

Usage

```
gf_density(object = NULL, gformula = NULL, data = NULL,
  alpha = 0.5, color, fill, group, linetype, size, kernel = "gaussian",
  n = 512, trim = FALSE, xlab, ylab, title, subtitle, caption,
  geom = "area", stat = "density", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)

gf_dens(object = NULL, gformula = NULL, data = NULL, alpha = 0.5,
  color, group, linetype, size, kernel = "gaussian", n = 512,
  trim = FALSE, xlab, ylab, title, subtitle, caption, geom = "line",
  stat = "density", position = "identity", show.legend = NA,
  show.help = NULL, inherit = TRUE, environment = parent.frame(),
  ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape ~ x. Faceting can be achieved by including | in the formula.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
kernel	Kernel. See list of available kernels in density().
n	number of equally spaced points at which the density is to be estimated, should be a power of two, see density() for details
trim	This parameter only matters if you are displaying multiple densities in one plot. If FALSE, the default, each density is computed on the full range of the data. If TRUE, each density is computed over the range of that group: this typically means the estimated x values will not line-up, and hence you won't be able to stack density values.

xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	Use to override the default connection between geom_density and stat_density.
stat	Use to override the default connection between geom_density and stat_density.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

# Chaining in the data
iris %>% gf_dens( ~ Sepal.Length, color = ~ Species)
```

---

gf_density_2d *Formula interface to geom_density_2d()*

Description

Perform a 2D kernel density estimation using `MASS::kde2d()` and display the results with contours. This can be useful for dealing with overplotting. This is a 2d version of `geom_density()`.

Usage

```
gf_density_2d(object = NULL, gformula = NULL, data = NULL, alpha,
  color, group, linetype, size, contour = TRUE, n = 100, h = NULL,
  lineend = "butt", linejoin = "round", linemitre = 1, xlab, ylab,
  title, subtitle, caption, geom = "density_2d", stat = "density_2d",
  position = "identity", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)

gf_density2d(object = NULL, gformula = NULL, data = NULL, alpha,
  color, group, linetype, size, contour = TRUE, n = 100, h = NULL,
  lineend = "butt", linejoin = "round", linemitre = 1, xlab, ylab,
  title, subtitle, caption, geom = "density2d", stat = "density2d",
  position = "identity", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)
```

Arguments

`object`	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
`gformula`	A formula with shape `y ~ x`. Faceting can be achieved by including `|` in the formula.

}
```

---

gf_dist *Plot distributions*

Description

Create a layer displaying a probability distribution.

Usage

```
gf_dist(object = ggplot(), dist, ..., xlim = NULL,
  kind = c("density", "cdf", "qq", "qqstep", "histogram"),
  resolution = 5000L, params = NULL)
```

Arguments

`object`	a gg object.
`dist`	A character string providing the name of a distribution. Any distribution for which the functions with names formed by prepending "d", "p", or "q" to `dist` exist can be used.
`...`	additional arguments passed both to the distribution functions and to the layer. Note: Possible ambiguities using `params` or by preceding plot arguement with `plot_`.
`xlim`	A numeric vector of length 2 providing lower and upper bounds for the portion of the distribution that will be displayed. The default is to attempt to determine reasonable bounds using quantiles of the distribution.
`kind`	One of `"density"`, `"cdf"`, `"qq"`, `"qqstep"`, or `"histogram"` describing what kind of plot to create.

resolution	An integer specifying the number of points to use for creating the plot.
params	a list of parameters for the distribution.

Examples

```
gf_dhistogram( ~ rnorm(100), bins = 20) %>%
  gf_dist("norm", color = "red")

# shading tails -- but see pdist() for this
gf_dist("norm", fill = ~(abs(x) <= 2), geom = "area")
gf_dist("norm", color = "red", kind = "cdf")
gf_dist("norm", fill = "red", kind = "histogram")
gf_dist("norm", color = "red", kind = "qqstep", resolution = 25) %>%
gf_dist("norm", color = "black", kind = "qq", resolution = 25, size = 2, alpha = 0.5)
# size is used as parameter for binomial distribution
gf_dist("binom", size = 20, prob = 0.25)
# If we want to adjust size argument for plots, we have two choices:
gf_dist("binom", size = 20, prob = 0.25, plot_size = 2)
gf_dist("binom", params = list(size = 20, prob = 0.25), size = 2)
```

---

gf_dotplot *Formula interface to geom_dotplot()*

Description

Scatterplots in ggformula.

Usage

```
gf_dotplot(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, binwidth = NULL, binaxis = "x", method = "dotdensity",
  binpositions = "bygroup", stackdir = "up", stackratio = 1,
  dotsize = 1, stackgroups = FALSE, origin = NULL, right = TRUE,
  width = 0.9, drop = FALSE, xlab, ylab, title, subtitle, caption,
  position = "identity", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape ~ x. Faceting can be achieved by including | in the formula.
data	A data frame with the variables to be plotted.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.

group	Used for grouping.
binwidth	When method is "dotdensity", this specifies maximum bin width. When method is "histodot", this specifies bin width. Defaults to 1/30 of the range of the data
binaxis	The axis to bin along, "x" (default) or "y"
method	"dotdensity" (default) for dot-density binning, or "histodot" for fixed bin widths (like stat_bin)
binpositions	When method is "dotdensity", "bygroup" (default) determines positions of the bins for each group separately. "all" determines positions of the bins with all the data taken together; this is used for aligning dot stacks across multiple groups.
stackdir	which direction to stack the dots. "up" (default), "down", "center", "centerwhole" (centered, but with dots aligned)
stackratio	how close to stack the dots. Default is 1, where dots just just touch. Use smaller values for closer, overlapping dots.
dotsize	The diameter of the dots relative to binwidth, default 1.
stackgroups	should dots be stacked across groups? This has the effect that position = "stack" should have, but can't (because this geom has some odd properties).
origin	When method is "histodot", origin of first bin
right	When method is "histodot", should intervals be closed on the right (a, b], or not [a, b)
width	When binaxis is "y", the spacing of the dot stacks for dodging.
drop	If TRUE, remove all bins with zero counts
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Details

There are two basic approaches: *dot-density* and *histodot*. With dot-density binning, the bin positions are determined by the data and `binwidth`, which is the maximum width of each bin. See Wilkinson (1999) for details on the dot-density binning algorithm. With histodot binning, the bins have fixed positions and fixed widths, much like a histogram.

When binning along the x axis and stacking along the y axis, the numbers on y axis are not meaningful, due to technical limitations of ggplot2. You can hide the y axis, as in one of the examples, or manually scale it to match the number of dots.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in `gformula`. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form `attribute = value` or mapped using arguments of the form `attribute = ~ expression`.

In formulas of the form `A | B`, `B` will be used to form facets using `facet_wrap()` or `facet_grid()`. This provides an alternative to `gf_facet_wrap()` and `gf_facet_grid()` that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of `gformula`. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

Wilkinson, L. (1999) Dot plots. The American Statistician, 53(3), 276-281.

See Also

`ggplot2::geom_dotplot()`

Examples

```
gf_dotplot( ~ Sepal.Length, fill = ~ Species, data = iris)
```

gf_empty *Create an "empty" plot*

Description

This is primarily useful as a way to start a sequence of piped plot layers.

Usage

```
gf_empty(environment = parent.frame())
```

Arguments

environment	An environment passed to ggplot2::ggplot()

Value

A plot with now layers.

Examples

```
gf_empty()
gf_empty() %>%
  gf_point(Sepal.Length ~ Sepal.Width, data = iris, color = ~ Species)
```

gf_errorbar *Formula interface to geom_errorbar()*

Description

For each x value, geom_ribbon displays a y interval defined by ymin and ymax. geom_area is a special case of geom_ribbon, where the ymin is fixed to 0.

Usage

```
gf_errorbar(object = NULL, gformula = NULL, data = NULL, alpha,
  color, group, linetype, size, xlab, ylab, title, subtitle, caption,
  geom = "errorbar", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = FALSE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape ymin + ymax ~ x. Faceting can be achieved by including | in the formula.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Note

There is discrepancy between the information required for gf_errorbar() and gf_errobarh(). It expected that this will change in a future release of ggplot2.

    gf_facet_grid( ~ sex)
}
```

---

gf_errorbarh *Formula interface to geom_errorbarh()*

Description

A rotated version of geom_errorbar().

Usage

```
gf_errorbarh(object = NULL, gformula = NULL, data = NULL, alpha,
  color, group, linetype, size, xlab, ylab, title, subtitle, caption,
  geom = "errorbarh", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `y ~ x + xmin + xmax`. Faceting can be achieved by including `|` in the formula.
data	The data to be displayed in this layer. There are three options: If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`. A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created. A `function` will be called with a single argument, the plot data. The return value must be a `data.frame.`, and will be used as the layer data.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also `gf_labs()`.
ylab	Label for y-axis. See also `gf_labs()`.
title	Title, sub-title, and caption for the plot. See also `gf_labs()`.
subtitle	Title, sub-title, and caption for the plot. See also `gf_labs()`.
caption	Title, sub-title, and caption for the plot. See also `gf_labs()`.
geom	A character string naming the geom used to make the layer.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If `TRUE`, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in `data`.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with `attribute = value`, (b) ggplot2 aesthetics to be mapped with `attribute = ~ expression`, or (c) attributes of the layer as a whole, which are set with `attribute = value`.

Value

a gg object

Note

    gf_facet_grid( ~ sex)
}
```

gf_facet_wrap *Add facets to a plot*

Description

These functions provide more control over faceting than is possible using the formula interface.

Usage

```
gf_facet_wrap(object, ...)

gf_facet_grid(object, ...)
```

Arguments

object	A ggplot object
...	Additional arguments passed to facet_wrap() or facet_grid(). This typically includes an unnamed formula argument describing the facets. scales and space are additional useful arguments. See the examples.

See Also

ggplot2::facet_grid(), ggplot2::facet_wrap().

Examples

```
if (require(mosaicData)) {
  gf_histogram(~ avg_drinks, data = HELPrct) %>%
    gf_facet_grid(~ substance)
  gf_histogram(~ avg_drinks, data = HELPrct) %>%
    gf_facet_grid(~ substance, scales = "free")
  gf_histogram(~ avg_drinks, data = HELPrct) %>%
    gf_facet_grid(~ substance, scales = "free", space = "free")
  gf_line(births ~ date, data = Births, color = ~ wday) %>%
    gf_facet_wrap( ~ year, scales = "free_x", nrow = 5) %>%
    gf_theme(axis.title.x = element_blank(),
             axis.text.x=element_blank(), axis.ticks.x=element_blank()) %>%
    gf_labs(color = "Day")
}
```

gf_fitdistr *Plot density function based on fit to data*

Description

MASS::fitdistr() is used to fit coefficients of a specified family of distributions and the resulting density curve is displayed.

Usage

```
gf_fitdistr(object = NULL, gformula = NULL, data = NULL,
  dist = "dnorm", start = NULL, alpha, color, fill, group, linetype,
  size, xlab, ylab, title, subtitle, caption, geom = "path",
  stat = "fitdistr", position = "identity", show.legend = NA,
  show.help = NULL, inherit = FALSE, environment = parent.frame(),
  ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See examples.
gformula	A formula with shape ~ x used to specify the data to be fit to a family of distributions.
data	A data frame containing the variable to be fitted.
dist	A quoted name of a distribution function. See mosaicCore::fit_distr_fun() for more details about allowable distributions.
start	Starting value(s) for the search for MLE. (See MASS::fitdistr.)
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	A character string naming the stat used to make the layer.

position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of gformula. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

gf_dhistogram( ~ f, data = Dat) %>%
  gf_fitdistr(dist = "df", start = list(df1 = 2, df2 = 50))

# fitted parameters are default argument values
args(
  mosaicCore::fit_distr_fun( ~ f, data = Dat, dist = "df",
    start = list(df1 = 2, df2 = 50)))
args(mosaicCore::fit_distr_fun( ~ g, data = Dat, dist = "dgamma"))

}
```

---

gf_freqpoly *Formula interface to geom_freqpoly()*

Description

Visualise the distribution of a single continuous variable by dividing the x axis into bins and counting the number of observations in each bin. Histograms (geom_histogram) display the count with bars; frequency polygons (geom_freqpoly) display the counts with lines. Frequency polygons are more suitable when you want to compare the distribution across the levels of a categorical variable.

Usage

```
gf_freqpoly(object = NULL, gformula = NULL, data = NULL, alpha,
  color, group, linetype, size, binwidth, bins, center, boundary, xlab,
  ylab, title, subtitle, caption, geom = "path", stat = "bin",
  position = "identity", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape ~ x or y ~ x. Faceting can be achieved by including | in the formula.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.
alpha	Opacity (0 = invisible, 1 = opaque).

color	A color or a formula used for mapping color.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
binwidth	The width of the bins. Can be specified as a numeric value, or a function that calculates width from x. The default is to use bins bins that cover the range of the data. You should always override this value, exploring multiple widths to find the best to illustrate the stories in your data. The bin width of a date variable is the number of days in each time; the bin width of a time variable is the number of seconds.
bins	Number of bins. Overridden by binwidth. Defaults to 30.
center	The center of one of the bins. Note that if center is above or below the range of the data, things will be shifted by an appropriate number of widths. To center on integers, for example, use width = 1 and center = 0, even if 0 is outside the range of the data. At most one of center and boundary may be specified.
boundary	A boundary between two bins. As with center, things are shifted when boundary is outside the range of the data. For example, to center on integers, use width = 1 and boundary = 0.5, even if 0.5 is outside the range of the data. At most one of center and boundary may be specified.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	Use to override the default connection between geom_histogram/geom_freqpoly and stat_bin.
stat	Use to override the default connection between geom_histogram/geom_freqpoly and stat_bin.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in `gformula`. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form `attribute = value` or mapped using arguments of the form `attribute = ~ expression`.

In formulas of the form `A | B`, `B` will be used to form facets using `facet_wrap()` or `facet_grid()`. This provides an alternative to `gf_facet_wrap()` and `gf_facet_grid()` that is terser and may feel more familiar to users of **lattice**.

Evaluation

gf_function *Layers displaying graphs of functions*

Description

These functions provide two different interfaces for creating a layer that contains the graph of a function.

Usage

```
gf_function(object = NULL, fun, xlim, ..., inherit = FALSE)

gf_fun(object = NULL, formula, xlim, ..., inherit = FALSE)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
fun	A function.
xlim	A numeric vector providing the extent of the x-axis when creating the first layer in a plot. Ignored when creating a subsequent layer.
...	Other arguments such as position="dodge".
inherit	A logical indicating whether default attributes are inherited.
formula	A formula describing a function. See examples and mosaicCore::makeFun().

Examples

```
gf_function(fun = sqrt, xlim = c(0, 10))
if (require(mosaicData)) {
  gf_dhistogram( ~ age, data = HELPrct, binwidth = 3, alpha = 0.6) %>%
    gf_function(fun = stats::dnorm,
      args = list(mean = mean(HELPrct$age), sd = sd(HELPrct$age)),
      color = "red")
}
gf_fun(5 + 3 * cos(10 * x) ~ x, xlim = c(0,2))
# Utility bill is quadratic in month?
f <- makeFun(lm(totalbill ~ poly(month, 2), data = Utilities))
gf_point(totalbill ~ month, data = Utilities, alpha = 0.6) %>%
  gf_fun(f(m) ~ m, color = "red")
```

---

gf_function_2d *Plot functions of two variables*

Description

Plot functions of two variables as tile and/or contour plots.

Usage

```
gf_function_2d(object = NULL, fun = identity, xlim = NULL,
  ylim = NULL, ..., tile = TRUE, contour = TRUE, resolution = 50)

gf_function2d(object = NULL, fun = identity, xlim = NULL,
  ylim = NULL, ..., tile = TRUE, contour = TRUE, resolution = 50)

gf_function_contour(object = NULL, fun = identity, xlim = NULL,
  ylim = NULL, ..., resolution = 50)

gf_function_tile(object = NULL, fun = identity, xlim = NULL,
  ylim = NULL, ..., resolution = 50)
```

```
gf_fun_2d(object = NULL, formula = NULL, xlim = NULL, ylim = NULL,
  tile = TRUE, contour = TRUE, ..., resolution = 50)

gf_fun2d(object = NULL, formula = NULL, xlim = NULL, ylim = NULL,
  tile = TRUE, contour = TRUE, ..., resolution = 50)

gf_fun_tile(object = NULL, formula = NULL, xlim = NULL,
  ylim = NULL, ..., resolution = 50)

gf_fun_contour(object = NULL, formula = NULL, xlim = NULL,
  ylim = NULL, ..., resolution = 50)
```

Arguments

object	An R object, typically of class "gg".
fun	A function of two variables to be plotted.
xlim	x limits for generating points to be plotted.
ylim	y limits for generating points to be plotted.
...	additional arguments passed to gf_tile() or gf_contour().
tile	A logical indicating whether the tile layer should be drawn.
contour	A logical indicating whether the contour layer should be drawn.
resolution	A numeric vector of length 1 or 2 specifiying the number of grid points at which the function is evaluated (in each dimension).
formula	A formula describing a function of two variables to be plotted. See mosaic::makeFun() for details regarding the conversion from a formula to a function.

Value

A gg plot.

Examples

```
theme_set(theme_bw())
gf_function_2d( fun = function(x, y) sin(2 * x * y), xlim = c(-pi, pi), ylim = c(-pi, pi)) %>%
  gf_refine(scale_fill_viridis_c())
gf_function_2d( fun = function(x, y) x + y, contour = FALSE)
gf_function_tile(fun = function(x, y) x * y) %>%
gf_function_contour(fun = function(x, y) x * y, color = "white") %>%
  gf_refine(scale_fill_viridis_c())
gf_fun_tile(x * y ~ x + y, xlim = c(-3,3), ylim = c(-2,2)) %>%
  gf_fun_contour(x * y ~ x + y, color = "white") %>%
  gf_refine(scale_fill_viridis_c()) %>%
  gf_labs(fill = "product")
```

gf_hex *Formula interface to geom_hex()*

Description

Line plots in ggformula. gf_path() differs from gf_line() in that points are connected in the order in which they appear in data.

Usage

```
gf_hex(object = NULL, gformula = NULL, data = NULL, bins, binwidth,
  alpha, color, fill, group, size, xlab, ylab, title, subtitle, caption,
  geom = "hex", stat = "binhex", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape y ~ x. Faceting can be achieved by including | in the formula.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.
bins	numeric vector giving number of bins in both vertical and horizontal directions. Set to 30 by default.
binwidth	Numeric vector giving bin width in both vertical and horizontal directions. Overrides bins if both set.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().

subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	Override the default connection between geom_hex and stat_binhex.
stat	Override the default connection between geom_hex and stat_binhex.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of gformula. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

Examples

```
if (require(mosaicData)) {
  gf_hex(avg_drinks ~ age, data = HELPrct, bins = 15) %>%
  gf_density2d(avg_drinks ~ age, data = HELPrct, color = "red", alpha = 0.5)
}
```

gf_histogram *Formula interface to geom_histogram()*

Description

Count and density histograms in ggformula.

Usage

```
gf_histogram(object = NULL, gformula = NULL, data = NULL,
  bins = 25, binwidth, alpha = 0.5, color, fill, group, linetype, size,
  xlab, ylab, title, subtitle, caption, geom = "bar", stat = "bin",
  position = "stack", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)

gf_dhistogram(object = NULL, gformula = NULL, data = NULL,
  bins = 25, binwidth, alpha = 0.5, color, fill, group, linetype, size,
  xlab, ylab, title, subtitle, caption, geom = "bar", stat = "bin",
  position = "stack", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)

gf_histogramh(object = NULL, gformula = NULL, data = NULL,
  bins = 25, binwidth, alpha = 0.5, color, fill, group, linetype, size,
  xlab, ylab, title, subtitle, caption, geom = "barh", stat = "binh",
  position = "stackv", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)

gf_dhistogramh(object = NULL, gformula = NULL, data = NULL,
  bins = 25, binwidth, alpha = 0.5, color, fill, group, linetype, size,
  xlab, ylab, title, subtitle, caption, geom = "barh", stat = "binh",
  position = "stackv", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape ~ x (or y ~ x, but this shape is not generally needed).
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.

bins	Number of bins. Overridden by binwidth. Defaults to 30.
binwidth	The width of the bins. Can be specified as a numeric value, or a function that calculates width from x. The default is to use bins bins that cover the range of the data. You should always override this value, exploring multiple widths to find the best to illustrate the stories in your data. The bin width of a date variable is the number of days in each time; the bin width of a time variable is the number of seconds.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	Use to override the default connection between geom_histogram/geom_freqpoly and stat_bin.
stat	Use to override the default connection between geom_histogram/geom_freqpoly and stat_bin.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in `gformula`. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form `attribute = value` or mapped using arguments of the form `attribute = ~ expression`.

In formulas of the form `A | B`, `B` will be used to form facets using `facet_wrap()` or `facet_grid()`. This provides an alternative to `gf_facet_wrap()` and `gf_facet_grid()` that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of `gformula`. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

gf_histogramh( x ~ ., bins = 30)
gf_histogramh( x ~ stat(density), bins = 30)
gf_dhistogramh(~ x, bins = 30)
gf_dhistogramh(x ~ ., bins = 30)
# better to use gf_histogramh() here, but this works
gf_dhistogramh(x ~ stat(count), bins = 30)
```

gf_jitter *Formula interface to geom_jitter()*

Description

Jittered scatter plots in ggformula.

Usage

```
gf_jitter(object = NULL, gformula = NULL, data = NULL, alpha, color,
  size, shape, fill, width, height, group, stroke, xlab, ylab, title,
  subtitle, caption, geom = "point", stat = "identity",
  position = "jitter", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `y ~ x`. Faceting can be achieved by including `|` in the formula.
data	A data frame with the variables to be plotted.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
size	A numeric size or a formula used for mapping size.
shape	An integer or letter shape or a formula used for mapping shape.
fill	A color for filling, or a formula used for mapping fill.
width	Amount of horizontal jitter.
height	Amount of vertical jitter.
group	Used for grouping.
stroke	A numeric size of the border or a formula used to map stroke.
xlab	Label for x-axis. See also `gf_labs()`.
ylab	Label for y-axis. See also `gf_labs()`.
title	Title, sub-title, and caption for the plot. See also `gf_labs()`.
subtitle	Title, sub-title, and caption for the plot. See also `gf_labs()`.
caption	Title, sub-title, and caption for the plot. See also `gf_labs()`.
geom	A character string naming the geom used to make the layer.
stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.

show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments.     position = "jitter", width = 0.2, height = 0)
}
```

gf_labs *Non-layer functions for gf plots*

Description

These functions modify things like labels, limits, scales, etc. for plots ggplot2 plots. They are wrappers around functions in ggplot2 that allow for chaining syntax.

Usage

```
gf_labs(object, ...)

gf_lims(object, ...)

gf_refine(object, ...)
```

Arguments

object	a gg object
...	additional arguments passed through to the similarly named function in **ggplot2**.

Details

gf_refine() provides a mechanism to replace + with the chaining operator from **magrittr**. Each of its ... arguments is added in turn to the base plot in object. The other functions are thin wrappers around specific ggplot2 refinement functions and pass their ... arguments through to the similarly named ggplot2 functions.

Value

a modified gg object

Examples

```
if (require(mosaicData)) {
gf_dens( ~ cesd, color = ~ substance, size = 1.5, data = HELPrct) %>%
gf_labs(
  title = "Center for Epidemiologic Studies Depression measure",
  subtitle = "(at baseline)",
  color = "Abused substance: ",
  x = "CESD score",
  y = "",
  caption = "Source: HELPrct"
) %>%
  gf_theme(theme_classic()) %>%
  gf_theme(
    axis.text.y = element_blank(),
    legend.position = "top",
```

```
    plot.title = element_text(hjust = 0.5, color = "navy"),
    plot.subtitle = element_text(hjust = 0.5, color = "navy", size = 12))
}
gf_point(eruptions ~ waiting, data = faithful, alpha = 0.5)
gf_point(eruptions ~ waiting, data = faithful, alpha = 0.5) %>%
  gf_lims(x = c(65, NA), y = c(3, NA))

# modify scales using gf_refine()
gf_jitter(Sepal.Length ~ Sepal.Width, color = ~ Species, data = iris) %>%
  gf_refine(scale_color_brewer(type = "qual", palette = 3)) %>%
  gf_theme(theme_bw())

gf_jitter(Sepal.Length ~ Sepal.Width, color = ~ Species, data = iris) %>%
  gf_refine(scale_color_manual(values = c("red", "navy", "limegreen"))) %>%
  gf_theme(theme_bw())
```

`gf_line` *Formula interface to geom_line() and geom_path()*

Description

Line plots in ggformula. `gf_path()` differs from `gf_line()` in that points are connected in the order in which they appear in `data`.

Usage

```
gf_line(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, lineend, linejoin, linemitre, arrow, xlab,
  ylab, title, subtitle, caption, geom = "line", stat = "identity",
  position = "identity", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)

gf_path(object = NULL, gformula = NULL, data = NULL, alpha, color,
  group, linetype, size, lineend = "butt", linejoin = "round",
  linemitre = 1, arrow = NULL, xlab, ylab, title, subtitle, caption,
  geom = "path", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

`object`	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
`gformula`	A formula with shape `y ~ x`. Faceting can be achieved by including `|` in the formula.
`data`	A data frame with the variables to be plotted.
`alpha`	Opacity (0 = invisible, 1 = opaque).

color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
lineend	Line end style (round, butt, square).
linejoin	Line join style (round, mitre, bevel).
linemitre	Line mitre limit (number greater than 1).
arrow	Arrow specification, as created by grid::arrow().
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of `gformula`. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

  gf_path(y ~ x, color = ~ t)
  }
```

---

gf_linerange *Formula interface to geom_linerange() and geom_pointrange()*

Description

Various ways of representing a vertical interval defined by `x`, `ymin` and `ymax`. Each case draws a single graphical object.

Usage

```
gf_linerange(object = NULL, gformula = NULL, data = NULL, alpha,
  color, group, linetype, size, xlab, ylab, title, subtitle, caption,
  geom = "linerange", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)

gf_pointrange(object = NULL, gformula = NULL, data = NULL, alpha,
  color, group, linetype, size, fatten = 2, xlab, ylab, title, subtitle,
  caption, geom = "pointrange", stat = "identity",
  position = "identity", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)
```

```
gf_linerangeh(object = NULL, gformula = NULL, data = NULL, alpha,
  color, group, linetype, size, xlab, ylab, title, subtitle, caption,
  geom = "linerangeh", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)

gf_pointrangeh(object = NULL, gformula = NULL, data = NULL, alpha,
  color, group, linetype, size, xlab, ylab, title, subtitle, caption,
  geom = "pointrangeh", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `ymin + ymax ~ x`. Faceting can be achieved by including `|` in the formula.
data	The data to be displayed in this layer. There are three options: If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`. A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created. A `function` will be called with a single argument, the plot data. The return value must be a `data.frame.`, and will be used as the layer data.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also `gf_labs()`.
ylab	Label for y-axis. See also `gf_labs()`.
title	Title, sub-title, and caption for the plot. See also `gf_labs()`.
subtitle	Title, sub-title, and caption for the plot. See also `gf_labs()`.
caption	Title, sub-title, and caption for the plot. See also `gf_labs()`.
geom	A character string naming the geom used to make the layer.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.

show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.
fatten	A multiplicative factor used to increase the size of the middle bar in geom_crossbar() and the middle point in geom_pointrange().

gf_point *Formula interface to geom_point()*

Description

Scatterplots in ggformula.

Usage

```
gf_point(object = NULL, gformula = NULL, data = NULL, alpha, color,
  size, shape, fill, group, stroke, xlab, ylab, title, subtitle, caption,
  geom = "point", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape y ~ x. Faceting can be achieved by including | in the formula.
data	A data frame with the variables to be plotted.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.

size	A numeric size or a formula used for mapping size.
shape	An integer or letter shape or a formula used for mapping shape.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
stroke	A numeric size of the border or a formula used to map stroke.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title, subtitle, caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, (c) attributes of the layer as a whole, which are set with attribute = value, or (d) arguments for the geom, stat, or position function.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of gformula. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

    subtitle = "(United States, 1978)",
    caption = "Source: mosaicData::Births78")
}
```

---

gf_polygon *Formula interface to geom_polygon()*

Description

Scatterplots in ggformula.

Usage

```
gf_polygon(object = NULL, gformula = NULL, data = NULL, alpha, color,
  size, shape, fill, group, stroke, xlab, ylab, title, subtitle, caption,
  geom = "polygon", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape y ~ x. Faceting can be achieved by including | in the formula.

data	A data frame with the variables to be plotted.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
size	A numeric size or a formula used for mapping size.
shape	An integer or letter shape or a formula used for mapping shape.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
stroke	A numeric size of the border or a formula used to map stroke.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, (c) attributes of the layer as a whole, which are set with attribute = value, or (d) arguments for the geom, stat, or position function.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of `gformula`. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

    color = "gray70", inherit = FALSE) %>%
  gf_refine(ggthemes::theme_map())
}
```

---

gf_qq *Formula interface to geom_qq()*

Description

`gf_qq()` an `gf_qqstep()` both create quantile-quantile plots. They differ in how they display the qq-plot. `gf_qq()` uses points and `gf_qqstep()` plots a step function through these points.

Usage

```
gf_qq(object = NULL, gformula = NULL, data = NULL, group,
  distribution = stats::qnorm, dparams = list(), xlab, ylab, title,
  subtitle, caption, geom = "point", stat = "qq",
  position = "identity", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)

gf_qqline(object = NULL, gformula = NULL, data = NULL, group,
  distribution = stats::qnorm, dparams = list(), linetype = "dashed",
  alpha = 0.7, xlab, ylab, title, subtitle, caption, geom = "line",
  stat = "qqline", position = "identity", show.legend = NA,
```

```
  show.help = NULL, inherit = TRUE, environment = parent.frame(),
  ...)

gf_qqstep(object = NULL, gformula = NULL, data = NULL, group,
  distribution = stats::qnorm, dparams = list(), xlab, ylab, title,
  subtitle, caption, geom = "step", stat = "qq",
  position = "identity", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `~ sample`. Facets can be added using `|`.
data	The data to be displayed in this layer. There are three options: If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`. A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created. A `function` will be called with a single argument, the plot data. The return value must be a `data.frame.`, and will be used as the layer data.
group	Used for grouping.
distribution	Distribution function to use, if x not specified
dparams	Additional parameters passed on to `distribution` function.
xlab	Label for x-axis. See also `gf_labs()`.
ylab	Label for y-axis. See also `gf_labs()`.
title	Title, sub-title, and caption for the plot. See also `gf_labs()`.
subtitle	Title, sub-title, and caption for the plot. See also `gf_labs()`.
caption	Title, sub-title, and caption for the plot. See also `gf_labs()`.
geom	Use to override the default connection between `geom_histogram`/`geom_freqpoly` and `stat_bin`.
stat	Use to override the default connection between `geom_histogram`/`geom_freqpoly` and `stat_bin`.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If `TRUE`, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in `data`.

...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with `attribute = value`, (b) ggplot2 aesthetics to be mapped with `attribute = ~ expression`, or (c) attributes of the layer as a whole, which are set with `attribute = value`.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
alpha	Opacity (0 = invisible, 1 = opaque).

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in `gformula`. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form `attribute = value` or mapped using arguments of the form `attribute = ~ expression`.

In formulas of the form `A | B`, `B` will be used to form facets using `facet_wrap()` or `facet_grid()`. This provides an alternative to `gf_facet_wrap()` and `gf_facet_grid()` that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of `gformula`. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

gf_qq( ~ Sepal.Length | Species, data = iris) %>% gf_qqline(tail = 0.10)
gf_qq( ~ Sepal.Length, color = ~ Species, data = iris) %>%
gf_qqstep( ~ Sepal.Length, color = ~ Species, data = iris)
```

---

gf_quantile *Formula interface to geom_quantile()*

Description

This fits a quantile regression to the data and draws the fitted quantiles with lines. This is as a continuous analogue to `geom_boxplot()`.

Usage

```
gf_quantile(object = NULL, gformula = NULL, data = NULL, alpha,
  color, group, linetype, size, weight, lineend = "butt",
  linejoin = "round", linemitre = 1, quantiles, formula, method,
  method.args, xlab, ylab, title, subtitle, caption, geom = "quantile",
  stat = "quantile", position = "identity", show.legend = NA,
  show.help = NULL, inherit = TRUE, environment = parent.frame(),
  ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `y ~ x`. Faceting can be achieved by including `|` in the formula.
data	The data to be displayed in this layer. There are three options: If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`. A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created. A `function` will be called with a single argument, the plot data. The return value must be a `data.frame.`, and will be used as the layer data.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
weight	Useful for summarized data, `weight` provides a count of the number of values with the given combination of `x` and `y` values.
lineend	Line end style (round, butt, square).
linejoin	Line join style (round, mitre, bevel).
linemitre	Line mitre limit (number greater than 1).
quantiles	conditional quantiles of y to calculate and display
formula	formula relating y variables to x variables
method	Quantile regression method to use. Currently only supports `quantreg::rq()`.
method.args	List of additional arguments passed on to the modelling function defined by `method`.
xlab	Label for x-axis. See also `gf_labs()`.
ylab	Label for y-axis. See also `gf_labs()`.
title	Title, sub-title, and caption for the plot. See also `gf_labs()`.

subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	Use to override the default connection between geom_quantile and stat_quantile.
stat	Use to override the default connection between geom_quantile and stat_quantile.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

  gf_quantile((1/hwy) ~ displ)
```

gf_raster *Formula interface to geom_raster()*

Description

Formula interface to geom_raster()

Usage

```
gf_raster(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, hjust = 0.5, vjust = 0.5,
  interpolate = FALSE, xlab, ylab, title, subtitle, caption,
  geom = "raster", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `y ~ x` or `fill ~ x + y`
data	A data frame with the variables to be plotted.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
hjust	horizontal and vertical justification of the grob. Each justification value should be a number between 0 and 1. Defaults to 0.5 for both, centering each pixel over its data location.
vjust	horizontal and vertical justification of the grob. Each justification value should be a number between 0 and 1. Defaults to 0.5 for both, centering each pixel over its data location.
interpolate	If `TRUE` interpolate linearly, if `FALSE` (the default) don't interpolate.
xlab	Label for x-axis. See also `gf_labs()`.
ylab	Label for y-axis. See also `gf_labs()`.
title	Title, sub-title, and caption for the plot. See also `gf_labs()`.
subtitle	Title, sub-title, and caption for the plot. See also `gf_labs()`.
caption	Title, sub-title, and caption for the plot. See also `gf_labs()`.
geom	A character string naming the geom used to make the layer.

stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of gformula. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

# Justification controls where the cells are anchored
D <- expand.grid(x = 0:5, y = 0:5)
D$z <- runif(nrow(D))
# centered squares
gf_raster(z ~ x + y, data = D)
gf_raster(y ~ x, fill = ~ z, data = D)
# zero padding
gf_raster(z ~ x + y, data = D, hjust = 0, vjust = 0)
```

gf_rect *Formula interface to geom_rect()*

Description

Line plots in ggformula. gf_path() differs from gf_line() in that points are connected in the order in which they appear in data.

Usage

```
gf_rect(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, xlab, ylab, title, subtitle, caption,
  geom = "rect", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape ymin + ymax ~ xmin + xmax. Faceting can be achieved by including | in the formula.
data	A data frame with the variables to be plotted.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.

show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

Examples

```
gf_rect( 1 + 2 ~ 3 + 4, alpha = 0.3, color = "red")
# use data = data.frame() so we get 1 rectangle and not 1 per row of faithful
# use inherit = FALSE because we are not reusing eruptions and waiting
gf_point(eruptions ~ waiting, data = faithful) %>%
  gf_rect(1.5 + 3 ~ 45 + 68, fill = "red", alpha = 0.2,
          data = data.frame(), inherit = FALSE) %>%
  gf_rect(3 + 5.5 ~ 68 + 100, fill = "green", alpha = 0.2,
          data = data.frame(), inherit = FALSE)
```

gf_ribbon *Formula interface to geom_ribbon()*

Description

For each x value, geom_ribbon displays a y interval defined by ymin and ymax. geom_area is a special case of geom_ribbon, where the ymin is fixed to 0.

Usage

```
gf_ribbon(object = NULL, gformula = NULL, data = NULL, alpha = 0.3,
  xlab, ylab, title, subtitle, caption, geom = "ribbon",
  stat = "identity", position = "identity", show.legend = NA,
  show.help = NULL, inherit = TRUE, environment = parent.frame(),
  ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape ymin + ymax ~ x. Faceting can be achieved by including | in the formula.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.

gf_ribbon(low_temp + high_temp ~ date, data = Weather, fill = ~ city, alpha = 0.4) %>%
   gf_theme(theme = theme_minimal())
gf_linerange(
    low_temp + high_temp ~ date | city ~ ., color = ~ high_temp,
    data = Weather) %>%
  gf_refine(scale_colour_gradientn(colors = rev(rainbow(5))))
gf_ribbon(low_temp + high_temp ~ date | city ~ ., data = Weather)
# Chaining in the data
Weather %>% gf_ribbon(low_temp + high_temp ~ date, alpha = 0.4) %>%
  gf_facet_grid(city ~ .)
}
```

---

gf_rug *Formula interface to geom_rug()*

Description

gf_rugx() and gf_rugy() are versions that only add a rug to x- or y- axis. By default, these functions do not inherit from the formula in the original layer (because doing so would often result in rugs on both axes), so the formula is required.

Usage

```
gf_rug(object = NULL, gformula = NULL, data = NULL, sides = "bl",
  alpha, color, group, linetype, size, xlab, ylab, title, subtitle,
  caption, geom = "rug", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)

gf_rugx(object = NULL, gformula = NULL, data = NULL, sides = "b",
  alpha, color, group, linetype, size, xlab, ylab, title, subtitle,
  caption, geom = "rug", stat = "identity", position = "identity",
```

```
  show.legend = NA, show.help = NULL, inherit = FALSE,
  environment = parent.frame(), ...)

gf_rugy(object = NULL, gformula = NULL, data = NULL, sides = "l",
  alpha, color, group, linetype, size, xlab, ylab, title, subtitle,
  caption, geom = "rug", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = FALSE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `y ~ x` (`gf_rug()`) or `~ x` (`gf_rugx()`) or `~ y` (`gf_rugy()`).
data	The data to be displayed in this layer. There are three options: If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`. A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created. A `function` will be called with a single argument, the plot data. The return value must be a `data.frame`., and will be used as the layer data.
sides	A string that controls which sides of the plot the rugs appear on. It can be set to a string containing any of `"trbl"`, for top, right, bottom, and left.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also `gf_labs()`.
ylab	Label for y-axis. See also `gf_labs()`.
title	Title, sub-title, and caption for the plot. See also `gf_labs()`.
subtitle	Title, sub-title, and caption for the plot. See also `gf_labs()`.
caption	Title, sub-title, and caption for the plot. See also `gf_labs()`.
geom	A character string naming the geom used to make the layer.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If `TRUE`, display some minimal help.

inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of gformula. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

Examples

```
gf_point(Sepal.Length ~ Sepal.Width, data = iris) %>%
gf_rug(Sepal.Length ~ Sepal.Width)

# There are several ways to control x- and y-rugs separately
gf_point(Sepal.Length ~ Sepal.Width, data = iris) %>%
gf_rugx( ~ Sepal.Width,  data = iris, color = "red") %>%
gf_rugy(Sepal.Length ~ ., data = iris, color = "green")

gf_point(Sepal.Length ~ Sepal.Width, data = iris) %>%
gf_rug(. ~ Sepal.Width,  data = iris, color = "red", inherit = FALSE) %>%
gf_rug(Sepal.Length ~ ., data = iris, color = "green", inherit = FALSE)

gf_point(Sepal.Length ~ Sepal.Width, data = iris) %>%
gf_rug(. ~ Sepal.Width,  data = iris, color = "red", sides = "b") %>%
gf_rug(Sepal.Length ~ ., data = iris, color = "green", sides = "l")

# jitter requires both an x and a y, but we can turn off one or the other with sides
gf_jitter(Sepal.Length ~ Sepal.Width, data = iris) %>%
```

```
gf_rug(color = "green", sides = "b", position = "jitter")

# rugs work with some 1-varialbe plots as well.
gf_histogram( ~ eruptions, data = faithful) %>%
gf_rug( ~ eruptions, data = faithful, color = "red")%>%
gf_rug( ~ eruptions, data = faithful, color = "navy", sides = "t")

# we can take advantage of inheritance to shorten the code
gf_histogram( ~ eruptions, data = faithful) %>%
gf_rug(color = "red") %>%
gf_rug(color = "navy", sides = "t")

# Need to turn off inheritance when using gf_dhistogram:
gf_dhistogram( ~ eruptions, data = faithful) %>%
gf_rug( ~ eruptions, data = faithful, color = "red", inherit = FALSE)

# using jitter with gf_histogram() requires manually setting the y value.
gf_dhistogram( ~ Sepal.Width, data = iris) %>%
gf_rug(0 ~ Sepal.Width, data = iris, color = "green", sides = "b", position = "jitter")

# the choice of y value can affect how the plot looks.
gf_dhistogram( ~ Sepal.Width, data = iris) %>%
gf_rug(0.5 ~ Sepal.Width, data = iris, color = "green", sides = "b", position = "jitter")
```

`gf_segment` *Formula interface to geom_segment()*

Description

`geom_segment` draws a straight line between points (x, y) and (xend, yend). `geom_curve` draws a curved line. See the underlying drawing function `grid::curveGrob()` for the parameters that control the curve.

Usage

```
gf_segment(object = NULL, gformula = NULL, data = NULL, alpha, color,
  group, linetype, size, arrow = NULL, lineend = "butt", xlab, ylab,
  title, subtitle, caption, geom = "segment", stat = "identity",
  position = "identity", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)
```

Arguments

`object`	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
`gformula`	A formula with shape `y + yend ~ x + xend`.

data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
arrow	specification for arrow heads, as created by arrow().
lineend	Line end style (round, butt, square).
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in `gformula`. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form `attribute = value` or mapped using arguments of the form `attribute = ~ expression`.

In formulas of the form `A | B`, `B` will be used to form facets using `facet_wrap()` or `facet_grid()`. This provides an alternative to `gf_facet_wrap()` and `gf_facet_grid()` that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of `gformula`. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

gf_point(mpg ~ wt, data = mtcars) %>%
  gf_curve(y1 + y2 ~ x1 + x2, data = D, color = "navy") %>%
  gf_segment(y1 + y2 ~ x1 + x2, data = D, color = "red")
```

---

gf_sf *Mapping with shape files*

Description

Mapping with shape files

Usage

```
gf_sf(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, geometry, xlab, ylab, title, subtitle,
  caption, stat = "sf", position = "identity", show.legend = NA,
  show.help = NULL, inherit = TRUE, environment = parent.frame(),
  ...)
```

Arguments

`object`	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
`gformula`	A formula with shape `y ~ x`. Faceting can be achieved by including `|` in the formula.

data	A data frame with the variables to be plotted.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
geometry	A column of class sfc containing simple features data. (Another option is that data may contain a column named geometry.) geometry is never inherited.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

```
if (require(maps) && require(maptools) &&
  require(sf) && require(rgeos) &&
  utils::packageVersion("ggplot2") > "2.2.1") {
  US <- sf::st_as_sf(map('state', plot = FALSE, fill = TRUE))
  gf_sf( fill = ~ factor(nchar(ID)), data = US) %>%
  gf_refine(coord_sf())

  # We can specify shape data and external data separately using geometry
  MI <- sf::st_as_sf(map('county', 'michigan', plot = FALSE, fill = TRUE))
  gf_sf(fill = ~ log10(population), data = MIpop %>% dplyr::arrange(county),
        geometry = ~ MI$geometry, color = "white") %>%
  gf_refine(coord_sf(), theme_bw())

  # alternatively we can merge external data and shape data into one data frame.
  MI %>%
    dplyr::mutate(county = gsub("michigan,", "", ID)) %>%
    dplyr::left_join(MIpop %>% dplyr::mutate(county = tolower(county))) %>%
    gf_sf(fill = ~ population/1e3) %>%
  gf_refine(
    coord_sf(), theme_bw(),
    scale_fill_continuous(name = "population (thousands)", trans = "log10"))
}
```

---

gf_smooth *Formula interface to geom_smooth()*

Description

LOESS and linear model smoothers in `ggformula`.

Usage

```
gf_smooth(object = NULL, gformula = NULL, data = NULL,
  method = "auto", formula = y ~ x, se = FALSE, method.args,
  n = 80, span = 0.75, fullrange = FALSE, level = 0.95, xlab, ylab,
  title, subtitle, caption, geom = "smooth", stat = "smooth",
  position = "identity", show.legend = NA, show.help = NULL,
```

```
  inherit = TRUE, environment = parent.frame(), ...)

gf_lm(object = NULL, gformula = NULL, data = NULL, alpha = 0.3,
  lm.args = list(), interval = "none", level = 0.95,
  fullrange = TRUE, xlab, ylab, title, subtitle, caption, geom = "lm",
  stat = "lm", position = "identity", show.legend = NA,
  show.help = NULL, inherit = TRUE, environment = parent.frame(),
  ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `y ~ x`. Faceting can be achieved by including `|` in the formula.
data	A data frame with the variables to be plotted.
method	Smoothing method (function) to use, eg. `lm`, `glm`, `gam`, `loess`, `MASS::rlm`. For `method = "auto"` the smoothing method is chosen based on the size of the largest group (across all panels). `loess()` is used for less than 1,000 observations; otherwise `mgcv::gam()` is used with `formula = y ~ s(x, bs = "cs")`. Somewhat anecdotally, `loess` gives a better appearance, but is O(n^2) in memory, so does not work for larger datasets. If you have fewer than 1,000 observations but want to use the same `gam` model that `method = "auto"` would use then set `method = "gam", formula = y ~ s(x, bs = "cs")`.
formula	Formula to use in smoothing function, eg. `y ~ x`, `y ~ poly(x, 2)`, `y ~ log(x)`
se	Display confidence interval around smooth? (TRUE by default, see level to control.)
method.args	List of additional arguments passed on to the modelling function defined by `method`.
n	Number of points at which to evaluate smoother.
span	Controls the amount of smoothing for the default loess smoother. Smaller numbers produce wigglier lines, larger numbers produce smoother lines.
fullrange	Should the fit span the full range of the plot, or just the data?
level	Level of confidence interval to use (0.95 by default).
xlab	Label for x-axis. See also `gf_labs()`.
ylab	Label for y-axis. See also `gf_labs()`.
title	Title, sub-title, and caption for the plot. See also `gf_labs()`.
subtitle	Title, sub-title, and caption for the plot. See also `gf_labs()`.
caption	Title, sub-title, and caption for the plot. See also `gf_labs()`.
geom	A character string naming the geom used to make the layer.
stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.

show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.
alpha	Opacity (0 = invisible, 1 = opaque).
lm.args	A list of arguments to stats::lm().
interval	One of "none", "confidence" or "prediction".

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

`gf_spline` *Formula interface to geom_spline()*

Description

Fitting splines in `ggformula`.

Usage

```
gf_spline(object = NULL, gformula = NULL, data = NULL, alpha, color,
  group, linetype, size, weight, df, spar, tol, xlab, ylab, title,
  subtitle, caption, geom = "line", stat = "spline",
  position = "identity", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)
```

Arguments

`object`	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
`gformula`	A formula with shape `y ~ x`. Faceting can be achieved by including `|` in the formula.
`data`	A data frame with the variables to be plotted.
`alpha`	Opacity (0 = invisible, 1 = opaque).
`color`	A color or a formula used for mapping color.
`group`	Used for grouping.
`linetype`	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
`size`	A numeric size or a formula used for mapping size.
`weight`	An optional vector of weights. See `smooth.spline()`.

df	desired equivalent degrees of freedom. See smooth.spline() for details.
spar	A smoothing parameter, typically in (0,1]. See smooth.spline() for details.
tol	A tolerance for sameness or uniqueness of the x values. The values are binned into bins of size tol and values which fall into the same bin are regarded as the same. Must be strictly positive (and finite). When NULL, IQR(x) * 10e-6 is used.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments.   gf_spline(births ~ date, color = ~ wday, data = Births78, df = 4)
}
```

---

gf_spoke *Formula interface to geom_spoke()*

Description

This is a polar parameterisation of geom_segment. It is useful when you have variables that describe direction and distance.

Usage

```
gf_spoke(object = NULL, gformula = NULL, data = NULL, angle, radius,
  alpha, color, group, linetype, size, xlab, ylab, title, subtitle,
  caption, geom = "spoke", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape y ~ x. Faceting can be achieved by including | in the formula.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.
angle	The angle at which segment leaves the point (x,y).
radius	The length of the segment.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.

group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

  gf_spoke(y ~ x, angle = ~ angle, radius = ~ speed)
```

---

gf_step *Formula interface to geom_step()*

Description

geom_path() connects the observations in the order in which they appear in the data. geom_line() connects them in order of the variable on the x axis. geom_step() creates a stairstep plot, highlighting exactly when changes occur. The group aesthetic determines which cases are connected together.

Usage

```
gf_step(object = NULL, gformula = NULL, data = NULL, alpha, color,
  group, linetype, size, direction = "hv", xlab, ylab, title, subtitle,
  caption, geom = "step", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape y ~ x. Faceting can be achieved by including | in the formula.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.

alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
direction	direction of stairs: 'vh' for vertical then horizontal, or 'hv' for horizontal then vertical.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

Specifying plot attributes

Positional attributes (a.k.a, aesthetics) are specified using the formula in gformula. Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form attribute = value or mapped using arguments of the form attribute = ~ expression.

In formulas of the form A | B, B will be used to form facets using facet_wrap() or facet_grid(). This provides an alternative to gf_facet_wrap() and gf_facet_grid() that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of `gformula`. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

`ggplot2::geom_step()`

Examples

```
if (require(mosaicData)) {
  gf_step( births ~ date, data = Births78, color = ~ wday)
}

# Roll your own Kaplan-Meier plot

if (require(survival) && require(broom)) {
  # fit a survival model
  surv_fit <- survfit(coxph(Surv(time, status) ~ age + sex, lung))
  surv_fit
  # use broom::tidy() to create a tidy data frame for plotting
  surv_df <- tidy(surv_fit)
  head(surv_df)
  # now create a plot
  surv_df %>%
    gf_step(estimate ~ time) %>%
    gf_ribbon(conf.low + conf.high ~ time, alpha = 0.2)
}
```

---

gf_text *Formula interface to geom_text() and geom_label()*

Description

`geom_text` adds text directly to the plot. `geom_label` draws a rectangle behind the text, making it easier to read.

Usage

```
gf_text(object = NULL, gformula = NULL, data = NULL, label, alpha,
  angle, color, family, fontface, group, hjust, lineheight, size, vjust,
  parse = FALSE, nudge_x = 0, nudge_y = 0, check_overlap = FALSE,
  xlab, ylab, title, subtitle, caption, geom = "text",
  stat = "identity", position = "nudge", show.legend = NA,
  show.help = NULL, inherit = TRUE, environment = parent.frame(),
  ...)
```

```
gf_label(object = NULL, gformula = NULL, data = NULL, label, alpha,
  angle, color, family, fontface, group, hjust, lineheight, size, vjust,
  parse, nudge_x = 0, nudge_y = 0, label.padding = unit(0.25,
  "lines"), label.r = unit(0.15, "lines"), label.size = 0.25, xlab,
  ylab, title, subtitle, caption, stat = "identity",
  position = "nudge", show.legend = NA, show.help = NULL,
  inherit = TRUE, environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape `y ~ x`. Faceting can be achieved by including `|` in the formula.
data	The data to be displayed in this layer. There are three options: If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`. A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created. A `function` will be called with a single argument, the plot data. The return value must be a `data.frame.`, and will be used as the layer data.
label	The text to be displayed.
alpha	Opacity (0 = invisible, 1 = opaque).
angle	An angle for rotating the text.
color	A color or a formula used for mapping color.
family	A font family.
fontface	One of `"plain"`, `"bold"`, `"italic"`, or `"bold italic"`.
group	Used for grouping.
hjust, vjust	Numbers between 0 and 1 indicating how to justify text relative the the specified location.
lineheight	Line height.
size	A numeric size or a formula used for mapping size.
parse	If `TRUE`, the labels will be parsed into expressions and displayed as described in ?plotmath
nudge_x	Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales.
nudge_y	Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales.
check_overlap	If `TRUE`, text that overlaps previous text in the same layer will not be plotted.
xlab	Label for x-axis. See also `gf_labs()`.
ylab	Label for y-axis. See also `gf_labs()`.

title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.
label.padding	Amount of padding around label. Defaults to 0.25 lines.
label.r	Radius of rounded corners. Defaults to 0.15 lines.
label.size	Size of label border, in mm.

Value

a gg object

    label = ~ Species, color = ~ Species, size = 2, alpha = 0.7)
}
```

---

gf_theme *Themes for ggformula*

Description

Themes for ggformula

Usage

```
gf_theme(object, theme, ...)
```

Arguments

object	a gg object
theme	a ggplot2 theme function like theme_minimal().
...	If theme is missing, then these additional arguments are theme elements of the sort handled by ggplot2::theme().

Value

a modified gg object

gf_tile *Formula interface to geom_tile()*

Description

geom_rect and geom_tile do the same thing, but are parameterised differently: geom_rect uses the locations of the four corners (xmin, xmax, ymin and ymax), while geom_tile uses the center of the tile and its size (x, y, width, height). geom_raster is a high performance special case for when all the tiles are the same size.

Usage

```
gf_tile(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, xlab, ylab, title, subtitle, caption,
  geom = "tile", stat = "identity", position = "identity",
  show.legend = NA, show.help = NULL, inherit = TRUE,
  environment = parent.frame(), ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape y ~ x. Faceting can be achieved by including | in the formula.
data	A data frame with the variables to be plotted.
alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	A character string naming the geom used to make the layer.
stat	A character string naming the stat used to make the layer.
position	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.

show.legend	A logical indicating whether this layer should be included in the legends. NA, the default, includes layer in the legends if any of the attributes of the layer are mapped.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

Value

a gg object

```

---

gf_violin *Formula interface to geom_violin()*

Description

A violin plot is a compact display of a continuous distribution. It is a blend of geom_boxplot() and geom_density(): a violin plot is a mirrored density plot displayed in the same way as a boxplot.

Usage

```
gf_violin(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, weight, draw_quantiles = NULL,
  trim = TRUE, scale = "area", bw, adjust = 1, kernel = "gaussian",
  xlab, ylab, title, subtitle, caption, geom = "violin",
  stat = "ydensity", position = "dodge", show.legend = NA,
  show.help = NULL, inherit = TRUE, environment = parent.frame(),
  ...)

gf_violinh(object = NULL, gformula = NULL, data = NULL, alpha, color,
  fill, group, linetype, size, weight, draw_quantiles = NULL,
  trim = TRUE, scale = "area", bw, adjust = 1, kernel = "gaussian",
  xlab, ylab, title, subtitle, caption, geom = "violinh",
  stat = "xdensity", position = "dodgev", show.legend = NA,
  show.help = NULL, inherit = TRUE, environment = parent.frame(),
  ...)
```

Arguments

object	When chaining, this holds an object produced in the earlier portions of the chain. Most users can safely ignore this argument. See details and examples.
gformula	A formula with shape y ~ x. Faceting can be achieved by including | in the formula.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.

alpha	Opacity (0 = invisible, 1 = opaque).
color	A color or a formula used for mapping color.
fill	A color for filling, or a formula used for mapping fill.
group	Used for grouping.
linetype	A linetype (numeric or "dashed", "dotted", etc.) or a formula used for mapping linetype.
size	A numeric size or a formula used for mapping size.
weight	Useful for summarized data, weight provides a count of the number of values with the given combination of x and y values.
draw_quantiles	If not(NULL) (default), draw horizontal lines at the given quantiles of the density estimate.
trim	If TRUE (default), trim the tails of the violins to the range of the data. If FALSE, don't trim the tails.
scale	if "area" (default), all violins have the same area (before trimming the tails). If "count", areas are scaled proportionally to the number of observations. If "width", all violins have the same maximum width.
bw	The smoothing bandwidth to be used. If numeric, the standard deviation of the smoothing kernel. If character, a rule to choose the bandwidth, as listed in stats::bw.nrd().
adjust	A multiplicate bandwidth adjustment. This makes it possible to adjust the bandwidth while still using the a bandwidth estimator. For example, adjust = 1/2 means use half of the default bandwidth.
kernel	Kernel. See list of available kernels in density().
xlab	Label for x-axis. See also gf_labs().
ylab	Label for y-axis. See also gf_labs().
title	Title, sub-title, and caption for the plot. See also gf_labs().
subtitle	Title, sub-title, and caption for the plot. See also gf_labs().
caption	Title, sub-title, and caption for the plot. See also gf_labs().
geom	Use to override the default connection between geom_violin and stat_ydensity.
stat	Use to override the default connection between geom_violin and stat_ydensity.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
show.help	If TRUE, display some minimal help.
inherit	A logical indicating whether default attributes are inherited.
environment	An environment in which to look for variables not found in data.
...	Additional arguments. Typically these are (a) ggplot2 aesthetics to be set with attribute = value, (b) ggplot2 aesthetics to be mapped with attribute = ~ expression, or (c) attributes of the layer as a whole, which are set with attribute = value.

ggformula *Formula interface to ggplot2*

Description

Formula interface to ggplot2

The ggformula system

The functions in **ggformula** provide a formula interface to **ggplot2** layer functions and a system for working with pipes to create multi-layer plots and to refine plots. For plots with just one layer, the formula interface is more compact than native **ggplot2** code and is consistent with modeling functions like `stats::lm()` that use a formula interface and with the numerical summary functions in the **mosaic** package.

Specifying plot attributes

Positional attributes (a.k.a aesthetics) are typically specified using a formula (see the `gformula` argument). Setting and mapping of additional attributes can be done through the use of additional arguments. Attributes can be set can be set using arguments of the form `attribute = value` or mapped using arguments of the form `attribute = ~ expression`. A (sometimes partial) list of available attributes can be obtained by executing plotting functions with no arguments.

In formulas of the form `A | B`, `B` will be used to form facets using `facet_wrap()` or `facet_grid()`. This provides an alternative to `gf_facet_wrap()` and `gf_facet_grid()` that is terser and may feel more familiar to users of **lattice**.

Evaluation

Evaluation of the **ggplot2** code occurs in the environment of `gformula`. This will typically do the right thing when formulas are created on the fly, but might not be the right thing if formulas created in one environment are used to create plots in another.

Examples

```
apropos("gf_")
gf_point()
```

---

layer_factory *Create a ggformula layer function*

Description

Primarily intended for package developers, this function factory is used to create the layer functions in the ggformula package.

Usage

```
layer_factory(geom = "point", position = "identity",
  stat = "identity", pre = { }, aes_form = y ~ x, extras = alist(),
  note = NULL, aesthetics = aes(), inherit.aes = TRUE,
  check.aes = TRUE, data = NULL, layer_fun = ggplot2::layer)
```

Arguments

geom	The geom to use for the layer (may be specified as a string).
position	The position function to use for the layer (may be specified as a string).
stat	The stat function to use for the layer (may be specified as a string).
pre	code to run as a "pre-process".
aes_form	A single formula or a list of formulas specifying how attributes are inferred from the formula. Use NULL if the function may be used without a formula.
extras	An alist of additional arguments (potentially with defaults)
note	A note to add to the quick help.
aesthetics	Additional aesthetics (typically created using ggplot2::aes()) set rather than inferred from formula. gf_dhistogram() uses this to set the y aesthetic to stat(density), for example.
inherit.aes	A logical indicating whether aesthetics should be inherited from prior layers.
check.aes	A logical indicating whether a warning should be emited when aesthetics provided don't match what is expected.
data	A data frame or NULL or NA.
layer_fun	The function used to create the layer.

Value

A function.

MIpop *Population of Michigan counties*

Description

Population of Michigan counties

Usage

```
data(MIpop)
```

Format

A data frame with populations of Michigan counties.

rank Population rank.

county County name.

population Population (2010 census).

StatAsh *ggproto classes for ggplot2*

Description

These are typically accessed through their associated `geom_*`, `stat_*` or `gf_*` functions.

These are typically accessed through their associated `geom_*`, `stat_*` or `gf_*` functions.

Usage

```
StatAsh

StatSpline

StatQqline

StatLm

GeomLm

StatAsh

StatFitdistr
```

See Also

`stat_ash()`
`gf_ash()`

stat_fitdistr *A stat for fitting distributions*

Description

This stat computes points for plotting a distribution function. Fitting is done using `MASS::fitdistr()` when analytic solutions are not available.

Usage

```
stat_fitdistr(mapping = NULL, data = NULL, geom = "path",
  position = "identity", na.rm = FALSE, show.legend = NA,
  inherit.aes = TRUE, dist = "dnorm", start = NULL, ...)
```

Arguments

`mapping`	Aesthetics created using `aes()` or `aes_string()`.
`data`	A data frame.
`geom`	A character string naming the geom used to make the layer.
`position`	Either a character string naming the position function used for the layer or a position object returned from a call to a position function.
`na.rm`	If TRUE, do not emit a warning about missing data.
`show.legend`	A logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes.
`inherit.aes`	If `FALSE`, overrides the default aesthetics, rather than combining with them.
`dist`	A character string indicating the distribution to fit. Examples include `"dnorm"`, `"dgamma"`, etc.
`start`	A list of starting values used by `MASS::fitdistr()` when numerically approximating the maximum likelihood estimate.
`...`	Additional arguments.

Value

A gg object

stat_lm *Linear Model Displays*

Description

Adds linear model fits to plots. geom_lm() and stat_lm() are essentially equivalent. Use geom_lm() unless you want a non-standard geom.

Usage

```
stat_lm(mapping = NULL, data = NULL, geom = "lm",
  position = "identity", interval = c("none", "prediction",
  "confidence"), level = 0.95, formula = y ~ x, lm.args = list(),
  backtrans = identity, ..., na.rm = FALSE, show.legend = NA,
  inherit.aes = TRUE)

geom_lm(mapping = NULL, data = NULL, stat = "lm",
  position = "identity", interval = c("none", "prediction",
  "confidence"), level = 0.95, formula = y ~ x, lm.args = list(),
  backtrans = identity, ..., na.rm = FALSE, show.legend = NA,
  inherit.aes = TRUE)
```

Arguments

mapping	Set of aesthetic mappings created by aes() or aes_(). If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot(). A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame., and will be used as the layer data.
geom, stat	Use to override the default connection between geom_lm and stat_lm.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
interval	One of "none", "confidence" or "prediction".
level	The level used for confidence or prediction intervals
formula	a formula describing the model in terms of y (response) and x (predictor).
lm.args	A list of arguments supplied to lm() when performing the fit.
backtrans	a function that transforms the response back to the original scale when the formula includes a transformation on y.

...	Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like color = "red" or size = 3. They may also be parameters to the paired geom/stat.
na.rm	If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
inherit.aes	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders().

Details

Stat calculation is performed by the (currently undocumented) predictdf. Pointwise confidence or prediction bands are calculated using the predict() method.

See Also

lm() for details on linear model fitting.

Examples

```
if (require(mosaicData)) {
  ggplot(data = KidsFeet, aes(y = length, x = width, color = sex)) +
    geom_lm() +
    geom_point()
  ggplot(data = KidsFeet, aes(y = length, x = width, color = sex)) +
    geom_lm(interval = "prediction", color = "skyblue") +
    geom_lm(interval = "confidence") +
    geom_point() +
    facet_wrap(~sex)
 # non-standard display
  ggplot(data = KidsFeet, aes(y = length, x = width, color = sex)) +
    stat_lm(aes(fill = sex), color = NA, interval = "confidence", geom = "ribbon",
    alpha = 0.2) +
    geom_point() +
    facet_wrap(~sex)
ggplot(mpg, aes(displ, hwy)) +
   geom_lm(formula = log(y) ~ poly(x,3), backtrans = exp,
     interval = "prediction", fill = "skyblue") +
   geom_lm(formula = log(y) ~ poly(x,3), backtrans = exp, interval = "confidence",
     color = "red") +
   geom_point()
}
```

stat_qqline *A Stat for Adding Reference Lines to QQ-Plots*

Description

This stat computes quantiles of the sample and theoretical distribution for the purpose of providing reference lines for QQ-plots.

Usage

```
stat_qqline(mapping = NULL, data = NULL, geom = "line",
  position = "identity", ..., distribution = stats::qnorm,
  dparams = list(), na.rm = FALSE, show.legend = NA,
  inherit.aes = TRUE)
```

Arguments

mapping	An aesthetic mapping produced with aes() or aes_string().
data	A data frame.
geom	A geom.
position	A position object.
...	Additional arguments
distribution	A quantile function.
dparams	A list of arguments for distribution.
na.rm	A logical indicating whether a warning should be issued when missing values are removed before plotting.
show.legend	A logical indicating whether legends should be included for this layer. If NA, legends will be include for each aesthetic that is mapped.
inherit.aes	A logical indicating whether aesthetics should be inherited. When FALSE, the supplied mapping will be the only aesthetics used.

Examples

```
ggplot(data = iris, aes(sample = Sepal.Length)) +
  geom_qq() +
  stat_qqline( alpha = 0.7, color = "red", linetype = "dashed") +
  facet_wrap(~Species)
```

stat_spline *Geoms and stats for spline smoothing*

Description

Similar to geom_smooth, this adds spline fits to plots.

Usage

```
stat_spline(mapping = NULL, data = NULL, geom = "line",
  position = "identity", na.rm = FALSE, show.legend = NA,
  inherit.aes = TRUE, weight = NULL, df = NULL, spar = NULL,
  cv = FALSE, all.knots = FALSE, nknots = stats::.nknots.smspl,
  df.offset = 0, penalty = 1, control.spar = list(), tol = NULL,
  ...)

geom_spline(mapping = NULL, data = NULL, stat = "spline",
  position = "identity", na.rm = FALSE, show.legend = NA,
  inherit.aes = TRUE, weight = NULL, df = NULL, spar = NULL,
  cv = FALSE, all.knots = FALSE, nknots = stats::.nknots.smspl,
  df.offset = 0, penalty = 1, control.spar = list(), tol = NULL,
  ...)
```

Arguments

mapping	An aesthetic mapping produced with aes() or aes_string().
data	A data frame.
geom	A geom.
position	A position object.
na.rm	A logical indicating whether a warning should be issued when missing values are removed before plotting.
show.legend	A logical indicating whether legends should be included for this layer. If NA, legends will be included for each aesthetic that is mapped.
inherit.aes	A logical indicating whether aesthetics should be inherited. When FALSE, the supplied mapping will be the only aesthetics used.
weight	An optional vector of weights. See smooth.spline().
df	desired equivalent degrees of freedom. See smooth.spline() for details.
spar	A smoothing parameter, typically in (0,1]. See smooth.spline() for details.
cv	A logical. See smooth.spline() for details.
all.knots	A logical. See smooth.spline() for details.
nknots	An integer or function giving the number of knots to use when all.knots = FALSE. See smooth.spline() for details.

df.offset	A numerical value used to increase the degrees of freedom when using GVC. See smooth.spline() for details.
penalty	the coefficient of the penalty for degrees of freedom in the GVC criterion. See smooth.spline() for details.
control.spar	An optional list used to control root finding when the parameter spar is computed. See smooth.spline() for details.
tol	A tolerance for sameness or uniqueness of the x values. The values are binned into bins of size tol and values which fall into the same bin are regarded as the same. Must be strictly positive (and finite). When NULL, IQR(x) * 10e-6 is used.
...	Additional arguments
stat	A stat.

Examples

```
if (require(mosaicData)) {
  ggplot(Births) + geom_spline(aes(x = date, y=births, colour = wday))
  ggplot(Births) + geom_spline(aes(x = date, y=births, colour = wday), nknots = 10)
}
```
