coxDKpls2DR   *Fitting a Direct Kernel PLS model on the (Deviance) Residuals*

Description

This function computes the Direct Kernel PLSR model with the Residuals of a Cox-Model fitted
with an intercept as the only explanatory variable as the response and Xplan as explanatory vari-
ables. Default behaviour uses the Deviance residuals.

Usage

```
coxDKpls2DR(Xplan, ...)
## Default S3 method:
coxDKpls2DR(Xplan,time,time2,event,type,
origin,typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, ncomp=min(7,ncol(Xplan)), methodpls="kernelpls",
validation = "CV", plot=FALSE, allres=FALSE, kernel="rbfdot",
hyperkernel,verbose=TRUE,...)
## S3 method for class 'formula'
coxDKpls2DR(Xplan,time,time2,event,type,
origin,typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, ncomp=min(7,ncol(Xplan)), methodpls="kernelpls",
validation = "CV", plot=FALSE, allres=FALSE,dataXplan=NULL,
```

```
subset,weights,model_frame=FALSE, kernel="rbfdot",hyperkernel,
verbose=TRUE,...)
```

Arguments

Xplan	a formula or a matrix with the eXplanatory variables (training) dataset
time	for right censored data, this is the follow up time. For interval data, the first argument is the starting time for the interval.
time2	The status indicator, normally 0=alive, 1=dead. Other choices are TRUE/FALSE (TRUE = death) or 1/2 (2=death). For interval censored data, the status indicator is 0=right censored, 1=event at time, 2=left censored, 3=interval censored. Although unusual, the event indicator can be omitted, in which case all subjects are assumed to have an event.
event	ending time of the interval for interval censored or counting process data only. Intervals are assumed to be open on the left and closed on the right, (start, end]. For counting process data, event indicates whether an event occurred at the end of the interval.
type	character string specifying the type of censoring. Possible values are "right", "left", "counting", "interval", or "interval2". The default is "right" or "counting" depending on whether the time2 argument is absent or present, respectively.
origin	for counting process data, the hazard function origin. This option was intended to be used in conjunction with a model containing time dependent strata in order to align the subjects properly when they cross over from one strata to another, but it has rarely proven useful.
typeres	character string indicating the type of residual desired. Possible values are "martingale", "deviance", "score", "schoenfeld", "dfbeta", "dfbetas", and "scaledsch". Only enough of the string to determine a unique match is required.
collapse	vector indicating which rows to collapse (sum) over. In time-dependent models more than one row data can pertain to a single individual. If there were 4 individuals represented by 3, 1, 2 and 4 rows of data respectively, then collapse=c(1,1,1,2,3,3,4,4,4,4) could be used to obtain per subject rather than per observation residuals.
weighted	if TRUE and the model was fit with case weights, then the weighted residuals are returned.
scaleX	Should the Xplan columns be standardized ?
scaleY	Should the time values be standardized ?
ncomp	The number of components to include in the model. The number of components to fit is specified with the argument ncomp. It this is not supplied, the maximal number of components is used (taking account of any cross-validation).
methodpls	The multivariate regression method to be used. See [mvrCv](#) for details.
validation	character. What kind of (internal) validation to use. If validation = "CV", cross-validation is performed. The number and type of cross-validation segments are specified with the arguments segments and segment.type. See [mvrCv](#) for details. If validation = "LOO", leave-one-out cross-validation is

	performed. It is an error to specify the segments when validation = "LOO" is specified.
plot	Should the survival function be plotted ?)
allres	FALSE to return only the Cox model and TRUE for additionnal results. See details. Defaults to FALSE.
dataXplan	an optional data frame, list or environment (or object coercible by `as.data.frame` to a data frame) containing the variables in the model. If not found in dataXplan, the variables are taken from environment(Xplan), typically the environment from which coxDKpls2DR is called.
subset	an optional vector specifying a subset of observations to be used in the fitting process.
weights	an optional vector of 'prior weights' to be used in the fitting process. Should be NULL or a numeric vector.
model_frame	If TRUE, the model frame is returned.
kernel	the kernel function used in training and predicting. This parameter can be set to any function, of class kernel, which computes the inner product in feature space between two vector arguments (see [kernels](#)). The kernlab package provides the most popular kernel functions which can be used by setting the kernel parameter to the following strings:

rbfdot Radial Basis kernel "Gaussian"

polydot Polynomial kernel

vanilladot Linear kernel

tanhdot Hyperbolic tangent kernel

laplacedot Laplacian kernel

besseldot Bessel kernel

anovadot ANOVA RBF kernel

splinedot Spline kernel

hyperkernel	the list of hyper-parameters (kernel parameters). This is a list which contains the parameters to be used with the kernel function. For valid parameters for existing kernels are :

- sigma, inverse kernel width for the Radial Basis kernel function "rbfdot" and the Laplacian kernel "laplacedot".
- degree, scale, offset for the Polynomial kernel "polydot".
- scale, offset for the Hyperbolic tangent kernel function "tanhdot".
- sigma, order, degree for the Bessel kernel "besseldot".
- sigma, degree for the ANOVA kernel "anovadot".

	In the case of a Radial Basis kernel function (Gaussian) or Laplacian kernel, if hyperkernel is missing, the heuristics in sigest are used to calculate a good sigma value from the data.
verbose	Should some details be displayed ?
...	Arguments to be passed on to survival::coxph.

Details

If `allres=FALSE` returns only the final Cox-model. If `allres=TRUE` returns a list with the PLS components, the final Cox-model and the PLSR model. `allres=TRUE` is useful for evluating model prediction accuracy on a test sample.

Value

If `allres=FALSE` :

cox_DKpls2DR	Final Cox-model.

If `allres=TRUE` :

tt_DKpls2DR	PLSR components.
cox_DKpls2DR	Final Cox-model.
DKpls2DR_mod	The PLSR model.

coxDKplsDR   *Fitting a Direct Kernel PLS model on the (Deviance) Residuals*

Description

This function computes the Cox Model based on PLSR components computed model with

- as the response: the Residuals of a Cox-Model fitted with no covariate
- as explanatory variables: a Kernel transform of Xplan.

It uses the package kernlab to compute the Kernel transforms of Xplan, then the package mixOmics to perform PLSR fit.

Usage

```
coxDKplsDR(Xplan, ...)
## Default S3 method:
coxDKplsDR(Xplan,time,time2,event,type,origin,
typeres="deviance", collapse, weighted, scaleX=TRUE, scaleY=TRUE,
ncomp=min(7,ncol(Xplan)), modepls="regression", plot=FALSE,
allres=FALSE, kernel="rbfdot",hyperkernel,verbose=TRUE,...)
## S3 method for class 'formula'
coxDKplsDR(Xplan,time,time2,event,type,origin,
typeres="deviance", collapse, weighted, scaleX=TRUE, scaleY=TRUE,
ncomp=min(7,ncol(Xplan)), modepls="regression", plot=FALSE,
allres=FALSE,dataXplan=NULL,subset,weights,model_frame=FALSE,
kernel="rbfdot",hyperkernel,verbose=TRUE,...)
```

Arguments

Xplan	a formula or a matrix with the eXplanatory variables (training) dataset
time	for right censored data, this is the follow up time. For interval data, the first argument is the starting time for the interval.
time2	The status indicator, normally 0=alive, 1=dead. Other choices are TRUE/FALSE (TRUE = death) or 1/2 (2=death). For interval censored data, the status indicator is 0=right censored, 1=event at time, 2=left censored, 3=interval censored. Although unusual, the event indicator can be omitted, in which case all subjects are assumed to have an event.
event	ending time of the interval for interval censored or counting process data only. Intervals are assumed to be open on the left and closed on the right, (start, end]. For counting process data, event indicates whether an event occurred at the end of the interval.
type	character string specifying the type of censoring. Possible values are "right", "left", "counting", "interval", or "interval2". The default is "right" or "counting" depending on whether the time2 argument is absent or present, respectively.
origin	for counting process data, the hazard function origin. This option was intended to be used in conjunction with a model containing time dependent strata in order to align the subjects properly when they cross over from one strata to another, but it has rarely proven useful.
typeres	character string indicating the type of residual desired. Possible values are "martingale", "deviance", "score", "schoenfeld", "dfbeta", "dfbetas", and "scaledsch". Only enough of the string to determine a unique match is required.
collapse	vector indicating which rows to collapse (sum) over. In time-dependent models more than one row data can pertain to a single individual. If there were 4 individuals represented by 3, 1, 2 and 4 rows of data respectively, then collapse=c(1,1,1,2,3,3,4,4,4,4) could be used to obtain per subject rather than per observation residuals.
weighted	if TRUE and the model was fit with case weights, then the weighted residuals are returned.
scaleX	Should the Xplan columns be standardized ?
scaleY	Should the time values be standardized ?
ncomp	The number of components to include in the model. The number of components to fit is specified with the argument ncomp. It this is not supplied, the maximal number of components is used.
modepls	character string. What type of algorithm to use, (partially) matching one of "regression", "canonical", "invariant" or "classic". See [pls](#) for details
plot	Should the survival function be plotted ?)
allres	FALSE to return only the Cox model and TRUE for additionnal results. See details. Defaults to FALSE.
dataXplan	an optional data frame, list or environment (or object coercible by [as.data.frame](#) to a data frame) containing the variables in the model. If not found in dataXplan, the variables are taken from environment(Xplan), typically the environment from which coxDKplsDR is called.

subset   an optional vector specifying a subset of observations to be used in the fitting
                process.

weights   an optional vector of 'prior weights' to be used in the fitting process. Should be
                NULL or a numeric vector.

model_frame   If TRUE, the model frame is returned.

kernel   the kernel function used in training and predicting. This parameter can be set to
                any function, of class kernel, which computes the inner product in feature space
                between two vector arguments (see [kernels](#)). The kernlab package provides the
                most popular kernel functions which can be used by setting the kernel parameter
                to the following strings:

                rbfdot Radial Basis kernel "Gaussian"

                polydot Polynomial kernel

                vanilladot Linear kernel

                tanhdot Hyperbolic tangent kernel

                laplacedot Laplacian kernel

                besseldot Bessel kernel

                anovadot ANOVA RBF kernel

                splinedot Spline kernel

hyperkernel   the list of hyper-parameters (kernel parameters). This is a list which contains the
                parameters to be used with the kernel function. For valid parameters for existing
                kernels are :

                • sigma, inverse kernel width for the Radial Basis kernel function "rbfdot"
                  and the Laplacian kernel "laplacedot".
                • degree, scale, offset for the Polynomial kernel "polydot".
                • scale, offset for the Hyperbolic tangent kernel function "tanhdot".
                • sigma, order, degree for the Bessel kernel "besseldot".
                • sigma, degree for the ANOVA kernel "anovadot".

                In the case of a Radial Basis kernel function (Gaussian) or Laplacian kernel,
                if hyperkernel is missing, the heuristics in sigest are used to calculate a good
                sigma value from the data.

verbose   Should some details be displayed ?

...   Arguments to be passed on to survival::coxph.

Details

If allres=FALSE returns only the final Cox-model. If allres=TRUE returns a list with the PLS
components, the final Cox-model and the PLSR model. allres=TRUE is useful for evluating model
prediction accuracy on a test sample.

Value

If allres=FALSE :

cox_DKplsDR   Final Cox-model.

If `allres=TRUE` :

`tt_DKplsDR`	PLSR components.
`cox_DKplsDR`	Final Cox-model.
`DKplsDR_mod`	The PLSR model.

coxDKsplsDR   *Fitting a Direct Kernel sPLSR model on the (Deviance) Residuals*

Description

This function computes the Cox Model based on sPLSR components computed model with

- as the response: the Residuals of a Cox-Model fitted with no covariate
- as explanatory variables: a Kernel transform of Xplan.

It uses the package kernlab to compute the Kernel transforms of Xplan, the package spls to
perform the first step in SPLSR then mixOmics to perform PLSR step fit.

Usage

```
coxDKsplsDR(Xplan, ...)
## Default S3 method:
coxDKsplsDR(Xplan,time,time2,event,type,
origin,typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, ncomp=min(7,ncol(Xplan)), modepls="regression",
plot=FALSE, allres=FALSE, eta, trace=FALSE, kernel="rbfdot",
hyperkernel,verbose=TRUE,...)
## S3 method for class 'formula'
coxDKsplsDR(Xplan,time,time2,event,type,
origin,typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, ncomp=min(7,ncol(Xplan)), modepls="regression",
plot=FALSE, allres=FALSE,dataXplan=NULL,subset,weights,
model_frame=FALSE, eta, trace=FALSE, kernel="rbfdot",
hyperkernel,verbose=TRUE,...)
```

Arguments

Xplan	a formula or a matrix with the eXplanatory variables (training) dataset
time	for right censored data, this is the follow up time. For interval data, the first argument is the starting time for the interval.
time2	The status indicator, normally 0=alive, 1=dead. Other choices are TRUE/FALSE (TRUE = death) or 1/2 (2=death). For interval censored data, the status indicator is 0=right censored, 1=event at time, 2=left censored, 3=interval censored. Although unusual, the event indicator can be omitted, in which case all subjects are assumed to have an event.

event	ending time of the interval for interval censored or counting process data only. Intervals are assumed to be open on the left and closed on the right, (start, end]. For counting process data, event indicates whether an event occurred at the end of the interval.
type	character string specifying the type of censoring. Possible values are "right", "left", "counting", "interval", or "interval2". The default is "right" or "counting" depending on whether the time2 argument is absent or present, respectively.
origin	for counting process data, the hazard function origin. This option was intended to be used in conjunction with a model containing time dependent strata in order to align the subjects properly when they cross over from one strata to another, but it has rarely proven useful.
typeres	character string indicating the type of residual desired. Possible values are "martingale", "deviance", "score", "schoenfeld", "dfbeta", "dfbetas", and "scaledsch". Only enough of the string to determine a unique match is required.
collapse	vector indicating which rows to collapse (sum) over. In time-dependent models more than one row data can pertain to a single individual. If there were 4 individuals represented by 3, 1, 2 and 4 rows of data respectively, then collapse=c(1,1,1,2,3,3,4,4,4,4) could be used to obtain per subject rather than per observation residuals.
weighted	if TRUE and the model was fit with case weights, then the weighted residuals are returned.
scaleX	Should the Xplan columns be standardized ?
scaleY	Should the time values be standardized ?
ncomp	The number of components to include in the model. The number of components to fit is specified with the argument ncomp. It this is not supplied, the maximal number of components is used.
modepls	character string. What type of algorithm to use, (partially) matching one of "regression", "canonical", "invariant" or "classic". See pls for details
plot	Should the survival function be plotted ?)
allres	FALSE to return only the Cox model and TRUE for additionnal results. See details. Defaults to FALSE.
dataXplan	an optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in dataXplan, the variables are taken from environment(Xplan), typically the environment from which coxDKsplsDR is called.
subset	an optional vector specifying a subset of observations to be used in the fitting process.
weights	an optional vector of 'prior weights' to be used in the fitting process. Should be NULL or a numeric vector.
model_frame	If TRUE, the model frame is returned.
eta	Thresholding parameter. eta should be between 0 and 1.
trace	Print out the progress of variable selection?

kernel   the kernel function used in training and predicting. This parameter can be set to
                  any function, of class kernel, which computes the inner product in feature space
                  between two vector arguments (see [kernels](#)). The kernlab package provides the
                  most popular kernel functions which can be used by setting the kernel parameter
                  to the following strings:

                 rbfdot Radial Basis kernel "Gaussian"

                 polydot Polynomial kernel

                 vanilladot Linear kernel

                 tanhdot Hyperbolic tangent kernel

                 laplacedot Laplacian kernel

                 besseldot Bessel kernel

                 anovadot ANOVA RBF kernel

                 splinedot Spline kernel

hyperkernel   the list of hyper-parameters (kernel parameters). This is a list which contains the
                  parameters to be used with the kernel function. For valid parameters for existing
                  kernels are :

- sigma, inverse kernel width for the Radial Basis kernel function "rbfdot"
  and the Laplacian kernel "laplacedot".
- degree, scale, offset for the Polynomial kernel "polydot".
- scale, offset for the Hyperbolic tangent kernel function "tanhdot".
- sigma, order, degree for the Bessel kernel "besseldot".
- sigma, degree for the ANOVA kernel "anovadot".

                  In the case of a Radial Basis kernel function (Gaussian) or Laplacian kernel,
                  if hyperkernel is missing, the heuristics in sigest are used to calculate a good
                  sigma value from the data.

verbose   Should some details be displayed ?

...   Arguments to be passed on to survival::coxph.

Details

If allres=FALSE returns only the final Cox-model. If allres=TRUE returns a list with the sPLS
components, the final Cox-model and the sPLSR model. allres=TRUE is useful for evluating model
prediction accuracy on a test sample.

Value

If allres=FALSE :

cox_DKsplsDR   Final Cox-model.

If allres=TRUE :

tt_DKsplsDR   sPLSR components.

cox_DKsplsDR   Final Cox-model.

DKsplsDR_mod   The sPLSR model.

coxpls   *Fitting a Cox-Model on PLSR components*

Description

This function computes the Cox Model based on PLSR components computed model with

- as the response: the Survival time

- as explanatory variables: Xplan.

It uses the package mixOmics to perform PLSR fit.

Usage

```
coxpls(Xplan, ...)
## Default S3 method:
coxpls(Xplan,time,time2,event,type,origin,
typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, ncomp=min(7,ncol(Xplan)), modepls="regression",
plot=FALSE, allres=FALSE,...)
## S3 method for class 'formula'
coxpls(Xplan,time,time2,event,type,origin,
typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, ncomp=min(7,ncol(Xplan)), modepls="regression",
plot=FALSE, allres=FALSE,dataXplan=NULL,subset,weights,
model_frame=FALSE,...)
```

Arguments

Xplan	a formula or a matrix with the eXplanatory variables (training) dataset
time	for right censored data, this is the follow up time. For interval data, the first argument is the starting time for the interval.
time2	The status indicator, normally 0=alive, 1=dead. Other choices are TRUE/FALSE (TRUE = death) or 1/2 (2=death). For interval censored data, the status indicator is 0=right censored, 1=event at time, 2=left censored, 3=interval censored. Although unusual, the event indicator can be omitted, in which case all subjects are assumed to have an event.
event	ending time of the interval for interval censored or counting process data only. Intervals are assumed to be open on the left and closed on the right, (start, end]. For counting process data, event indicates whether an event occurred at the end of the interval.
type	character string specifying the type of censoring. Possible values are "right", "left", "counting", "interval", or "interval2". The default is "right" or "counting" depending on whether the time2 argument is absent or present, respectively.
origin	for counting process data, the hazard function origin. This option was intended to be used in conjunction with a model containing time dependent strata in order to align the subjects properly when they cross over from one strata to another, but it has rarely proven useful.
typeres	character string indicating the type of residual desired. Possible values are "martingale", "deviance", "score", "schoenfeld", "dfbeta", "dfbetas", and "scaledsch". Only enough of the string to determine a unique match is required.

collapse	vector indicating which rows to collapse (sum) over. In time-dependent models more than one row data can pertain to a single individual. If there were 4 individuals represented by 3, 1, 2 and 4 rows of data respectively, then collapse=c(1,1,1,2,3,3,4,4,4,4) could be used to obtain per subject rather than per observation residuals.
weighted	if TRUE and the model was fit with case weights, then the weighted residuals are returned.
scaleX	Should the Xplan columns be standardized ?
scaleY	Should the time values be standardized ?
ncomp	The number of components to include in the model. It this is not supplied, min(7,maximal number) components is used.
modepls	character string. What type of algorithm to use, (partially) matching one of "regression", "canonical", "invariant" or "classic". See pls for details
plot	Should the survival function be plotted ?)
allres	FALSE to return only the Cox model and TRUE for additionnal results. See details. Defaults to FALSE.
dataXplan	an optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in dataXplan, the variables are taken from environment(Xplan), typically the environment from which coxpls is called.
subset	an optional vector specifying a subset of observations to be used in the fitting process.
weights	an optional vector of 'prior weights' to be used in the fitting process. Should be NULL or a numeric vector.
model_frame	If TRUE, the model frame is returned.
...	Arguments to be passed on to survival::coxph.

Details

If allres=FALSE returns only the final Cox-model. If allres=TRUE returns a list with the PLS components, the final Cox-model and the PLSR model. allres=TRUE is useful for evluating model prediction accuracy on a test sample.

Value

If allres=FALSE :

cox_pls	Final Cox-model.

If allres=TRUE :

tt_pls	PLSR components.
cox_pls	Final Cox-model.
pls_mod	The PLSR model.

coxpls2   *Fitting a Cox-Model on PLSR components*

Description

This function computes the the Cox-Model with PLSR components as the explanatory variables. It uses the package `pls`.

Usage

```
coxpls2(Xplan, ...)
## Default S3 method:
coxpls2(Xplan,time,time2,event,type,origin,
typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, ncomp=min(7,ncol(Xplan)), methodpls="kernelpls",
validation = "CV", plot=FALSE, allres=FALSE,...)
## S3 method for class 'formula'
coxpls2(Xplan,time,time2,event,type,origin,
```

```
typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, ncomp=min(7,ncol(Xplan)), methodpls="kernelpls",
validation = "CV", plot=FALSE, allres=FALSE,dataXplan=NULL,
subset,weights,model_frame=FALSE,...)
```

Arguments

Xplan	a formula or a matrix with the eXplanatory variables (training) dataset
time	for right censored data, this is the follow up time. For interval data, the first argument is the starting time for the interval.
time2	The status indicator, normally 0=alive, 1=dead. Other choices are TRUE/FALSE (TRUE = death) or 1/2 (2=death). For interval censored data, the status indicator is 0=right censored, 1=event at time, 2=left censored, 3=interval censored. Although unusual, the event indicator can be omitted, in which case all subjects are assumed to have an event.
event	ending time of the interval for interval censored or counting process data only. Intervals are assumed to be open on the left and closed on the right, (start, end]. For counting process data, event indicates whether an event occurred at the end of the interval.
type	character string specifying the type of censoring. Possible values are "right", "left", "counting", "interval", or "interval2". The default is "right" or "counting" depending on whether the time2 argument is absent or present, respectively.
origin	for counting process data, the hazard function origin. This option was intended to be used in conjunction with a model containing time dependent strata in order to align the subjects properly when they cross over from one strata to another, but it has rarely proven useful.
typeres	character string indicating the type of residual desired. Possible values are "martingale", "deviance", "score", "schoenfeld", "dfbeta", "dfbetas", and "scaledsch". Only enough of the string to determine a unique match is required.
collapse	vector indicating which rows to collapse (sum) over. In time-dependent models more than one row data can pertain to a single individual. If there were 4 individuals represented by 3, 1, 2 and 4 rows of data respectively, then collapse=c(1,1,1,2,3,3,4,4,4,4) could be used to obtain per subject rather than per observation residuals.
weighted	if TRUE and the model was fit with case weights, then the weighted residuals are returned.
scaleX	Should the Xplan columns be standardized ?
scaleY	Should the time values be standardized ?
ncomp	The number of components to include in the model. The number of components to fit is specified with the argument ncomp. It this is not supplied, the maximal number of components is used (taking account of any cross-validation).
methodpls	The multivariate regression method to be used. See [mvrCv](#) for details.

validation	character. What kind of (internal) validation to use. If validation = "CV", cross-validation is performed. The number and type of cross-validation segments are specified with the arguments segments and segment.type. See [mvrCv](#) for details. If validation = "LOO", leave-one-out cross-validation is performed. It is an error to specify the segments when validation = "LOO" is specified.
plot	Should the survival function be plotted ?)
allres	FALSE to return only the Cox model and TRUE for additionnal results. See details. Defaults to FALSE.
dataXplan	an optional data frame, list or environment (or object coercible by [as.data.frame](#) to a data frame) containing the variables in the model. If not found in dataXplan, the variables are taken from environment(Xplan), typically the environment from which coxpls2 is called.
subset	an optional vector specifying a subset of observations to be used in the fitting process.
weights	an optional vector of 'prior weights' to be used in the fitting process. Should be NULL or a numeric vector.
model_frame	If TRUE, the model frame is returned.
...	Arguments to be passed on to survival::coxph.

Details

If allres=FALSE returns only the final Cox-model. If allres=TRUE returns a list with the PLS components, the final Cox-model and the PLSR model. allres=TRUE is useful for evluating model prediction accuracy on a test sample.

Value

If allres=FALSE :

cox_pls	Final Cox-model.

If allres=TRUE :

tt_pls	PLSR components.
cox_pls	Final Cox-model.
pls_mod	The PLSR model.

coxpls2DR *Fitting a PLSR model on the (Deviance) Residuals*

Description

This function computes the PLSR model with the Residuals of a Cox-Model fitted with an intercept as the only explanatory variable as the response and Xplan as explanatory variables. Default behaviour uses the Deviance residuals. It uses the package pls.

Usage

```
coxpls2DR(Xplan, ...)
## Default S3 method:
coxpls2DR(Xplan, time, time2, event, type,
origin, typeres = "deviance", collapse, weighted,
scaleX = TRUE, scaleY = TRUE, ncomp=min(7,ncol(Xplan)),
methodpls="kernelpls", validation = "CV", plot = FALSE,
allres = FALSE, ...)
## S3 method for class 'formula'
coxpls2DR(Xplan,time,time2,event,type,
origin,typeres="deviance", collapse, weighted,
scaleX=TRUE, scaleY=TRUE, ncomp=min(7,ncol(Xplan)),
methodpls="kernelpls", validation = "CV", plot=FALSE,
allres=FALSE,dataXplan=NULL,subset,weights,
model_frame=FALSE,...)
```

Arguments

Xplan	a formula or a matrix with the eXplanatory variables (training) dataset
time	for right censored data, this is the follow up time. For interval data, the first argument is the starting time for the interval.
time2	The status indicator, normally 0=alive, 1=dead. Other choices are TRUE/FALSE (TRUE = death) or 1/2 (2=death). For interval censored data, the status indicator is 0=right censored, 1=event at time, 2=left censored, 3=interval censored. Although unusual, the event indicator can be omitted, in which case all subjects are assumed to have an event.
event	ending time of the interval for interval censored or counting process data only. Intervals are assumed to be open on the left and closed on the right, (start, end]. For counting process data, event indicates whether an event occurred at the end of the interval.
type	character string specifying the type of censoring. Possible values are "right", "left", "counting", "interval", or "interval2". The default is "right" or "counting" depending on whether the time2 argument is absent or present, respectively.
origin	for counting process data, the hazard function origin. This option was intended to be used in conjunction with a model containing time dependent strata in order to align the subjects properly when they cross over from one strata to another, but it has rarely proven useful.
typeres	character string indicating the type of residual desired. Possible values are "martingale", "deviance", "score", "schoenfeld", "dfbeta", "dfbetas", and "scaledsch". Only enough of the string to determine a unique match is required.
collapse	vector indicating which rows to collapse (sum) over. In time-dependent models more than one row data can pertain to a single individual. If there were 4 individuals represented by 3, 1, 2 and 4 rows of data respectively, then collapse=c(1,1,1,2,3,3,4,4,4,4) could be used to obtain per subject rather than per observation residuals.
weighted	if TRUE and the model was fit with case weights, then the weighted residuals are returned.
scaleX	Should the Xplan columns be standardized ?
scaleY	Should the time values be standardized ?
ncomp	The number of components to include in the model. The number of components to fit is specified with the argument ncomp. It this is not supplied, the maximal number of components is used (taking account of any cross-validation).
methodpls	The multivariate regression method to be used. See mvrCv for details.
validation	character. What kind of (internal) validation to use. If validation = "CV", cross-validation is performed. The number and type of cross-validation segments are specified with the arguments segments and segment.type. See mvrCv for details. If validation = "LOO", leave-one-out cross-validation is performed. It is an error to specify the segments when validation = "LOO" is specified.
plot	Should the survival function be plotted ?)

allres	FALSE to return only the Cox model and TRUE for additionnal results. See details. Defaults to FALSE.
dataXplan	an optional data frame, list or environment (or object coercible by `as.data.frame` to a data frame) containing the variables in the model. If not found in `dataXplan`, the variables are taken from `environment(Xplan)`, typically the environment from which `coxpls2DR` is called.
subset	an optional vector specifying a subset of observations to be used in the fitting process.
weights	an optional vector of 'prior weights' to be used in the fitting process. Should be NULL or a numeric vector.
model_frame	If TRUE, the model frame is returned.
...	Arguments to be passed on to `survival::coxph`.

Details

If `allres=FALSE` returns only the final Cox-model. If `allres=TRUE` returns a list with the PLS components, the final Cox-model and the PLSR model. `allres=TRUE` is useful for evluating model prediction accuracy on a test sample.

Value

If `allres=FALSE` :

cox_pls2DR	Final Cox-model.

If `allres=TRUE` :

tt_pls2DR	PLSR components.
cox_pls2DR	Final Cox-model.
pls2DR_mod	The PLSR model.

coxpls3   *Fitting a Cox-Model on PLSR components*

Description

This function computes the the Cox-Model with PLSR components as the explanatory variables. It uses the package plsRglm.

Usage

```
coxpls3(Xplan, ...)
## Default S3 method:
coxpls3(Xplan,time,time2,event,type,
origin,typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, nt=min(7,ncol(Xplan)), typeVC="none",
plot=FALSE, allres=FALSE,sparse=FALSE,sparseStop=TRUE,...)
## S3 method for class 'formula'
coxpls3(Xplan,time,time2,event,type,
origin,typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, nt=min(7,ncol(Xplan)), typeVC="none",
plot=FALSE, allres=FALSE,dataXplan=NULL,subset,weights,
model_frame=FALSE,sparse=FALSE,sparseStop=TRUE,...)
```

Arguments

Xplan	a formula or a matrix with the eXplanatory variables (training) dataset
time	for right censored data, this is the follow up time. For interval data, the first argument is the starting time for the interval.
time2	The status indicator, normally 0=alive, 1=dead. Other choices are TRUE/FALSE (TRUE = death) or 1/2 (2=death). For interval censored data, the status indicator is 0=right censored, 1=event at time, 2=left censored, 3=interval censored.

	Although unusual, the event indicator can be omitted, in which case all subjects are assumed to have an event.
event	ending time of the interval for interval censored or counting process data only. Intervals are assumed to be open on the left and closed on the right, (start, end]. For counting process data, event indicates whether an event occurred at the end of the interval.
type	character string specifying the type of censoring. Possible values are "right", "left", "counting", "interval", or "interval2". The default is "right" or "counting" depending on whether the time2 argument is absent or present, respectively.
origin	for counting process data, the hazard function origin. This option was intended to be used in conjunction with a model containing time dependent strata in order to align the subjects properly when they cross over from one strata to another, but it has rarely proven useful.
typeres	character string indicating the type of residual desired. Possible values are "martingale", "deviance", "score", "schoenfeld", "dfbeta", "dfbetas", and "scaledsch". Only enough of the string to determine a unique match is required.

If there were 4 individuals represented by 3, 1, 2 and 4 rows of data respectively, then collapse=c(1,1,1,2,3,3,4,4,4,4) could be used to obtain per subject rather than per observation residuals.
weighted	if TRUE and the model was fit with case weights, then the weighted residuals are returned.
scaleX	Should the Xplan columns be standardized ?
scaleY	Should the time values be standardized ?
nt	Number of PLSR components to fit.
typeVC	type of leave one out crossed validation. Several procedures are available and may be forced. none no crossed validation standard as in SIMCA for datasets without missing values and with all values predicted as those with missing values for datasets with any missing values missingdata all values predicted as those with missing values for datasets with any missing values adaptative predict a response value for an x with any missing value as those with missing values and for an x without any missing value as those without missing values.
plot	Should the survival function be plotted ?)
allres	FALSE to return only the Cox model and TRUE for additionnal results. See details. Defaults to FALSE.
dataXplan	an optional data frame, list or environment (or object coercible by [as.data.frame](#) to a data frame) containing the variables in the model. If not found in dataXplan, the variables are taken from environment(Xplan), typically the environment from which coxpls3 is called.

subset	an optional vector specifying a subset of observations to be used in the fitting process.
weights	an optional vector of 'prior weights' to be used in the fitting process. Should be NULL or a numeric vector.
model_frame	If TRUE, the model frame is returned.
sparse	should the coefficients of non-significant predictors (<alpha.pvals.expli) be set to 0
sparseStop	should component extraction stop when no significant predictors (<alpha.pvals.expli) are found
...	Arguments to be passed on to survival::coxph and to plsRglm::PLS_lm.

Details

If allres=FALSE returns only the final Cox-model. If allres=TRUE returns a list with the PLS components, the final Cox-model and the PLSR model. allres=TRUE is useful for evluating model prediction accuracy on a test sample.

Value

If allres=FALSE :

cox_pls3	Final Cox-model.

If allres=TRUE :

tt_pls3	PLSR components.
cox_pls3	Final Cox-model.
pls3_mod	The PLSR model.

Several procedures are available and may be forced. none no crossed validation standard as in SIMCA for datasets without missing values and with all values predicted as those with missing values for datasets with any missing values missingdata all values predicted as those with missing values for datasets with any missing values adaptative predict a response value for an x with any missing value as those with missing values and for an x without any missing value as those without missing values.
plot	Should the survival function be plotted ?)

allres	FALSE to return only the Cox model and TRUE for additionnal results. See details. Defaults to FALSE.
dataXplan	an optional data frame, list or environment (or object coercible by `as.data.frame` to a data frame) containing the variables in the model. If not found in `dataXplan`, the variables are taken from `environment(Xplan)`, typically the environment from which `coxpls3DR` is called.
subset	an optional vector specifying a subset of observations to be used in the fitting process.
weights	an optional vector of 'prior weights' to be used in the fitting process. Should be `NULL` or a numeric vector.
model_frame	If `TRUE`, the model frame is returned.
sparse	should the coefficients of non-significant predictors (<alpha.pvals.expli) be set to 0
sparseStop	should component extraction stop when no significant predictors (<alpha.pvals.expli) are found
...	Arguments to be passed on to `survival::coxph` and to `plsRglm::PLS_lm`.

Details

If `allres=FALSE` returns only the final Cox-model. If `allres=TRUE` returns a list with the PLS components, the final Cox-model and the PLSR model. `allres=TRUE` is useful for evluating model prediction accuracy on a test sample.

Value

If `allres=FALSE` :

cox_pls3DR	Final Cox-model.

If `allres=TRUE` :

tt_pls3DR	PLSR components.
cox_pls3DR	Final Cox-model.
pls3DR_mod	The PLSR model.

coxplsDR   *Fitting a PLSR model on the (Deviance) Residuals*

Description

This function computes the Cox Model based on PLSR components computed model with

- as the response: the Residuals of a Cox-Model fitted with no covariate
- as explanatory variables: Xplan.

It uses the package mixOmics to perform PLSR fit.

Usage

```
coxplsDR(Xplan, ...)
## Default S3 method:
coxplsDR(Xplan, time, time2, event, type,
origin, typeres = "deviance", collapse, weighted, scaleX = TRUE,
scaleY = TRUE, ncomp=min(7,ncol(Xplan)), modepls="regression",
plot = FALSE, allres = FALSE, ...)
## S3 method for class 'formula'
coxplsDR(Xplan,time,time2,event,type,
origin,typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, ncomp=min(7,ncol(Xplan)), modepls="regression",
```

```
plot=FALSE, allres=FALSE,dataXplan=NULL,subset,weights,
model_frame=FALSE,...)
```

Arguments

Xplan	a formula or a matrix with the eXplanatory variables (training) dataset
time	for right censored data, this is the follow up time. For interval data, the first argument is the starting time for the interval.
time2	The status indicator, normally 0=alive, 1=dead. Other choices are TRUE/FALSE (TRUE = death) or 1/2 (2=death). For interval censored data, the status indicator is 0=right censored, 1=event at time, 2=left censored, 3=interval censored. Although unusual, the event indicator can be omitted, in which case all subjects are assumed to have an event.
event	ending time of the interval for interval censored or counting process data only. Intervals are assumed to be open on the left and closed on the right, (start, end]. For counting process data, event indicates whether an event occurred at the end of the interval.
type	character string specifying the type of censoring. Possible values are "right", "left", "counting", "interval", or "interval2". The default is "right" or "counting" depending on whether the time2 argument is absent or present, respectively.
origin	for counting process data, the hazard function origin. This option was intended to be used in conjunction with a model containing time dependent strata in order to align the subjects properly when they cross over from one strata to another, but it has rarely proven useful.
typeres	character string indicating the type of residual desired. Possible values are "martingale", "deviance", "score", "schoenfeld", "dfbeta", "dfbetas", and "scaledsch". Only enough of the string to determine a unique match is required.
collapse	vector indicating which rows to collapse (sum) over. In time-dependent models more than one row data can pertain to a single individual. If there were 4 individuals represented by 3, 1, 2 and 4 rows of data respectively, then collapse=c(1,1,1,2,3,3,4,4,4,4) could be used to obtain per subject rather than per observation residuals.
weighted	if TRUE and the model was fit with case weights, then the weighted residuals are returned.
scaleX	Should the Xplan columns be standardized ?
scaleY	Should the time values be standardized ?
ncomp	The number of components to include in the model. The number of components to fit is specified with the argument ncomp. It this is not supplied, the maximal number of components is used.
modepls	character string. What type of algorithm to use, (partially) matching one of "regression", "canonical", "invariant" or "classic". See [pls](pls) for details
plot	Should the survival function be plotted ?)
allres	FALSE to return only the Cox model and TRUE for additionnal results. See details. Defaults to FALSE.

dataXplan	an optional data frame, list or environment (or object coercible by `as.data.frame` to a data frame) containing the variables in the model. If not found in `dataXplan`, the variables are taken from `environment(Xplan)`, typically the environment from which `coxplsDR` is called.
subset	an optional vector specifying a subset of observations to be used in the fitting process.
weights	an optional vector of 'prior weights' to be used in the fitting process. Should be `NULL` or a numeric vector.
model_frame	If `TRUE`, the model frame is returned.
...	Arguments to be passed on to `survival::coxph`.

Details

If `allres=FALSE` returns only the final Cox-model. If `allres=TRUE` returns a list with the PLS components, the final Cox-model and the PLSR model. `allres=TRUE` is useful for evluating model prediction accuracy on a test sample.

Value

If `allres=FALSE` :

cox_plsDR	Final Cox-model.

If `allres=TRUE` :

tt_plsDR	PLSR components.
cox_plsDR	Final Cox-model.
plsDR_mod	The PLSR model.

coxsplsDR	*Fitting a sPLSR model on the (Deviance) Residuals*

Description

This function computes the Cox Model based on sPLSR components computed model with

- as the response: the Residuals of a Cox-Model fitted with no covariate
- as explanatory variables: Xplan.

It uses the package `spls` to perform the first step in SPLSR then `mixOmics` to perform PLSR step fit.

Usage

```
coxsplsDR(Xplan, ...)
## Default S3 method:
coxsplsDR(Xplan, time, time2, event, type,
origin, typeres = "deviance", collapse, weighted, scaleX = TRUE,
scaleY = TRUE, ncomp=min(7,ncol(Xplan)), modepls="regression",
plot = FALSE, allres = FALSE, eta, trace=FALSE,...)
## S3 method for class 'formula'
coxsplsDR(Xplan,time,time2,event,type,
origin,typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, ncomp=min(7,ncol(Xplan)), modepls="regression",
plot=FALSE, allres=FALSE,dataXplan=NULL,subset,weights,
model_frame=FALSE,eta, trace=FALSE,...)
```

Arguments

Xplan	a formula or a matrix with the eXplanatory variables (training) dataset
time	for right censored data, this is the follow up time. For interval data, the first argument is the starting time for the interval.

time2	The status indicator, normally 0=alive, 1=dead. Other choices are TRUE/FALSE (TRUE = death) or 1/2 (2=death). For interval censored data, the status indicator is 0=right censored, 1=event at time, 2=left censored, 3=interval censored. Although unusual, the event indicator can be omitted, in which case all subjects are assumed to have an event.
event	ending time of the interval for interval censored or counting process data only. Intervals are assumed to be open on the left and closed on the right, (start, end]. For counting process data, event indicates whether an event occurred at the end of the interval.
type	character string specifying the type of censoring. Possible values are "right", "left", "counting", "interval", or "interval2". The default is "right" or "counting" depending on whether the time2 argument is absent or present, respectively.
origin	for counting process data, the hazard function origin. This option was intended to be used in conjunction with a model containing time dependent strata in order to align the subjects properly when they cross over from one strata to another, but it has rarely proven useful.
typeres	character string indicating the type of residual desired. Possible values are "martingale", "deviance", "score", "schoenfeld", "dfbeta", "dfbetas", and "scaledsch". Only enough of the string to determine a unique match is required.
collapse	vector indicating which rows to collapse (sum) over. In time-dependent models more than one row data can pertain to a single individual. If there were 4 individuals represented by 3, 1, 2 and 4 rows of data respectively, then collapse=c(1,1,1,2,3,3,4,4,4,4) could be used to obtain per subject rather than per observation residuals.
weighted	if TRUE and the model was fit with case weights, then the weighted residuals are returned.
scaleX	Should the Xplan columns be standardized ?
scaleY	Should the time values be standardized ?
ncomp	The number of components to include in the model. The number of components to fit is specified with the argument ncomp. It this is not supplied, the maximal number of components is used.
modepls	character string. What type of algorithm to use, (partially) matching one of "regression", "canonical", "invariant" or "classic". See [pls](#) for details
plot	Should the survival function be plotted ?)
allres	FALSE to return only the Cox model and TRUE for additionnal results. See details. Defaults to FALSE.
dataXplan	an optional data frame, list or environment (or object coercible by [as.data.frame](#) to a data frame) containing the variables in the model. If not found in dataXplan, the variables are taken from environment(Xplan), typically the environment from which coxsplsDR is called.
subset	an optional vector specifying a subset of observations to be used in the fitting process.
weights	an optional vector of 'prior weights' to be used in the fitting process. Should be NULL or a numeric vector.

model_frame	If TRUE, the model frame is returned.
eta	Thresholding parameter. eta should be between 0 and 1.
trace	Print out the progress of variable selection?
...	Arguments to be passed on to survival::coxph.

Details

If allres=FALSE returns only the final Cox-model. If allres=TRUE returns a list with the sPLS components, the final Cox-model and the sPLSR model. allres=TRUE is useful for evluating model prediction accuracy on a test sample.

Value

If allres=FALSE :

cox_splsDR	Final Cox-model.

If allres=TRUE :

tt_splsDR	sPLSR components.
cox_splsDR	Final Cox-model.
splsDR_mod	The sPLSR model.

cv.autoplsRcox   *Cross-validating an autoplsRcox-Model*

Description

This function cross-validates plsRcox models with automatic number of components selection.

It only computes the recommended iAUCSH criterion. Set allCVcrit=TRUE to retrieve the 13 other ones.

Usage

```
cv.autoplsRcox(data, method = c("efron", "breslow"), nfold = 5, nt = 10, plot.it = TRUE,
se = TRUE, givefold, scaleX = TRUE, folddetails=FALSE, allCVcrit=FALSE, details=FALSE,
namedataset="data", save=FALSE, verbose=TRUE,...)
```

Arguments

data	A list of three items:
	• x the explanatory variables passed to plsRcox's Xplan argument,
	• time passed to plsRcox's time argument,
	• status plsRcox's status argument.
method	A character string specifying the method for tie handling. If there are no tied death times all the methods are equivalent. The Efron approximation is used as the default here, it is more accurate when dealing with tied death times, and is as efficient computationally.
nfold	The number of folds to use to perform the cross-validation process.
nt	The number of components to include in the model. It this is not supplied, 10 components are fitted.
plot.it	Shall the results be displayed on a plot ?
se	Should standard errors be plotted ?
givefold	Explicit list of omited values in each fold can be provided using this argument.
scaleX	Shall the predictors be standardized ?
folddetails	Should values and completion status for each folds be returned ?
allCVcrit	Should the other 13 CV criteria be evaled and returned ?
details	Should all results of the functions that perform error computations be returned ?
namedataset	Name to use to craft temporary results names
save	Should temporary results be saved ?
verbose	Should some CV details be displayed ?
...	Other arguments to pass to plsRcox.

Value

nt	The number of components requested
cv.error1	Vector with the mean values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.error2	Vector with the mean values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.error3	Vector with the mean values, across folds, of iAUC_CD for models with 0 to nt components.
cv.error4	Vector with the mean values, across folds, of iAUC_hc for models with 0 to nt components.
cv.error5	Vector with the mean values, across folds, of iAUC_sh for models with 0 to nt components.
cv.error6	Vector with the mean values, across folds, of iAUC_Uno for models with 0 to nt components.
cv.error7	Vector with the mean values, across folds, of iAUC_hz.train for models with 0 to nt components.
cv.error8	Vector with the mean values, across folds, of iAUC_hz.test for models with 0 to nt components.
cv.error9	Vector with the mean values, across folds, of iAUC_survivalROC.train for models with 0 to nt components.
cv.error10	Vector with the mean values, across folds, of iAUC_survivalROC.test for models with 0 to nt components.
cv.error11	Vector with the mean values, across folds, of iBrierScore unw for models with 0 to nt components.
cv.error12	Vector with the mean values, across folds, of iSchmidScore (robust BS) unw for models with 0 to nt components.
cv.error13	Vector with the mean values, across folds, of iBrierScore w for models with 0 to nt components.
cv.error14	Vector with the mean values, across folds, of iSchmidScore (robust BS) w for models with 0 to nt components.
cv.se1	Vector with the standard error values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.se2	Vector with the standard error values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.se3	Vector with the standard error values, across folds, of iAUC_CD for models with 0 to nt components.
cv.se4	Vector with the standard error values, across folds, of iAUC_hc for models with 0 to nt components.
cv.se5	Vector with the standard error values, across folds, of iAUC_sh for models with 0 to nt components.
cv.se6	Vector with the standard error values, across folds, of iAUC_Uno for models with 0 to nt components.

`cv.se7`	Vector with the standard error values, across folds, of iAUC_hz.train for models with 0 to nt components.
`cv.se8`	Vector with the standard error values, across folds, of iAUC_hz.test for models with 0 to nt components.
`cv.se9`	Vector with the standard error values, across folds, of iAUC_survivalROC.train for models with 0 to nt components.
`cv.se10`	Vector with the standard error values, across folds, of iAUC_survivalROC.test for models with 0 to nt components.
`cv.se11`	Vector with the standard error values, across folds, of iBrierScore unw for models with 0 to nt components.
`cv.se12`	Vector with the standard error values, across folds, of iSchmidScore (robust BS) unw for models with 0 to nt components.
`cv.se13`	Vector with the standard error values, across folds, of iBrierScore w for models with 0 to nt components.
`cv.se14`	Vector with the standard error values, across folds, of iSchmidScore (robust BS) w for models with 0 to nt components.
`folds`	Explicit list of the values that were omited values in each fold.
`lambda.min1`	Vector with the standard error values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
`lambda.min2`	Vector with the standard error values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.
`lambda.min1`	Optimal Nbr of components, min Cross-validated log-partial-likelihood criterion.
`lambda.se1`	Optimal Nbr of components, min+1se Cross-validated log-partial-likelihood criterion.
`lambda.min2`	Optimal Nbr of components, min van Houwelingen Cross-validated log-partial-likelihood.
`lambda.se2`	Optimal Nbr of components, min+1se van Houwelingen Cross-validated log-partial-likelihood.
`lambda.min3`	Optimal Nbr of components, max iAUC_CD criterion.
`lambda.se3`	Optimal Nbr of components, max+1se iAUC_CD criterion.
`lambda.min4`	Optimal Nbr of components, max iAUC_hc criterion.
`lambda.se4`	Optimal Nbr of components, max+1se iAUC_hc criterion.
`lambda.min5`	Optimal Nbr of components, max iAUC_sh criterion.
`lambda.se5`	Optimal Nbr of components, max+1se iAUC_sh criterion.
`lambda.min6`	Optimal Nbr of components, max iAUC_Uno criterion.
`lambda.se6`	Optimal Nbr of components, max+1se iAUC_Uno criterion.
`lambda.min7`	Optimal Nbr of components, max iAUC_hz.train criterion.
`lambda.se7`	Optimal Nbr of components, max+1se iAUC_hz.train criterion.
`lambda.min8`	Optimal Nbr of components, max iAUC_hz.test criterion.

`lambda.se8`	Optimal Nbr of components, max+1se iAUC_hz.test criterion.
`lambda.min9`	Optimal Nbr of components, max iAUC_survivalROC.train criterion.
`lambda.se9`	Optimal Nbr of components, max+1se iAUC_survivalROC.train criterion.
`lambda.min10`	Optimal Nbr of components, max iAUC_survivalROC.test criterion.
`lambda.se10`	Optimal Nbr of components, max+1se iAUC_survivalROC.test criterion.
`lambda.min11`	Optimal Nbr of components, min iBrierScore unw criterion.
`lambda.se11`	Optimal Nbr of components, min+1se iBrierScore unw criterion.
`lambda.min12`	Optimal Nbr of components, min iSchmidScore unw criterion.
`lambda.se12`	Optimal Nbr of components, min+1se iSchmidScore unw criterion.
`lambda.min13`	Optimal Nbr of components, min iBrierScore w criterion.
`lambda.se13`	Optimal Nbr of components, min+1se iBrierScore w criterion.
`lambda.min14`	Optimal Nbr of components, min iSchmidScore w criterion.
`lambda.se14`	Optimal Nbr of components, min+1se iSchmidScore w criterion.
`errormat1-14`	If `details=TRUE`, matrices with the error values for every folds across each of the components and each of the criteria
`completed.cv1-14`	
	If `details=TRUE`, matrices with logical values for every folds across each of the components and each of the criteria: `TRUE` if the computation was completed and `FALSE` it is failed.
`All_indics`	All results of the functions that perform error computation, for each fold, each component and error criterion.

cv.error12	Vector with the mean values, across folds, of iSchmidScore (robust BS) unw for models with 0 to nt components.
cv.error13	Vector with the mean values, across folds, of iBrierScore w for models with 0 to nt components.
cv.error14	Vector with the mean values, across folds, of iSchmidScore (robust BS) w for models with 0 to nt components.
cv.se1	Vector with the standard error values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.se2	Vector with the standard error values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.se3	Vector with the standard error values, across folds, of iAUC_CD for models with 0 to nt components.
cv.se4	Vector with the standard error values, across folds, of iAUC_hc for models with 0 to nt components.
cv.se5	Vector with the standard error values, across folds, of iAUC_sh for models with 0 to nt components.
cv.se6	Vector with the standard error values, across folds, of iAUC_Uno for models with 0 to nt components.

`cv.se7`	Vector with the standard error values, across folds, of iAUC_hz.train for models with 0 to nt components.
`cv.se8`	Vector with the standard error values, across folds, of iAUC_hz.test for models with 0 to nt components.
`cv.se9`	Vector with the standard error values, across folds, of iAUC_survivalROC.train for models with 0 to nt components.
`cv.se10`	Vector with the standard error values, across folds, of iAUC_survivalROC.test for models with 0 to nt components.
`cv.se11`	Vector with the standard error values, across folds, of iBrierScore unw for models with 0 to nt components.
`cv.se12`	Vector with the standard error values, across folds, of iSchmidScore (robust BS) unw for models with 0 to nt components.
`cv.se13`	Vector with the standard error values, across folds, of iBrierScore w for models with 0 to nt components.
`cv.se14`	Vector with the standard error values, across folds, of iSchmidScore (robust BS) w for models with 0 to nt components.
`folds`	Explicit list of the values that were omited values in each fold.
`lambda.min1`	Vector with the standard error values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
`lambda.min2`	Vector with the standard error values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.
`lambda.min1`	Optimal Nbr of components, min Cross-validated log-partial-likelihood criterion.
`lambda.se1`	Optimal Nbr of components, min+1se Cross-validated log-partial-likelihood criterion.
`lambda.min2`	Optimal Nbr of components, min van Houwelingen Cross-validated log-partial-likelihood.
`lambda.se2`	Optimal Nbr of components, min+1se van Houwelingen Cross-validated log-partial-likelihood.
`lambda.min3`	Optimal Nbr of components, max iAUC_CD criterion.
`lambda.se3`	Optimal Nbr of components, max+1se iAUC_CD criterion.
`lambda.min4`	Optimal Nbr of components, max iAUC_hc criterion.
`lambda.se4`	Optimal Nbr of components, max+1se iAUC_hc criterion.
`lambda.min5`	Optimal Nbr of components, max iAUC_sh criterion.
`lambda.se5`	Optimal Nbr of components, max+1se iAUC_sh criterion.
`lambda.min6`	Optimal Nbr of components, max iAUC_Uno criterion.
`lambda.se6`	Optimal Nbr of components, max+1se iAUC_Uno criterion.
`lambda.min7`	Optimal Nbr of components, max iAUC_hz.train criterion.
`lambda.se7`	Optimal Nbr of components, max+1se iAUC_hz.train criterion.
`lambda.min8`	Optimal Nbr of components, max iAUC_hz.test criterion.

lambda.se8	Optimal Nbr of components, max+1se iAUC_hz.test criterion.
lambda.min9	Optimal Nbr of components, max iAUC_survivalROC.train criterion.
lambda.se9	Optimal Nbr of components, max+1se iAUC_survivalROC.train criterion.
lambda.min10	Optimal Nbr of components, max iAUC_survivalROC.test criterion.
lambda.se10	Optimal Nbr of components, max+1se iAUC_survivalROC.test criterion.
lambda.min11	Optimal Nbr of components, min iBrierScore unw criterion.
lambda.se11	Optimal Nbr of components, min+1se iBrierScore unw criterion.
lambda.min12	Optimal Nbr of components, min iSchmidScore unw criterion.
lambda.se12	Optimal Nbr of components, min+1se iSchmidScore unw criterion.
lambda.min13	Optimal Nbr of components, min iBrierScore w criterion.
lambda.se13	Optimal Nbr of components, min+1se iBrierScore w criterion.
lambda.min14	Optimal Nbr of components, min iSchmidScore w criterion.
lambda.se14	Optimal Nbr of components, min+1se iSchmidScore w criterion.
errormat1-14	If details=TRUE, matrices with the error values for every folds across each of the components and each of the criteria
completed.cv1-14	
	If details=TRUE, matrices with logical values for every folds across each of the components and each of the criteria: TRUE if the computation was completed and FALSE it is failed.
All_indics	All results of the functions that perform error computation, for each fold, each component and error criterion.

cv.coxDKsplsDR   *Cross-validating a DKsplsDR-Model*

Description

This function cross-validates [coxDKsplsDR](#) models.

It only computes the recommended iAUCSurvROC criterion. Set allCVcrit=TRUE to retrieve the 13 other ones.

Usage

```
cv.coxDKsplsDR(data, method = c("efron", "breslow"), nfold = 5, nt = 10, eta=.5,
plot.it = TRUE, se = TRUE, givefold, scaleX = TRUE, scaleY = FALSE,
folddetails=FALSE, allCVcrit=FALSE, details=FALSE, namedataset="data",
save=FALSE, verbose=TRUE,...)
```

Arguments

data	A list of three items:
	• x the explanatory variables passed to [coxDKsplsDR](#)'s Xplan argument,
	• time passed to [coxDKsplsDR](#)'s time argument,
	• status [coxDKsplsDR](#)'s status argument.
method	A character string specifying the method for tie handling. If there are no tied death times all the methods are equivalent. The Efron approximation is used as the default here, it is more accurate when dealing with tied death times, and is as efficient computationally.
nfold	The number of folds to use to perform the cross-validation process.
nt	The number of components to include in the model. It this is not supplied, 10 components are fitted.
eta	Thresholding parameter. eta should be between 0 and 1.
plot.it	Shall the results be displayed on a plot ?
se	Should standard errors be plotted ?
givefold	Explicit list of omited values in each fold can be provided using this argument.
scaleX	Shall the predictors be standardized ?
scaleY	Should the time values be standardized ?
folddetails	Should values and completion status for each folds be returned ?

allCVcrit	Should the other 13 CV criteria be evaled and returned ?
details	Should all results of the functions that perform error computations be returned ?
namedataset	Name to use to craft temporary results names
save	Should temporary results be saved ?
verbose	Should some CV details be displayed ?
...	Other arguments to pass to coxDKsplsDR.

Value

nt	The number of components requested
cv.error1	Vector with the mean values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.error2	Vector with the mean values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.error3	Vector with the mean values, across folds, of iAUC_CD for models with 0 to nt components.
cv.error4	Vector with the mean values, across folds, of iAUC_hc for models with 0 to nt components.
cv.error5	Vector with the mean values, across folds, of iAUC_sh for models with 0 to nt components.
cv.error6	Vector with the mean values, across folds, of iAUC_Uno for models with 0 to nt components.
cv.error7	Vector with the mean values, across folds, of iAUC_hz.train for models with 0 to nt components.
cv.error8	Vector with the mean values, across folds, of iAUC_hz.test for models with 0 to nt components.
cv.error9	Vector with the mean values, across folds, of iAUC_survivalROC.train for models with 0 to nt components.
cv.error10	Vector with the mean values, across folds, of iAUC_survivalROC.test for models with 0 to nt components.
cv.error11	Vector with the mean values, across folds, of iBrierScore unw for models with 0 to nt components.
cv.error12	Vector with the mean values, across folds, of iSchmidScore (robust BS) unw for models with 0 to nt components.
cv.error13	Vector with the mean values, across folds, of iBrierScore w for models with 0 to nt components.
cv.error14	Vector with the mean values, across folds, of iSchmidScore (robust BS) w for models with 0 to nt components.
cv.se1	Vector with the standard error values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.se2	Vector with the standard error values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.

cv.se3	Vector with the standard error values, across folds, of iAUC_CD for models with 0 to nt components.
cv.se4	Vector with the standard error values, across folds, of iAUC_hc for models with 0 to nt components.
cv.se5	Vector with the standard error values, across folds, of iAUC_sh for models with 0 to nt components.
cv.se6	Vector with the standard error values, across folds, of iAUC_Uno for models with 0 to nt components.
cv.se7	Vector with the standard error values, across folds, of iAUC_hz.train for models with 0 to nt components.
cv.se8	Vector with the standard error values, across folds, of iAUC_hz.test for models with 0 to nt components.
cv.se9	Vector with the standard error values, across folds, of iAUC_survivalROC.train for models with 0 to nt components.
cv.se10	Vector with the standard error values, across folds, of iAUC_survivalROC.test for models with 0 to nt components.
cv.se11	Vector with the standard error values, across folds, of iBrierScore unw for models with 0 to nt components.
cv.se12	Vector with the standard error values, across folds, of iSchmidScore (robust BS) unw for models with 0 to nt components.
cv.se13	Vector with the standard error values, across folds, of iBrierScore w for models with 0 to nt components.
cv.se14	Vector with the standard error values, across folds, of iSchmidScore (robust BS) w for models with 0 to nt components.
folds	Explicit list of the values that were omited values in each fold.
lambda.min1	Vector with the standard error values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
lambda.min2	Vector with the standard error values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.
lambda.min1	Optimal Nbr of components, min Cross-validated log-partial-likelihood criterion.
lambda.se1	Optimal Nbr of components, min+1se Cross-validated log-partial-likelihood criterion.
lambda.min2	Optimal Nbr of components, min van Houwelingen Cross-validated log-partial-likelihood.
lambda.se2	Optimal Nbr of components, min+1se van Houwelingen Cross-validated log-partial-likelihood.
lambda.min3	Optimal Nbr of components, max iAUC_CD criterion.
lambda.se3	Optimal Nbr of components, max+1se iAUC_CD criterion.
lambda.min4	Optimal Nbr of components, max iAUC_hc criterion.
lambda.se4	Optimal Nbr of components, max+1se iAUC_hc criterion.

lambda.min5	Optimal Nbr of components, max iAUC_sh criterion.
lambda.se5	Optimal Nbr of components, max+1se iAUC_sh criterion.
lambda.min6	Optimal Nbr of components, max iAUC_Uno criterion.
lambda.se6	Optimal Nbr of components, max+1se iAUC_Uno criterion.
lambda.min7	Optimal Nbr of components, max iAUC_hz.train criterion.
lambda.se7	Optimal Nbr of components, max+1se iAUC_hz.train criterion.
lambda.min8	Optimal Nbr of components, max iAUC_hz.test criterion.
lambda.se8	Optimal Nbr of components, max+1se iAUC_hz.test criterion.
lambda.min9	Optimal Nbr of components, max iAUC_survivalROC.train criterion.
lambda.se9	Optimal Nbr of components, max+1se iAUC_survivalROC.train criterion.
lambda.min10	Optimal Nbr of components, max iAUC_survivalROC.test criterion.
lambda.se10	Optimal Nbr of components, max+1se iAUC_survivalROC.test criterion.
lambda.min11	Optimal Nbr of components, min iBrierScore unw criterion.
lambda.se11	Optimal Nbr of components, min+1se iBrierScore unw criterion.
lambda.min12	Optimal Nbr of components, min iSchmidScore unw criterion.
lambda.se12	Optimal Nbr of components, min+1se iSchmidScore unw criterion.
lambda.min13	Optimal Nbr of components, min iBrierScore w criterion.
lambda.se13	Optimal Nbr of components, min+1se iBrierScore w criterion.
lambda.min14	Optimal Nbr of components, min iSchmidScore w criterion.
lambda.se14	Optimal Nbr of components, min+1se iSchmidScore w criterion.
errormat1-14	If `details=TRUE`, matrices with the error values for every folds across each of the components and each of the criteria
completed.cv1-14	
	If `details=TRUE`, matrices with logical values for every folds across each of the components and each of the criteria: `TRUE` if the computation was completed and `FALSE` it is failed.
All_indics	All results of the functions that perform error computation, for each fold, each component and error criterion.

cv.coxpls   *Cross-validating a Cox-Model fitted on PLSR components*

Description

This function cross-validates coxpls models.

It only computes the recommended iAUCSurvROC criterion. Set allCVcrit=TRUE to retrieve the 13 other ones.

Usage

```
cv.coxpls(data, method = c("efron", "breslow"), nfold = 5, nt = 10, plot.it = TRUE,
se = TRUE, givefold, scaleX = TRUE, folddetails=FALSE, allCVcrit=FALSE, details=FALSE,
namedataset="data", save=FALSE, verbose=TRUE,...)
```

Arguments

data	A list of three items:
	• x the explanatory variables passed to coxpls's Xplan argument,
	• time passed to coxpls's time argument,
	• status coxpls's status argument.
method	A character string specifying the method for tie handling. If there are no tied death times all the methods are equivalent. The Efron approximation is used as the default here, it is more accurate when dealing with tied death times, and is as efficient computationally.
nfold	The number of folds to use to perform the cross-validation process.
nt	The number of components to include in the model. It this is not supplied, 10 components are fitted.
plot.it	Shall the results be displayed on a plot ?
se	Should standard errors be plotted ?
givefold	Explicit list of omited values in each fold can be provided using this argument.

scaleX	Shall the predictors be standardized ?
folddetails	Should values and completion status for each folds be returned ?
allCVcrit	Should the other 13 CV criteria be evaled and returned ?
details	Should all results of the functions that perform error computations be returned ?
namedataset	Name to use to craft temporary results names
save	Should temporary results be saved ?
verbose	Should some CV details be displayed ?
...	Other arguments to pass to coxpls.

cv.error11	Vector with the mean values, across folds, of iBrierScore unw for models with 0 to nt components.
cv.error12	Vector with the mean values, across folds, of iSchmidScore (robust BS) unw for models with 0 to nt components.
cv.error13	Vector with the mean values, across folds, of iBrierScore w for models with 0 to nt components.

`cv.error14`	Vector with the mean values, across folds, of iSchmidScore (robust BS) w for models with 0 to nt components.
`cv.se1`	Vector with the standard error values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
`cv.se2`	Vector with the standard error values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.
`cv.se3`	Vector with the standard error values, across folds, of iAUC_CD for models with 0 to nt components.
`cv.se4`	Vector with the standard error values, across folds, of iAUC_hc for models with 0 to nt components.
`cv.se5`	Vector with the standard error values, across folds, of iAUC_sh for models with 0 to nt components.
`cv.se6`	Vector with the standard error values, across folds, of iAUC_Uno for models with 0 to nt components.
`cv.se7`	Vector with the standard error values, across folds, of iAUC_hz.train for models with 0 to nt components.
`cv.se8`	Vector with the standard error values, across folds, of iAUC_hz.test for models with 0 to nt components.
`cv.se9`	Vector with the standard error values, across folds, of iAUC_survivalROC.train for models with 0 to nt components.
`cv.se10`	Vector with the standard error values, across folds, of iAUC_survivalROC.test for models with 0 to nt components.
`cv.se11`	Vector with the standard error values, across folds, of iBrierScore unw for models with 0 to nt components.
`cv.se12`	Vector with the standard error values, across folds, of iSchmidScore (robust BS) unw for models with 0 to nt components.
`cv.se13`	Vector with the standard error values, across folds, of iBrierScore w for models with 0 to nt components.
`cv.se14`	Vector with the standard error values, across folds, of iSchmidScore (robust BS) w for models with 0 to nt components.
`folds`	Explicit list of the values that were omited values in each fold.
`lambda.min1`	Vector with the standard error values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
`lambda.min2`	Vector with the standard error values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.
`lambda.min1`	Optimal Nbr of components, min Cross-validated log-partial-likelihood criterion.
`lambda.se1`	Optimal Nbr of components, min+1se Cross-validated log-partial-likelihood criterion.
`lambda.min2`	Optimal Nbr of components, min van Houwelingen Cross-validated log-partial-likelihood.
`lambda.se2`	Optimal Nbr of components, min+1se van Houwelingen Cross-validated log-partial-likelihood.

lambda.min3	Optimal Nbr of components, max iAUC_CD criterion.
lambda.se3	Optimal Nbr of components, max+1se iAUC_CD criterion.
lambda.min4	Optimal Nbr of components, max iAUC_hc criterion.
lambda.se4	Optimal Nbr of components, max+1se iAUC_hc criterion.
lambda.min5	Optimal Nbr of components, max iAUC_sh criterion.
lambda.se5	Optimal Nbr of components, max+1se iAUC_sh criterion.
lambda.min6	Optimal Nbr of components, max iAUC_Uno criterion.
lambda.se6	Optimal Nbr of components, max+1se iAUC_Uno criterion.
lambda.min7	Optimal Nbr of components, max iAUC_hz.train criterion.
lambda.se7	Optimal Nbr of components, max+1se iAUC_hz.train criterion.
lambda.min8	Optimal Nbr of components, max iAUC_hz.test criterion.
lambda.se8	Optimal Nbr of components, max+1se iAUC_hz.test criterion.
lambda.min9	Optimal Nbr of components, max iAUC_survivalROC.train criterion.
lambda.se9	Optimal Nbr of components, max+1se iAUC_survivalROC.train criterion.
lambda.min10	Optimal Nbr of components, max iAUC_survivalROC.test criterion.
lambda.se10	Optimal Nbr of components, max+1se iAUC_survivalROC.test criterion.
lambda.min11	Optimal Nbr of components, min iBrierScore unw criterion.
lambda.se11	Optimal Nbr of components, min+1se iBrierScore unw criterion.
lambda.min12	Optimal Nbr of components, min iSchmidScore unw criterion.
lambda.se12	Optimal Nbr of components, min+1se iSchmidScore unw criterion.
lambda.min13	Optimal Nbr of components, min iBrierScore w criterion.
lambda.se13	Optimal Nbr of components, min+1se iBrierScore w criterion.
lambda.min14	Optimal Nbr of components, min iSchmidScore w criterion.
lambda.se14	Optimal Nbr of components, min+1se iSchmidScore w criterion.
errormat1-14	If details=TRUE, matrices with the error values for every folds across each of the components and each of the criteria
completed.cv1-14	
	If details=TRUE, matrices with logical values for every folds across each of the components and each of the criteria: TRUE if the computation was completed and FALSE it is failed.
All_indics	All results of the functions that perform error computation, for each fold, each component and error criterion.

cv.coxsplsDR   *Cross-validating a splsDR-Model*

Description

This function cross-validates coxsplsDR models.

It only computes the recommended iAUCSurvROC criterion. Set allCVcrit=TRUE to retrieve the 13 other ones.

Usage

```
cv.coxsplsDR(data, method = c("efron", "breslow"), nfold = 5, nt = 10, eta=.5,
plot.it = TRUE, se = TRUE, givefold, scaleX = TRUE, scaleY = FALSE,
folddetails=FALSE, allCVcrit=FALSE, details=FALSE, namedataset="data",
save=FALSE, verbose=TRUE,...)
```

Arguments

data   A list of three items:

- x the explanatory variables passed to coxsplsDR's Xplan argument,
- time passed to coxsplsDR's time argument,
- status coxsplsDR's status argument.

method	A character string specifying the method for tie handling. If there are no tied death times all the methods are equivalent. The Efron approximation is used as the default here, it is more accurate when dealing with tied death times, and is as efficient computationally.
nfold	The number of folds to use to perform the cross-validation process.
nt	The number of components to include in the model. It this is not supplied, 10 components are fitted.
eta	Thresholding parameter. eta should be between 0 and 1.
plot.it	Shall the results be displayed on a plot ?
se	Should standard errors be plotted ?
givefold	Explicit list of omited values in each fold can be provided using this argument.
scaleX	Shall the predictors be standardized ?
scaleY	Should the time values be standardized ?
folddetails	Should values and completion status for each folds be returned ?
allCVcrit	Should the other 13 CV criteria be evaled and returned ?
details	Should all results of the functions that perform error computations be returned ?
namedataset	Name to use to craft temporary results names
save	Should temporary results be saved ?
verbose	Should some CV details be displayed ?
...	Other arguments to pass to [coxsplsDR]().

Value

nt	The number of components requested
cv.error1	Vector with the mean values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.error2	Vector with the mean values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.error3	Vector with the mean values, across folds, of iAUC_CD for models with 0 to nt components.
cv.error4	Vector with the mean values, across folds, of iAUC_hc for models with 0 to nt components.
cv.error5	Vector with the mean values, across folds, of iAUC_sh for models with 0 to nt components.
cv.error6	Vector with the mean values, across folds, of iAUC_Uno for models with 0 to nt components.
cv.error7	Vector with the mean values, across folds, of iAUC_hz.train for models with 0 to nt components.
cv.error8	Vector with the mean values, across folds, of iAUC_hz.test for models with 0 to nt components.
cv.error9	Vector with the mean values, across folds, of iAUC_survivalROC.train for models with 0 to nt components.

cv.error10	Vector with the mean values, across folds, of iAUC_survivalROC.test for models with 0 to nt components.
cv.error11	Vector with the mean values, across folds, of iBrierScore unw for models with 0 to nt components.
cv.error12	Vector with the mean values, across folds, of iSchmidScore (robust BS) unw for models with 0 to nt components.
cv.error13	Vector with the mean values, across folds, of iBrierScore w for models with 0 to nt components.
cv.error14	Vector with the mean values, across folds, of iSchmidScore (robust BS) w for models with 0 to nt components.
cv.se1	Vector with the standard error values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.se2	Vector with the standard error values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.se3	Vector with the standard error values, across folds, of iAUC_CD for models with 0 to nt components.
cv.se4	Vector with the standard error values, across folds, of iAUC_hc for models with 0 to nt components.
cv.se5	Vector with the standard error values, across folds, of iAUC_sh for models with 0 to nt components.
cv.se6	Vector with the standard error values, across folds, of iAUC_Uno for models with 0 to nt components.
cv.se7	Vector with the standard error values, across folds, of iAUC_hz.train for models with 0 to nt components.
cv.se8	Vector with the standard error values, across folds, of iAUC_hz.test for models with 0 to nt components.
cv.se9	Vector with the standard error values, across folds, of iAUC_survivalROC.train for models with 0 to nt components.
cv.se10	Vector with the standard error values, across folds, of iAUC_survivalROC.test for models with 0 to nt components.
cv.se11	Vector with the standard error values, across folds, of iBrierScore unw for models with 0 to nt components.
cv.se12	Vector with the standard error values, across folds, of iSchmidScore (robust BS) unw for models with 0 to nt components.
cv.se13	Vector with the standard error values, across folds, of iBrierScore w for models with 0 to nt components.
cv.se14	Vector with the standard error values, across folds, of iSchmidScore (robust BS) w for models with 0 to nt components.
folds	Explicit list of the values that were omited values in each fold.
lambda.min1	Vector with the standard error values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
lambda.min2	Vector with the standard error values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.

`lambda.min1`	Optimal Nbr of components, min Cross-validated log-partial-likelihood criterion.
`lambda.se1`	Optimal Nbr of components, min+1se Cross-validated log-partial-likelihood criterion.
`lambda.min2`	Optimal Nbr of components, min van Houwelingen Cross-validated log-partial-likelihood.
`lambda.se2`	Optimal Nbr of components, min+1se van Houwelingen Cross-validated log-partial-likelihood.
`lambda.min3`	Optimal Nbr of components, max iAUC_CD criterion.
`lambda.se3`	Optimal Nbr of components, max+1se iAUC_CD criterion.
`lambda.min4`	Optimal Nbr of components, max iAUC_hc criterion.
`lambda.se4`	Optimal Nbr of components, max+1se iAUC_hc criterion.
`lambda.min5`	Optimal Nbr of components, max iAUC_sh criterion.
`lambda.se5`	Optimal Nbr of components, max+1se iAUC_sh criterion.
`lambda.min6`	Optimal Nbr of components, max iAUC_Uno criterion.
`lambda.se6`	Optimal Nbr of components, max+1se iAUC_Uno criterion.
`lambda.min7`	Optimal Nbr of components, max iAUC_hz.train criterion.
`lambda.se7`	Optimal Nbr of components, max+1se iAUC_hz.train criterion.
`lambda.min8`	Optimal Nbr of components, max iAUC_hz.test criterion.
`lambda.se8`	Optimal Nbr of components, max+1se iAUC_hz.test criterion.
`lambda.min9`	Optimal Nbr of components, max iAUC_survivalROC.train criterion.
`lambda.se9`	Optimal Nbr of components, max+1se iAUC_survivalROC.train criterion.
`lambda.min10`	Optimal Nbr of components, max iAUC_survivalROC.test criterion.
`lambda.se10`	Optimal Nbr of components, max+1se iAUC_survivalROC.test criterion.
`lambda.min11`	Optimal Nbr of components, min iBrierScore unw criterion.
`lambda.se11`	Optimal Nbr of components, min+1se iBrierScore unw criterion.
`lambda.min12`	Optimal Nbr of components, min iSchmidScore unw criterion.
`lambda.se12`	Optimal Nbr of components, min+1se iSchmidScore unw criterion.
`lambda.min13`	Optimal Nbr of components, min iBrierScore w criterion.
`lambda.se13`	Optimal Nbr of components, min+1se iBrierScore w criterion.
`lambda.min14`	Optimal Nbr of components, min iSchmidScore w criterion.
`lambda.se14`	Optimal Nbr of components, min+1se iSchmidScore w criterion.
`errormat1-14`	If `details=TRUE`, matrices with the error values for every folds across each of the components and each of the criteria
`completed.cv1-14`	If `details=TRUE`, matrices with logical values for every folds across each of the components and each of the criteria: `TRUE` if the computation was completed and `FALSE` it is failed.
`All_indics`	All results of the functions that perform error computation, for each fold, each component and error criterion.

cv.larsDR   *Cross-validating a larsDR-Model*

Description

This function cross-validates larsDR_coxph models.

It only computes the recommended van Houwelingen CV partial likelihood criterion criterion. Set allCVcrit=TRUE to retrieve the 13 other ones.

Usage

```
cv.larsDR(data, method = c("efron", "breslow"), nfold = 5,
fraction = seq(0, 1, length = 100), plot.it = TRUE, se = TRUE,
givefold, scaleX=TRUE, scaleY=FALSE, folddetails=FALSE, allCVcrit=FALSE,
details=FALSE,namedataset="data", save=FALSE, verbose=TRUE,...)
```

Arguments

data	A list of three items:

- x the explanatory variables passed to [larsDR_coxph](#)'s Xplan argument,
- time passed to [larsDR_coxph](#)'s time argument,
- status [larsDR_coxph](#)'s status argument.

method	A character string specifying the method for tie handling. If there are no tied death times all the methods are equivalent. The Efron approximation is used as the default here, it is more accurate when dealing with tied death times, and is as efficient computationally.
nfold	The number of folds to use to perform the cross-validation process.
fraction	L1 norm fraction.
plot.it	Shall the results be displayed on a plot ?
se	Should standard errors be plotted ?
givefold	Explicit list of omited values in each fold can be provided using this argument.
scaleX	Shall the predictors be standardized ?
scaleY	Should the time values be standardized ?
folddetails	Should values and completion status for each folds be returned ?
allCVcrit	Should the other 13 CV criteria be evaled and returned ?
details	Should all results of the functions that perform error computations be returned ?
namedataset	Name to use to craft temporary results names
save	Should temporary results be saved ?
verbose	Should some CV details be displayed ?
...	Other arguments to pass to [larsDR_coxph](#).

cv.error8	Vector with the mean values, across folds, of iAUC_hz.test for models with 0 to nt components.
cv.error9	Vector with the mean values, across folds, of iAUC_survivalROC.train for models with 0 to nt components.
cv.error10	Vector with the mean values, across folds, of iAUC_survivalROC.test for models with 0 to nt components.
cv.error11	Vector with the mean values, across folds, of iBrierScore unw for models with 0 to nt components.
cv.error12	Vector with the mean values, across folds, of iSchmidScore (robust BS) unw for models with 0 to nt components.
cv.error13	Vector with the mean values, across folds, of iBrierScore w for models with 0 to nt components.
cv.error14	Vector with the mean values, across folds, of iSchmidScore (robust BS) w for models with 0 to nt components.
cv.se1	Vector with the standard error values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.se2	Vector with the standard error values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.
cv.se3	Vector with the standard error values, across folds, of iAUC_CD for models with 0 to nt components.
cv.se4	Vector with the standard error values, across folds, of iAUC_hc for models with 0 to nt components.
cv.se5	Vector with the standard error values, across folds, of iAUC_sh for models with 0 to nt components.
cv.se6	Vector with the standard error values, across folds, of iAUC_Uno for models with 0 to nt components.
cv.se7	Vector with the standard error values, across folds, of iAUC_hz.train for models with 0 to nt components.
cv.se8	Vector with the standard error values, across folds, of iAUC_hz.test for models with 0 to nt components.
cv.se9	Vector with the standard error values, across folds, of iAUC_survivalROC.train for models with 0 to nt components.
cv.se10	Vector with the standard error values, across folds, of iAUC_survivalROC.test for models with 0 to nt components.
cv.se11	Vector with the standard error values, across folds, of iBrierScore unw for models with 0 to nt components.

`cv.se12`	Vector with the standard error values, across folds, of iSchmidScore (robust BS) unw for models with 0 to nt components.
`cv.se13`	Vector with the standard error values, across folds, of iBrierScore w for models with 0 to nt components.
`cv.se14`	Vector with the standard error values, across folds, of iSchmidScore (robust BS) w for models with 0 to nt components.
`folds`	Explicit list of the values that were omited values in each fold.
`lambda.min1`	Vector with the standard error values, across folds, of, per fold unit, Cross-validated log-partial-likelihood for models with 0 to nt components.
`lambda.min2`	Vector with the standard error values, across folds, of, per fold unit, van Houwelingen Cross-validated log-partial-likelihood for models with 0 to nt components.
`lambda.min1`	Optimal Nbr of components, min Cross-validated log-partial-likelihood criterion.
`lambda.se1`	Optimal Nbr of components, min+1se Cross-validated log-partial-likelihood criterion.
`lambda.min2`	Optimal Nbr of components, min van Houwelingen Cross-validated log-partial-likelihood.
`lambda.se2`	Optimal Nbr of components, min+1se van Houwelingen Cross-validated log-partial-likelihood.
`lambda.min3`	Optimal Nbr of components, max iAUC_CD criterion.
`lambda.se3`	Optimal Nbr of components, max+1se iAUC_CD criterion.
`lambda.min4`	Optimal Nbr of components, max iAUC_hc criterion.
`lambda.se4`	Optimal Nbr of components, max+1se iAUC_hc criterion.
`lambda.min5`	Optimal Nbr of components, max iAUC_sh criterion.
`lambda.se5`	Optimal Nbr of components, max+1se iAUC_sh criterion.
`lambda.min6`	Optimal Nbr of components, max iAUC_Uno criterion.
`lambda.se6`	Optimal Nbr of components, max+1se iAUC_Uno criterion.
`lambda.min7`	Optimal Nbr of components, max iAUC_hz.train criterion.
`lambda.se7`	Optimal Nbr of components, max+1se iAUC_hz.train criterion.
`lambda.min8`	Optimal Nbr of components, max iAUC_hz.test criterion.
`lambda.se8`	Optimal Nbr of components, max+1se iAUC_hz.test criterion.
`lambda.min9`	Optimal Nbr of components, max iAUC_survivalROC.train criterion.
`lambda.se9`	Optimal Nbr of components, max+1se iAUC_survivalROC.train criterion.
`lambda.min10`	Optimal Nbr of components, max iAUC_survivalROC.test criterion.
`lambda.se10`	Optimal Nbr of components, max+1se iAUC_survivalROC.test criterion.
`lambda.min11`	Optimal Nbr of components, min iBrierScore unw criterion.
`lambda.se11`	Optimal Nbr of components, min+1se iBrierScore unw criterion.
`lambda.min12`	Optimal Nbr of components, min iSchmidScore unw criterion.
`lambda.se12`	Optimal Nbr of components, min+1se iSchmidScore unw criterion.

lambda.min13	Optimal Nbr of components, min iBrierScore w criterion.
lambda.se13	Optimal Nbr of components, min+1se iBrierScore w criterion.
lambda.min14	Optimal Nbr of components, min iSchmidScore w criterion.
lambda.se14	Optimal Nbr of components, min+1se iSchmidScore w criterion.
errormat1-14	If details=TRUE, matrices with the error values for every folds across each of the components and each of the criteria
completed.cv1-14	
	If details=TRUE, matrices with logical values for every folds across each of the components and each of the criteria: TRUE if the computation was completed and FALSE it is failed.
All_indics	All results of the functions that perform error computation, for each fold, each component and error criterion.

DKplsRcox | *Partial least squares Regression generalized linear models*

Description

This function implements an extension of Partial least squares Regression to Cox Models.

Usage

```
DKplsRcox(Xplan, ...)
## Default S3 method:
DKplsRcoxmodel(Xplan,time,time2,event,type,
origin,typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, nt=min(2,ncol(Xplan)),limQ2set=.0975,
dataPredictY=Xplan, pvals.expli=FALSE,alpha.pvals.expli=.05,
tol_Xi=10^(-12),weights,control, sparse=FALSE,
sparseStop=TRUE,plot=FALSE,allres=FALSE, kernel = "rbfdot",
hyperkernel, verbose=TRUE,...)
## S3 method for class 'formula'
DKplsRcoxmodel(Xplan,time,time2,event,type,
origin,typeres="deviance", collapse, weighted,scaleX=TRUE,
scaleY=NULL,dataXplan=NULL, nt=min(2,ncol(Xplan)),
limQ2set=.0975, dataPredictY=Xplan, pvals.expli=FALSE,
model_frame=FALSE, alpha.pvals.expli=.05,tol_Xi=10^(-12),
weights,subset,control,sparse=FALSE,sparseStop=TRUE,
plot=FALSE,allres=FALSE, kernel = "rbfdot", hyperkernel,
verbose=TRUE,...)
```

Arguments

Xplan	a formula or a matrix with the eXplanatory variables (training) dataset
time	for right censored data, this is the follow up time. For interval data, the first argument is the starting time for the interval.
time2	The status indicator, normally 0=alive, 1=dead. Other choices are TRUE/FALSE (TRUE = death) or 1/2 (2=death). For interval censored data, the status indicator is 0=right censored, 1=event at time, 2=left censored, 3=interval censored. Although unusual, the event indicator can be omitted, in which case all subjects are assumed to have an event.
event	ending time of the interval for interval censored or counting process data only. Intervals are assumed to be open on the left and closed on the right, (start, end]. For counting process data, event indicates whether an event occurred at the end of the interval.
type	character string specifying the type of censoring. Possible values are "right", "left", "counting", "interval", or "interval2". The default is "right" or "counting" depending on whether the time2 argument is absent or present, respectively.

origin   for counting process data, the hazard function origin. This option was intended
                     to be used in conjunction with a model containing time dependent strata in order
                     to align the subjects properly when they cross over from one strata to another,
                     but it has rarely proven useful.

typeres   character string indicating the type of residual desired. Possible values are
                     "martingale", "deviance", "score", "schoenfeld", "dfbeta", "dfbetas",
                     and "scaledsch". Only enough of the string to determine a unique match is
                     required.

collapse   vector indicating which rows to collapse (sum) over. In time-dependent models
                     more than one row data can pertain to a single individual. If there were 4 individ-
                     uals represented by 3, 1, 2 and 4 rows of data respectively, then collapse=c(1,1,1,2,3,3,4,4,4,4)
                     could be used to obtain per subject rather than per observation residuals.

weighted   if TRUE and the model was fit with case weights, then the weighted residuals are
                     returned.

scaleX   Should the Xplan columns be standardized ?

scaleY   Should the time values be standardized ?

nt   number of components to be extracted

limQ2set   limit value for the Q2

dataPredictY   predictor(s) (testing) dataset

pvals.expli   should individual p-values be reported to tune model selection ?

alpha.pvals.expli
                     level of significance for predictors when pvals.expli=TRUE

tol_Xi   minimal value for Norm2(Xi) and $\det(pp' \times pp)$ if there is any missing value in
                     the dataX. It defaults to 10^{-12}

weights   an optional vector of 'prior weights' to be used in the fitting process. Should be
                     NULL or a numeric vector.

subset   an optional vector specifying a subset of observations to be used in the fitting
                     process.

plot   Should the survival function be plotted ?)

allres   FALSE to return only the Cox model and TRUE for additionnal results. See
                     details. Defaults to FALSE.

dataXplan   an optional data frame, list or environment (or object coercible by as.data.frame
                     to a data frame) containing the variables in the model. If not found in dataXplan,
                     the variables are taken from environment(Xplan), typically the environment
                     from which coxDKplsDR is called.

model_frame   If TRUE, the model frame is returned.

method   the method to be used in fitting the model. The default method "glm.fit" uses
                     iteratively reweighted least squares (IWLS). User-supplied fitting functions can
                     be supplied either as a function or a character string naming a function, with a
                     function which takes the same arguments as glm.fit.

control   a list of parameters for controlling the fitting process. For glm.fit this is passed
                     to glm.control.

sparse	should the coefficients of non-significant predictors (<alpha.pvals.expli) be set to 0
sparseStop	should component extraction stop when no significant predictors (<alpha.pvals.expli) are found
kernel	the kernel function used in training and predicting. This parameter can be set to any function, of class kernel, which computes the inner product in feature space between two vector arguments (see kernels). The kernlab package provides the most popular kernel functions which can be used by setting the kernel parameter to the following strings:

rbfdot Radial Basis kernel "Gaussian"

polydot Polynomial kernel

vanilladot Linear kernel

tanhdot Hyperbolic tangent kernel

laplacedot Laplacian kernel

besseldot Bessel kernel

anovadot ANOVA RBF kernel

splinedot Spline kernel

hyperkernel	the list of hyper-parameters (kernel parameters). This is a list which contains the parameters to be used with the kernel function. For valid parameters for existing kernels are :

- sigma, inverse kernel width for the Radial Basis kernel function "rbfdot" and the Laplacian kernel "laplacedot".
- degree, scale, offset for the Polynomial kernel "polydot".
- scale, offset for the Hyperbolic tangent kernel function "tanhdot".
- sigma, order, degree for the Bessel kernel "besseldot".
- sigma, degree for the ANOVA kernel "anovadot".

In the case of a Radial Basis kernel function (Gaussian) or Laplacian kernel, if hyperkernel is missing, the heuristics in sigest are used to calculate a good sigma value from the data.

verbose	Should some details be displayed ?
...	arguments to pass to plsRmodel.default or to plsRmodel.formula

Details

A typical predictor has the form response ~ terms where response is the (numeric) response vector and terms is a series of terms which specifies a linear predictor for response. A terms specification of the form first + second indicates all the terms in first together with all the terms in second with any duplicates removed.

A specification of the form first:second indicates the the set of terms obtained by taking the interactions of all terms in first with all terms in second. The specification first*second indicates the cross of first and second. This is the same as first + second + first:second.

The terms in the formula will be re-ordered so that main effects come first, followed by the interactions, all second-order, all third-order and so on: to avoid this pass a terms object as the formula.

Non-NULL weights can be used to indicate that different observations have different dispersions (with the values in weights being inversely proportional to the dispersions); or equivalently, when the elements of weights are positive integers w_i, that each response y_i is the mean of w_i unit-weight observations.

Value

Depends on the model that was used to fit the model.

larsDR_coxph   *Fitting a LASSO/LARS model on the (Deviance) Residuals*

Description

This function computes the Cox Model based on lars variables computed model with

- as the response: the Residuals of a Cox-Model fitted with no covariate
- as explanatory variables: Xplan.

It uses the package `lars` to perform PLSR fit.

This function computes the LASSO/LARS model with the Residuals of a Cox-Model fitted with an intercept as the only explanatory variable as the response and Xplan as explanatory variables. Default behaviour uses the Deviance residuals.

Usage

```
larsDR_coxph(Xplan, ...)
## Default S3 method:
larsDR_coxph(Xplan, time, time2, event, type,
origin, typeres = "deviance", collapse, weighted, scaleX = FALSE,
scaleY = TRUE, plot = FALSE, typelars="lasso", normalize=TRUE, max.steps,
use.Gram=TRUE, allres = FALSE, verbose=TRUE,...)
## S3 method for class 'formula'
larsDR_coxph(Xplan, time, time2, event, type,
origin, typeres = "deviance", collapse, weighted, scaleX = FALSE,
scaleY = TRUE, plot = FALSE, typelars="lasso", normalize=TRUE, max.steps,
use.Gram=TRUE, allres = FALSE, dataXplan = NULL, subset, weights,
model_frame=FALSE,model_matrix=FALSE, verbose=TRUE,...)
```

Arguments

Xplan	a formula or a matrix with the eXplanatory variables (training) dataset
time	for right censored data, this is the follow up time. For interval data, the first argument is the starting time for the interval.
time2	The status indicator, normally 0=alive, 1=dead. Other choices are TRUE/FALSE (TRUE = death) or 1/2 (2=death). For interval censored data, the status indicator is 0=right censored, 1=event at time, 2=left censored, 3=interval censored. Although unusual, the event indicator can be omitted, in which case all subjects are assumed to have an event.
event	ending time of the interval for interval censored or counting process data only. Intervals are assumed to be open on the left and closed on the right, (start, end]. For counting process data, event indicates whether an event occurred at the end of the interval.
type	character string specifying the type of censoring. Possible values are "right", "left", "counting", "interval", or "interval2". The default is "right" or "counting" depending on whether the time2 argument is absent or present, respectively.
origin	for counting process data, the hazard function origin. This option was intended to be used in conjunction with a model containing time dependent strata in order to align the subjects properly when they cross over from one strata to another, but it has rarely proven useful.
typeres	character string indicating the type of residual desired. Possible values are "martingale", "deviance", "score", "schoenfeld", "dfbeta", "dfbetas", and "scaledsch". Only enough of the string to determine a unique match is required.
collapse	vector indicating which rows to collapse (sum) over. In time-dependent models more than one row data can pertain to a single individual. If there were 4 individuals represented by 3, 1, 2 and 4 rows of data respectively, then collapse=c(1,1,1,2,3,3,4,4,4,4) could be used to obtain per subject rather than per observation residuals.
weighted	if TRUE and the model was fit with case weights, then the weighted residuals are returned.

scaleX	Should the Xplan columns be standardized ?
scaleY	Should the time values be standardized ?
plot	Should the survival function be plotted ?)
typelars	One of "lasso", "lar", "forward.stagewise" or "stepwise". The names can be abbreviated to any unique substring. Default is "lasso".
normalize	If TRUE, each variable is standardized to have unit L2 norm, otherwise it is left alone. Default is TRUE.
max.steps	Limit the number of steps taken; the default is 8 * min(m, n-intercept), with m the number of variables, and n the number of samples. For type="lar" or type="stepwise", the maximum number of steps is min(m,n-intercept). For type="lasso" and especially type="forward.stagewise", there can be many more terms, because although no more than min(m,n-intercept) variables can be active during any step, variables are frequently droppped and added as the algorithm proceeds. Although the default usually guarantees that the algorithm has proceeded to the saturated fit, users should check.
use.Gram	When the number m of variables is very large, i.e. larger than N, then you may not want LARS to precompute the Gram matrix. Default is use.Gram=TRUE
allres	FALSE to return only the Cox model and TRUE for additionnal results. See details. Defaults to FALSE.
dataXplan	an optional data frame, list or environment (or object coercible by [as.data.frame](#) to a data frame) containing the variables in the model. If not found in dataXplan, the variables are taken from environment(Xplan), typically the environment from which plscox is called.
subset	an optional vector specifying a subset of observations to be used in the fitting process.
weights	an optional vector of 'prior weights' to be used in the fitting process. Should be NULL or a numeric vector.
model_frame	If TRUE, the model frame is returned.
model_matrix	If TRUE, the "unweighted" model matrix is returned.
verbose	Should some details be displayed ?
...	Arguments to be passed on to survival::coxph or to lars::lars.

Details

If allres=FALSE returns only the final Cox-model. If allres=TRUE returns a list with the (Deviance) Residuals, the LASSO/LARS model fitted to the (Deviance) Residuals, the eXplanatory variables and the final Cox-model. allres=TRUE is useful for evluating model prediction accuracy on a test sample.

Value

If allres=FALSE :

cox_larsDR	Final Cox-model.

If `allres=TRUE` :

DR_coxph	The (Deviance) Residuals.
larsDR	The LASSO/LARS model fitted to the (Deviance) Residuals.
X_larsDR	The eXplanatory variables.
cox_larsDR	Final Cox-model.

plsRcox   *Partial least squares Regression generalized linear models*

Description

This function implements an extension of Partial least squares Regression to Cox Models.

Usage

```
plsRcox(Xplan, ...)
## Default S3 method:
plsRcoxmodel(Xplan,time,time2,event,type,
origin,typeres="deviance", collapse, weighted, scaleX=TRUE,
scaleY=TRUE, nt=min(2,ncol(Xplan)),limQ2set=.0975,
dataPredictY=Xplan, pvals.expli=FALSE,alpha.pvals.expli=.05,
tol_Xi=10^(-12),weights,control, sparse=FALSE,
sparseStop=TRUE,allres=TRUE, verbose=TRUE,...)
## S3 method for class 'formula'
plsRcoxmodel(Xplan,time,time2,event,type,
origin,typeres="deviance", collapse, weighted,scaleX=TRUE,
scaleY=NULL,dataXplan=NULL, nt=min(2,ncol(Xplan)),
limQ2set=.0975, dataPredictY=Xplan, pvals.expli=FALSE,
model_frame=FALSE, alpha.pvals.expli=.05,tol_Xi=10^(-12),
weights,subset,control,sparse=FALSE,sparseStop=TRUE,
allres=TRUE, verbose=TRUE,...)
```

Arguments

Xplan	a formula or a matrix with the eXplanatory variables (training) dataset
time	for right censored data, this is the follow up time. For interval data, the first argument is the starting time for the interval.
time2	The status indicator, normally 0=alive, 1=dead. Other choices are TRUE/FALSE (TRUE = death) or 1/2 (2=death). For interval censored data, the status indicator is 0=right censored, 1=event at time, 2=left censored, 3=interval censored. Although unusual, the event indicator can be omitted, in which case all subjects are assumed to have an event.

event	ending time of the interval for interval censored or counting process data only. Intervals are assumed to be open on the left and closed on the right, (start, end]. For counting process data, event indicates whether an event occurred at the end of the interval.
type	character string specifying the type of censoring. Possible values are ″right″, ″left″, ″counting″, ″interval″, or ″interval2″. The default is ″right″ or ″counting″ depending on whether the time2 argument is absent or present, respectively.
origin	for counting process data, the hazard function origin. This option was intended to be used in conjunction with a model containing time dependent strata in order to align the subjects properly when they cross over from one strata to another, but it has rarely proven useful.
typeres	character string indicating the type of residual desired. Possible values are ″martingale″, ″deviance″, ″score″, ″schoenfeld″, ″dfbeta″, ″dfbetas″, and ″scaledsch″. Only enough of the string to determine a unique match is required.
collapse	vector indicating which rows to collapse (sum) over. In time-dependent models more than one row data can pertain to a single individual. If there were 4 individuals represented by 3, 1, 2 and 4 rows of data respectively, then collapse=c(1,1,1,2,3,3,4,4,4,4) could be used to obtain per subject rather than per observation residuals.
weighted	if TRUE and the model was fit with case weights, then the weighted residuals are returned.
scaleX	Should the Xplan columns be standardized ?
scaleY	Should the time values be standardized ?
nt	number of components to be extracted
limQ2set	limit value for the Q2
dataPredictY	predictor(s) (testing) dataset
pvals.expli	should individual p-values be reported to tune model selection ?
alpha.pvals.expli	
	level of significance for predictors when pvals.expli=TRUE
tol_Xi	minimal value for Norm2(Xi) and $\det(pp' \times pp)$ if there is any missing value in the dataX. It defaults to 10^{-12}
weights	an optional vector of 'prior weights' to be used in the fitting process. Should be NULL or a numeric vector.
subset	an optional vector specifying a subset of observations to be used in the fitting process.
allres	FALSE to return only the Cox model and TRUE for additionnal results. See details. Defaults to FALSE.
dataXplan	an optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in dataXplan, the variables are taken from environment(Xplan), typically the environment from which coxDKplsDR is called.
model_frame	If TRUE, the model frame is returned.

method	the method to be used in fitting the model. The default method ″glm.fit″ uses iteratively reweighted least squares (IWLS). User-supplied fitting functions can be supplied either as a function or a character string naming a function, with a function which takes the same arguments as glm.fit.
control	a list of parameters for controlling the fitting process. For glm.fit this is passed to glm.control.
sparse	should the coefficients of non-significant predictors (<alpha.pvals.expli) be set to 0
sparseStop	should component extraction stop when no significant predictors (<alpha.pvals.expli) are found
verbose	Should some details be displayed ?
...	arguments to pass to plsRmodel.default or to plsRmodel.formula

Details

A typical predictor has the form response ~ terms where response is the (numeric) response vector and terms is a series of terms which specifies a linear predictor for response. A terms specification of the form first + second indicates all the terms in first together with all the terms in second with any duplicates removed.

A specification of the form first:second indicates the the set of terms obtained by taking the interactions of all terms in first with all terms in second. The specification first*second indicates the cross of first and second. This is the same as first + second + first:second.

The terms in the formula will be re-ordered so that main effects come first, followed by the interactions, all second-order, all third-order and so on: to avoid this pass a terms object as the formula.

Non-NULL weights can be used to indicate that different observations have different dispersions (with the values in weights being inversely proportional to the dispersions); or equivalently, when the elements of weights are positive integers w_i, that each response y_i is the mean of w_i unit-weight observations.

Value

Depends on the model that was used to fit the model.

---

predict.plsRcoxmodel   *Print method for plsRcox models*

Description

This function provides a predict method for the class "plsRcoxmodel"

Usage

```
## S3 method for class 'plsRcoxmodel'
predict(object,newdata,comps=object$computed_nt,
type=c("lp", "risk", "expected", "terms", "scores"),se.fit=FALSE,
weights,methodNA="adaptative",verbose=TRUE,...)
```

Arguments

object	An object of the class "plsRcoxmodel".
newdata	An optional data frame in which to look for variables with which to predict. If omitted, the fitted values are used.
comps	A value with a single value of component to use for prediction.
type	Type of predicted value. Choices are the linear predictor ("lp"), the risk score exp(lp) ("risk"), the expected number of events given the covariates and follow-up time ("expected"), the terms of the linear predictor ("terms") or the scores ("scores").
se.fit	If TRUE, pointwise standard errors are produced for the predictions using the Cox model.
weights	Vector of case weights. If weights is a vector of integers, then the estimated coefficients are equivalent to estimating the model from data with the individual cases replicated as many times as indicated by weights.

methodNA   Selects the way of predicting the response or the scores of the new data. For
                  complete rows, without any missing value, there are two different ways of com-
                  puting the prediction. As a consequence, for mixed datasets, with complete and
                  incomplete rows, there are two ways of computing prediction : either predicts
                  any row as if there were missing values in it (missingdata) or selects the pre-
                  diction method accordingly to the completeness of the row (adaptative).

verbose   Should some details be displayed ?

...   Arguments to be passed on to survival::coxph and to plsRglm::PLS_lm.

Value

When type is "response", a matrix of predicted response values is returned.
When type is "scores", a score matrix is returned.

Xmicro.censure_compl_imp
                            Imputed Microsat features

Description

This dataset provides imputed microsat specifications. Imputations were computed using Multi-
variate Imputation by Chained Equations (MICE) using predictive mean matching for the numeric
columns, logistic regression imputation for the binary data or the factors with 2 levels and polyto-
mous regression imputation for categorical data i.e. factors with three or more levels.

Format

A data frame with 117 observations on the following 40 variables.

D18S61 a numeric vector

D17S794 a numeric vector

D13S173 a numeric vector

```
D20S107  a numeric vector
