

# Package ‘merDeriv’

November 30, 2018

**Title** Case-Wise and Cluster-Wise Derivatives for Mixed Effects Models

**Version** 0.1-6

**Description** Compute analytic case-wise and cluster-wise derivative for mixed effects models with respect to fixed effects parameter, random effect (co)variances, and residual variance.

**Depends** R (>= 3.2.3), lme4 (>= 1.1-10), stats, methods, nonnest2, sandwich

**Imports** utils, Matrix

**License** GPL (>= 2)

**LazyData** yes

**URL** <http://semtools.r-forge.r-project.org>

**NeedsCompilation** no

**Author** Ting Wang [aut, cre],  
Edgar Merkle [aut]

**Maintainer** Ting Wang <twb8d@mail.missouri.edu>

**Repository** CRAN

**Date/Publication** 2018-11-30 07:20:02 UTC

bread.lmerMod	<i>Extract Bread Component for Huber-White Sandwich Estimator of Linear Mixed Effects Models</i>
---------------	--

---

## Description

This function calculates the bread component of the Huber-White sandwich estimator (variance covariance matrix multiplied by the number of clusters) for a linear mixed effects model of class `lmerMod`.

## Usage

```
## S3 method for class 'lmerMod'
bread(x, ...)
```

## Arguments

- |                  |   |
|------------------|---|
| <code>x</code>   | An object of class <code>lmerMod</code> .   |
| <code>...</code> | additional arguments, including <code>full</code> and <code>information</code> ( <code>full = FALSE</code> and <code>information = "expected"</code> are default; see details). |

## Value

A  $p$  by  $p$  "bread" matrix for the Huber-White sandwich estimator (variance-covariance matrix multiplied by the number of clusters), where  $p$  represents the number of parameters. If `full = FALSE`, returns the variance-covariance matrix of only fixed effect parameters. If `full = TRUE`, returns the variance-covariance matrix for all fitted parameters (including fixed effect parameters, random effect (co)variances, and residual variance). If `information = "expected"`, the variance-covariance matrix is based on the inversion of Fisher information matrix. If `information = "observed"`, the variance-covariance matrix is based on the observed Fisher information, which is the negative of Hessian matrix.

## Examples

```
## Not run:
# The sleepstudy example
lme4fit <- lmer(Reaction ~ Days + (Days|Subject), sleepstudy, REML = FALSE)

# bread component for all parameters
```

```

  bread(lme4fit, full = TRUE)

## End(Not run)

```

---

<code>estfun.lmerMod</code>	<i>Extract Case-wise and Cluster-wise Derivatives for Linear Mixed Effects Models</i>
-----------------------------	---

---

## Description

A function for extracting the case-wise and cluster-wise derivatives of a linear mixed effects models fitted via **lme4**. This function returns the case-wise and cluster-wise scores, evaluated at the ML estimates.

## Usage

```

## S3 method for class 'lmerMod'
estfun(x, ...)

```

## Arguments

- x An object of class `lmerMod`.
- ... additional arguments, including `level` (`level = 2` is default; see details).

## Value

If `level = 2`, a  $g$  by  $p$  score matrix, corresponding to  $g$  clusters and  $p$  parameters. If `level = 1`, a  $n$  by  $p$  score matrix, corresponding to  $n$  observations and  $p$  parameters. For models with multiple clustering variables (three-level models, crossed random effects), an error is thrown if `level = 2`.

## Examples

```

## Not run:
# The sleepstudy example
lme4fit <- lmer(Reaction ~ Days + (Days|Subject), sleepstudy, REML = FALSE)

# casewise scores
estfun(lme4fit, level = 1)

# clusterwise scores
estfun(lme4fit, level = 2)

## End(Not run)

```

**llcont.lmerMod***Extract Case-wise Log Likelihoods for Linear Mixed Effects Models*

## Description

A function for extracting the case-wise log likelihoods of a linear mixed effects model fitted via **lme4**. This function returns the case-wise log likelihoods, evaluated at the ML estimates.

## Usage

```
## S3 method for class 'lmerMod'
llcont(x, ...)
```

## Arguments

- x An object of class **lmerMod**.
- ... additional arguments, including `level` (`level = 2` is default; see details).

## Value

If `level = 2`, a vector of log-likelihoods whose length is the number of clusters. If `level = 1`, a vector of length  $n$ , containing log-likelihoods for all  $n$  observations.

<code>vcov.glmerMod</code>	<i>Extract Variance-Covariance Matrix of all Parameters for Generalized Linear Mixed Effects Models</i>
----------------------------	---

---

## Description

This function calculates the variance-covariance matrix for all parameters (fixed and random effect) in a generalized linear mixed effects model of class `glmerMod`.

## Usage

```
## S3 method for class 'glmerMod'
vcov(object, ...)
```

## Arguments

- |        |   |
|--------|---|
| object | An object of class <code>glmerMod</code> .  |
| ...    | additional arguments, including <code>full = FALSE</code> is default; see details). |

## Value

A  $p$  by  $p$  variance-covariance matrix, where  $p$  represents the number of parameters. If `full = FALSE`, returns the variance-covariance matrix of only fixed effect parameters. If `full = TRUE`, returns the variance-covariance matrix for all fitted parameters (including fixed effect parameters and random effect (co)variances). The variance-covariance matrix is based on the negative of Hessian matrix, which is extracted from `lme4`.

## Examples

```
## Not run:
# The cbpp example
lme4fit <- glmer(cbind(incidence, size - incidence) ~ period + (1 | herd),
  data = cbpp, family = binomial)

# variance covariance matrix for all parameters
vcov(lme4fit, full = TRUE)

## End(Not run)

vcov.lmerMod	<i>Extract Variance-Covariance Matrix of all Parameters for Linear Mixed Effects Models</i>
--------------	---

---

## Description

This function calculates the variance-covariance matrix for all parameters (fixed, random effect, and residual) in a linear mixed effects model of class [lmerMod](#).

## Usage

```
## S3 method for class 'lmerMod'
vcov(object, ...)
```

## Arguments

- |        |   |
|--------|---|
| object | An object of class <a href="#">lmerMod</a> .  |
| ...    | additional arguments, including <code>full</code> and <code>information</code> ( <code>full = FALSE</code> and <code>information = "expected"</code> are default; see details). |

## Value

A  $p$  by  $p$  variance-covariance matrix, where  $p$  represents the number of parameters. If `full = FALSE`, returns the variance-covariance matrix of only fixed effect parameters. If `full = TRUE`, returns the variance-covariance matrix for all fitted parameters (including fixed effect parameters, random effect (co)variances, and residual variance). If `information = "expected"`, the variance-covariance matrix is based on the inversion of Fisher information matrix. If `information = "observed"`, the variance-covariance matrix is based on the observed Fisher information, which is the negative of Hessian matrix.
