

Package ‘radiant.basics’

October 6, 2018

Type Package

Title Basics Menu for Radiant: Business Analytics using R and Shiny

Version 0.9.7

Date 2018-10-5

Description The Radiant Basics menu includes interfaces for probability calculation, central limit theorem simulation, comparing means and proportions, goodness-of-fit testing, cross-tabs, and correlation. The application extends the functionality in radiant.data.

Depends R (>= 3.4.0), radiant.data (>= 0.9.7)

Imports ggplot2 (>= 2.2.1), gridExtra (>= 2.0.0), scales (>= 0.4.0), dplyr (>= 0.7.6), tidyr (>= 0.8.0), magrittr (>= 1.5), shiny (>= 1.1.0), psych (>= 1.8.3.3), import (>= 1.1.0)

Suggests testthat (>= 2.0.0), pkgdown (>= 1.1.0)

clt *Central Limit Theorem simulation*

Description

Central Limit Theorem simulation

Usage

```
clt(dist, n = 100, m = 100, norm_mean = 0, norm_sd = 1,
binom_size = 10, binom_prob = 0.2, unif_min = 0, unif_max = 1,
expo_rate = 1)
```

Arguments

dist	Distribution to simulate
n	Sample size
m	Number of samples
norm_mean	Mean for the normal distribution
norm_sd	Standard deviation for the normal distribution
binom_size	Size for the binomial distribution
binom_prob	Probability for the binomial distribution
unif_min	Minimum for the uniform distribution
unif_max	Maximum for the uniform distribution
expo_rate	Rate for the exponential distribution

Details

See <https://radiantrstats.github.io/docs/basics/clt.html> for an example in R radiant

Value

A list with the name of the Distribution and a matrix of simulated data

Examples

```
clt("Uniform", 10, 10, unif_min = 10, unif_max = 20)
```

`compare_means`

Compare sample means

Description

Compare sample means

Usage

```
compare_means(dataset, var1, var2, samples = "independent",
  alternative = "two.sided", conf_lev = 0.95, comb = "",
  adjust = "none", test = "t", data_filter = "")
```

Arguments

<code>dataset</code>	Dataset
<code>var1</code>	A numeric variable or factor selected for comparison
<code>var2</code>	One or more numeric variables for comparison. If <code>var1</code> is a factor only one variable can be selected and the mean of this variable is compared across (factor) levels of <code>var1</code>
<code>samples</code>	Are samples independent ("independent") or not ("paired")
<code>alternative</code>	The alternative hypothesis ("two.sided", "greater" or "less")
<code>conf_lev</code>	Span of the confidence interval
<code>comb</code>	Combinations to evaluate
<code>adjust</code>	Adjustment for multiple comparisons ("none" or "bonf" for Bonferroni)
<code>test</code>	t-test ("t") or Wilcox ("wilcox")
<code>data_filter</code>	Expression entered in, e.g., Data > View to filter the dataset in R radiant. The expression should be a string (e.g., "price > 10000")

Details

See https://radiantrstats.github.io/docs/basics/compare_means.html for an example in R radiant

Value

A list of all variables defined in the function as an object of class compare_means

See Also

[summary.compare_means](#) to summarize results

[plot.compare_means](#) to plot results

Examples

```
compare_means(diamonds, "cut", "price") %>% str()
```

compare_props

Compare sample proportions across groups

Description

Compare sample proportions across groups

Usage

```
compare_props(dataset, var1, var2, levs = "",  
alternative = "two.sided", conf_lev = 0.95, comb = "",  
adjust = "none", data_filter = "")
```

Arguments

dataset	Dataset
var1	A grouping variable to split the data for comparisons
var2	The variable to calculate proportions for
levs	The factor level selected for the proportion comparison
alternative	The alternative hypothesis ("two.sided", "greater" or "less")
conf_lev	Span of the confidence interval
comb	Combinations to evaluate
adjust	Adjustment for multiple comparisons ("none" or "bonf" for Bonferroni)
data_filter	Expression entered in, e.g., Data > View to filter the dataset in R radiant. The expression should be a string (e.g., "price > 10000")

Details

See https://radiant-rstats.github.io/docs/basics/compare_props.html for an example in R radiant

Value

A list of all variables defined in the function as an object of class compare_props

See Also

[summary.compare_props](#) to summarize results
[plot.compare_props](#) to plot results

Examples

```
compare_props(titanic, "pclass", "survived") %>% str()
```

consider	<i>Car brand consideration</i>
----------	--------------------------------

Description

Car brand consideration

Usage

```
data(consider)
```

Format

A data frame with 1000 rows and 2 variables

Details

Survey data of consumer purchase intentions. Description provided in attr(consider,"description")

correlation	<i>Calculate correlations for two or more variables</i>
-------------	---

Description

Calculate correlations for two or more variables

Usage

```
correlation(dataset, vars = "", method = "pearson", data_filter = "")
```

Arguments

dataset	Dataset
vars	Variables to include in the analysis. Default is all but character and factor variables with more than two unique values are removed
method	Type of correlations to calculate. Options are "pearson", "spearman", and "kendall". "pearson" is the default
data_filter	Expression entered in, e.g., Data > View to filter the dataset in Radiant. The expression should be a string (e.g., "price > 10000")

Details

See <https://radiant-rstats.github.io/docs/basics/correlation.html> for an example in Radiant

Value

A list with all variables defined in the function as an object of class compare_means

See Also

[summary.correlation](#) to summarize results
[plot.correlation](#) to plot results

Examples

```
correlation(diamonds, c("price", "carat")) %>% str()  
correlation(diamonds, "x:z") %>% str()
```

cross_tabs

Evaluate associations between categorical variables

Description

Evaluate associations between categorical variables

Usage

```
cross_tabs(dataset, var1, var2, tab = NULL, data_filter = "")
```

Arguments

dataset	Dataset (i.e., a data.frame or table)
var1	A categorical variable
var2	A categorical variable
tab	Table with frequencies as alternative to dataset
data_filter	Expression entered in, e.g., Data > View to filter the dataset in Radiant. The expression should be a string (e.g., "price > 10000")

Details

See https://radiantrstats.github.io/docs/basics/cross_tabs.html for an example in R radiant

Value

A list of all variables used in cross_tabs as an object of class cross_tabs

See Also

[summary.cross_tabs](#) to summarize results

[plot.cross_tabs](#) to plot results

Examples

```
cross_tabs(newspaper, "Income", "Newspaper") %>% str()
table(select(newspaper, Income, Newspaper)) %>% cross_tabs(tab = .)
```

demand_uk

Demand in the UK

Description

Demand in the UK

Usage

```
data(demand_uk)
```

Format

A data frame with 1000 rows and 2 variables

Details

Survey data of consumer purchase intentions. Description provided in attr(demand_uk,"description")

goodness	<i>Evaluate if sample data for a categorical variable is consistent with a hypothesized distribution</i>
----------	--

Description

Evaluate if sample data for a categorical variable is consistent with a hypothesized distribution

Usage

```
goodness(dataset, var, p = NULL, tab = NULL, data_filter = "")
```

Arguments

dataset	Dataset
var	A categorical variable
p	Hypothesized distribution as a number, fraction, or numeric vector. If unspecified, defaults to an even distribution
tab	Table with frequencies as alternative to dataset
data_filter	Expression entered in, e.g., Data > View to filter the dataset in Radiant. The expression should be a string (e.g., "price > 10000")

Details

See <https://radiant-rstats.github.io/docs/basics/goodness.html> for an example in Radiant

Value

A list of all variables used in goodness as an object of class goodness

See Also

[summary.goodness](#) to summarize results

[plot.goodness](#) to plot results

Examples

```
goodness(newspaper, "Income") %>% str()
table(select(newspaper, Income)) %>% goodness(tab = .)
```

`newspaper` *Newspaper readership*

Description

Newspaper readership

Usage

```
data(newspaper)
```

Format

A data frame with 580 rows and 2 variables

Details

Newspaper readership data for 580 consumers. Description provided in attr(newspaper,"description")

`plot.clt` *Plot method for the Central Limit Theorem simulation*

Description

Plot method for the Central Limit Theorem simulation

Usage

```
## S3 method for class 'clt'
plot(x, stat = "sum", bins = 15, ...)
```

Arguments

<code>x</code>	Return value from <code>clt</code>
<code>stat</code>	Statistic to use (sum or mean)
<code>bins</code>	Number of bins to use
<code>...</code>	further arguments passed to or from other methods

Details

See <https://radiantrstats.github.io/docs/basics/clt.html> for an example in Radian

Examples

```
clt("Uniform", 100, 100, unif_min = 10, unif_max = 20) %>% plot()
```

plot.compare_means *Plot method for the compare_means function*

Description

Plot method for the compare_means function

Usage

```
## S3 method for class 'compare_means'  
plot(x, plots = "scatter", shiny = FALSE,  
      custom = FALSE, ...)
```

Arguments

x	Return value from compare_means
plots	One or more plots ("bar", "density", "box", or "scatter")
shiny	Did the function call originate inside a shiny app
custom	Logical (TRUE, FALSE) to indicate if ggplot object (or list of ggplot objects) should be returned. This option can be used to customize plots (e.g., add a title, change x and y labels, etc.). See examples and http://docs.ggplot2.org for options.
...	further arguments passed to or from other methods

Details

See https://radiant-rstats.github.io/docs/basics/compare_means.html for an example in R radiant

See Also

[compare_means](#) to calculate results

[summary.compare_means](#) to summarize results

Examples

```
result <- compare_means(diamonds, "cut", "price")  
plot(result, plots = c("bar", "density"))
```

`plot.compare_props` *Plot method for the compare_props function*

Description

Plot method for the compare_props function

Usage

```
## S3 method for class 'compare_props'  
plot(x, plots = "bar", shiny = FALSE,  
      custom = FALSE, ...)
```

Arguments

<code>x</code>	Return value from <code>compare_props</code>
<code>plots</code>	One or more plots of proportions ("bar" or "dodge")
<code>shiny</code>	Did the function call originate inside a shiny app
<code>custom</code>	Logical (TRUE, FALSE) to indicate if ggplot object (or list of ggplot objects) should be returned. This option can be used to customize plots (e.g., add a title, change x and y labels, etc.). See examples and http://docs.ggplot2.org for options.
<code>...</code>	further arguments passed to or from other methods

Details

See https://radiant-rstats.github.io/docs/basics/compare_props.html for an example in R radiant

See Also

[compare_props](#) to calculate results
[summary.compare_props](#) to summarize results

Examples

```
result <- compare_props(titanic, "pclass", "survived")  
plot(result, plots = c("bar", "dodge"))
```

plot.correlation *Plot method for the correlation function*

Description

Plot method for the correlation function

Usage

```
## S3 method for class 'correlation'  
plot(x, nrobs = -1, jit = 0.3, dec = 2, ...)
```

Arguments

x	Return value from correlation
nrobs	Number of data points to show in scatter plots (-1 for all)
jit	Level of jittering to apply to scatter plot. Default is .3. Use 0 for no jittering
dec	Number of decimals to show
...	further arguments passed to or from other methods.

Details

See <https://radiantrstats.github.io/docs/basics/correlation.html> for an example in R radiant

See Also

[correlation](#) to calculate results
[summary.correlation](#) to summarize results

Examples

```
result <- correlation(diamonds, c("price", "carat", "table"))  
plot(result)
```

plot.cross_tabs *Plot method for the cross_tabs function*

Description

Plot method for the cross_tabs function

Usage

```
## S3 method for class 'cross_tabs'
plot(x, check = "", shiny = FALSE,
      custom = FALSE, ...)
```

Arguments

x	Return value from cross_tabs
check	Show plots for variables var1 and var2. "observed" for the observed frequencies table, "expected" for the expected frequencies table (i.e., frequencies that would be expected if the null hypothesis holds), "chi_sq" for the contribution to the overall chi-squared statistic for each cell (i.e., $(o - e)^2 / e$), "dev_std" for the standardized differences between the observed and expected frequencies (i.e., $(o - e) / \sqrt{e}$), and "row_perc", "col_perc", and "perc" for row, column, and table percentages respectively
shiny	Did the function call originate inside a shiny app
custom	Logical (TRUE, FALSE) to indicate if ggplot object (or list of ggplot objects) should be returned. This option can be used to customize plots (e.g., add a title, change x and y labels, etc.). See examples and http://docs.ggplot2.org for options.
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/cross_tabs.html for an example in R radiant

See Also

[cross_tabs](#) to calculate results
[summary.cross_tabs](#) to summarize results

Examples

```
result <- cross_tabs(newspaper, "Income", "Newspaper")
plot(result, check = c("observed", "expected", "chi_sq"))
```

plot.goodness *Plot method for the goodness function*

Description

Plot method for the goodness function

Usage

```
## S3 method for class 'goodness'  
plot(x, check = "", fillcol = "blue",  
      shiny = FALSE, custom = FALSE, ...)
```

Arguments

x	Return value from goodness
check	Show plots for variable var. "observed" for the observed frequencies table, "expected" for the expected frequencies table (i.e., frequencies that would be expected if the null hypothesis holds), "chi_sq" for the contribution to the overall chi-squared statistic for each cell (i.e., $(o - e)^2 / e$), and "dev_std" for the standardized differences between the observed and expected frequencies (i.e., $(o - e) / \sqrt{e}$)
fillcol	Color used for bar plots
shiny	Did the function call originate inside a shiny app
custom	Logical (TRUE, FALSE) to indicate if ggplot object (or list of ggplot objects) should be returned. This option can be used to customize plots (e.g., add a title, change x and y labels, etc.). See examples and http://docs.ggplot2.org for options.
...	further arguments passed to or from other methods

Details

See <https://radiantrstats.github.io/docs/basics/goodness> for an example in R radiant

See Also

[goodness](#) to calculate results

[summary.goodness](#) to summarize results

Examples

```
result <- goodness(newspaper, "Income")  
plot(result, check = c("observed", "expected", "chi_sq"))  
goodness(newspaper, "Income") %>% plot(c("observed", "expected"))
```

`plot.prob_binom` *Plot method for the probability calculator (binomial)*

Description

Plot method for the probability calculator (binomial)

Usage

```
## S3 method for class 'prob_binom'
plot(x, type = "values", ...)
```

Arguments

<code>x</code>	Return value from prob_binom
<code>type</code>	Probabilities ("probs") or values ("values")
<code>...</code>	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radiantr

Examples

```
result <- prob_binom(n = 10, p = 0.3, ub = 3)
plot(result, type = "values")
```

`plot.prob_chisq` *Plot method for the probability calculator (Chi-squared distribution)*

Description

Plot method for the probability calculator (Chi-squared distribution)

Usage

```
## S3 method for class 'prob_chisq'
plot(x, type = "values", ...)
```

Arguments

<code>x</code>	Return value from prob_chisq
<code>type</code>	Probabilities ("probs") or values ("values")
<code>...</code>	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian-

Examples

```
result <- prob_chisq(df = 1, ub = 3.841)
plot(result, type = "values")
```

plot.prob_disc

Plot method for the probability calculator (discrete)

Description

Plot method for the probability calculator (discrete)

Usage

```
## S3 method for class 'prob_disc'
plot(x, type = "values", ...)
```

Arguments

x	Return value from prob_disc
type	Probabilities ("probs") or values ("values")
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian-

Examples

```
result <- prob_disc(v = "5 6 7 8 9 10 11", p = ".1 .2 .3 .15 .1 .05", pub = 0.95)
plot(result, type = "probs")
```

`plot.prob_expo` *Plot method for the probability calculator (Exponential distribution)*

Description

Plot method for the probability calculator (Exponential distribution)

Usage

```
## S3 method for class 'prob_expo'
plot(x, type = "values", ...)
```

Arguments

- x Return value from `prob_expo`
- type Probabilities ("probs") or values ("values")
- ... further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in R-diant

Examples

```
result <- prob_expo(rate = 1, ub = 2.996)
plot(result, type = "values")
```

`plot.prob_fdist` *Plot method for the probability calculator (F-distribution)*

Description

Plot method for the probability calculator (F-distribution)

Usage

```
## S3 method for class 'prob_fdist'
plot(x, type = "values", ...)
```

Arguments

- x Return value from `prob_fdist`
- type Probabilities ("probs") or values ("values")
- ... further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian-

Examples

```
result <- prob_fdist(df1 = 10, df2 = 10, ub = 2.978)
plot(result, type = "values")
```

plot.prob_lnorm

Plot method for the probability calculator (log normal)

Description

Plot method for the probability calculator (log normal)

Usage

```
## S3 method for class 'prob_lnorm'
plot(x, type = "values", ...)
```

Arguments

x	Return value from prob_norm
type	Probabilities ("probs") or values ("values")
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian-

Examples

```
result <- prob_lnorm(meanlog = 0, sdlog = 1, lb = 0, ub = 1)
plot(result, type = "values")
```

`plot.prob_norm`*Plot method for the probability calculator (normal)***Description**

Plot method for the probability calculator (normal)

Usage

```
## S3 method for class 'prob_norm'
plot(x, type = "values", ...)
```

Arguments

<code>x</code>	Return value from <code>prob_norm</code>
<code>type</code>	Probabilities ("probs") or values ("values")
<code>...</code>	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radiantr

See Also

[prob_norm](#) to calculate results
[summary.prob_norm](#) to summarize results

Examples

```
result <- prob_norm(mean = 0, stdev = 1, ub = 0)
plot(result)
```

`plot.prob_pois`*Plot method for the probability calculator (poisson)***Description**

Plot method for the probability calculator (poisson)

Usage

```
## S3 method for class 'prob_pois'
plot(x, type = "values", ...)
```

Arguments

x	Return value from <code>prob_pois</code>
type	Probabilities ("probs") or values ("values")
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian

Examples

```
result <- prob_pois(lambda = 1, ub = 3)
plot(result, type = "values")
```

`plot.prob_tdist` *Plot method for the probability calculator (t-distribution)*

Description

Plot method for the probability calculator (t-distribution)

Usage

```
## S3 method for class 'prob_tdist'
plot(x, type = "values", ...)
```

Arguments

x	Return value from <code>prob_tdist</code>
type	Probabilities ("probs") or values ("values")
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian

Examples

```
result <- prob_tdist(df = 10, ub = 2.228)
plot(result, type = "values")
```

plot.prob_unif*Plot method for the probability calculator (uniform)***Description**

Plot method for the probability calculator (uniform)

Usage

```
## S3 method for class 'prob_unif'
plot(x, type = "values", ...)
```

Arguments

<code>x</code>	Return value from prob_unif
<code>type</code>	Probabilities ("probs") or values ("values")
<code>...</code>	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian

Examples

```
result <- prob_unif(min = 0, max = 1, ub = 0.3)
plot(result, type = "values")
```

plot.single_mean*Plot method for the single_mean function***Description**

Plot method for the single_mean function

Usage

```
## S3 method for class 'single_mean'
plot(x, plots = "hist", shiny = FALSE,
      custom = FALSE, ...)
```

Arguments

x	Return value from <code>single_mean</code>
plots	Plots to generate. "hist" shows a histogram of the data along with vertical lines that indicate the sample mean and the confidence interval. "simulate" shows the location of the sample mean and the comparison value (comp_value). Simulation is used to demonstrate the sampling variability in the data under the null-hypothesis
shiny	Did the function call originate inside a shiny app
custom	Logical (TRUE, FALSE) to indicate if ggplot object (or list of ggplot objects) should be returned. This option can be used to customize plots (e.g., add a title, change x and y labels, etc.). See examples and http://docs.ggplot2.org for options.
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/single_mean.html for an example in R radiant

See Also

[single_mean](#) to generate the result
[summary.single_mean](#) to summarize results

Examples

```
result <- single_mean(diamonds, "price", comp_value = 3500)
plot(result, plots = c("hist", "simulate"))
```

`plot.single_prop` *Plot method for the single_prop function*

Description

Plot method for the single_prop function

Usage

```
## S3 method for class 'single_prop'
plot(x, plots = "bar", shiny = FALSE,
      custom = FALSE, ...)
```

Arguments

x	Return value from single_prop
plots	Plots to generate. "bar" shows a bar chart of the data. The "simulate" chart shows the location of the sample proportion and the comparison value (comp_value). Simulation is used to demonstrate the sampling variability in the data under the null-hypothesis
shiny	Did the function call originate inside a shiny app
custom	Logical (TRUE, FALSE) to indicate if ggplot object (or list of ggplot objects) should be returned. This option can be used to customize plots (e.g., add a title, change x and y labels, etc.). See examples and http://docs.ggplot2.org for options.
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/single_prop.html for an example in R radiant

See Also

[single_prop](#) to generate the result
[summary.single_prop](#) to summarize the results

Examples

```
result <- single_prop(titanic, "survived", lev = "Yes", comp_value = 0.5, alternative = "less")
plot(result, plots = c("bar", "simulate"))
```

print.rcorr

Print method for the correlation function

Description

Print method for the correlation function

Usage

```
## S3 method for class 'rcorr'
print(x, ...)
```

Arguments

x	Return value from correlation
...	further arguments passed to or from other methods

prob_binom*Probability calculator for the binomial distribution*

Description

Probability calculator for the binomial distribution

Usage

```
prob_binom(n, p, lb = NA, ub = NA, plb = NA, pub = NA, dec = 3)
```

Arguments

n	Number of trials
p	Probability
lb	Lower bound on the number of successes
ub	Upper bound on the number of successes
plb	Lower probability bound
pub	Upper probability bound
dec	Number of decimals to show

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radiantr

Examples

```
prob_binom(n = 10, p = 0.3, ub = 3)
```

prob_chisq*Probability calculator for the chi-squared distribution*

Description

Probability calculator for the chi-squared distribution

Usage

```
prob_chisq(df, lb = NA, ub = NA, plb = NA, pub = NA, dec = 3)
```

Arguments

<code>df</code>	Degrees of freedom
<code>lb</code>	Lower bound (default is 0)
<code>ub</code>	Upper bound (default is Inf)
<code>plb</code>	Lower probability bound
<code>pub</code>	Upper probability bound
<code>dec</code>	Number of decimals to show

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian

Examples

```
prob_chisq(df = 1, ub = 3.841)
```

`prob_disc`

Probability calculator for a discrete distribution

Description

Probability calculator for a discrete distribution

Usage

```
prob_disc(v, p, lb = NA, ub = NA, plb = NA, pub = NA, dec = 3)
```

Arguments

<code>v</code>	Values
<code>p</code>	Probabilities
<code>lb</code>	Lower bound on the number of successes
<code>ub</code>	Upper bound on the number of successes
<code>plb</code>	Lower probability bound
<code>pub</code>	Upper probability bound
<code>dec</code>	Number of decimals to show

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian

Examples

```
prob_disc(v = "5 6 7 8 9 10 11", p = ".1 .2 .3 .15 .1 .05", pub = 0.95)
```

prob_expo

Probability calculator for the exponential distribution

Description

Probability calculator for the exponential distribution

Usage

```
prob_expo(rate, lb = NA, ub = NA, plb = NA, pub = NA, dec = 3)
```

Arguments

rate	Rate
lb	Lower bound (default is 0)
ub	Upper bound (default is Inf)
plb	Lower probability bound
pub	Upper probability bound
dec	Number of decimals to show

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian

Examples

```
prob_expo(rate = 1, ub = 2.996)
```

prob_fdist*Probability calculator for the F-distribution***Description**

Probability calculator for the F-distribution

Usage

```
prob_fdist(df1, df2, lb = NA, ub = NA, plb = NA, pub = NA,
dec = 3)
```

Arguments

df1	Degrees of freedom
df2	Degrees of freedom
lb	Lower bound (default is 0)
ub	Upper bound (default is Inf)
plb	Lower probability bound
pub	Upper probability bound
dec	Number of decimals to show

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radiantr

Examples

```
prob_fdist(df1 = 10, df2 = 10, ub = 2.978)
```

prob_lnorm*Probability calculator for the log normal distribution***Description**

Probability calculator for the log normal distribution

Usage

```
prob_lnorm(meanlog, sdlog, lb = NA, ub = NA, plb = NA, pub = NA,
dec = 3)
```

Arguments

meanlog	Mean of the distribution on the log scale
sdlog	Standard deviation of the distribution on the log scale
lb	Lower bound (default is -Inf)
ub	Upper bound (default is Inf)
plb	Lower probability bound
pub	Upper probability bound
dec	Number of decimals to show

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radiantr

Examples

```
prob_lnorm(meanlog = 0, sdlog = 1, lb = 0, ub = 1)
```

prob_norm

Probability calculator for the normal distribution

Description

Probability calculator for the normal distribution

Usage

```
prob_norm(mean, stdev, lb = NA, ub = NA, plb = NA, pub = NA,
          dec = 3)
```

Arguments

mean	Mean
stdev	Standard deviation
lb	Lower bound (default is -Inf)
ub	Upper bound (default is Inf)
plb	Lower probability bound
pub	Upper probability bound
dec	Number of decimals to show

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radiantr

See Also

[summary.prob_norm](#) to summarize results

[plot.prob_norm](#) to plot results

Examples

```
prob_norm(mean = 0, stdev = 1, ub = 0)
```

prob_pois

Probability calculator for the poisson distribution

Description

Probability calculator for the poisson distribution

Usage

```
prob_pois(lambda, lb = NA, ub = NA, plb = NA, pub = NA, dec = 3)
```

Arguments

lambda	Rate
lb	Lower bound (default is 0)
ub	Upper bound (default is Inf)
plb	Lower probability bound
pub	Upper probability bound
dec	Number of decimals to show

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in R-diant

Examples

```
prob_pois(lambda = 1, ub = 3)
```

prob_tdist*Probability calculator for the t-distribution*

Description

Probability calculator for the t-distribution

Usage

```
prob_tdist(df, lb = NA, ub = NA, plb = NA, pub = NA, dec = 3)
```

Arguments

df	Degrees of freedom
lb	Lower bound (default is -Inf)
ub	Upper bound (default is Inf)
plb	Lower probability bound
pub	Upper probability bound
dec	Number of decimals to show

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian

Examples

```
prob_tdist(df = 10, ub = 2.228)
```

prob_unif*Probability calculator for the uniform distribution*

Description

Probability calculator for the uniform distribution

Usage

```
prob_unif(min, max, lb = NA, ub = NA, plb = NA, pub = NA,  
          dec = 3)
```

Arguments

min	Minimum value
max	Maximum value
lb	Lower bound (default = 0)
ub	Upper bound (default = 1)
p1b	Lower probability bound
pub	Upper probability bound
dec	Number of decimals to show

Details

See https://radiant-rstats.github.io/docs/basics/prob_calc.html for an example in Radiant

Examples

```
prob_unif(min = 0, max = 1, ub = 0.3)
```

radiant.basics

radiant.basics

Description

radiant.basics

Launch *radiant.basics* in the default browser

Usage

```
radiant.basics()
```

Details

See <https://radiant-rstats.github.io/docs> for documentation and tutorials

Examples

```
## Not run:  
radiant.basics()  
  
## End(Not run)
```

`radiant.basics_viewer` *Launch radiant.basics in the Rstudio viewer*

Description

Launch radiant.basics in the Rstudio viewer

Usage

```
radiant.basics_viewer()
```

Details

See <https://radiant-rstats.github.io/docs> for documentation and tutorials

Examples

```
## Not run:  
radiant.basics_viewer()  
  
## End(Not run)
```

`radiant.basics_window` *Launch radiant.basics in an Rstudio window*

Description

Launch radiant.basics in an Rstudio window

Usage

```
radiant.basics_window()
```

Details

See <https://radiant-rstats.github.io/docs> for documentation and tutorials

Examples

```
## Not run:  
radiant.basics_window()  
  
## End(Not run)
```

salary	<i>Salaries for Professors</i>
---------------	--------------------------------

Description

Salaries for Professors

Usage

```
data(salary)
```

Format

A data frame with 397 rows and 6 variables

Details

2008-2009 nine-month salary for professors in a college in the US. Description provided in attr(salary,description")

single_mean	<i>Compare a sample mean to a population mean</i>
--------------------	---

Description

Compare a sample mean to a population mean

Usage

```
single_mean(dataset, var, comp_value = 0, alternative = "two.sided",
conf_lev = 0.95, data_filter = "")
```

Arguments

dataset	Dataset
var	The variable selected for the mean comparison
comp_value	Population value to compare to the sample mean
alternative	The alternative hypothesis ("two.sided", "greater", or "less")
conf_lev	Span for the confidence interval
data_filter	Expression entered in, e.g., Data > View to filter the dataset in Radiant. The expression should be a string (e.g., "price > 10000")

Details

See https://radiant-rstats.github.io/docs/basics/single_mean.html for an example in Radiant

Value

A list of variables defined in single_mean as an object of class single_mean

See Also

[summary.single_mean](#) to summarize results
[plot.single_mean](#) to plot results

Examples

```
single_mean(diamonds, "price") %>% str()
```

single_prop

Compare a sample proportion to a population proportion

Description

Compare a sample proportion to a population proportion

Usage

```
single_prop(dataset, var, lev = "", comp_value = 0.5,  
           alternative = "two.sided", conf_lev = 0.95, data_filter = "")
```

Arguments

dataset	Dataset
var	The variable selected for the proportion comparison
lev	The factor level selected for the proportion comparison
comp_value	Population value to compare to the sample proportion
alternative	The alternative hypothesis ("two.sided", "greater", or "less")
conf_lev	Span of the confidence interval
data_filter	Expression entered in, e.g., Data > View to filter the dataset in R radiant. The expression should be a string (e.g., "price > 10000")

Details

See https://rstats.radiant-project.com/docs/basics/single_prop.html for an example in R radiant

Value

A list of variables used in single_prop as an object of class single_prop

See Also

[summary.single_prop](#) to summarize the results
[plot.single_prop](#) to plot the results

Examples

```
single_prop(titanic, "survived") %>% str()
single_prop(titanic, "survived", lev = "Yes", comp_value = 0.5, alternative = "less") %>% str()
```

`summary.compare_means` *Summary method for the compare_means function*

Description

Summary method for the `compare_means` function

Usage

```
## S3 method for class 'compare_means'
summary(object, show = FALSE, dec = 3, ...)
```

Arguments

<code>object</code>	Return value from compare_means
<code>show</code>	Show additional output (i.e., t.value, df, and confidence interval)
<code>dec</code>	Number of decimals to show
<code>...</code>	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/compare_means.html for an example in R radiant

See Also

[compare_means](#) to calculate results
[plot.compare_means](#) to plot results

Examples

```
result <- compare_means(diamonds, "cut", "price")
summary(result)
```

summary.compare_props *Summary method for the compare_props function*

Description

Summary method for the compare_props function

Usage

```
## S3 method for class 'compare_props'  
summary(object, show = FALSE, dec = 3, ...)
```

Arguments

object	Return value from compare_props
show	Show additional output (i.e., chisq.value, df, and confidence interval)
dec	Number of decimals to show
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/compare_props.html for an example in R radiant

See Also

[compare_props](#) to calculate results
[plot.compare_props](#) to plot results

Examples

```
result <- compare_props(titanic, "pclass", "survived")  
summary(result)
```

summary.correlation *Summary method for the correlation function*

Description

Summary method for the correlation function

Usage

```
## S3 method for class 'correlation'
summary(object, cutoff = 0, covar = FALSE,
        dec = 2, ...)
```

Arguments

object	Return value from correlation
cutoff	Show only correlations larger than the cutoff in absolute value. Default is a cutoff of 0
covar	Show the covariance matrix (default is FALSE)
dec	Number of decimals to show
...	further arguments passed to or from other methods.

Details

See <https://radiantrstats.github.io/docs/basics/correlation.html> for an example in Radian

See Also

[correlation](#) to calculate results
[plot.correlation](#) to plot results

Examples

```
result <- correlation(diamonds, c("price", "carat", "table"))
summary(result, cutoff = .3)
```

[summary.cross_tabs](#) *Summary method for the cross_tabs function*

Description

Summary method for the cross_tabs function

Usage

```
## S3 method for class 'cross_tabs'
summary(object, check = "", dec = 2, ...)
```

Arguments

object	Return value from cross_tabs
check	Show table(s) for variables var1 and var2. "observed" for the observed frequencies table, "expected" for the expected frequencies table (i.e., frequencies that would be expected if the null hypothesis holds), "chi_sq" for the contribution to the overall chi-squared statistic for each cell (i.e., $(o - e)^2 / e$), "dev_std" for the standardized differences between the observed and expected frequencies (i.e., $(o - e) / \sqrt{e}$), and "dev_perc" for the percentage difference between the observed and expected frequencies (i.e., $(o - e) / e$)
dec	Number of decimals to show
...	further arguments passed to or from other methods.

Details

See https://radiantrstats.github.io/docs/basics/cross_tabs.html for an example in R radiant

See Also

[cross_tabs](#) to calculate results

[plot.cross_tabs](#) to plot results

Examples

```
result <- cross_tabs(newspaper, "Income", "Newspaper")
summary(result, check = c("observed", "expected", "chi_sq"))
```

`summary.goodness` *Summary method for the goodness function*

Description

Summary method for the goodness function

Usage

```
## S3 method for class 'goodness'
summary(object, check = "", dec = 2, ...)
```

Arguments

<code>object</code>	Return value from goodness
<code>check</code>	Show table(s) for the selected variable (var). "observed" for the observed frequencies table, "expected" for the expected frequencies table (i.e., frequencies that would be expected if the null hypothesis holds), "chi_sq" for the contribution to the overall chi-squared statistic for each cell (i.e., $(o - e)^2 / e$), "dev_std" for the standardized differences between the observed and expected frequencies (i.e., $(o - e) / \sqrt{e}$), and "dev_perc" for the percentage difference between the observed and expected frequencies (i.e., $(o - e) / e$)
<code>dec</code>	Number of decimals to show
...	further arguments passed to or from other methods.

Details

See <https://radiantrstats.github.io/docs/basics/goodness> for an example in R radiant

See Also

[goodness](#) to calculate results
[plot.goodness](#) to plot results

Examples

```
result <- goodness(newspaper, "Income", c(.3, .7))
summary(result, check = c("observed", "expected", "chi_sq"))
goodness(newspaper, "Income", "1/3 2/3") %>% summary("observed")
```

summary.prob_binom *Summary method for the probability calculator (binomial)*

Description

Summary method for the probability calculator (binomial)

Usage

```
## S3 method for class 'prob_binom'
summary(object, type = "values", ...)
```

Arguments

<code>object</code>	Return value from prob_binom
<code>type</code>	Probabilities ("probs") or values ("values")
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radiantr

Examples

```
result <- prob_binom(n = 10, p = 0.3, ub = 3)
summary(result, type = "values")
```

summary.prob_chisq

Summary method for the probability calculator (Chi-squared distribution)

Description

Summary method for the probability calculator (Chi-squared distribution)

Usage

```
## S3 method for class 'prob_chisq'
summary(object, type = "values", ...)
```

Arguments

object	Return value from prob_chisq
type	Probabilities ("probs") or values ("values")
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radiantr

Examples

```
result <- prob_chisq(df = 1, ub = 3.841)
summary(result, type = "values")
```

`summary.prob_disc` *Summary method for the probability calculator (discrete)*

Description

Summary method for the probability calculator (discrete)

Usage

```
## S3 method for class 'prob_disc'
summary(object, type = "values", ...)
```

Arguments

<code>object</code>	Return value from prob_disc
<code>type</code>	Probabilities ("probs") or values ("values")
<code>...</code>	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radiantr

Examples

```
result <- prob_disc(v = "5 6 7 8 9 10 11", p = ".1 .2 .3 .15 .1 .05", pub = 0.95)
summary(result, type = "probs")
```

`summary.prob_expo` *Summary method for the probability calculator (exponential)*

Description

Summary method for the probability calculator (exponential)

Usage

```
## S3 method for class 'prob_expo'
summary(object, type = "values", ...)
```

Arguments

<code>object</code>	Return value from prob_expo
<code>type</code>	Probabilities ("probs") or values ("values")
<code>...</code>	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian-

Examples

```
result <- prob_expo(rate = 1, ub = 2.996)
summary(result, type = "values")
```

summary.prob_fdist *Summary method for the probability calculator (F-distribution)*

Description

Summary method for the probability calculator (F-distribution)

Usage

```
## S3 method for class 'prob_fdist'
summary(object, type = "values", ...)
```

Arguments

object	Return value from prob_fdist
type	Probabilities ("probs") or values ("values")
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian-

Examples

```
result <- prob_fdist(df1 = 10, df2 = 10, ub = 2.978)
summary(result, type = "values")
```

summary.prob_lnorm *Summary method for the probability calculator (log normal)*

Description

Summary method for the probability calculator (log normal)

Usage

```
## S3 method for class 'prob_lnorm'
summary(object, type = "values", ...)
```

Arguments

object	Return value from prob_norm
type	Probabilities ("probs") or values ("values")
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian

Examples

```
result <- prob_lnorm(meanlog = 0, sdlog = 1, lb = 0, ub = 1)
summary(result, type = "values")
```

summary.prob_norm *Summary method for the probability calculator (normal)*

Description

Summary method for the probability calculator (normal)

Usage

```
## S3 method for class 'prob_norm'
summary(object, type = "values", ...)
```

Arguments

object	Return value from prob_norm
type	Probabilities ("probs") or values ("values")
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radiant

See Also

[prob_norm](#) to calculate results
[plot.prob_norm](#) to plot results

Examples

```
result <- prob_norm(mean = 0, stdev = 1, ub = 0)
summary(result)
```

summary.prob_pois *Summary method for the probability calculator (poisson)*

Description

Summary method for the probability calculator (poisson)

Usage

```
## S3 method for class 'prob_pois'
summary(object, type = "values", ...)
```

Arguments

object	Return value from prob_pois
type	Probabilities ("probs") or values ("values")
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radiant

Examples

```
result <- prob_pois(lambda = 1, ub = 3)
summary(result, type = "values")
```

`summary.prob_tdist` *Summary method for the probability calculator (t-distribution)*

Description

Summary method for the probability calculator (t-distribution)

Usage

```
## S3 method for class 'prob_tdist'
summary(object, type = "values", ...)
```

Arguments

<code>object</code>	Return value from <code>prob_tdist</code>
<code>type</code>	Probabilities ("probs") or values ("values")
<code>...</code>	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radiantr

Examples

```
result <- prob_tdist(df = 10, ub = 2.228)
summary(result, type = "values")
```

`summary.prob_unif` *Summary method for the probability calculator (uniform)*

Description

Summary method for the probability calculator (uniform)

Usage

```
## S3 method for class 'prob_unif'
summary(object, type = "values", ...)
```

Arguments

<code>object</code>	Return value from <code>prob_unif</code>
<code>type</code>	Probabilities ("probs") or values ("values")
<code>...</code>	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/prob_calc.html for an example in Radian

Examples

```
result <- prob_unif(min = 0, max = 1, ub = 0.3)
summary(result, type = "values")
```

summary.single_mean *Summary method for the single_mean function*

Description

Summary method for the single_mean function

Usage

```
## S3 method for class 'single_mean'
summary(object, dec = 3, ...)
```

Arguments

object	Return value from <code>single_mean</code>
dec	Number of decimals to show
...	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/single_mean.html for an example in Radian

See Also

`single_mean` to generate the results
`plot.single_mean` to plot results

Examples

```
result <- single_mean(diamonds, "price")
summary(result)
diamonds %>% single_mean("price") %>% summary()
```

`summary.single_prop` *Summary method for the single_prop function*

Description

Summary method for the `single_prop` function

Usage

```
## S3 method for class 'single_prop'  
summary(object, dec = 3, ...)
```

Arguments

<code>object</code>	Return value from <code>single_prop</code>
<code>dec</code>	Number of decimals to show
<code>...</code>	further arguments passed to or from other methods

Details

See https://radiantrstats.github.io/docs/basics/single_prop.html for an example in Radian

See Also

`single_prop` to generate the results
`plot.single_prop` to plot the results

Examples

```
result <- single_prop(titanic, "survived", lev = "Yes", comp_value = 0.5, alternative = "less")  
summary(result)
```
