

Package ‘CompR’

July 1, 2015

Version 1.0

Date 2015-07-01

Title Paired Comparison Data Analysis

Author Michel Semenou

Maintainer Michel Semenou <michel.semenou@oniris-nantes.fr>

Depends R (>= 3.1), methods, utils, MASS, graphics, stats

Description

Different tools for describing and analysing paired comparison data are presented. Main methods are estimation of products scores according Bradley Terry Luce model. A segmentation of the individual could be conducted on the basis of a mixture distribution approach. The number of classes can be tested by the use of Monte Carlo simulations. This package deals also with multi-criteria paired comparison data.

This package deals also with multi-criteria paired comparison data.

Details

Package: CompR
Type: Package
Version: 1.0
Date: 2015-07-01
License: GPL-2
Depends: methods, MASS, stats, graphics, utils

Function to estimate products configurations (Bradley's scores) and weights of the classes is `EstimBradley()`.

Function to perform a test concerning the number of classes is `ResSimulLvrRatio()`.

Function to obtain a graphical representation of Bradley's scores is `Piplot()`.

Author(s)

Michel Semenou

BradleyEstim-class *Class "BradleyEstim"*

Description

A class for Bradley's scores estimation results

Objects from the Class

Objects can be created by the function `EstimBradley()`.

Slots

- Lvrwriter:** Object of class "matrix" corresponding to the number of iterations of the EM algorithm, LogLikelihoods at the previous step and the current step, and the differences between these 2 LogLikelihoods
- Lvr:** Object of class "numeric" final value of the LogLikelihood
- Lambda:** Object of class "matrix" weights of the different classes
- Pi:** Object of class "list" Bradley's scores for each class and each criteria
- Zh:** Object of class "matrix" with the posterior probabilities for each individual to belong to the different classes and the class with the higher probability
- Ic:** Object of class "matrix" value of the different Information criterion (AIC, BIC, CAIC)
- Restestglob:** Object of class "list" result of testing the whole Bradley's scores equality for each class and each criteria
- Restestprod:** Object of class "list" result of multiple comparison tests for Bradley's scores in each class and for each criteria
- Varcov:** Object of class "list" of covaraince matrices of Bradley's scores in each class and for each criteria

Methods

- getIc** signature(object = "BradleyEstim")
- getLambda** signature(object = "BradleyEstim")
- getLvr** signature(object = "BradleyEstim")
- getLvrwriter** signature(object = "BradleyEstim")
- getPi** signature(object = "BradleyEstim")
- getRestestglob** signature(object = "BradleyEstim")
- getRestestprod** signature(object = "BradleyEstim")
- getVarcov** signature(object = "BradleyEstim")
- getZh** signature(object = "BradleyEstim")
- show** signature(object = "BradleyEstim")

Examples

```
data(ResCocktail1)
show(ResCocktail1)
```

ClassDataPairComp *Create an object of class DataPairComp*

Description

return an object of DataPairComp class

Usage

ClassDataPairComp(Mat, labelprod = NULL, labelcons = NULL, labelcrit = NULL)

Arguments

Mat	Paired comparison matrix with a number of rows equal to nsubject*nitems and nitems columns.
labelprod	names of the different items (default labelprod=NULL)
labelcons	names of the different subjects (default labelcons=NULL)
labelcrit	name of the criterium (default labelcrit=NULL)

Value

Object of class DataPairComp with the following elements:

Cons : corresponding to the label of consumers (default : Number of consumers)

Crit : name of the different criteria contained

Prod : names of the different products (default : number of the product)

Paircomp : list of number of criteria elements each corresponding to the results of paired comparisons performed by the consumers.

ClassifPaired *Classification of paired comparison data*

Description

Returns the result of consumers classification

Usage

ClassifPaired(Data, Tcla)

Arguments

Data	Object of class DataPairComp
Tcla	Number of classes to use for classification

Details

The function performs a hierarchical cluster analysis on a set of dissimilarities based on pairwise comparison matrices, using the functions `hclust` and `cutree` of stats package.

Value

vector with group memberships resulting from the classification with Tcla clusters.

See Also

`hclust`, `cutree` of stats package

Cocktail

Beverages paired comparison

Description

Paired comparison of 7 beverages by 112 subjects according their preferences

Usage

```
data(Cocktail)
```

Format

A `DataPairComp` class object with the following elements:

`Cons` : corresponding to the label of consumers (default : Number of consumers)

`Crit` : name of the different criteria contained

`Prod` : names of the different products (default : number of the product)

`Paircomp` : list of number of criteria elements each corresponding to the results of paired comparisons performed by the consumers.

Examples

```
data(Cocktail)
show(Cocktail)
```

Cocktail_Cum	<i>Beverages paired comparison</i>
--------------	------------------------------------

Description

Paired comparison of 7 beverages by 112 subjects according their preferences

Usage

```
data(Cocktail)
```

Format

A matrix resulting of the cumulative paired comparison results of 7 products by 112 consumers. The (i,j) element correponds to the number of time product i was preferred to product j among all comparisons between these two products.

Examples

```
data(Cocktail_Cum)
Cocktail_Cum
```

C_piBTL	<i>Estimation of Bradley's scores</i>
---------	---------------------------------------

Description

Returns the Bradley's scores of the different items and the value of the LogLikelihood

Usage

```
C_piBTL(Matpair, Constraint=0, eps1=1e-04, Pi=NULL, TestPi=FALSE, Zht=NULL)
```

Arguments

Matpair	Matrix of the cumulative sum of the results of paired comparisons or object of class DataPairComp
Constraint	Kind of constraint on Bradley's scores. If Constraint=0, the sum of Bradley's scores should be equal to 1. For other values for Constraint, the product of Bradley's scores should be equal to 1. (default is Constraint=0)
eps1	value to take into account for the convergence criteria of the algorithm of Bradley's scores estimation.(default is eps1=1e-04)

Pi	Initial values for Bradley's scores. If Pi=NULL the initialisation is based on a mean score for each item obtained from the data Matpair. Else, initial values for Bradley's scores are Pi given by the user. (default is Pi=NULL)
TestPi	Indicate if the user wants to perform a multiple comparison tests on the Bradley's scores. (default TestPi=FALSE)
Zht	Indicate the individuals probabilities to belong to the different classes. Zht has not to be provided for external use of this function. It is used in the main function EstimBradley (default Zht=NULL)

Details

The algorithm is based on a maximum likelihood approach using Dykstra method.

Value

List of following components:

Pi	Bradley's scores
lnL	value of the log-likelihood
lvrH0	value of the log-likelihood under the hypothesis of equal values for the Bradley's scores
lvrH1	value of the log-likelihood at the end of the Bradley's scores estimation algorithm
lRatio	value of the likelihood ration statistic
Pvalue	Pvalue of the test
H1	logical value, FALSE if Bradley's scores should be considered as equal, TRUE otherwise
VarcovPi	Matrix of covariances of Bradley's scores
restestij	Matrix of the following elements - products i and j compared - value of the test statistic - Pvalue of the test - decision at a 0.05 level

Examples

```
data(Cocktail_Cum)
res<-C_piBTL(Cocktail_Cum,Constraint=0,eps1=1e-04,Pi=NULL,TestPi=TRUE)
res
```

DataPairComp-class *Class "DataPairComp"*

Description

A class for Paired comparison data

Objects from the Class

Objects can be created by calls of the form `new("DataPairComp", ...)`, or by the function `ImportData()`.

Slots

Cons: Object of class "character" label for the individuals

Crit: Object of class "character" label for the criterion

Prod: Object of class "character" label for the products

Paircomp: Object of class "list" corresponding to the individual results of paired comparisons for each criteria, when products *i* and *j* are presented to individual *h*, the (*i,j*) element resulting is coded by 1 if *i* is chosen against *j* and 0 otherwise

Methods

getCons signature(object = "DataPairComp")

getCrit signature(object = "DataPairComp")

getPaircomp signature(object = "DataPairComp")

getProd signature(object = "DataPairComp")

show signature(object = "DataPairComp")

See Also

`ImportData`

Examples

```
data(Cocktail)
show(Cocktail)
```

DataSimulH0	<i>Simulation of paired comparison data</i>
-------------	---

Description

Returns paired comparison data according a given configuration

Usage

```
DataSimulH0(Data, ResH0)
```

Arguments

Data	Object of class DataPairComp
ResH0	Object of class BradleyEstim.

Details

The paired comparison data are simulated according the products configuration, the weight of the different classes for the different criteria (stored in the object ResH0 of class BradleyEstim) obtained on the basis of the results of EstimBradley function for the paired comparison data contained in the objet Data of class DataPairComp

Value

Object of class DataPairComp with the following components:

Cons : corresponding to the label of consumers

Crit : names of the different criteria

Prod : names of the different products

Paircomp : list of number of criteria elements each corresponding to the results of simulated paired comparisons performed by the consumers according their belonging to the different classes.

EstimBradley	<i>Estimation of Bradley's scores in the different classes of subjects</i>
--------------	--

Description

Estimates Bradley's scores according the desired number of classes.

Usage

```
EstimBradley(Data, Constraint=0, Tcla=1, eps=1e-04, eps1=1e-04, TestPi=TRUE)
```

Arguments

Data	Object of class DataPairComp
Constraint	Kind of constraint on Bradley's scores. If Constraint=0, the sum of Bradley's scores should be equal to 1. For other values for Constraint, the product of Bradley's scores should be equal to 1.(default constraint=0)
Tcla	Number of classes, default=1, no segmentation.
eps	value of the convergence criteria for the EM algorithm (default eps=1e-04).
eps1	value of the criteria convergence for Dykstra algorithm (default eps1=1e-04).
TestPi	if TestPi=TRUE multiple comparison tests for Bradley's scores are performed. Else no multiple comparison test. (default is TestPi=TRUE)

Details

The estimation is based on maximum likelihood for mixture distributions with E.M. algorithm.

Value

Object of class BradleyEstim with the following components:

Lvrwriter	matrix describing the evolution of log likelihood at the different steps of the maximization procedure.
Lvr	Final value of the log likelihood
Lambda	numeric Final estimates of classes' weight
Pi	list of Tcla elements containing Bradley's scores for the different criteria
Zh	matrix of the belongings probabilities of the individuals to the different classes and the belonging class according to these probabilities
IC	value of Information Criterion (AIC,BIC,CAIC)
Restestglob	(given if TestPi=TRUE) list of five elements: lvrH0 matrix of size (Tcla * number of criteria), giving the value of the log likelihood under the hypothesis of equality of Bradley's scores lvrH1 matrix of size (Tcla * number of criteria), giving the value of the log likelihood under the hypothesis of non equality of Bradley's scores lRatio matrix of size (Tcla * number of criteria), giving the value of the log likelihood Ratio statistic Pvalue matrix of size (Tcla * number of criteria), giving the P value of the log likelihood Ratio test H1 matrix of size (Tcla * number of criteria) giving the result of rejection of equality of Bradley's scores
Restestprod	(given if TestPi=TRUE and if Bradley's scores are not equal) list of Tcla elements of type matrix of size (number of paired comparison * 7), each column corresponding to: class identification, criterion identification, product identification i,

product identification j,
 value for the statistic corresponding to H0: equality of the Bradley's scores of products i and j,
 P value of this test,
 Rejection or acceptance of H0 for a level of 5%.

Varcov (given if TestPi=TRUE)
 list of Tcla elements containing Bradley's scores covariance matrices for the different criteria.

Examples

```
data(Cocktail)
show(Cocktail)
ResCock1<-EstimBradley(Cocktail,Constraint=0,Tcla=1,eps=0.001,eps1=0.001,TestPi=TRUE)
show(ResCock1)
```

getCons *Gets the individuals labels.*

Description

Gets the individuals labels.

Usage

```
getCons(object)
```

Arguments

object An object of class DataPairComp

Value

vector of the individuals labels.

Examples

```
data(Cocktail)
Cocktail_Cons<-getCons(Cocktail)
```

getCons-methods *Methods for Function getCons*

Description

Methods for function getCons

Methods

```
signature(object = "DataPairComp")
```

getCrit *Gets the criteria's labels.*

Description

Gets the criteria's labels.

Usage

```
getCrit(object)
```

Arguments

object An object of class DataPairComp

Value

vector of the criteria's labels.

Examples

```
data(Cocktail)
Cocktail_Crit<-getCrit(Cocktail)
```

getCrit-methods *Methods for Function getCrit*

Description

Methods for function getCrit

Methods

```
signature(object = "DataPairComp")
```

getIc	<i>Gets the Information criteria's labels.</i>
-------	--

Description

Gets the Information criteria's labels (AIC, BIC, CAIC).

Usage

```
getIc(object)
```

Arguments

object An object of class BradleyEstim

Value

vector of Information criteria.

Examples

```
data(Cocktail)
ResCock<-EstimBradley(Cocktail,Constraint=0,Tcla=1,eps=1e-04,eps1=1e-04,TestPi=TRUE)
ResCock_Ic<-getIc(ResCock)
```

getIc-methods	<i>Methods for Function getIc</i>
---------------	-----------------------------------

Description

Methods for function getIc

Methods

```
signature(object = "BradleyEstim")
```

getLambda	<i>Gets the weight of the different classes.</i>
-----------	--

Description

Gets the weight of the different classes from the function `EstimBradley()`.

Usage

```
getLambda(object)
```

Arguments

object	An object of class <code>BradleyEstim</code>
--------	--

Value

A vector of the weights of the different classes.

Examples

```
data(Cocktail)
ResCock<-EstimBradley(Cocktail,Constraint=0,Tcla=1,eps=1e-04,eps1=1e-04,TestPi=TRUE)
ResCock_Lambda<-getLambda(ResCock)
```

getLambda-methods	<i>Methods for Function getLambda</i>
-------------------	---------------------------------------

Description

Methods for function `getLambda`

Methods

```
signature(object = "BradleyEstim")
```

getLvr	<i>Gets the final value of loglikelihood.</i>
--------	---

Description

Gets the final value of loglikelihood from the function `EstimBradley()`.

Usage

```
getLvr(object)
```

Arguments

object An object of class `BradleyEstim`

Value

Numeric value of the loglikelihood.

Examples

```
data(Cocktail)
ResCock<-EstimBradley(Cocktail,Constraint=0,Tcla=1,eps=1e-04,eps1=1e-04,TestPi=TRUE)
ResCock_Lvr<-getLvr(ResCock)
```

getLvr-methods	<i>Methods for Function getLvr</i>
----------------	------------------------------------

Description

Methods for function `getLvr`

Methods

```
signature(object = "BradleyEstim")
```

getLvrwriter	<i>Gets the iteration done until convergence of the loglikelihood estimation of Bradley's scores.</i>
--------------	---

Description

Gets the iteration done until convergence from the function `EstimBradley()`

Usage

```
getLvrwriter(object)
```

Arguments

object An object of class `BradleyEstim`

Value

A matrix with numbers of iteration rows and 4 columns giving the iteration, the previous value of loglikelihood, the current value of the loglikelihood, and the difference between these loglikelihoods.

Examples

```
data(Cocktail)
ResCock<-EstimBradley(Cocktail,Constraint=0,Tcla=1,eps=1e-04,eps1=1e-04,TestPi=TRUE)
ResCock_Lvrwriter<-getLvrwriter(ResCock)
```

getLvrwriter-methods	<i>Methods for Function getLvrwriter</i>
----------------------	--

Description

Methods for function `getLvrwriter`

Methods

```
signature(object = "BradleyEstim")
```

getPaircomp	<i>Gets the individual paired comparisons.</i>
-------------	--

Description

Gets the individual paired comparisons.

Usage

```
getPaircomp(object)
```

Arguments

object An object of class DataPairComp

Value

list of number of criteria elements each corresponding to the results of paired comparisons performed by the consumers.

Examples

```
data(Cocktail)
Cocktail_Paircomp<-getPaircomp(Cocktail)
```

getPaircomp-methods	<i>Methods for Function getPaircomp</i>
---------------------	---

Description

Methods for function getPaircomp

Methods

```
signature(object = "DataPairComp")
```

getPi	<i>Gets the Bradley's scores.</i>
-------	-----------------------------------

Description

Gets the Bradley's scores from the function `EstimBradley()`.

Usage

```
getPi(object)
```

Arguments

object An object of class `BradleyEstim`

Value

A list of the Bradley's scores for the different criteria .

Examples

```
data(Cocktail)
ResCock<-EstimBradley(Cocktail,Constraint=0,Tcla=1,eps=1e-04,eps1=1e-04,TestPi=TRUE)
ResCock_Pi<-getPi(ResCock)
```

getPi-methods	<i>Methods for Function getPi</i>
---------------	-----------------------------------

Description

Methods for function `getPi`

Methods

```
signature(object = "BradleyEstim")
```

getProd	<i>Gets the products labels.</i>
---------	----------------------------------

Description

Gets the products labels.

Usage

```
getProd(object)
```

Arguments

object An object of class DataPairComp

Value

vector of the products labels.

Examples

```
data(Cocktail)  
Cocktail_Prod<-getProd(Cocktail)
```

getProd-methods	<i>Methods for Function getProd</i>
-----------------	-------------------------------------

Description

Methods for function getProd

Methods

```
signature(object = "DataPairComp")
```

getRestestglob	<i>Gets the result of the test of Bradley's scores equality.</i>
----------------	--

Description

Gets the result of the test of Bradley's scores equality from the function `EstimBradley()`.

Usage

```
getRestestglob(object)
```

Arguments

object An object of class `BradleyEstim`

Value

list of five elements:

`lvrH0` matrix of size (`Tcla * number of criteria`), giving the value of the log likelihood under the hypothesis of equality of Bradley's scores

`lvrH1` matrix of size (`Tcla * number of criteria`), giving the value of the log likelihood under the hypothesis of non equality of Bradley's scores

`lRatio` matrix of size (`Tcla * number of criteria`), giving the value of the log likelihood Ratio statistic

`Pvalue` matrix of size (`Tcla * number of criteria`), giving the P value of the log likelihood Ratio test

`H1` matrix of size (`Tcla * number of criteria`) giving the result of rejection of equality of Bradley's scores

Examples

```
data(Cocktail)
ResCock<-EstimBradley(Cocktail,Constraint=0,Tcla=1,eps=1e-04,eps1=1e-04,TestPi=TRUE)
ResCock_Restestglob<-getRestestglob(ResCock)
```

getRestestglob-methods

Methods for Function getRestestglob

Description

Methods for function `getRestestglob`

Methods

```
signature(object = "BradleyEstim")
```

getRestestprod	<i>Gets the result of the Bradley's scores multiple comparison tests.</i>
----------------	---

Description

Gets the result of the Bradley's scores multiple comparison tests from the function `EstimBradley()`.

Usage

```
getRestestprod(object)
```

Arguments

object An object of class `BradleyEstim`

Value

list of `Tcla` elements of type `matrix` of size (number of paired comparison * 7), each column corresponding to:

class identification,

criterion identification,

product identification i,

product identification j,

value for the statistic corresponding to H_0 : equality of the Bradley's scores of products i and j,

P value of this test,

Rejection or acceptance of H_0 for a level of 5%.

Examples

```
data(Cocktail)
ResCock<-EstimBradley(Cocktail,Constraint=0,Tcla=1,eps=1e-04,eps1=1e-04,TestPi=TRUE)
ResCock_Restestprod<-getRestestprod(ResCock)
```

getRestestprod-methods

Methods for Function getRestestprod

Description

Methods for function `getRestestprod`

Methods

```
signature(object = "BradleyEstim")
```

getSimu	<i>Gets the results of Likelihood Ratio Test.</i>
---------	---

Description

Gets the results of Likelihood Ratio Test obtained by Monte-Carlo simulations.

Usage

```
getSimu(object)
```

Arguments

object	An object of class LvrRatio
--------	-----------------------------

Value

A matrix with the number of classes under H0, the values of Loglikelihood under H0 and H1 and the differences between these Loglikelihoods.

getSimu-methods	<i>Methods for Function getSimu</i>
-----------------	-------------------------------------

Description

Methods for function getSimu

Methods

```
signature(object = "LvrRatio")
```

getTest	<i>Gets the level and the quantile of Likelihood ratio test.</i>
---------	--

Description

Gets the level and the quantile of Likelihood ratio test from the function ResSimulLvrRatio()

Usage

```
getTest(object)
```

Arguments

object	An object of class LvrRatio
--------	-----------------------------

Value

Matrix with the level and the associated quantile after performing Likelihood Ratio test.

getTest-methods	<i>Methods for Function getTest</i>
-----------------	-------------------------------------

Description

Methods for function getTest

Methods

signature(object = "LvrRatio")

getVarcov	<i>Gets the Bradley'scores covariance matrices.</i>
-----------	---

Description

Gets the Bradley'scores covariance matrices from the function EstimBradley().

Usage

```
getVarcov(object)
```

Arguments

object An object of class BradleyEstim

Value

list of Tc1a elements containing Bradley'scores covariance matrices for the different criteria.

Examples

```
data(Cocktail)
ResCock<-EstimBradley(Cocktail,Constraint=0,Tc1a=1,eps=1e-04,eps1=1e-04,TestPi=TRUE)
ResCock_Varcov<-getVarcov(ResCock)
```

getVarcov-methods *Methods for Function getVarcov*

Description

Methods for function getVarcov

Methods

signature(object = "BradleyEstim")

getZh *Gets the result of the function EstimBradley()*

Description

Gets the posterior probabilities for each individual to belong to the different classes and the class with the higher probability.

Usage

```
getZh(object)
```

Arguments

object An object of class BradleyEstim

Value

Object of class `matrix` with the posterior probabilities for each individual to belong to the different classes and the class with the higher probability.

Examples

```
data(Cocktail)
ResCock2<-EstimBradley(Cocktail,Constraint=0,Tcla=2,eps=1e-04,eps1=1e-04,TestPi=TRUE)
ResCock2_Zh<-getZh(ResCock2)
```

getZh-methods	<i>Methods for Function getZh</i>
---------------	-----------------------------------

Description

Methods for function getZh

Methods

signature(object = "BradleyEstim")

ImportData	<i>Import data file</i>
------------	-------------------------

Description

Import the different paired comparison data files in cvs format and create an object of class DataPairComp

Usage

```
ImportData(name,labelprod=FALSE,labelconso=NULL, sep=";",dec=".")
```

Arguments

name	part of name of the different data files (.csv files)
labelprod	indicate the existence of labels of the different products in data files (default=FALSE) given in the header of each column of the data files.
labelconso	vector of label of consumers given by the user (default=NULL)
sep	the field separator character. Values on each line of the file are separated by this character.(default=";")
dec	the character used in the file for decimal points.(default=".")

Value

Object of class DataPairComp with the following elements:

Cons : corresponding to the label of consumers (default : Number of consumer)

Crit : names of the different criteria contained in the name of the different data files

Prod : names of the different products (default : number of the product)

Paircomp : list of number of criteria elements each corresponding to the results of paired comparisons performed by the consumers.

LvrRatio-class	<i>Class "LvrRatio"</i>
----------------	-------------------------

Description

A class for Likelihood Ratio Test results

Objects from the Class

Objects can be created by `ResSimuLvrRatio()`.

Slots

Simu: Object of class "matrix" with the number of classes under H0, Loglikelihoods under H0 and H1, difference between these Loglikelihoods.

Test: Object of class "matrix" with the level and the associated quantile after performing Likelihood Ratio test.

Methods

getSimu signature(object = "LvrRatio")

getTest signature(object = "LvrRatio")

Examples

```
showClass("LvrRatio")
```

Pilot	<i>Graphical representation of the Bradley's scores</i>
-------	---

Description

Gives a graphical representation of the Bradley's scores.

Usage

```
Pilot(Pi, SigmaPi = NULL, level=0.05, main = NULL, ylab = "Bradley's scores",
      xlab = "Item", labelprod = NULL)
```

Arguments

Pi	vector of Bradley's scores
SigmaPi	vector of Bradley's scores standard deviation given by the user. (default SigmaPi=NULL)
level	level to use for the confidence intervals. (default level=0.05)
main	Title of the plot.(default main=NULL)
ylab	value for ylab. (default ylab= Bradley's scores)
xlab	value for xlab. (default xlab=Item)
labelprod	label vector of the Item. (default labelprod=NULL)

Details

The representation is based on plot(x) function, with Item on x axis, and Bradley's scores on y axis. If SigmaPi is provided by user, a 1-level (default 95%) confidence interval is drawn for each Item.

Value

A graphical representation of bradley's scores.

Examples

```
data(Cocktail_Cum)
res<-C_piBTL(Cocktail_Cum,Constraint=0,eps1=0.0001,Pi=NULL,TestPi=TRUE)
Res_Pi<-res$Pi
Res_Varcov<-res$VarcovPi
Res_Sigma<-sqrt(diag(Res_Varcov))
Piplot(Res_Pi, SigmaPi = Res_Sigma, level=0.01, main = NULL, ylab = "Bradley's scores",
xlab = "Item", labelprod = NULL)
```

ResCocktail1

Result of EstimBradley function for 1 class and data Cocktail

Description

Result of EstimBradley function for 1 class and data Cocktail

Usage

```
data(ResCocktail1)
```

Format

A BradleyEstim class object with the following elements:

Examples

```
data(ResCocktail1)
show(ResCocktail1)
```

ResSimulLvrRatio *Log Likelihood Ratio Test for Paired comparison data*

Description

Returns the result of Log Likelihood Ratio Test of the number of classes for Paired comparison data (T classes versus (T+1) classes)

Usage

```
ResSimulLvrRatio(Data, ResH0, Constraint, nsimul, level, eps=1e-04, eps1=1e-04)
```

Arguments

Data	Object of class DataPairComp
ResH0	Object of class BradleyEstim corresponding to the result of BradleyEstim() function for T classes (H0)
Constraint	Kind of constraint on Bradley's scores. If Constraint=0, the sum of Bradley's scores should be equal to 1. For other values for Constraint, the product of Bradley's scores should be equal to 1 (default Constraint=0).
nsimul	number of Monte Carlo simulations
level	level of the Log Likelihood Ratio test defined by the user (default level=0.05).
eps	value of the convergence criteria for the EM algorithm (default eps=1e-04).
eps1	value of the criteria convergence for Dykstra algorithm (default eps1=1e-04).

Details

The likelihood ratio test is based on a Monte Carlo procedure. A simulation of nsimul data set is done. We perform estimation of the different parameters for the number of classes defined in the object ResH0 of class BradleyEstim (corresponding to the null hypothesis) and for one more class corresponding to the alternative hypothesis.

We obtain a set of Log Likelihoods under the null and alternative hypothesis on the basis of simulated data and so of the Log Likelihood Ratio Statistic.

We replace the observed value of this statistic for the true data set. And we conclude on the acceptance or not of the null hypothesis (no differences between T and T+1 classes).

Value

Object of class LvrRatio with the following components:

Simu	Matrix with the number of classes under H0, Loglikelihoods under H0 and H1, difference between these Loglikelihoods.
Test	Matrix with the level of the test and the associated quantile

Examples

```
data(Cocktail)
ResCock1<-EstimBradley(Cocktail,Constraint=0,Tcla=1,eps=1e-04,eps1=1e-04,TestPi=TRUE)
Res_LvrRatio1<-ResSimulLvrRatio(Cocktail,ResCock1,0,3,level=0.05,eps=0.001,eps1=0.001)
getSimu(Res_LvrRatio1)
getTest(Res_LvrRatio1)
```
