Type Package

Title Fitting Semi-Parametric Generalized log-Gamma Regression Models

Version 0.1.4

Author

Carlos Alberto Cardozo Delgado <cardozorpackages@gmail.com> and G. Paula and L. Vanegas

Maintainer Carlos Alberto Cardozo Delgado <cardozorpackages@gmail.com>

Description Set of tools to fit a linear multiple or semi-parametric regression models and non-informative right-censoring may be considered. Under this setup, the localization parameter of the response variable distribution is modeled by using linear multiple regression or semi-parametric functions, whose non-parametric components may be approximated by natural cubic spline or P-splines. The supported distribution for the model error is a generalized log-gamma distribution which includes the generalized extreme value distribution as an important special case.

deBoor2	<i>Build the basis matrix and the penalty matrix of cubic B-spline basis.</i>
---------	-------------------------------------------------------------------------------

Description

deBoor builds the basis matrix and penalty matrix to approximate a smooth function using cubic B-spline cubic.

Usage

```
deBoor2(t, knots)
```

Arguments

t	a vector of values.
knots	a set of internal knot.

Value

nknot number of knots.
knots set of knots.
N basis matrix.
K penalty matrix.

Author(s)

Carlos Alberto Cardozo Delgado <cardozorpackages@gmail.com>, G. Paula and L. Vanegas.

References

Carlos Alberto Cardozo Delgado, Semi-parametric generalized log-gamma regression models. Ph. D. thesis. Sao Paulo University.

Examples

```
t <- runif(120)
knot <- 6
deBoor2(t, knot)
```

entropy *Tool to calculate the entropy for a generalized log-gamma distribution.*

Description

entropy is used to obtain the entropy for a generalized log-gamma distribution.

Usage

```
entropy(mu, sigma, lambda)
```

Arguments

mu	numeric, represent the location parameter of a generalized log-gamma distribution. Default value is 0.
sigma	numeric, represent the scale parameter of a generalized log-gamma distribution. Default value is 1.
lambda	numeric, represent the shape parameter of a generalized log-gamma distribution. Default value is 1.

Author(s)

Carlos Alberto Cardozo Delgado <cardozorpackages@gmail.com>, G. Paula and L. Vanegas.

References

Carlos Alberto Cardozo Delgado, Semi-parametric generalized log-gamma regression models. Ph. D. thesis. Sao Paulo University.

Examples

```
entropy(0,1,-1) # Extreme value type I distribution, maximum case.
entropy(0,1,1) # Extreme value type I distribution, minimum case.
entropy(0,1,0.077) # Standard normal distribution.
```

envelope.sglg *envelope.sglg*

Description

Build a Normal probability plot with simulated envelope for a deviance-type residuals in semiparametric or multiple linear generalized log-gamma regression models.

Usage

```
envelope.sglg(fit, Rep)
```

Arguments

`fit` an object of the class `sglg`. This object is returned from the call to `glg()`, `sglg()`.
`Rep` a positive integer. This is the number of replications on which to build the simulated envelope. Default is `Rep=50`.

Author(s)

Carlos Alberto Cardozo Delgado <cardozorpackages@gmail.com>, G. Paula and L. Vanegas.

Ortega, E., Paula, G. A. and Bolfarine, H. (2008) Deviance residuals in generalized log-gamma regression models with censored observations. *Journal of Statistical Computation and Simulation*, 78, 747-764.

Examples

```
rows <- 80
columns <- 2
t_beta <- c(0.5, 2)
t_sigma <- 1
t_lambda <- 1
set.seed(8142031)
x1 <- rbinom(rows, 1, 0.5)
x2 <- runif(columns, 0, 1)
X <- cbind(x1,x2)
error <- rglg(rows, 0, 1, t_lambda)
y1 <- X %*%t_beta + t_sigma * error
data.example <- data.frame(y1,X)
fit1 <- glg(y1 ~ x1 + x2 - 1,data=data.example)
envelope.sglg(fit1)
```

Description

glg is used to fit a multiple linear regression model suitable for analysis of data sets in which the response variable is continuous, strictly positive, and asymmetric. In this setup, the location parameter of the response variable is explicitly modeled by a linear function of the parameters.

Usage

```
glg(formula, data, shape, Tolerance, Maxiter)
```

Arguments

formula	a symbolic description of the systematic component of the model to be fitted. See details for further information.
data	an optional data frame, list containing the variables in the model.
shape	an optional value for the shape parameter of the error distribution of a generalized log-gamma distribution. Default value is 1.
Tolerance	an optional positive value, which represents the convergence criterion. Default value is 1e-04.
Maxiter	an optional positive integer giving the maximal number of iterations for the estimating process. Default value is 1e03.

Value

mu a vector of parameter estimates associated with the location parameter.

sigma estimate of the scale parameter associated with the model.

lambda estimate of the shape parameter associated with the model.

interval estimate of a 95% confidence interval for each estimate parameters associated with the model.

Deviance the deviance associated with the model.

`gnfit`*gnfit*

Description

This function provides some useful statistics to assess the quality of fit of generalized log-gamma probabilistic model, including the statistics Cramer-von Mises and Anderson-Darling. It can also calculate other goodness of fit such as Hannan-Quin Information Criterion and Kolmogorov-Smirnov test.

Usage

```
gnfit(starts, data)
```

Arguments

<code>starts</code>	numeric vector. Initial parameters to maximize the likelihood function
<code>data</code>	numeric vector. A sample of a generalized log-gamma distribution.

Author(s)

Carlos Alberto Cardozo Delgado <cardozorpackages@gmail.com>, G. Paula and L. Vanegas.

References

Carlos Alberto Cardozo Delgado, Semi-parametric generalized log-gamma regression models. Ph. D. thesis. Sao Paulo University.

Examples

```
set.seed(1)
sample <- rglg(16, location=0.7, scale=0.5, shape=1.2)
gnfit(c(0.55, 0.6, 1), sample)
```

`Gu`*Tool to build the basis matrix and the penalty matrix of natural cubic splines.*

Description

Gu builds the basis matrix and penalty matrix to approximate a smooth function using natural cubic splines based on the Gu basis form.

Usage

```
Gu(t, knot)
```

Arguments

t the covariate.
 knot a integer value that represent the number of knots of the natural cubic spline.

Value

nknot number of knots.
 knots set of knots.
 N basis matrix.
 K penalty matrix.

```
t <- runif(120)
knot <- 6
Gu(t,knot)
```

influence.sglg

influence

Description

influence.sglg extracts from a object of class sglg the local influence measures and displays their graphs versus the index of the observations.

Usage

```
## S3 method for class 'sglg'
influence(model, ...)
```

Arguments

model an object of the class sglg. This object is returned from the call to glg(), sglg(), survglg() or ssurvglg().
 ... other arguments.

Author(s)

Carlos Alberto Cardozo Delgado <cardozorpackages@gmail.com>, G. Paula and L. Vanegas.

References

Examples

```
rows <- 100
columns <- 2
t_beta <- c(0.5, 2)
t_sigma <- 1
t_lambda <- 1
set.seed(8142031)
x1 <- rbinom(rows, 1, 0.5)
x2 <- runif(columns, 0, 1)
X <- cbind(x1,x2)
error <- robustloggamma::rloggamma(rows, 0, 1, t_lambda)
y1 <- X %*%t_beta + t_sigma * error
data.example <- data.frame(y1,X)
fit1 <- glg(y1 ~ x1 + x2 - 1,data=data.example)
influence(fit1)
```

logLik.sglg

Extract Log-Likelihood

Description

logLik.sglg extracts log-likelihood from a model from an object of class 'sglg'.

Usage

```
## S3 method for class 'sglg'
logLik(object, ...)
```

Arguments

object	an object of the class sglg. This object is returned from the call to glg(), sglg(), survglg() or ssurvglg() function.
...	other arguments.

lss	<i>Measures of location, scale and shape measures for a generalized log-gamma distribution</i>
-----	------------------------------------------------------------------------------------------------

Description

lss is used to obtain the mean, variance, skewness and kurtosis for a generalized log-gamma distribution.

Usage

```
lss(mu, sigma, lambda)
```

Arguments

mu	numeric, represent the location parameter of a generalized log-gamma distribution. Default value is 0.
sigma	numeric, represent the scale parameter of a generalized log-gamma distribution. Default value is 1.
lambda	numeric, represent the shape parameter of a generalized log-gamma distribution. Default value is 1.

Author(s)

Carlos Alberto Cardozo Delgado <cardozorpackages@gmail.com>, G. Paula and L. Vanegas.

Examples

```
lss(0,1,-1) # Extreme value type I distribution, maximum case.
lss(0,1,1)  # Extreme value type I distribution, minimum case.
lss(0,1,0.005) # Standard normal distribution.
```

order_glg	<i>Random Sampling of Order Statistics from a Generalized Log-gamma Distribution</i>
-----------	--------------------------------------------------------------------------------------

Description

order_glg is used to obtain a random sample of order statistics from a Generalized Log-gamma Distribution.

Usage

```
order_glg(size, mu, sigma, lambda, k, n)
```

Arguments

size	numeric, represents the size of the sample.
mu	numeric, represents the location parameter. Default value is 0.
sigma	numeric, represents the scale parameter. Default value is 1.
lambda	numeric, represents the shape parameter. Default value is 1.
k	numeric, represents the Kth smallest value from a sample.
n	numeric, represents the size of the sample to compute the order statistic from.

Examples

```
{  
# A random sample of size 10 of order statistics from a Extreme Value Distribution.  
order_glg(10,0,1,1,1,50)}
```

plot.sglg	<i>plot</i>
-----------	-------------

Description

plot produces the graph of the goodness-of-fit statistic which is based on the statistic Y . Also produces a graph of the deviance-type residuals versus the fitted values for the location model. Under the presence of a right-censored sample, the function plot() produces a graph of the survival function of the error distribution.

Usage

```
## S3 method for class 'sglg'
plot(x, ...)
```

Arguments

x	an object of the class sglg. This object is returned from the call to glg(), sglg(), survglg() or ssurvglg().
...	other arguments.

plotnpc	<i>Plotting a natural cubic splines or P-splines.</i>
---------	-------------------------------------------------------

Description

plot.npc displays a graph of a fitted nonparametric effect, either natural cubic spline or P-spline, from an object of class sglg.

Usage

```
plotnpc(fit)
```

Arguments

fit	an object of the class sglg. This object is returned from the call to glg(), sglg(), survglg() or ssurvglg().

fit1 <- sglg(y1 ~ x1 + x2 - 1, npc=x3, method='FS',data=data.example)
plotnpc(fit1)

```

plotsurv.sglg

Plot simultaneously the Kaplan-Meier and parametric estimators of the survival function.

Description

plotsurv.sglg is used to plot simultaneously the Kaplan-Meier and parametric estimators of the survival function.

Usage

```
plotsurv.sglg(fit)
```

Arguments

`fit` an object of the class `sglg`. This object is returned from the call to `survglg()` or `ssurvglg()`.

plotsurv.sglg(fit3)
```

residuals.sglg

Extract Model Residuals

Description

`residuals.sglg` extracts the deviance-type residuals for a model from an object of class `'sglg'`.

Usage

```
## S3 method for class 'sglg'
residuals(object, ...)
```

Arguments

object	an object of the class <code>sglg</code> . This object is returned from the call to <code>glg()</code> , <code>sglg()</code> , <code>survglg()</code> or <code>ssurvglg()</code> function.
...	other arguments.

rglg	<i>Random number generation for a generalized log-gamma distribution</i>
------	--------------------------------------------------------------------------

Description

`rglg` is used to generate random numbers for a generalized log-gamma distribution.

Usage

```
rglg(n, location, scale, shape)
```

Arguments

n	numeric, size of the random sample.
location	numeric, represent the location parameter of a generalized log-gamma distribution. Default value is 0.
scale	numeric, represent the scale parameter of a generalized log-gamma distribution. Default value is 1.
shape	numeric, represent the shape parameter of a generalized log-gamma distribution. Default value is 1.

Author(s)

Carlos Alberto Cardozo Delgado <cardozorpackages@gmail.com>, G. Paula and L. Vanegas.

References

Examples

```
rglg(10, location=-1, scale=0.5, shape=1)
```

sglg

*Fitting semi-parametric generalized log-gamma regression models***Description**

sglg is used to fit a semi-parametric regression model suitable for analysis of data sets in which the response variable is continuous, strictly positive, and asymmetric. In this setup, the location parameter of the response variable is explicitly modeled by semi-parametric functions, whose non-parametric components may be approximated by natural cubic splines or cubic P-splines.

Usage

```
sglg(formula, npc, basis, data, shape, method, Tolerance, Maxiter)
```

Arguments

formula	a symbolic description of the systematic component of the model to be fitted. See details for further information.
npc	a data frame with potential nonparametric variables of the systematic part of the model to be fitted.
basis	a name of the cubic spline basis to be used in the model. Supported basis include deBoor and Gu basis which are a B-spline basis and a natural cubic spline basis, respectively.
data	an optional data frame, list containing the variables in the model.
shape	an optional value for the shape parameter of the error distribution of a generalized log-gamma distribution. Default value is 1.
method	There are two possible algorithms to estimate the parameters. The default algorithm is 'FS' Fisher-Scoring, the other option is 'GSFS' an adequate combination between the block matrix version of non-linear Gauss-Seidel algorithm and Fisher-Scoring algorithm.
Tolerance	an optional positive value, which represents the convergence criterion. Default value is 1e-04.
Maxiter	an optional positive integer giving the maximal number of iterations for the estimating process. Default value is 1e03.

Value

mu a vector of parameter estimates associated with the location parameter.

sigma estimate of the scale parameter associated with the model.

lambda estimate of the shape parameter associated with the model.

interval estimate of a 95% confidence interval for each estimate parameters associated with the model.

Deviance the deviance associated with the model.

Author(s)

Examples

```

rows <- 175 # Number of observations
columns <- 2 # Number of parametric components
library(ssym)
t_beta <- c(0.5, 2)
t_sigma <- 1
t_lambda <- 1
t_knot1 <- 7
ts1 <- seq(0, 1, length = t_knot1)
t_g1 <- 0.4 * sin(pi * ts1)

BasisN <- function(n, knot) {
  N <- matrix(0, n, knot)
  m <- n/knot
  block <- matrix(1, m, 1)
  for (i in 1:knot) {
    l <- (i - 1) * m + 1
    r <- i * m
    N[l:r, i] <- block }
  return(N)
}

s_N1 <- BasisN(rows, length(ts1))
x3 <- s_N1 %*% ts1
colnames(x3) <- 'x3'
set.seed(8142031)
x1 <- rbinom(rows, 1, 0.5)
x2 <- runif(rows, 0, 1)
X <- cbind(x1,x2)
error <- rglg(rows, 0, 1, t_lambda)
y1 <- X %*%t_beta + + s_N1 %*% t_g1 + t_sigma * error
data.example <- data.frame(y1,X,x3)
fit1 <- sglg(y1 ~ x1 + x2 - 1, npc=x3, method='FS',data=data.example)
fit2 <- sglg(y1 ~ x1 + x2 - 1, npc=x3, method='GSFS',data=data.example)

```

Description

Tool that supports the estimation of the shape parameter in semi-parametric or multiple linear accelerated failure time model with generalized log-gamma errors under the presence of censored data. The estimation is based on the profiled likelihood function for the shape parameter of the model.

Usage

```
shape(formula, npc, data, interval, semi, step)
```

Arguments

formula	a symbolic description of the systematic component of the model to be fitted.
npc	a data frame with potential nonparametric variables of the systematic part of the model to be fitted.
data	a data frame which contains the variables in the model.
interval	an optional numerical vector of length 2. In this interval is the maximum likelihood estimate of the shape parameter of the model. By default is [0.1,1.5].
semi	a logical value. TRUE means that the model has a non-parametric component. By default is FALSE.
step	an optional positive value. This parameter represents the length of the step of the partition of the interval parameter. By default is 0.1.

lambda

```

ssurvglg

Fitting semi-parametric generalized log-gamma regression models under the presence of right censored data.

Description

ssurvglg is used to fit a semi-parametric regression model in which the response variable is continuous, strictly positive, asymmetric and there are right censored observations. In this setup, the location parameter of the logarithm of the variable is explicitly modeled by semi-parametric functions, whose nonparametric components may be approximated by natural cubic splines or cubic P-splines.

Usage

```
ssurvglg(formula, npc, basis, data, shape, Maxiter, Tolerance)
```

Arguments

formula	a symbolic description of the systematic component of the model to be fitted. See details for further information.
npc	a data frame with potential nonparametric variables of the systematic part of the model to be fitted.
basis	a name of the cubic spline basis to be used in the model. Supported basis include deBoor and Gu basis which are a B-spline basis and a natural cubic spline basis, respectively.
data	an optional data frame, list containing the variables in the model.
shape	an optional value for the shape parameter of the model.
Maxiter	an optional positive integer giving the maximal number of iterations for the estimating process. Default value is 1e03.
Tolerance	an optional positive value, which represents the convergence criterion. Default value is 1e-04.

Value

mu a vector of parameter estimates associated with the location parameter.

sigma estimate of the scale parameter associated with the model.

lambda estimate of the shape parameter associated with the model.

interval estimate of a 95% confidence interval for each estimate parameters associated with the model.

Deviance the deviance associated with the model.

summary.sglg

summary.sglg

Description

summary.sglg extracts displays the summary of the fitted model including parameter estimates, associated (approximated) standard errors and goodness-of-fit statistics from a model from an object of class 'sglg'.

Usage

```

## S3 method for class 'sglg'
summary(object, ...)

```

Arguments

object	an object of the class sglg. This object is returned from the call to glg(), sglg(), survglg() or ssurvglg() function.
...	other arguments.

survglg

Fitting linear generalized log-gamma regression models under the presence of right censored data.

Description

survglg is used to fit a multiple linear regression model in which the response variable is continuous, strictly positive, asymmetric and there are right censored observations. In this setup, the location parameter of the logarithm of the response variable is modeled by a linear model of the parametes.

Usage

```

survglg(formula, data, shape, Maxiter, Tolerance)

```

Arguments

formula	a symbolic description of the systematic component of the model to be fitted. See details for further information.
data	an optional data frame, list containing the variables in the model.
shape	an optional value for the shape parameter of the model.
Maxiter	an optional positive integer giving the maximal number of iterations for the estimating process. Default value is 1e03.
Tolerance	an optional positive value, which represents the convergence criterion. Default value is 1e-04.

Value

mu a vector of parameter estimates associated with the location parameter.

sigma estimate of the scale parameter associated with the model.

lambda estimate of the shape parameter associated with the model.

interval estimate of a 95% confidence interval for each estimate parameters associated with the model.

Deviance the deviance associated with the model.
