

# Package ‘mlgt’

February 20, 2015

**Type** Package

**Title** Multi-Locus Geno-Typing

**Version** 0.16

**Date** 2012-03-26

**Author** Dave T. Gerrard

**Maintainer** Dave T. Gerrard <david.gerrard@manchester.ac.uk>

**Description** Processing and analysis of high throughput (Roche 454) sequences generated from multiple loci and multiple biological samples. Sequences are assigned to their locus and sample of origin, aligned and trimmed. Where possible, genotypes are called and variants mapped to known alleles.

**License** GPL (>= 2)

**LazyLoad** yes

**Depends** R (>= 2.13.0), methods, seqinr

**Suggests** snowfall

**URL** <http://personalpages.manchester.ac.uk/staff/David.Gerrard/>

**Collate** 'mlgt.R'

**Repository** CRAN

**Date/Publication** 2012-03-26 13:20:25

**NeedsCompilation** no

mlgt-package	<i>mlgt: Multi-locus geno-typing</i>
--------------	--------------------------------------

---

## Description

```

Package:    mlgt
Type:      Package
Version:    0.16
Date:      2012-03-27
Author:    Dave T. Gerrard <david.gerrard@manchester.ac.uk>
License:   GPL (>= 2)
LazyLoad:  yes

```

## Details

mlgt sorts a batch of sequence by barcode and identity to templates. It makes use of external applications BLAST and MUSCLE. Genotypes are called and alleles can be compared to a reference list of sequences. More information about each function can be found in its help documentation.

Some text

The main functions are: [prepareMlgtRun](#), [mlgt](#), [callGenotypes](#), [createKnownAlleleList](#),

...

---

alignReport	<i>Report on alignment</i>
-------------	----------------------------

---

## Description

Inspect site frequency spectra for alignments.

## Usage

```
alignReport(mlgtResultObject,
  markers = names(mlgtResultObject@markers),
  samples = mlgtResultObject@samples,
  correctThreshold = 0.01,
  consThreshold = (1 - correctThreshold),
  profPlotWidth = 60, fileName = NULL, method = "table",
  warn = TRUE)
```

## Arguments

mlgtResultObject	an object of class <code>mlgtResult</code>
markers	Which markers to output
samples	Which samples to output
correctThreshold	A hypothetical level at which you might correct low frequency variants. Default = 0.01.
consThreshold	(1- correctThreshold)
profPlotWidth	How many residues to plot in profile mode. Default=60.
fileName	Give a filename to export result to (pdf).
method	One of c("table", "profile", "hist"). "hist" plot a histogram of MAF frequencies. "profile" plots a coloured barplot representing the allele frequencies at each site.
warn	Issue warnings (default = TRUE)

## Details

Produce different kinds of reports to assess quality of data for each marker/sample pair. Can be a good way to assess whether `errorCorrect` should be applied.

## Value

A data frame for each marker listing site statistics.

**See Also**[errorCorrect](#)**Examples**

```
## Not run:
data("mlgtResult", package="mlgt")
alignReport(my.mlgt.Result,markers="DPA1_E2", samples="MID-22", method="profile")
alignReport(my.mlgt.Result,markers="DPA1_E2", samples="MID-22", method="hist")

## End(Not run)
```

---

callGenotypes	<i>Make genotype calls</i>
---------------	----------------------------

---

**Description**

Apply a genotype call method to a table or list of tables of variant data such as the `markerSampleList` table of an [mlgtResult](#).

**Usage**

```
callGenotypes(resultObject,
  method = "callGenotypes.default",
  markerList = names(resultObject@markers),
  sampleList = resultObject@samples, mapAlleles = FALSE,
  alleleDb = NULL, approxMatching = FALSE, ...)
```

**Arguments**

<code>resultObject</code>	An object of class <a href="#">mlgtResult</a> , as returned by <a href="#">mlgt</a>
<code>alleleDb</code>	A list of <a href="#">variantMap</a> objects derived from known alleles. As made by <a href="#">createKnownAlleleList</a>
<code>method</code>	How to call genotypes. Currently only "callGenotypes.default" is implemented. Users can define their own methods as R functions (see the vignette).
<code>markerList</code>	For which of the markers do you want to call genotypes (default is all)?
<code>sampleList</code>	For which of the samples do you want to call genotypes (default is all)?
<code>mapAlleles</code>	FALSE/TRUE. Whether to map variants to db 'alleleDb' of known alleles.
<code>approxMatching</code>	If TRUE, a BLAST search is also performed to find matches (slower). Additional columns are added to the genotypeTable
<code>...</code>	Other parameter values will be passed to custom methods such as <a href="#">callGenotypes.default</a>

## Details

After `mlgt` has generated tables of the most common variants assigned in each marker/sample pair, an attempt can be made to call genotypes. This is kept separate because users might want to try different calling methods and have the option to map to a known set of alleles. Currently, only one method is implemented (*'custom'*). See `callGenotypes.default`. This function also includes the option to map variants to a list of known alleles created using `createKnownAlleleList`. The basic method makes only perfect matches but a secondary method can be triggered (`approxMatching=TRUE`) to find the allele with the greatest similarity using a local BLAST search.

## Value

list of call results including the call parameters and a table of calls (class `genotypeCall`). If an `mlgtResult` object was supplied then a list of `genotypeCall` objects will be returned, each named by marker.

## Examples

```
## Not run:
data("mlgtResult", package="mlgt")
my.mlgt.Result
# the default method
my.genotypes <- callGenotypes(my.mlgt.Result)
# using a custom method
callGenotypes.custom <- function(table, maxPropUniqueVars=0.5) {
  table$status <- "notCalled"
  table$propUniqueVars <- table$numbVar/table$numbSeq
  table$status <- ifelse(table$propUniqueVars <= maxPropUniqueVars,"good", "bad")
  return(table)
}
my.custom.Genotypes <- callGenotypes(my.mlgt.Result, method="callGenotypes.custom")

## End(Not run)
```

---

`callGenotypes.default` *Default internal methods for `callGenotypes`*

---

## Description

This is the default method to call genotypes from a table of variant counts. Methods:-

**'callGenotypes.default'** Three sequential steps for each marker/sample pair:

1. if the number of reads is less than `minTotalReads` the genotype is *'tooFewReads'*
2. if the difference between the sum of counts of the top two variants and the count of the third most variant, expressed as proportion of total, is less than `minDiffToVarThree`, OR the third most abundant variant accounts for more than `maxPropVarThree` (default=0.1) of the reads, then the genotype is *'complexVars'*
3. if the difference between the counts of top two variants, expressed as a proportion of the total, is greater than or equal to `minPropDiffHomHetThreshold`, then the genotype is *HOMOZYGOTE*. Otherwise it is *HETEROZYGOTE*.

**Usage**

```
callGenotypes.default(table, minTotalReads = 50,
  minDiffToVarThree = 0.4,
  minPropDiffHomHetThreshold = 0.3,
  maxPropVarThree = 0.1)
```

**Arguments**

table	The table of sequence counts as in the markerSampleTable of an mlgtResult object.
minTotalReads	Minimum number of reads before attempting to call genotypes
minDiffToVarThree	Difference between sum of counts of top two variants and the count of the third most frequent variant, expressed as proportion of total.
minPropDiffHomHetThreshold	Difference between counts of top two variants. One way to distinguish HOMOZYGOTES and HETEROZYGOTES.
maxPropVarThree	Also call as 'complexVars' if the third variant accounts for more than this proportion of used reads (default=0.1)

**Value**

A data.frame identical to those in markerSampleList but with additional columns giving parameter values, and a 'status' column giving the genotype status.

---

combineMlgtResults	<i>Combine two or more mlgtResult objects</i>
--------------------	---

---

**Description**

Combine results from one or more runs, or combine partial results after a parallel job.

**Usage**

```
combineMlgtResults(resultList,
  projectName = resultList[[1]]@projectName,
  runName = "combinedMlgtResults")
```

**Arguments**

resultList	A list of objects of class <code>mlgtResult</code>
projectName	Do you want to provide your own projectName
runName	Do you want to provide your own runName

## Details

In some cases, you may want to combine multiple `mlgtResult` objects into a single object. Can combine results using the same markers as long as the samples used have different names between results. Can combine results using different sets (subsets) of markers. Will fail if the same marker/sample combination appears in more than one `mlgtResult`. Can be used to recombine the list of result obtained by running `mlgt` in parallel on subsets of the full marker list.

## Value

An object of class `mlgtResult`

---

`createKnownAlleleList` Create `variantMap` object from allele alignment

---

## Description

Create a `variantMap` object to store known alleles for a marker

## Usage

```
createKnownAlleleList(markerName, markerSeq,  
  alignedAlleleFile, alignFormat = "msf",  
  sourceName = alignedAlleleFile, userAlignment = FALSE)
```

## Arguments

<code>markerName</code>	A specific marker name
<code>markerSeq</code>	something
<code>alignedAlleleFile</code>	a sequence alignment
<code>alignFormat</code>	the format of <code>alignedAlleleFile</code> . "msf" (the default) or "fasta"
<code>sourceName</code>	A character string to record the source of the alignment. Defaults to the value of <code>alignedAlleleFile</code>
<code>userAlignment</code>	The specified ' <code>alignedAlleleFile</code> ' already includes the marker sequence. Default = FALSE.

## Details

To compare variants produced using `mlgt` the sequences of the known alleles must be aligned to the same marker used to find the variants. The resulting sub-sequence alignment may have identical sequences for different alleles. If that happens, those alleles are condensed into one and their names concatenated. User can supply files with marker sequences pre-aligned to the reference alleles.

## Value

a `variantMap` object named by `markerName`

---

dumpVariantMap.mlgtResult

*Dump variants as fasta*

---

### Description

Output unique variants to one or more fasta files.

### Usage

```
dumpVariantMap.mlgtResult(resultObject,
  markers = names(resultObject@markers),
  file = paste(resultObject@projectName, resultObject@runName, "seqDump", sep = "."),
  singleFile = TRUE)
```

### Arguments

resultObject	An object of class <code>mlgtResult</code> containing the sequence variants.
markers	For which markers do you want to output sequences.
file	An output file name. If not supplied, one is created.
singleFile	Whether to output results for all markers to a single file or to one file per marker.

### Details

This is a stop-gap function while I decide how best to handle output of full sequences.

### Value

Writes fasta files in the current directory.

---

dumpVariants

*Print sequence to file*

---

### Description

A function to output all sequences or just unique sequences to a fasta file

### Usage

```
dumpVariants(mlgtResultObject,
  markers = names(mlgtResultObject@markers),
  samples = mlgtResultObject@samples,
  fileSuffix = "variantDump.fasta", uniqueOnly = FALSE)
```

**Arguments**

mlgtResultObject	an object of class <a href="#">mlgtResult</a>
markers	Which markers to output
samples	Which samples to output
fileSuffix	Add a common suffix to the file names. Usefull for keeping track of different sets of sequences.
uniqueOnly	Only output single copy of each sequence. A count for each sequence are appended to the names.

**Details**

The sequence variants stored within an object of class [mlgtResult](#) are not very easy to extract. This function will output all variants or all variant for specific markers and samples into fasta files. Users can select to only output unique sequences or the full alignment including duplicated sequences. One file will be created for each marker/sample pair.

---

errorCorrect	<i>Alignment error correction</i>
--------------	-----------------------------------

---

**Description**

Correct very low frequency site variants.

**Arguments**

mlgtResultObject	An object of class <a href="#">mlgtResult</a>
correctThreshold	The maximum Minor Allele Frequency (MAF) at which variants will be corrected.

**Details**

You may want to alter some of the sequences if you believe that sequences at very low frequency (within the set of sequences from a marker/sample pair) represent sequencing errors. `errorCorrect()` is implemented as an additional step after running [mlgt](#), however, it is recommended to include error correction within [mlgt](#) using the `errorCorrect=TRUE` option. Using [alignReport](#) beforehand may help you decide whether to do this.

**Value**

A new [mlgtResult](#) object with errors 'corrected'

**See Also**

[alignReport](#)

---

genotypeCall	<i>Results from <a href="#">callGenotypes</a></i>
--------------	---

---

### Description

An S4 class containing a table and parameter values returned by [callGenotypes](#)

### Details

**projectName** In which project does this run belong

**runName** Which run was this. An identifier for the sequence run

**marker** Which marker was this.

**genotypeTable** A data frame with variant counts, statistics, genotype calls and, optionally, allele names.

**callMethod** Which method was used to call genotypes

**callParameters** a named list containing parameter values used in the call

**mappedToAlleles** TRUE/FALSE whether an attempt was made to map the variants to a db on known alleles.

**alleleDbName** A list of objects of class [variantMap](#). Contains all variants returned by [mlgt](#)

### See Also

[callGenotypes](#), [writeGenotypeCallsToFile](#)

---

getSubSeqsTable	<i>Align and trim sequences for marker/sample pair</i>
-----------------	--

---

### Description

A list of sequences mapped to both ‘thisMarker’ and ‘thisSample’ is created and these sequences are aligned to ‘markerSeq’.

### Usage

```
getSubSeqsTable(thisMarker, thisSample, sampleMap,
  fMarkerMap, rMarkerMap, markerSeq, maxVarsToAlign = 30,
  minTotalCount = 500, errorCorrect = FALSE,
  correctThreshold = 0.01, minLength = 70)
```

**Arguments**

thisMarker	A specific marker name
thisSample	A specific sample name
sampleMap	A list of sequence IDs assigned to each marker. Each element named by marker name.
fMarkerMap	A list of sequence IDs assigned to each sample using BLAST hits in forward orientation. Each element named by sample name.
rMarkerMap	A list of sequence IDs assigned to each sample using BLAST hits in reverse orientation. Each element named by sample name.
markerSeq	The sequence of 'thisMarker'
maxVarsToAlign	If total assigned sequences exceeds 'minTotalCount', then only the 'maxVarsToAlign' most abundant variants are used.
minTotalCount	How many assigned sequences to allow before limiting the number of raw variants to align.
errorCorrect	Use error correction on alignment of raw variants
correctThreshold	Maximum proportion of raw reads at which (minor allele) bases and gaps are corrected.
minLength	Reads below this length are excluded (they are very likely to be primer-dimers).

**Details**

This internal function is called by [mlgt](#)

**Value**

A table of unique variants and their counts. The sequences have been trimmed to the portion aligned with 'markerSeq'

---

getTopBlastHits	<i>Return top blast hits</i>
-----------------	------------------------------

---

**Description**

Auxillary function

**Usage**

```
getTopBlastHits(blastTableFile)
```

**Arguments**

blastTableFile The name of a file of tabulated blast results.

**Value**

A reduced blast table with one hit per query

---

`inspectBlastResults`     *Plot BLAST statistics for one marker*

---

### Description

[prepareMlgtRun](#) produces several BLAST tables. It is instructive to plot the BLAST results and assess the performance of different markers.

### Usage

```
inspectBlastResults(blastTable, subject)
```

### Arguments

<code>blastTable</code>	The file of BLAST results.
<code>subject</code>	The name of a single marker

### Details

This function is used to plot a series of histograms based on BLAST statistics.

### Value

Plots three histograms based on the BLAST statistics 'Alignment length', 'Bit Score' and 'Percent Identity'

### See Also

[printBlastResultGraphs](#)

---

`mlgt`     *Get variants for all markers/samples*

---

### Description

`mlgt` Works through all pairs of markers and samples. Aligns variants and trims aligned variants to the marker sequence. Potential 'alleles' are assigned from the most common variants within each sample.

### Usage

```
mlgt(designObject, maxVarsToAlign = 30,  
     minTotalCount = 500, errorCorrect = FALSE,  
     correctThreshold = 0.01, minLength = 70)
```

**Arguments**

<code>designObject</code>	an object of class <code>mlgtDesign</code>
<code>minTotalCount</code>	How many assigned sequences to allow before limiting the number of raw variants to align.
<code>maxVarsToAlign</code>	If total assigned sequences exceeds 'minTotalCount', then only the 'maxVarsToAlign' most abundant variants are used.
<code>errorCorrect</code>	Use error correction on alignment of raw variants
<code>correctThreshold</code>	Maximum proportion of raw reads at which (minor allele) bases and gaps are corrected.
<code>minLength</code>	Reads below this length are excluded (they are very likely to be primer-dimers).

**Details**

Depends upon `prepareMlgtRun` having been run in the current directory to generate 'designObject' of class `mlgtDesign`. The basic process for each marker/sample pair is to align all unique variants using MUSCLE and then extract the alignment portion aligned to the reference marker sequence, ignoring the rest. The marker alignment is critical and `mlgt` has several options to optimise this alignment. If the total number of reads is less than `minTotalCount`, then all variants are aligned. Otherwise, only the most abundant 30 unique variants are aligned. Optionally, alignments are 'error-corrected' as per the separate function `errorCorrect`. Reads shorter than 'minLength' are filtered out.

**Value**

an object of class `mlgtResult` containing all variants and their counts, a summary table (all markers) and one summary table per marker.

**See Also**

[prepareMlgtRun](#)

---

`mlgtDesign`

*An S4 class that holds information about an mlgt analysis.*

---

**Description**

Returned by `prepareMlgtRun`. Used as sole input for `mlgt`

**Details**

**projectName** In which project does this run belong

**runName** Which run was this. An identifier for the sequence run

**markers** A list of named sequences.

**samples** A vector of sample names

**fTags** A vector of named sequence of MIDs used to barcode samples at the 5' end.

**rTags** A vector of named sequence of MIDs used to barcode samples at the 3' end.

**inputFastaFile** The name of the file containing sequences. Currently only fasta format is supported. It is up to you to pre-filter the sequences.

### See Also

[prepareMlgtRun](#), [mlgt](#)

---

mlgtResult

*An S4 class to hold results from [mlgt](#)*

---

### Description

Extends [mlgtDesign](#)

### Details

**projectName** In which project does this run belong

**runName** Which run was this. An identifier for the sequenece run

**markers** A *list* of named sequences.

**samples** A vector of sample names

**fTags** A vector of named sequence of MIDs used to barcode samples at the 5' end.

**rTags** A vector of named sequence of MIDs used to barcode samples at the 3' end. May be same as fTags

**inputFastaFile** The name of the file containing sequences. Currently only fasta format is supported. It is up to you to pre-filter the sequences.

**runSummaryTable** A summary table with one row per marker

**alleleDb** A list of objects of class [variantMap](#). Contains all variants returned by [mlgt](#)

**markerSampleList** A list of tables, one table per marker giving results for each sample/MID

### See Also

[mlgtDesign](#), [prepareMlgtRun](#), [mlgt](#)

---

my.mlgt.Result      *An example mlgtResult object.*

---

**Description**

This is the result of running `mlgt` on the sample data given in the README.

**Format**

a `mlgtResult` object.

**Author(s)**

Dave T. Gerrard, 2012-04-01

**Source**

Package mlgt

---

plotGenotypeEvidence      *Plot genotyping evidence*

---

**Description**

Plot the distributions of values used in calling genotypes.

**Arguments**

<code>callList</code>	A list of genotypes calls.
<code>genotypeCall</code>	A single table of genotype calls
<code>file</code>	The file to write to.

**Details**

Currently only makes sense with "custom" method. The resulting plots are

1. Histogram of the number of sequences assigned to each sample
2. Histogram of `diffToVarThree` parameter. Used to decide whether to make the call
3. Histogram of `propDiffHomHet` parameter. Used to distinguish HOMOZYGOTES and HETEROZYGOTES
4. `propDiffHomHet` against `diffToVarThree`
5. `diffToVarThree` against number of sequences
6. `propDiffHomHet` against number of sequences

**Value**

Creates six plots for each marker with a genotypeCall table. See details.

**See Also**

[callGenotypes](#)

**Examples**

```
## Not run:
data("mlgtResult", package="mlgt")
my.genotypes <- callGenotypes(my.mlgt.Result)
plotGenotypeEvidence(genotypeCall=my.genotypes[["DPA1_E2"]])

## End(Not run)
```

---

```
prepareMlgtRun
```

```
Prepare to run mlgt
```

---

**Description**

Required before [mlgt](#) is used. Create BLAST databases and assign sequences using BLAST.

**Usage**

```
prepareMlgtRun(designObject, projectName, runName,
  samples, markers, fTags, rTags, inputFastaFile,
  overwrite)
```

**Arguments**

designObject	Only used internally.
projectName	In which project does this run belong
runName	Which run was this. An identifier for the sequece run
markers	A <i>list</i> of named sequences.
samples	A vector of sample names
fTags	A vector of named sequence of MIDs used to barcode samples at the 5' end.
rTags	A vector of named sequence of MIDs used to barcode samples at the 3' end.
inputFastaFile	The name of the file containing sequences. Currently only fasta format is supported. It is up to you to pre-filter the sequences.
overwrite	Should files in the current directory be overwritten? c("prompt", "yes", "no")

**Details**

This important function stores all the information about the analysis run AND populates the working directory with multiple local Blast databases, which are later required by [mlgt](#). Once prepareMlgtRun has been run, [mlgt](#) can be run aswell as [printBlastResultGraphs](#) and [inspectBlastResults](#).

**Value**

An object of class [mlgtDesign](#) is returned. Also, several BLAST dbs and sets of BLAST results are created in the working directory. These are essential for [mlgt](#) to run.

**See Also**

[printBlastResultGraphs](#) and [inspectBlastResults](#) can only be run AFTER [prepareMlgtRun](#).

---

```
printBlastResultGraphs
```

*Plot BLAST statistics for several markers to file*

---

**Description**

Plot the BLAST statistics easily for all markers of an [mlgtResult](#) object.

**Usage**

```
printBlastResultGraphs(designObject,
  markerList = designObject@markers,
  fileName = "blastResultGraphs.pdf")
```

**Arguments**

designObject	An object of class <a href="#">mlgtDesign</a> which will contain the name of the blast results file designObject@markerBlastResults
markerList	Which markers to output. Defaults to designObject@markers
fileName	Defaults to "blastResultGraphs.pdf"

**Value**

Plots BLAST results to a pdf file.

**See Also**

[inspectBlastResults](#)

---

```
variantMap
```

*An S4 class to hold all unique variants found/known for a marker.*

---

**Description**

An S4 class to hold all unique variants found/known for a marker.

---

`writeGenotypeCallsToFile`*Write genotype calls to file*

---

**Description**

A genotype call table or a list of tables can be written to tab-delimited file(s).

**Arguments**

<code>callList</code>	A list of genotypes calls.
<code>genotypeCall</code>	Alternatively, supply a single table of genotype calls
<code>filePrefix</code>	A prefix to add to the start of each file name. Useful to distinguish sets of genotype call results from same run.
<code>file</code>	The file to write to. If none specified, function will attempt to make one. Ignored if <code>'singleFile = TRUE'</code> .
<code>singleFile</code>	FALSE/TRUE whether to concatenate results from a list of genotypeCalls
<code>writeParams</code>	List call parameter values at top of file? Beware using this option when <code>'singleFile = TRUE'</code>
<code>appendValue</code>	Used internally to concatenate results.

**Details**

This function is quite flexible and can output a single table of concatenated results or a series of individual files. Call parameters can be included above each table but be careful doing this when `singleFile=TRUE`

**Value**

Writes tables in the current working directory.

**Examples**

```
## Not run:  
data("mlgtResult", package="mlgt")  
my.genotypes <- callGenotypes(my.mlgt.Result)  
writeGenotypeCallsToFile(my.genotypes)  
  
## End(Not run)
```
