

# Package ‘neurobase’

November 20, 2018

**Type** Package

**Title** 'Neuroconductor' Base Package with Helper Functions for 'nifti' Objects

**Version** 1.27.6

**Maintainer** John Muschelli <muschelli.j2@gmail.com>

**Description** Base package for 'Neuroconductor', which includes many helper functions that interact with objects of class 'nifti', implemented by package 'oro.nifti', for reading/writing and also other manipulation functions.

**Imports** methods, abind, matrixStats, R.utils, graphics, grDevices, stats, RNifti

**Depends** oro.nifti (>= 0.9.0), R (>= 3.2.0)

**License** GPL-2

**Suggests** testthat, ggplot2, knitr, rmarkdown, dplyr, reshape2, httr, covr

**VignetteBuilder** knitr

**BugReports** <https://github.com/muschelli.j2/neurobase/issues>

**Encoding** UTF-8

**RoxygenNote** 6.1.0

**NeedsCompilation** no

**Author** John Muschelli [aut, cre]

**Repository** CRAN

**Date/Publication** 2018-11-20 17:10:03 UTC

applyEmptyImageDimensions-methods

*Apply Subsetting from Empty Image Dimensions*

**Description**

Simple wrapper for subsetting an image with indices, dropping empty dimensions.

**Usage**

```
applyEmptyImageDimensions(img, inds, reorient = FALSE, ...)
```

```
## S4 method for signature 'nifti'
```

```
applyEmptyImageDimensions(img, inds, reorient = FALSE,
  ...)
```

```
## S4 method for signature 'character'
```

```
applyEmptyImageDimensions(img, inds,
  reorient = FALSE, ...)
```

```
## S4 method for signature 'factor'
```

```
applyEmptyImageDimensions(img, inds, reorient = FALSE,
  ...)
```

```
## S4 method for signature 'list'
```

```
applyEmptyImageDimensions(img, inds, reorient = FALSE,
  ...)
```

```

## S4 method for signature 'array'
applyEmptyImageDimensions(img, inds, reorient = FALSE,
  ...)

## S4 method for signature 'anlz'
applyEmptyImageDimensions(img, inds, reorient = FALSE,
  ...)

## S4 method for signature 'ANY'
applyEmptyImageDimensions(img, inds, reorient = FALSE,
  ...)

apply_empty_dim(img, ...)

```

### Arguments

|          |  |
|----------|--|
| img      | image, nifti object, or array  |
| inds     | indices of subset from <a href="#">getEmptyImageDimensions</a> or <a href="#">dropEmptyImageDimensions</a> . |
| reorient | Should image be reoriented if a filename?  |
| ...      | not used   |

### Value

Object of class nifti or array if nifti is not supplied

### Note

apply\_empty\_dim is a shorthand for applyEmptyImageDimensions with all the same arguments.

### See Also

[getEmptyImageDimensions](#), [dropEmptyImageDimensions](#)

---

boxplot.nifti

*Boxplot of Values in an Image*

---

### Description

Computes the boxplot of values of an image with the option for a mask.

### Usage

```

## S3 method for class 'nifti'
boxplot(x, ..., mask)

## S3 method for class 'anlz'
boxplot(x, ..., mask)

```

**Arguments**

|      |   |
|------|---|
| x    | Object of class <code>nifti</code>  |
| ...  | Arguments passed to <code>boxplot.default</code>                                  |
| mask | object to subset the image. If missing, then all values of the image are plotted. |

**Value**

Output of `boxplot`

**Examples**

```
img = nifti(array(rnorm(10^3), dim = rep(10, 3)))
mask = img > 0
boxplot(img, mask = mask)
```

---

breaker

*Find Breaks for nifti Image Plotting*

---

**Description**

Helper function for plotting - returns breaks for `image` plot function for object of class `nifti`

**Usage**

```
breaker(x, zlim, col, breaks = NULL)
```

**Arguments**

|        |  |
|--------|--|
| x      | Object of class <code>nifti</code>   |
| zlim   | A user-specified <code>zlim</code> . If <code>NULL</code> , will calculate how <code>ortho2</code> would calculate <code>zlim</code> |
| col    | colors to be plotted. Only used for <code>length(col)</code> , so can be a vector of length cols to be plotted                       |
| breaks | if <code>!is.null(breaks)</code> , then will calculate breaks. Otherwise will return this breaks vector                              |

**Value**

Vector of length 2

If `breaks = NULL`, then vector of `length(col) + 1`, otherwise returns breaks

---

checking-methods      *Force object to filename*

---

### Description

Ensures the output to be a character filename (or vector) from an input image or nifti.

### Usage

```
checking(file, allow_array = FALSE, ...)  
  
## S4 method for signature 'nifti'  
checking(file, allow_array = FALSE, ...)  
  
## S4 method for signature 'ANY'  
checking(file, allow_array = FALSE, ...)  
  
## S4 method for signature 'character'  
checking(file, allow_array = FALSE, ...)  
  
## S4 method for signature 'list'  
checking(file, allow_array = FALSE, ...)
```

### Arguments

|             |   |
|-------------|---|
| file        | character or nifti object                 |
| allow_array | allow arrays to be passed in              |
| ...         | options passed to <a href="#">tempimg</a> |

### Value

character filename of image or temporary nii, with .nii extension

### Author(s)

John Muschelli <muschellij2@gmail.com>

---

|                  |   |
|------------------|---|
| checknii-methods | <i>Force object to filename with .nii extension</i> |
|------------------|---|

---

## Description

Ensures the output to be a character filename (or vector) from an input image or nifti, but not gzipped and has .nii extension

## Usage

```
checknii(file, ...)  
  
## S4 method for signature 'nifti'  
checknii(file, ...)  
  
## S4 method for signature 'character'  
checknii(file, ...)  
  
## S4 method for signature 'list'  
checknii(file, ...)  
  
## S4 method for signature 'ANY'  
checknii(file, ...)  
  
ensure_nii(file, ...)
```

## Arguments

|      |  |
|------|--|
| file | character or nifti object                  |
| ...  | options passed to <a href="#">checking</a> |

## Value

character filename of image or temporary nii, with .nii extension

## Author(s)

John Muschelli <muschellij2@gmail.com>

---

checkniigz-methods      *Force object to filename with .nii.gz extension*

---

## Description

Ensures the output to be a character filename (or vector) from an input image or nifti, to be gzipped and has .nii.gz extension

## Usage

```
checkniigz(file, ...)  
  
## S4 method for signature 'nifti'  
checkniigz(file, ...)  
  
## S4 method for signature 'ANY'  
checkniigz(file, ...)  
  
## S4 method for signature 'character'  
checkniigz(file, ...)  
  
## S4 method for signature 'list'  
checkniigz(file, ...)  
  
ensure_nii_gz(file, ...)
```

## Arguments

|      |  |
|------|--|
| file | character or nifti object                  |
| ...  | options passed to <a href="#">checking</a> |

## Value

Character filename of image or temporary nii, with .nii.gz extension

## Author(s)

John Muschelli <muschellij2@gmail.com>

---

|            |                             |
|------------|-----------------------------|
| check_mask | <i>Check Mask is Binary</i> |
|------------|-----------------------------|

---

**Description**

Determine if only values in a mask are 0/1

**Usage**

```
check_mask(mask, allow.NA = FALSE, allow.array = TRUE)
```

**Arguments**

|             |   |
|-------------|---|
| mask        | Object of class <code>nifti</code>                  |
| allow.NA    | allow NAs in the mask                               |
| allow.array | if <code>class(mask)</code> is "array", is this OK? |

**Value**

Logical indicating if object is binary mask with only 0, 1, and NA if applicable

**Examples**

```
arr = array(rbinom(1000, size = 1, prob = 0.2), dim = c(10,10,10))
nim = oro.nifti::nifti(arr)
check_mask(nim)
```

---

|                 |   |
|-----------------|---|
| check_mask_fail | <i>Check Mask is Binary, Fail otherwise</i> |
|-----------------|---|

---

**Description**

Determine if only values in a mask are 0/1. Will error otherwise.

**Usage**

```
check_mask_fail(...)
```

**Arguments**

... arguments to pass to [check\\_mask](#)

**Value**

Either will error if conditions not met or an invisible NULL

## Examples

```
arr = array(rbinom(1000, size = 1, prob = 0.2), dim = c(10,10,10))
nim = oro.nifti::nifti(arr)
check_mask_fail(nim)
```

---

check\_nifti-methods    *Check if nifti image or read in a nifti image*

---

## Description

Simple check to see if input is character or of class nifti

## Usage

```
check_nifti(x, reorient = FALSE, allow.array = FALSE, fast = FALSE,
  need_header = TRUE)
```

```
## S4 method for signature 'nifti'
check_nifti(x, reorient = FALSE, allow.array = FALSE,
  fast = FALSE, need_header = TRUE)
```

```
## S4 method for signature 'character'
check_nifti(x, reorient = FALSE,
  allow.array = FALSE, fast = FALSE, need_header = TRUE)
```

```
## S4 method for signature 'factor'
check_nifti(x, reorient = FALSE,
  allow.array = FALSE, fast = FALSE, need_header = TRUE)
```

```
## S4 method for signature 'list'
check_nifti(x, reorient = FALSE, allow.array = FALSE,
  fast = FALSE, need_header = TRUE)
```

```
## S4 method for signature 'array'
check_nifti(x, reorient = FALSE, allow.array = FALSE,
  fast = FALSE, need_header = FALSE)
```

```
## S4 method for signature 'anlz'
check_nifti(x, reorient = FALSE, allow.array = FALSE,
  fast = FALSE, need_header = TRUE)
```

```
## S4 method for signature 'ANY'
check_nifti(x, reorient = FALSE, allow.array = FALSE,
  fast = FALSE, need_header = TRUE)
```

**Arguments**

|             |  |
|-------------|--|
| x           | character path of image or an object of class nifti, or array  |
| reorient    | (logical) passed to <code>readnii</code> if the image is to be re-oriented   |
| allow.array | (logical) Are array types allowed (TRUE) or should there be an error if the object is not character or class nifti.  |
| fast        | if TRUE, then <code>fast_readnii</code> will be used versus <code>readnii</code> if the files need to be read in.  |
| need_header | if TRUE, then an image type with header information will be returned. If not, then an array is fine. Used really only in conjunction with <code>allow.array</code> |

**Value**

nifti object or array if `allow.array=TRUE` and `x` is an array

**Author(s)**

John Muschelli <muschellij2@gmail.com>

**See Also**

[readnii](#)

**Examples**

```
x = nifti()
check_nifti(x)
```

---

check\_nifti\_header-methods

*Check if nifti image or read in a nifti header*

---

**Description**

Simple check to see if input is character or of class nifti and read in the header

**Usage**

```
check_nifti_header(x)

## S4 method for signature 'nifti'
check_nifti_header(x)

## S4 method for signature 'character'
check_nifti_header(x)

## S4 method for signature 'factor'
```

```

check_nifti_header(x)

## S4 method for signature 'list'
check_nifti_header(x)

## S4 method for signature 'array'
check_nifti_header(x)

## S4 method for signature 'anlz'
check_nifti_header(x)

## S4 method for signature 'ANY'
check_nifti_header(x)

```

**Arguments**

x                      character path of image or an object of class nifti, or array

**Value**

nifti object or character

**Author(s)**

John Muschelli <muschellij2@gmail.com>

---

|               |                              |
|---------------|------------------------------|
| check_outfile | <i>Check output filename</i> |
|---------------|------------------------------|

---

**Description**

This function checks if an output filename is not NULL in conjunction whether the user would like to return an image

**Usage**

```
check_outfile(outfile, retimg, fileext = ".nii.gz")
```

**Arguments**

outfile                output filename or NULL  
retimg                 Should an image be returned  
fileext                a non-empty character vector giving the file extension

**Value**

Filename of output file or a temporary filename

---

cog                      *Image Center of Gravity*

---

**Description**

Find Center of Gravity of Image, after thresholding

**Usage**

```
cog(img, thresh = 0, ceil = FALSE, warn = TRUE)
```

**Arguments**

|        |  |
|--------|--|
| img    | Object of class nifti  |
| thresh | threshold for image, will find $\text{img} > 0$                  |
| ceil   | Run <a href="#">ceiling</a> to force integers (usu for plotting) |
| warn   | Produce a warning if the image is empty after thresholding       |

**Value**

Vector of length 3

**Examples**

```
dims = rep(20, 3)
x = array(rnorm(prod(dims)), dim = dims)
img = nifti(x, dim= dims,
datatype = convert.datatype()$FLOAT32, cal.min = min(x),
cal.max = max(x), pixdim = rep(1, 4))
cog(img)
```

---

colorbar                      *Add a colorbar to an ortho2 object*

---

**Description**

Adds a series of colors mapped to a value

**Usage**

```
colorbar(breaks, col, text.col = "white", labels = TRUE,
maxleft = 0.95)
```

**Arguments**

|          |  |
|----------|--|
| breaks   | a set of finite numeric breakpoints for the colours (see <a href="#">image</a> ) |
| col      | a list of colors (see <a href="#">image</a> )                                    |
| text.col | axis and text label color  |
| labels   | labels for tick marks - see <a href="#">axis</a>                                 |
| maxleft  | Extent the left hand for colorbar  |

**Value**

A plot

**Note**

Much of this was taken from `vertical.image.legend` from the `aqfig` package

---

|                 |                                      |
|-----------------|--------------------------------------|
| copyNIFTIHeader | <i>Copy NIFTI Header to an array</i> |
|-----------------|--------------------------------------|

---

**Description**

Copies slots of a `nifti` object to an array. This is useful if you're subsetting 4D data and getting an array out

**Usage**

```
copyNIFTIHeader(img, arr, drop_slots = c(".Data", "dim_"), drop = TRUE,
  onlylast = TRUE, warn = TRUE, ...)
```

**Arguments**

|            |  |
|------------|--|
| img        | object of class <code>nifti</code> to copy header  |
| arr        | array to copy header information   |
| drop_slots | Slots not to copy over from header   |
| drop       | Should <a href="#">dropImageDimension</a> be called before returning?  |
| onlylast   | if <code>drop = TRUE</code> , passed to <a href="#">dropImageDimension</a> , if only the last dimensions should be dropped |
| warn       | if <code>drop = TRUE</code> , passed to <a href="#">dropImageDimension</a> , for warning print out                         |
| ...        | arguments to pass to <code>nifti</code>  |

**Value**

Object of class `nifti` the size of `arr`

**Examples**

```
img = nifti(img = array(rnorm(10^4), dim=rep(10, 4)), dim=rep(10, 4), datatype = 16)
sub = img[,,1:3]
copyNIFTIHeader(img, sub)
sub = img[,,1, drop=FALSE]
copyNIFTIHeader(img, sub)
copyNIFTIHeader(img, sub, drop = FALSE)
```

cut.nifti

*Perform Cut on an image***Description**

Cuts a numeric image into an integer factor, with the option of a mask.

**Usage**

```
## S3 method for class 'nifti'
cut(x, breaks, ..., mask)

## S3 method for class 'anlz'
cut(x, ..., mask)
```

**Arguments**

|        |  |
|--------|--|
| x      | Object of class nifti  |
| breaks | either a numeric vector of two or more unique cut points or a single number (greater than or equal to 2) giving the number of intervals into which x is to be cut. Passed to <a href="#">cut</a> |
| ...    | Arguments passed to <a href="#">cut</a>  |
| mask   | object to subset the image. If missing, then all values of the image are used  |

**Value**

Object of class nifti with an attribute of levels

**Examples**

```
img = nifti(array(rnorm(10^3), dim = rep(10, 3)))
mask = img > 0
cut(img, mask = mask, breaks = 4)
```

---

|          |                                 |
|----------|---------------------------------|
| datatype | <i>Change Data type for img</i> |
|----------|---------------------------------|

---

**Description**

Tries to figure out the correct datatype for image. Useful for image masks - makes them binary if

**Usage**

```
datatype(img, type_string = NULL, datatype = NULL, bitpix = NULL,
         trybyte = TRUE, warn = TRUE)
```

**Arguments**

|             |  |
|-------------|--|
| img         | nifti object (or character of filename)  |
| type_string | (NULL) character of datatype and bitpix. Supercedes both datatype and bitpix. If specified <code>convert.datatype[[type_string]]</code> and <code>convert.bitpix[[type_string]]</code> will be used. |
| datatype    | (NULL) character of datatype see <a href="#">convert.datatype</a>  |
| bitpix      | (NULL) character of bitpix see <a href="#">convert.bitpix</a>  |
| trybyte     | (logical) Should you try to make a byte (UINT8) if image in c(0, 1)?   |
| warn        | Should a warning be issued if defaulting to FLOAT32?   |

**Value**

object of type nifti

---

|               |                                      |
|---------------|--------------------------------------|
| density.nifti | <i>Density of Values in an Image</i> |
|---------------|--------------------------------------|

---

**Description**

Computes the density of values of an image with the option for a mask.

**Usage**

```
## S3 method for class 'nifti'
density(x, ..., mask)
```

```
## S3 method for class 'anlz'
density(x, ..., mask)
```

**Arguments**

x                    Object of class `nifti`  
...                   Arguments passed to `density.default`  
mask                 object to subset the image. If missing, then all values of the image are plotted.

**Value**

Output of `density`

**Examples**

```
img = nifti(array(rnorm(10^3), dim = rep(10, 3)))  
mask = img > 0  
density(img, mask = mask)
```

---

|       |                                    |
|-------|------------------------------------|
| dicer | <i>Calculate Dice from a Table</i> |
|-------|------------------------------------|

---

**Description**

Simple wrapper to calculate the Dice Coefficient/Similarity Index from a table

**Usage**

```
dicer(tab, verbose = TRUE)
```

**Arguments**

tab                    table or matrix that is 2 by 2  
verbose                should the Dice be printed before returned?

**Value**

Numeric scalar (one number)

**Examples**

```
tab = matrix(c(1000, 20, 20, 400), ncol = 2)  
dicer(tab)
```

---

double\_ortho                      *Double Orthographic Display*

---

### Description

Copy of oro.nifti's [orthographic](#) function with some tweaks such as adding L/R designations for left and right

### Usage

```
double_ortho(x, y = NULL, col.y = gray(0:64/64), NA.x = TRUE,
            mfrow = c(2, 4), add = FALSE, ...)
```

### Arguments

|       |  |
|-------|--|
| x     | is an object of class nifti or similar.                          |
| y     | is an object of class nifti or similar to be set aside x.        |
| col.y | is grayscale (by default).                                       |
| NA.x  | Set any values of 0 in x to NA                                   |
| mfrow | (numeric) layout of the 3 slices                                 |
| add   | Should the y-plot be added or its own plot? Used in double_ortho |
| ...   | other arguments to <a href="#">ortho2</a>                        |

### See Also

[orthographic](#)

---

dropEmptyImageDimensions  
*Drop Empty Image Dimensions*

---

### Description

Drops dimensions of an image that has all irrelevant values

### Usage

```
dropEmptyImageDimensions(img, value = 0, threshold = 0,
                        other.imgs = NULL, keep_ind = FALSE, reorient = FALSE)

drop_empty_dim(img, value = 0, threshold = 0, other.imgs = NULL,
              keep_ind = FALSE, reorient = FALSE)
```

**Arguments**

|            |  |
|------------|--|
| img        | nifti object   |
| value      | Value to check against. If zero, then dropEmptyImageDimensions will drop any dimension that has fewer than threshold zeroes. May be a vector of values, matched with <a href="#">match</a> |
| threshold  | Drop dimension if fewer than threshold voxels are in the slice   |
| other_imgs | List of other nifti objects or filenames to apply the same dropping as img.  |
| keep_ind   | keep indices in output. Will return list, even if other_imgs not specified   |
| reorient   | Should image be reoriented if a filename?  |

**Value**

List of output image indices, and other images if other\_imgs not specified or keep\_ind = TRUE. Otherwise object of class nifti

**Note**

drop\_empty\_dim is a shorthand for dropEmptyImageDimensions with all the same arguments. Also, NA are set to zero.

**See Also**

[getEmptyImageDimensions](#)

**Examples**

```
set.seed(5)
dims = rep(10, 3)
arr = array(rnorm(prod(dims)), dim = dims)
arr[, ,10] = 0
nim = oro.nifti::nifti(arr)

dnim = dropEmptyImageDimensions(nim, keep_ind = TRUE)
new_nim = dnim$outimg
names(dnim)
```

---

emptyImageDimensionsMask

*Make Mask from Empty Image Dimensions*

---

**Description**

Make a mask of an image that has all irrelevant values

**Usage**

```
emptyImageDimensionsMask(img, ..., reorient = FALSE)
```

```
empty_dim_mask(img, ..., reorient = FALSE)
```

**Arguments**

|          |   |
|----------|---|
| img      | nifti object  |
| ...      | Arguments to be passed to <a href="#">getEmptyImageDimensions</a> . |
| reorient | Should image be reoriented if a filename?                           |

**Value**

Object of class nifti, with binary values

**Note**

empty\_dim\_mask is a shorthand for emptyImageDimensionsMask with all the same arguments.

**See Also**

[getEmptyImageDimensions](#)

---

ensure\_array

*Ensure an array output*

---

**Description**

Forces an array output for manipulation and overall conversion

**Usage**

```
ensure_array(img)
```

**Arguments**

|     |   |
|-----|---|
| img | Image object ( <a href="#">nifti</a> or niftiImage) |
|-----|---|

**Value**

Array of same dimensions as image object

---

|              |  |
|--------------|--|
| fast_readnii | <i>Reading NIfTI images through RNifti</i> |
|--------------|--|

---

**Description**

This function calls the `readNifti` function from the `RNifti` package, and then converts the image to a `nifti` object

**Usage**

```
fast_readnii(fname, dtype = TRUE, drop_dim = TRUE)
```

**Arguments**

|                       |  |
|-----------------------|--|
| <code>fname</code>    | file name of the NIfTI file.                           |
| <code>dtype</code>    | Should <code>datatyper</code> be run after reading?    |
| <code>drop_dim</code> | Should <code>drop_img_dim</code> be run after reading? |

**Value**

A `nifti` object

---

|             |                                 |
|-------------|---------------------------------|
| file_imgext | <i>Get Image file extension</i> |
|-------------|---------------------------------|

---

**Description**

Get the image file extension, either `.nii`, `.hdr`, `.nii.gz`, or `.hdr.gz`

**Usage**

```
file_imgext(file, withdot = TRUE)
```

**Arguments**

|                      |   |
|----------------------|---|
| <code>file</code>    | Vector of character filenames                     |
| <code>withdot</code> | Should the extension begin with <code>."</code> ? |

**Value**

Vector of extensions. If `withdot = FALSE`, then will return `nii` instead of `.nii`

---

finite\_img-methods     *Finite Image*

---

### Description

Simple wrapper for setting non-finite values to zero

### Usage

```
finite_img(img, replace = 0)

## S4 method for signature 'nifti'
finite_img(img, replace = 0)

## S4 method for signature 'array'
finite_img(img, replace = 0)

## S4 method for signature 'ANY'
finite_img(img, replace = 0)

## S4 method for signature 'character'
finite_img(img, replace = 0)

## S4 method for signature 'list'
finite_img(img, replace = 0)
```

### Arguments

|         |  |
|---------|--|
| img     | character path of image or an object of class nifti, or list of images |
| replace | Value to replace non-finite values to                                  |

### Value

nifti object

### Author(s)

John Muschelli <muschellij2@gmail.com>

|----------|-------------------------|
| flip_img | <i>Flip NiftI Image</i> |
|----------|-------------------------|

---

**Description**

This image will flip x, y, or z direction

**Usage**

```
flip_img(img, x = FALSE, y = FALSE, z = FALSE, ...)
```

**Arguments**

|     |   |
|-----|---|
| img | nifti object or character filename              |
| x   | (logical) Flip x direction                      |
| y   | (logical) Flip y direction                      |
| z   | (logical) Flip z direction                      |
| ... | Arguments passed to <a href="#">check_nifti</a> |

**Value**

Object of class nifti

---

|                         |                                   |
|-------------------------|-----------------------------------|
| getEmptyImageDimensions | <i>Get Empty Image Dimensions</i> |
|-------------------------|-----------------------------------|

---

**Description**

Creates a list of indices of an image that has all irrelevant values

**Usage**

```
getEmptyImageDimensions(img, value = 0, threshold = 0,
  reorient = FALSE)
```

```
get_empty_dim(img, value = 0, threshold = 0, reorient = FALSE)
```

**Arguments**

|           |  |
|-----------|--|
| img       | nifti object or array  |
| value     | Value to check against. If zero, then getEmptyImageDimensions will include any dimension that has fewer than threshold zeroes. May be a vector of values, matched with <a href="#">match</a> |
| threshold | Include dimension if fewer than threshold voxels are in the slice  |
| reorient  | Should image be reoriented if a filename?  |

**Value**

List of length 3 of indices.

**Note**

`get_empty_dim` is a shorthand for `getEmptyImageDimensions` with all the same arguments. Also, NA are set to zero.

---

`hist.nifti`*Histogram of Values in an Image*

---

**Description**

Computes and displays a histogram of the values of an image with the option for a mask.

**Usage**

```
## S3 method for class 'nifti'  
hist(x, ..., mask)
```

```
## S3 method for class 'anlz'  
hist(x, ..., mask)
```

**Arguments**

|                   |   |
|-------------------|---|
| <code>x</code>    | Object of class <code>nifti</code>  |
| <code>...</code>  | Arguments passed to <code>hist.default</code>                                     |
| <code>mask</code> | object to subset the image. If missing, then all values of the image are plotted. |

**Value**

Output of `hist`

**Examples**

```
img = nifti(array(rnorm(10^3), dim = rep(10, 3)))  
mask = img > 0  
hist(img, mask = mask)
```

---

|               |  |
|---------------|--|
| images2matrix | <i>Transform set of images to matrix</i> |
|---------------|--|

---

**Description**

Creates a matrix, where the voxels are on the rows and images are on the columns

**Usage**

```
images2matrix(imgs, mask = NULL)
```

**Arguments**

|      |   |
|------|---|
| imgs | Vector of files or list of images (niftiImage, array, or nifti) |
| mask | Binary image to subset the voxels                               |

**Value**

Matrix of V by p, where V is the product of the dimensions of one image or the number of voxels in the mask, and p is the number of images

---

|               |  |
|---------------|--|
| img_colour_df | <i>Convert Image to Data.frame with Colors</i> |
|---------------|--|

---

**Description**

Takes in an image and a color scheme, converts that image into a data.frame with the data and a color mapping.

**Usage**

```
img_colour_df(img, zlim = NULL, breaks = NULL, col = gray(0:64/64))
img_color_df(...)
```

**Arguments**

|        |  |
|--------|--|
| img    | an object to be coerced to nifti using <a href="#">check_nifti</a> |
| zlim   | Limits for the domain of the intensities                           |
| breaks | Breaks for the intensities to map to colors                        |
| col    | Colors to map intensities  |
| ...    | not used   |

**Value**

A data.frame with the first columns being the x,y,z (maybe t) coordinates (named dim and the dimension number), a value column that contains the intensity information, and a colour column representing the color that voxel maps to

**Note**

img\_color\_df is a duplicate of img\_colour\_df

**Examples**

```
img = nifti(array(rnorm(10^3), dim = rep(10, 3)))
df = img_colour_df(img)
```

---

|             |                               |
|-------------|-------------------------------|
| img_indices | <i>Retrieve Image Indices</i> |
|-------------|-------------------------------|

---

**Description**

Extract image xyz indices (in voxels or millimeters), with the option to append the values

**Usage**

```
img_indices(img, mask = NULL, add_values = FALSE, units = c("index",
"mm"))
```

**Arguments**

|            |  |
|------------|--|
| img        | Object of class nifti                                    |
| mask       | Mask to be applied for indices the index                 |
| add_values | Should the value be column-bound to the matrix           |
| units      | Should the indices be in xyz-coordinates or millimeters. |

**Value**

Matrix of 3 columns if add\_values = FALSE or 4 columns, otherwise.

---

|                |                                  |
|----------------|----------------------------------|
| img_list_to_ts | <i>Image List to Time Series</i> |
|----------------|----------------------------------|

---

**Description**

Turns a a list of 3D images into a 4D time series image

**Usage**

```
img_list_to_ts(imgs, copy_nifti = TRUE, warn = TRUE)
```

**Arguments**

|            |  |
|------------|--|
| imgs       | object of class <code>list</code> , each with 3 dimensions,  |
| copy_nifti | Should a nifti object be returned (TRUE) or a simply array (FALSE). Should only be used for slight speed up when array is adequate |
| warn       | Should a warning be printed if object is not class <code>nifti</code>  |

**Value**

Object of class `nifti`

**Note**

If the object is not of class `list`, then the object is returned

---

|              |  |
|--------------|--|
| img_ts_to_df | <i>Image Time Series to Data.frame</i> |
|--------------|--|

---

**Description**

Turns a 4D time series image to a Data.frame

**Usage**

```
img_ts_to_df(imgs, warn = FALSE)
```

**Arguments**

|      |   |
|------|---|
| imgs | object of class <code>nifti</code> with 4 dimensions, aka a 4D time series                  |
| warn | Should a warning be printed if object is not class <code>nifti</code> (e.g. a list instead) |

**Value**

Matrix of values

---

img\_ts\_to\_list      *Image Time Series to list*

---

**Description**

Turns a 4D time series image to a list of 3D images

**Usage**

```
img_ts_to_list(imgs, copy_nifti = TRUE, warn = TRUE)
```

**Arguments**

|            |   |
|------------|---|
| imgs       | object of class <code>nifti</code> with 4 dimensions, aka a 4D time series  |
| copy_nifti | Should <code>nifti</code> objects be returned (TRUE) or simply arrays (FALSE). Should only be used for slight speed up when array is adequate |
| warn       | Should a warning be printed if object is not class <code>nifti</code>   |

**Value**

List of images

**Note**

If the object is not of class `nifti` or have 4 dimensions, then the object is returned

---

img\_ts\_to\_matrix      *Image Time Series to Matrix*

---

**Description**

Turns a 4D time series image to a Matrix

**Usage**

```
img_ts_to_matrix(imgs, warn = FALSE)
```

**Arguments**

|      |   |
|------|---|
| imgs | object of class <code>nifti</code> with 4 dimensions, aka a 4D time series                  |
| warn | Should a warning be printed if object is not class <code>nifti</code> (e.g. a list instead) |

**Value**

Matrix of values

---

maskEmptyImageDimensions-methods

*Apply Masking from Empty Image Dimensions*

---

### Description

Simple wrapper for replacing indices with a value

### Usage

```
maskEmptyImageDimensions(img, inds, reorient = FALSE, mask.value = 0,
  ...)
```

```
## S4 method for signature 'nifti'
```

```
maskEmptyImageDimensions(img, inds, reorient = FALSE,
  mask.value = 0, ...)
```

```
## S4 method for signature 'character'
```

```
maskEmptyImageDimensions(img, inds,
  reorient = FALSE, mask.value = 0, ...)
```

```
## S4 method for signature 'factor'
```

```
maskEmptyImageDimensions(img, inds, reorient = FALSE,
  mask.value = 0, ...)
```

```
## S4 method for signature 'list'
```

```
maskEmptyImageDimensions(img, inds, reorient = FALSE,
  mask.value = 0, ...)
```

```
## S4 method for signature 'array'
```

```
maskEmptyImageDimensions(img, inds, reorient = FALSE,
  mask.value = 0, ...)
```

```
## S4 method for signature 'anlz'
```

```
maskEmptyImageDimensions(img, inds, reorient = FALSE,
  mask.value = 0, ...)
```

```
## S4 method for signature 'ANY'
```

```
maskEmptyImageDimensions(img, inds, reorient = FALSE,
  mask.value = 0, ...)
```

```
mask_empty_dim(img, ...)
```

### Arguments

|      |  |
|------|--|
| img  | image, nifti object, or array  |
| inds | indices of subset from <a href="#">getEmptyImageDimensions</a> or <a href="#">dropEmptyImageDimensions</a> . |

|            |   |
|------------|---|
| reorient   | Should image be reoriented if a filename? |
| mask.value | Value to replace voxels outside the mask. |
| ...        | not used                                  |

**Value**

Object of class `nifti` or array if `nifti` is not supplied

**Note**

`mask_empty_dim` is a shorthand for `maskEmptyImageDimensions` with all the same arguments.

**See Also**

[getEmptyImageDimensions](#), [dropEmptyImageDimensions](#)

---

mask\_img

*Mask Image*

---

**Description**

Takes an image, masks it by `mask`, and returns an object of class `nifti`

**Usage**

```
mask_img(img, mask, allow.NA = TRUE)
```

**Arguments**

|                       |   |
|-----------------------|---|
| <code>img</code>      | object of class <code>nifti</code>  |
| <code>mask</code>     | array or object of class <code>nifti</code> , same dimensions as <code>img</code> |
| <code>allow.NA</code> | allow NAs in the mask   |

**Value**

Object of class `nifti` with values outside mask set to 0 if mask is 0 and NA if mask is NA and `img` if `mask == 1`

**Examples**

```
set.seed(5)
dims = rep(10, 3)
arr = array(rnorm(prod(dims)), dim = dims)
nim = oro.nifti::nifti(arr)
mask = abs(nim) > 1
masked = mask_img(nim, mask)
mask[mask == 0] = NA
na_masked = mask_img(nim, mask, allow.NA = TRUE)
```

---

 mask\_vals

*Extract or Replace Values Inside a Mask*

---

### Description

Methods that act on the .Data field in a NIfTI/ANALYZE image but only on values inside a mask.

### Usage

```
mask_vals(object, mask)

mask_vals(object, mask) <- value

## S4 replacement method for signature 'nifti'
mask_vals(object, mask) <- value

## S4 replacement method for signature 'anlz'
mask_vals(object, mask) <- value

## S4 replacement method for signature 'array'
mask_vals(object, mask) <- value
```

### Arguments

|        |  |
|--------|--|
| object | is an object of class nifti or anlz.       |
| mask   | is an object of class nifti or anlz.       |
| value  | is the value to assign to the .Data field. |

### Examples

```
img = nifti(array(rnorm(10^3), dim = rep(10, 3)))
mask = img > 1.5
mask_vals(img, mask)
mask_vals(img, mask) = rep(4, sum(mask))
mask_vals(img, as(mask, "array")) = rep(4, sum(mask))
mask_vals(as(img, "array"),
  as(mask, "array")) = rep(4, sum(mask))
```

---

 mean.nifti

*Mean of Values in an Image*

---

### Description

Computes the mean of values of an image with the option for a mask.

**Usage**

```
## S3 method for class 'nifti'  
mean(x, ..., mask)  
  
## S3 method for class 'anlz'  
mean(x, ..., mask)
```

**Arguments**

|      |   |
|------|---|
| x    | Object of class nifti   |
| ...  | Arguments passed to <a href="#">mean.default</a>                                  |
| mask | object to subset the image. If missing, then all values of the image are plotted. |

**Value**

Output of [mean](#)

**Examples**

```
img = nifti(array(rnorm(10^3), dim = rep(10, 3)))  
mask = img > 0  
mean(img, mask = mask)
```

---

minmax\_img-methods      *Normalize Image using Range*

---

**Description**

Calculates the range of values in an image, then scales the image minimum to 0 and maximum to 1

**Usage**

```
minmax_img(img)  
  
## S4 method for signature 'nifti'  
minmax_img(img)  
  
## S4 method for signature 'array'  
minmax_img(img)  
  
## S4 method for signature 'ANY'  
minmax_img(img)  
  
## S4 method for signature 'character'  
minmax_img(img)  
  
## S4 method for signature 'list'  
minmax_img(img)
```

**Arguments**

`img` character path of image or an object of class `nifti`, or list of images

**Value**

A `nifti` object (or list of them) or class of object passed in if not specified

---

`multi_overlay` *Create Multi-Image Plot with Overlays*

---

**Description**

Creates a multi-row or multi-column plot with image slices and the potential for overlays as well.

**Usage**

```
multi_overlay(x, y = NULL, z = NULL, w = 1, mask = NULL,
  col.x = gray(0:64/64), col.y = hotmetal(), zlim.x = NULL,
  zlim.y = NULL, plane = c("axial", "coronal", "sagittal"),
  xlab = "", ylab = "", axes = FALSE, direction = c("horizontal",
  "vertical"), par.opts = list(oma = c(0, 0, 0, 0), mar = rep(0, 4), bg =
  "black"), text = NULL, text.x = 0.5, text.y = 1.4,
  text.cex = 2.5, text.col = "white", main = NULL,
  main.col = text.col, main.cex = text.cex, NA.x = TRUE,
  NA.y = TRUE, pdim = NULL, useRaster = TRUE, ...)
```

**Arguments**

`x` List of images of class `nifti` or character vector of filenames

`y` List of images of class `nifti` or character vector of filenames. Same length as `x`.

`z` Slice to display.

`w` 3D volume to display if `x` has 4-D elements

`mask` `nifti` image to drop empty image dimensions if wanted. Passed to [dropEmptyImageDimensions](#)

`col.x` Color to display `x` images

`col.y` Color to display `y` images

`zlim.x` Limits for `x` to plot

`zlim.y` Limits for `y` to plot

`plane` the plane of acquisition to be displayed

`xlab` Label for `x`-axis

`ylab` Label for `y`-axis

`axes` Should axes be displayed

`direction` Should images be a row or column? Ignored if `mfrow` is in `par.opts`

|           |   |
|-----------|---|
| par.opts  | Options to pass to <a href="#">par</a>  |
| text      | Text to be displayed  |
| text.x    | Location of text in x-domain  |
| text.y    | Location of text in y-domain  |
| text.cex  | Multiplier for text font  |
| text.col  | Color for text and main.  |
| main      | Title for each plot   |
| main.col  | Color for main. Will default to text.col  |
| main.cex  | Multiplier for text font. Will default to text.cex  |
| NA.x      | Should 0's in x be set to NA?   |
| NA.y      | Should 0's in y be set to NA?   |
| pdim      | Pixel dimensions if passing in arrays. Will be overridden if x is a nifti object                        |
| useRaster | if TRUE, a bitmap raster is used to plot the image instead of polygons. Passed to <a href="#">image</a> |
| ...       | Additional arguments to pass to <a href="#">image</a>   |

## Examples

```
## Not run:

if (require(brainR)) {
  visits = 1:3
  y = paste0("Visit_", visits, ".nii.gz")
  y = system.file(y, package = "brainR")
  y = lapply(y, readnii)

  y = lapply(y, function(r){
    pixdim(r) = c(0, rep(1, 3), rep(0, 4))
    dropImageDimension(r)
  })

  x = system.file("MNI152_T1_1mm_brain.nii.gz",
                 package = "brainR")
  x = readnii(x)
  mask = x > 0
  x = lapply(visits, function(tmp){
    x
  })
  alpha = function(col, alpha = 1) {
    cols = t(col2rgb(col, alpha = FALSE)/255)
    rgb(cols, alpha = alpha)
  }
  multi_overlay(x, y,
               col.y = alpha(hotmetal(), 0.5),
               mask = mask,
               main = paste0("\n", "Visit ", visits),
               text = LETTERS[visits],
```

```

        text.x = 0.9,
        text.y = 0.1,
        text.cex = 3)
    }

    ## End(Not run)

```

---

newnii

*Resets image parameters for a copied nifti object*

---

### Description

Resets the slots of a nifti object, usually because an image was loaded, then copied and filled in with new data instead of making a nifti object from scratch. Just a wrapper for smaller functions

### Usage

```
newnii(img, ...)
```

### Arguments

```

img          nifti object (or character of filename)
...          arguments to be passed to datatype

```

### Value

object of type nifti

---

niftiarr

*Make new nifti from array*

---

### Description

Make new nifti object by passing in old nifti and array

### Usage

```
niftiarr(img, arr)
```

### Arguments

```

img          object of class nifti
arr          array to be passed in to .Data slot

```

### Value

object of class nifti

---

|          |                               |
|----------|-------------------------------|
| nii.stub | <i>Grab nii file stubname</i> |
|----------|-------------------------------|

---

### Description

Quick helper function to strip off .nii or .nii.gz from filename

### Usage

```
nii.stub(x, bn = FALSE)
```

### Arguments

|    |   |
|----|---|
| x  | character vector of filenames ending in .nii or .nii.gz |
| bn | Take <a href="#">basename</a> of file?                  |

### Value

A character vector with the same length as x

---

|        |  |
|--------|--|
| ortho2 | <i>Orthographic Display, added options</i> |
|--------|--|

---

### Description

Copy of oro.nifti's [orthographic](#) function with some tweaks such as adding L/R designations for left and right

### Usage

```
ortho2(x, y = NULL, xyz = NULL, w = 1, col = gray(0:64/64),
  col.y = oro.nifti::hotmetal(), zlim = NULL, zlim.y = NULL,
  NA.x = FALSE, NA.y = TRUE, crosshairs = TRUE,
  col.crosshairs = "red", xlab = "", ylab = "", axes = FALSE,
  oma = c(0, 0, 0, ifelse(ycolorbar, 5, 0)), mar = rep(0, 4),
  bg = "black", text = NULL, text.color = "white", text.cex = 2,
  text.x = 32, text.y = 32, add.orient = TRUE, mfrow = c(2, 2),
  ybreaks = NULL, breaks = NULL, addlegend = FALSE, leg.x = 32,
  leg.y = 32, legend, leg.col, leg.title = NULL, leg.cex,
  window = NULL, ycolorbar = FALSE, clabels = TRUE, add = TRUE,
  pdim = NULL, useRaster = is.null(y), mask = NULL, ...)
```

**Arguments**

|                |  |
|----------------|--|
| x              | is an object of class nifti or similar.  |
| y              | is an object of class nifti or similar for the overlay.  |
| xyz            | is the coordinate for the center of the crosshairs.  |
| w              | is the time point to be displayed (4D arrays only).  |
| col            | is grayscale (by default).   |
| col.y          | is hotmetal (by default).  |
| zlim           | is the minimum and maximum 'z' values passed into image.   |
| zlim.y         | is the minimum and maximum 'z' values passed into image for the overlay.                           |
| NA.x           | Set any values of 0 in x to NA   |
| NA.y           | Set any values of 0 in y to NA   |
| crosshairs     | is a logical value for the presence of crosshairs in all three orthogonal planes (default = TRUE). |
| col.crosshairs | is the color of the crosshairs (default = red).  |
| xlab           | is set to "" since all margins are set to zero.  |
| ylab           | is set to "" since all margins are set to zero.  |
| axes           | is set to FALSE since all margins are set to zero.   |
| oma            | is the size of the outer margins in the par function.  |
| mar            | is the number of lines of margin in the par function.  |
| bg             | is the background color in the par function.   |
| text           | allows the user to specify text to appear in the fourth (unused) pane.                             |
| text.color     | is the color of the user-specified text (default = "white").                                       |
| text.cex       | is the size of the user-specified text (default = 2).  |
| text.x         | x coordinate for text  |
| text.y         | y coordinate for text  |
| add.orient     | (logical) Add left/right, A/P, etc. orientation  |
| mfrac          | (numeric) layout of the 3 slices   |
| ybreaks        | (numeric) breaks for y to passed to <a href="#">image</a>  |
| breaks         | (numeric) breaks for x to passed to <a href="#">image</a>  |
| addlegend      | (logical) add legend?  |
| leg.x          | (numeric) x coordinate for legend  |
| leg.y          | (numeric) y coordinate for legend  |
| legend         | (character) legend text  |
| leg.col        | (character) Colors for legend  |
| leg.title      | (character) title for legend   |
| leg.cex        | (numeric) cex for <a href="#">legend</a>   |
| window         | (vector) Length-2 vector to limit image to certain range   |

|           |   |
|-----------|---|
| ycolorbar | (logical) Should a colorbar for y be plotted  |
| clabels   | Label for colorbar (see <a href="#">colorbar</a> )  |
| add       | Should the y-plot be added or its own plot? Used in <code>double_ortho</code>                                     |
| pdim      | Pixel dimensions if passing in arrays. Will be overridden if x is a <code>nifti</code> object                     |
| useRaster | logical; if TRUE a bitmap raster is used to plot the image instead of polygons. Passed to <a href="#">image</a> . |
| mask      | If a mask is passed, <code>drop_empty_dim</code> is applied to both x and y                                       |
| ...       | other arguments to the image function may be provided here.   |

**See Also**

[orthographic](#)

**Examples**

```
x = oro.nifti::nifti(array(rnorm(1000), dim = rep(10, 3)))
ortho2(x)
y = x > 2
ortho2(x, y)
arr_x = as.array(x)
arr_y = as.array(y)
ortho2(arr_x)
ortho2(arr_x, arr_y, useRaster = FALSE)
```

---

ortho\_diff

*Plot differences for Prediction and Gold Standard*

---

**Description**

Uses [ortho2](#) to plot differences between a predicted binary image and the assumed ground truth (roi).

**Usage**

```
ortho_diff(img, pred, roi, xyz = NULL, cols = c("#56B4E9", "#D55E00",
"#009E73"), levels = c("False Negative", "False Positive",
"True Positive"), addlegend = TRUE, center = TRUE, leg.cex = 1.5,
...)
```

**Arguments**

|      |  |
|------|--|
| img  | image to be overlaid                         |
| pred | binary segmentation (prediction)             |
| roi  | binary manual segmentation (ground truth)    |
| xyz  | coordinate for the center of the crosshairs. |

|           |  |
|-----------|--|
| cols      | colors for false negatives/positives                           |
| levels    | labels for false negatives/positives                           |
| addlegend | add legend, passed to <a href="#">ortho2</a>                   |
| center    | run <a href="#">xyz</a> on roi. Disregarded if xyz is not NULL |
| leg.cex   | multiplier for legend size                                     |
| ...       | arguments to be passed to <a href="#">ortho2</a>               |

**See Also**

[ortho2](#)

---

parse\_img\_ext                      *Parse Image Extensions*

---

**Description**

Get image extensions from a filename

**Usage**

```
parse_img_ext(file)
```

**Arguments**

file                      Character filename to parse

**Value**

Extension of file

**Examples**

```
parse_img_ext("blah.nii.gz")
parse_img_ext("blah.mnc")
parse_img_ext("blah.nii")
parse_img_ext("blah")
parse_img_ext("blah.img")
parse_img_ext("blah.hdr")
parse_img_ext("blah.hdr.gz")
```

quantile.nifti      *Sample Quantiles*

---

### Description

Computes sample quantiles for an image, with the option of a mask.

### Usage

```
## S3 method for class 'nifti'  
quantile(x, ..., mask)
```

```
## S3 method for class 'anlz'  
quantile(x, ..., mask)
```

### Arguments

|      |   |
|------|---|
| x    | Object of class nifti   |
| ...  | Arguments passed to <a href="#">quantile</a>                                  |
| mask | object to subset the image. If missing, then all values of the image are used |

### Value

Output of [quantile](#)

### Examples

```
img = nifti(array(rnorm(10^3), dim = rep(10, 3)))  
mask = img > 0  
quantile(img, mask = mask)
```

---

quantile\_img      *Create Quantile Image*

---

### Description

Creates output image of the quantiles that each voxel is in, after applying the mask

### Usage

```
quantile_img(img, mask = NULL, ...)
```

**Arguments**

|      |   |
|------|---|
| img  | Character vector, or object of class <code>nifti</code>       |
| mask | Mask to determine cumulative distribution function (cdf) from |
| ...  | Additional arguments to pass to <a href="#">ecdf</a>          |

**Value**

Object of class `nifti`

---

|                |                                      |
|----------------|--------------------------------------|
| randomize_mask | <i>Randomize Image based on Mask</i> |
|----------------|--------------------------------------|

---

**Description**

Randomize the values within a mask

**Usage**

```
randomize_mask(img, mask)
```

**Arguments**

|      |   |
|------|---|
| img  | Object of class <code>nifti</code> with values to be randomized |
| mask | Binary mask indicating which values should be randomized.       |

**Value**

Object of class `nifti`

**Examples**

```
set.seed(5)
dims = rep(10, 3)
arr = array(rnorm(prod(dims)), dim = dims)
nim = oro.nifti::nifti(arr)
mask = abs(nim) > 1
randomize_mask(nim, mask)
```

---

|            |   |
|------------|---|
| readNIFTI2 | <i>readNIFTI with default non-reorientation</i> |
|------------|---|

---

### Description

This function calls the [readNIFTI](#) function from the `oro.nifti` package, but sets the reorientation to FALSE by default

### Usage

```
readNIFTI2(..., reorient = FALSE)

readnii(..., reorient = FALSE, dtype = TRUE, drop_dim = TRUE,
         reset_slope = FALSE, warn = FALSE, rm_extensions = TRUE)
```

### Arguments

|               |   |
|---------------|---|
| ...           | Arguments to pass to <a href="#">readNIFTI</a>  |
| reorient      | Reorientation argument to pass to <a href="#">readNIFTI</a>   |
| dtype         | Should <a href="#">datatyper</a> be run after reading?  |
| drop_dim      | Should <a href="#">drop_img_dim</a> be run after reading?   |
| reset_slope   | Reset slope/intercept of image  |
| warn          | Should warnings from <a href="#">readNIFTI</a> be printed? If not, <a href="#">suppressWarnings</a> is called. Also passed to <a href="#">datatyper</a> |
| rm_extensions | should <code>niftiExtensions</code> be converted to simple nifti objects?   |

### Value

nifti object

---

|            |                                 |
|------------|---------------------------------|
| remake_img | <i>Remake Image from Vector</i> |
|------------|---------------------------------|

---

### Description

Wrapper function to take a vector of values and result in a `nifti` object

### Usage

```
remake_img(vec, img, mask = NULL, warn = FALSE, ...)
```

**Arguments**

|      |  |
|------|--|
| vec  | vector of values to be in resulting image  |
| img  | object of class <code>nifti</code> to put vector into                            |
| mask | binary array/ <code>nifti</code> object to denote where vector values are to be. |
| warn | Should a warning be issued if defaulting to FLOAT32?                             |
| ...  | additional arguments passed to <code>datatyper</code>                            |

**Value**

Object of class `nifti`

**See Also**

`niftiarr`

---

|                |  |
|----------------|--|
| remap_filename | <i>Build Filename (usually for images)</i> |
|----------------|--|

---

**Description**

This is a simple function that helps with the case where you want to construct a filename (usually for an image) with the same base of the filename, the same directory (default), but things added to the front or end of that base filename, with the same extension.

**Usage**

```
remap_filename(x, sub_dir = NULL, prefix = "", suffix = "")
```

**Arguments**

|         |  |
|---------|--|
| x       | input filename/character vector  |
| sub_dir | sub-directory for the new filename. If NULL, then the directory is the the same directory as x |
| prefix  | string to put in front of base of filename   |
| suffix  | string to put at the end of base of filename   |

**Value**

Character vector

**Examples**

```
fname = file.path("/path/to/file", "original.nii.gz")
remap_filename(fname, prefix = "preproc_", "_with_gz")
fname = "original.nii"
remap_filename(fname, prefix = "note_", "_has_directory")
remap_filename(c(fname, "other.nii.gz"), prefix = "note_", "_has_directory")
```

---

 replace\_dropped\_dimensions

*Remake Dropped Dimensions*

---

### Description

This function is the reverse of `dropEmptyImageDimensions`. If `dropEmptyImageDimensions` was run, and the output is a list, usually if `keep_ind = TRUE`, this function reverses that.

### Usage

```
replace_dropped_dimensions(img, inds, orig.dim)
```

### Arguments

|                       |  |
|-----------------------|--|
| <code>img</code>      | Object of class <code>nifti</code> where image dimensions were dropped.  |
| <code>inds</code>     | List of length 3 of indices from <code>dropEmptyImageDimensions</code> or <code>getEmptyImageDimensions</code> |
| <code>orig.dim</code> | Original dimension of pre-dropped image. Output image will have dimensions same as this value                  |

### Value

Object of class `nifti`

### Examples

```
## Not run:
# nim is an object of class nifti
dd = dropEmptyImageDimensions(nim, keep_ind = TRUE)
remake = replace_dropped_dimensions(img = dd$outimg,
  inds = dd$inds,
  orig.dim = dd$orig.dim)
all.equal(nim, remake)

## End(Not run)
```

---

 replace\_outside\_surface

*Replace Values Outside Surface of image*

---

### Description

Determines values outside the surface of an image and gives a mask back with those values set to a replacement.

**Usage**

```
replace_outside_surface(img, value = 0, threshold = 0,
  replace_value = NA, reorient = FALSE)
```

**Arguments**

|               |  |
|---------------|--|
| img           | nifti object or array  |
| value         | Value to check against. If zero, then <code>replace_outside_surface</code> will include any dimension that has fewer than <code>threshold</code> zeroes. May be a vector of values, matched with <a href="#">match</a> |
| threshold     | Include dimension if fewer than <code>threshold</code> voxels are in the slice   |
| replace_value | Value to replace those outside the surface.  |
| reorient      | Should image be reoriented if a filename? Passed to <a href="#">check_nifti</a>  |

**Value**

Creates an array of binary values. If `img` is a `nifti` object, then a `nifti` is returned

---

|             |                       |
|-------------|-----------------------|
| rescale_img | <i>Image Rescaler</i> |
|-------------|-----------------------|

---

**Description**

Rescales an image to be in certain value range. This was created as sometimes DICOM scale and slope parameters may be inconsistent across sites and the data need to be value restricted

**Usage**

```
rescale_img(filename, pngname = NULL, write.nii = FALSE,
  outfile = NULL, min.val = -1024, max.val = 3071,
  ROIformat = FALSE, writer = "dcm2nii", ...)
```

**Arguments**

|           |  |
|-----------|--|
| filename  | filename of image to be read into R or nifti object  |
| pngname   | filename of png of histogram of values of image to be made. For no png - set to NULL (default) |
| write.nii | logical - should the image be written.   |
| outfile   | if <code>write.nii = TRUE</code> , filename of output file                                     |
| min.val   | minimum value of image (default -1024 (for CT)). If no thresholding set to -Inf                |
| max.val   | maximum value of image (default 3071 (for CT)). If no thresholding set to Inf                  |
| ROIformat | if TRUE, any values $\leq 0$ will be set to 0  |
| writer    | character value to add to description slot of NIFTI header                                     |
| ...       | extra methods to be passed to <a href="#">writenii</a>   |

**Value**

Object of class nifti

---

|               |   |
|---------------|---|
| robust_window | <i>Window image based on quantiles of Image</i> |
|---------------|---|

---

**Description**

Takes an image, finds the quantiles given by probs, then sets values outside these values to other values, as determined by replace argument passed to [window\\_img](#)

**Usage**

```
robust_window(img, non_zero = FALSE, probs = c(0, 0.999), ...,
             mask = NULL)
```

**Arguments**

|          |   |
|----------|---|
| img      | object of class nifti   |
| non_zero | Should zeroes be excluded from the calculation of quantiles?                                |
| probs    | quantiles to constrain the image these define the window sent to <a href="#">window_img</a> |
| ...      | additional arguments sent to <a href="#">window_img</a>                                     |
| mask     | binary image to use to calculate quantiles  |

**Value**

Object of class nifti with values outside quantiles replaced by values depending on replace argument passed to [window\\_img](#)

---

|           |  |
|-----------|--|
| same_dims | <i>Check if Objects have Same Dimensions</i> |
|-----------|--|

---

**Description**

Wrapper to check if multiple objects all have the same dimensions

**Usage**

```
same_dims(...)
```

**Arguments**

|     |   |
|-----|---|
| ... | Arguments (matrices or arrays) where the dimension will be checked against the first object's dimension |
|-----|---|

**Value**

Logical indicating if all have the same dimensions or not

**Examples**

```
mat1 = matrix(1:9, ncol = 3)
mat2 = matrix(rnorm(9), ncol = 3)
mat3 = matrix(rnorm(16), ncol = 4)
mat4 = matrix(rnorm(9), ncol = 3)
same_dims(mat1, mat2)
same_dims(mat1, mat3)
same_dims(mat1, mat2, mat4)
```

---

separate\_img-methods    *Separate Labeled Image into Multiple Binary Images*

---

**Description**

Takes in an image, gets the unique values, then creates a list of binary images for each one of those values.

**Usage**

```
separate_img(img, levels = NULL, drop_zero = TRUE)

## S4 method for signature 'nifti'
separate_img(img, levels = NULL, drop_zero = TRUE)

## S4 method for signature 'array'
separate_img(img, levels = NULL, drop_zero = TRUE)

## S4 method for signature 'ANY'
separate_img(img, levels = NULL, drop_zero = TRUE)

## S4 method for signature 'character'
separate_img(img, levels = NULL,
             drop_zero = TRUE)

## S4 method for signature 'list'
separate_img(img, levels = NULL, drop_zero = TRUE)
```

**Arguments**

|           |   |
|-----------|---|
| img       | character path of image or an object of class <code>nifti</code> , or list of images                      |
| levels    | if levels is given, then the separation is only done for those levels and not unique values of the image. |
| drop_zero | Should zeroes be dropped from the labels? Zero usually denotes background or non-interesting voxels       |

**Value**

A nifti object (or list of them) or class of object passed in if not specified

**Note**

Exact equalling is using ==

---

|                 |                                       |
|-----------------|---------------------------------------|
| slice_colour_df | <i>Slice a Image Color Data.frame</i> |
|-----------------|---------------------------------------|

---

**Description**

Slices a image color data.frame along the 3 planes (axial, coronal, sagittal) and returns it in a ggplot-ready format for faceting.

**Usage**

```
slice_colour_df(img_df, xyz = NULL)
```

**Arguments**

img\_df            an image data.frame, usually from `img_colour_df`. Must have the columns: dim1, dim2, dim3, colour, and value.

xyz                coordinates to slice the data.frame in x, y, and z - domains

**Value**

A data.frame with x and y coordinates, colour, and intensity values, along with the associated planes that were sliced.

**Examples**

```
img = nifti(array(rnorm(10^3), dim = rep(10, 3)))
df = img_colour_df(img)
sliced = slice_colour_df(df, c(5, 5, 4))
```

---

subset\_dti-methods      *Subset DTI data based on b-values #'*

---

### Description

Subset DTI data based on b-values #'

### Usage

```
subset_dti(img, bvals, bvecs, b_step = 1, maximum = Inf,  
           shells = NULL, verbose = TRUE, ...)
```

```
## S4 method for signature 'nifti'  
subset_dti(img, bvals, bvecs, b_step = 1,  
           maximum = Inf, shells = NULL, verbose = TRUE, ...)
```

```
## S4 method for signature 'ANY'  
subset_dti(img, bvals, bvecs, b_step = 1,  
           maximum = Inf, shells = NULL, verbose = TRUE, ...)
```

```
## S4 method for signature 'character'  
subset_dti(img, bvals, bvecs, b_step = 1,  
           maximum = Inf, shells = NULL, verbose = TRUE, ...)
```

```
## S4 method for signature 'list'  
subset_dti(img, bvals, bvecs, b_step = 1,  
           maximum = Inf, shells = NULL, verbose = TRUE, ...)
```

### Arguments

|         |  |
|---------|--|
| img     | character or nifti object                  |
| bvals   | filename of b-values (assuming 1 row)      |
| bvecs   | filename of b-vectors (assuming 3 rows)    |
| b_step  | step of b-values to round to               |
| maximum | maximum b-value threshold                  |
| shells  | Shells to keep (after rounding)            |
| verbose | print diagnostic messages                  |
| ...     | options passed to <a href="#">checking</a> |

### Value

List of filenames of image, b-values, and b-vectors that were subsetted.

### Author(s)

John Muschelli <muschellij2@gmail.com>

**Examples**

```

## Not run:
img = "~/Downloads/data.nii.gz"
bvals = "~/Downloads/bvals"
bvecs = "~/Downloads/bvals"
verbose = TRUE
b_step = 50
maximum = 1500
shells = NULL
sub = subset_dti(img = img, bvals = bvals, bvecs = bvecs,
maximum = 1500,
b_step = 50)

## End(Not run)

```

---

tempimg

*Create temporary nii.gz file*

---

**Description**

Takes in a object of class `nifti`, writes it to a temp file, appends `.nii.gz` as `writenii` adds it.

**Usage**

```
tempimg(nim, gzipped = TRUE, checknan = TRUE, check_type = FALSE,
warn = FALSE, ...)
```

**Arguments**

|                         |  |
|-------------------------|--|
| <code>nim</code>        | object of class <code>nifti</code>   |
| <code>gzipped</code>    | Should file be gzipped? Passed to <code>writenii</code>  |
| <code>checknan</code>   | Check for NAs or NaNs  |
| <code>check_type</code> | Check the datatype for an image. Will run <code>datatyper</code> .                               |
| <code>warn</code>       | Should warnings be displayed if <code>writenii</code> has any? Passed to <code>writenii</code> . |
| <code>...</code>        | Not used   |

**Value**

filename of output `nii.gz`

---

|            |                             |
|------------|-----------------------------|
| window_img | <i>nifti image windower</i> |
|------------|-----------------------------|

---

**Description**

Windows an image to min and max values and also changes cal\_max and cal\_min parameters

**Usage**

```
window_img(x, window = c(0, 100), replace = c("window", "missing",
      "zero"), ...)
```

**Arguments**

|         |   |
|---------|---|
| x       | is either a character name for the image or an object of class nifti  |
| window  | numeric of length 2 that gives min and max for window   |
| replace | either "window" if the any values outside of c(min, max) are set to the min or max or "missing" for these to be set to NA |
| ...     | not used  |

**Value**

Object of class nifti

**See Also**

[readnii](#)

**Examples**

```
set.seed(5)
dims = rep(10, 3)
arr = array(rnorm(prod(dims)), dim = dims)
nim = oro.nifti::nifti(arr)
window_img(nim, window = c(1, 5))
window_img(nim, window = c(1, 5), replace = "missing")
tfile = tempimg(nim)
window_img(tfile)
window_img(as.factor(tfile))
arr = window_img(img_data(nim))
rnim = RNifti::readNifti(tfile)
window_img(rnim, window = c(1, 5))
range(window_img(rnim, window = c(1, 5)))
window_img(rnim, window = c(1, 5), replace = "missing")
range(window_img(rnim, window = c(1, 5), replace = "missing"))
```

---

|             |  |
|-------------|--|
| writeNIFTI2 | <i>writeNIFTI with default non-reorientation</i> |
|-------------|--|

---

### Description

This function calls the `writeNIFTI` function from the `oro.nifti` package, but makes sure to remove `.nii` extension and warnings can be suppressed.

### Usage

```
writeNIFTI2(nim, filename, dtype = FALSE, compression = 9, ...)

writenii(nim, filename, dtype = TRUE, drop_dim = TRUE, warn = FALSE,
         compression = 9, rm_extensions = TRUE, ...)
```

### Arguments

|                            |  |
|----------------------------|--|
| <code>nim</code>           | object of class <code>nifti</code> , passed to <code>writeNIFTI</code>                                   |
| <code>filename</code>      | path to save the NIFTI file. Suffix will be removed  |
| <code>dtype</code>         | Should <code>datatyper</code> be run before writing?   |
| <code>compression</code>   | compression level for gzipped files.   |
| <code>...</code>           | Additional arguments passed to <code>writeNIFTI</code>   |
| <code>drop_dim</code>      | Should <code>drop_img_dim</code> be run before writing?  |
| <code>warn</code>          | Should warnings from <code>writeNIFTI</code> be printed? If not, <code>suppressWarnings</code> is called |
| <code>rm_extensions</code> | should <code>niftiExtensions</code> be converted to simple <code>nifti</code> objects before writing?    |

### Value

Nothing

### Note

While `writeNIFTI2` does not run `datatyper` as default, `writenii` does. Additional functionality will be added to `writenii` likely but will not to `writeNIFTI2`

---

|             |                             |
|-------------|-----------------------------|
| write_nifti | <i>General NIFTI Writer</i> |
|-------------|-----------------------------|

---

**Description**

Writes out NIFTI files for multiple formats. Currently, for nifti objects and niftiImage objects from RNifti

**Usage**

```
write_nifti(nim, filename, ...)
```

**Arguments**

|          |  |
|----------|--|
| nim      | Container for NIFTI Image  |
| filename | Filename of image to be written out  |
| ...      | additional arguments, to be passed to <a href="#">writeNifti</a> or <a href="#">writenii</a> |

**Value**

Output from NIFTI writer

---

|     |  |
|-----|--|
| xyz | <i>Image Center of Gravity Wrapper</i> |
|-----|--|

---

**Description**

Find Center of Gravity of Image, after thresholding and take ceiling (wrapper for [cog](#))

**Usage**

```
xyz(...)
```

**Arguments**

|     |   |
|-----|---|
| ... | Arguments passed to <a href="#">cog</a> |
|-----|---|

**Value**

Vector of length 3

**Note**

Just a convenience wrapper for `cog(ceil=TRUE)`

---

|          |                           |
|----------|---------------------------|
| zero_pad | <i>Zero pads an image</i> |
|----------|---------------------------|

---

**Description**

This function zero pads an image by a certain number of dimensions, usually for convolution

**Usage**

```
zero_pad(img, kdim, invert = FALSE, ...)
```

**Arguments**

|        |   |
|--------|---|
| img    | Array or class nifti  |
| kdim   | Dimensions of kernel  |
| invert | (logical) If FALSE, does zero padding. If TRUE, reverses the process. |
| ...    | Options to <a href="#">copyNIFTIHeader</a>                            |

**Value**

Object of class nifti

**Examples**

```
kdim = c(3,3,5)
img = array(rnorm(30*30*36), dim = c(30, 30, 36))
pad = zero_pad(img, kdim)
back = zero_pad(pad, kdim, invert=TRUE)
all.equal(back, img)
```

---

|         |                            |
|---------|----------------------------|
| zlimmer | <i>Find Image z-limits</i> |
|---------|----------------------------|

---

**Description**

Helper function for plotting - returns zlim for [image](#) plot function

**Usage**

```
zlimmer(x, zlim = NULL, computed_range = NULL)
```

**Arguments**

|                |  |
|----------------|--|
| x              | Object of class nifti  |
| zlim           | A user-specified zlim. If NULL, will calculate how <a href="#">ortho2</a> would calculate zlim     |
| computed_range | If the range of the data was already computed, this can be passed in and will be used if relevant. |

**Value**

If zlim = NULL, then vector of length 2, otherwise returns zlim

---

|            |  |
|------------|--|
| zscore_img | <i>Get Z-score over a margin of an img</i> |
|------------|--|

---

**Description**

Standardizes an image either by the axial, sagittal, or coronal slice or whole image

**Usage**

```
zscore_img(img, mask = NULL, margin = NULL, centrality = c("mean",
  "median", "trimmed_mean"), variability = c("sd", "iqrdiff", "mad",
  "maddiff", "iqr", "trimmed_sd"), trim = 0.2, remove.na = TRUE,
  remove.nan = TRUE, remove.inf = TRUE, remove.val = 0,
  remask = TRUE)
```

**Arguments**

|             |   |
|-------------|---|
| img         | character path of image or an object of class nifti                                     |
| mask        | character path of mask or an object of class nifti                                      |
| margin      | Margin of image to z-score over (NULL - whole brain, 3-Axial, 2-Sagittal, 1-Coronal)    |
| centrality  | (character) Measure to center the data, either mean or median                           |
| variability | (character) Measure to scale the data   |
| trim        | if centrality is trimmed_mean or variability is trimmed_sd, then the amount of trimming |
| remove.na   | (logical) change NAs to remove.val  |
| remove.nan  | (logical) change NaN to remove.val  |
| remove.inf  | (logical) change Inf to remove.val  |
| remove.val  | (logical) value to put the NA/NaN/Inf   |
| remask      | (logical) Should the image be remasked after normalizing?                               |

**Value**

Array of object of class nifti

**See Also**

[aperm](#)

**Examples**

```
dim = c(100, 30, 5)
img = array(rnorm(prod(dim), mean=4, sd=4),
            dim=dim)

truth2 = img
for (i in 1:dim(img)[2]) {
  truth2[,i,] = (truth2[,i,] - mean(truth2[,i,]))/sd(truth2[,i,])
}

truth1 = img
for (i in 1:dim(img)[1]) {
  truth1[i,,] = (truth1[i,,] - mean(truth1[i,,]))/sd(truth1[i,,])
}

truth3 = img
for (i in 1:dim(img)[3]) {
  truth3[,,i] = (truth3[,,i] - mean(truth3[,,i]))/sd(truth3[,,i])
}
try3 = zscore_img(img, margin=3)
stopifnot(all.equal(try3, truth3))
try2 = zscore_img(img, margin=2)
stopifnot(all.equal(try2, truth2))
try1 = zscore_img(img, margin=1)
stopifnot(all.equal(try1, truth1))

z = zscore_img(img, margin=NULL)
ztrim = zscore_img(img, margin=NULL,
                   centrality = "trimmed_mean", variability = "trimmed_sd")
```
