How to Present Tables in Plot Devices

Peter Carl

Chicago R User Group Meetup: R Output

Outline

Overview

Graphics in R are plotted on a graphics device

- Depending on the OS, in an interactive R session the default device is the screen, using `windows()`, `X11()`, or `quartz()`.
- Common graphics file formats use the `bmp()`, `jpeg()`, `png()`, and `tiff()` devices.
- Other useful file devices include `postscript()`, `pdf()`, `pictex()`, `xfig()`, and `bitmap()`.

Why would we display tabular data on a plot device?

- Reviewing results in a terminal isn't usually effective
- Garner benefits from formatting
- Combining graphics and tables can be very powerful

Some solutions, with a focus on `textplot`

Set up an example

```
> library('PerformanceAnalytics')
> data(managers)
> #managers=read.csv("/home/peter/dev/R/managers.csv",row.names=1)
> head(managers)
```

```
              HAM1 HAM2    HAM3    HAM4 HAM5 HAM6 EDHEC LS EQ SP500 TR

1996-05-31  -0.00543  0.00443
1996-06-30   0.01507  0.00412
```

```
> dim(managers)
```

```
[1] 132  10
```

```
> colnames(managers)
```

```
 [1] "HAM1"        "HAM2"        "HAM3"        "HAM4"        "HAM5"
 [6] "HAM6"        "EDHEC LS EQ" "SP500 TR"    "US 10Y TR"   "US 3m TR"
```

Set up an example

```
> manager.col = 1
> peers.cols = c(2,3,4,5,6)
> indexes.cols = c(7,8)
> Rf.col = 10
> peer.colorset=c("red", rep("darkorange", 2), rep("gray", 5))
> ham1.downside = t(table.DownsideRisk(managers[,c(manager.col,
+ indexes.cols, peers.cols)],Rf=.03/12))
```

Construct a table example

> ham1.downside

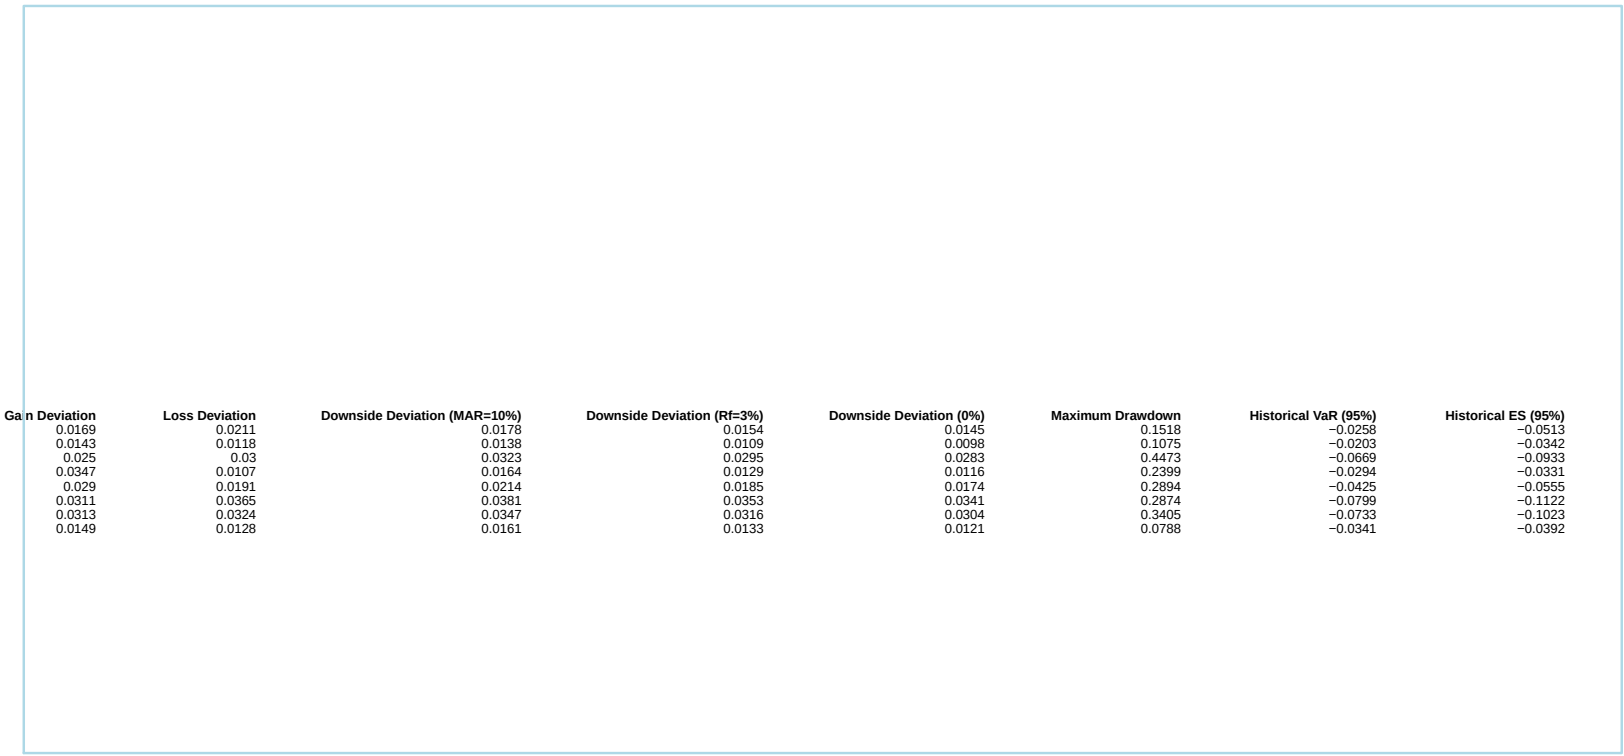
gplots:::textplot

Gregory R. Warnes' package, `gplots`, includes the `textplot` function

- Displays text output in a graphics window
- Provides the equivalent of `print`
- Creates a new `plot` and displays a table using the largest font that will fit in the plotting region
- Several other good things in the package, too

gplots:::textplot example

```
> library(gplots)
> #args(gplots:::textplot)
> gplots:::textplot(ham1.downside); box(col="lightblue")
```



Deviation	Gain Deviation	Loss Deviation	Downside Deviation (MAR=10%)	Downside Deviation (Rf=3%)	Downside Deviation (0%)	Maximum Drawdown	Historical VaR (95%)	Historical ES (95%)	Modif

Hmisc:::format.df

The Hmisc package by Frank E. Harrell, Jr., and Richard M. Heiberger contains several functions useful for data analysis

- Includes functions for advanced table making, character string manipulation, and conversion of S objects to LaTeX code, and many others.
- format.df does rounding and decimal alignment for data.frames, similar to format in base
- Generates a character matrix containing the formatted data
- Useful for formating tables in LaTeX or HTML, as well

Hmisc::format.df example

```
> library(Hmisc)
> args(format.df)

function (x, digits, dec = NULL, rdec = NULL, cdec = NULL, numeric.dollar = !dcolumn,
    na.blank = FALSE, na.dot = FALSE, blank.dot = FALSE, col.just = NULL,
    cdot = FALSE, dcolumn = FALSE, matrix.sep = " ", scientific = c(-4,
        4), math.row.names = FALSE, already.math.row.names = FALSE,
    math.col.names = FALSE, already.math.col.names = FALSE, double.slash = FALSE,
    format.Date = "%m/%d/%Y", format.POSIXt = "%m/%d/%Y %H:%M:%OS",
    ...)
NULL

> ham1.f.downside = format.df(ham1.downside, na.blank=TRUE, numeric.dollar = FALSE, cdec=rep(4,d
```

Hmisc:::format.df example

> ham1.f.downside

PerformanceAnalytics:::textplot

The PerformanceAnalytics package extends the gplots:::textplot function

- Equivalent of print except that the output is displayed as a plot
- Fixes some of the layout math
- Adds column and row name word wrapping
- Adds color to the table elements
- Adds vertical alignment for headers and data

PerformanceAnalytics:::textplot example

```
> require(PerformanceAnalytics)
> args(PerformanceAnalytics:::textplot)

function (object, halign = "center", valign = "center", cex,
    max.cex = 1, cmar = 2, rmar = 0.5, show.rownames = TRUE,
    show.colnames = TRUE, hadj = 1, vadj = NULL, row.valign = "center",
    heading.valign = "bottom", mar = c(0, 0, 0, 0) + 0.1, col.data = par("col"),
    col.rownames = par("col"), col.colnames = par("col"), wrap = TRUE,
    wrap.colnames = 10, wrap.rownames = 10, ...)
NULL
```

PerformanceAnalytics:::textplot example

```
> PerformanceAnalytics:::textplot(ham1.f.downside,  halign = "center", valign = "top", row.valign
> box(col="lightblue")
```

Other Possibilities

What else is available?

- A very promising package presented at useR! 2010, `tabulaR`
- Dump results to a spreadsheet, perhaps with `XLConnect`
- Finally learn LaTeX and Sweave
- What did I miss? Any feedback would be much appreciated ...
