

Package ‘redland’

July 21, 2018

Version 1.0.17-10

Title RDF Library Bindings in R

Date 2018-07-18

VignetteBuilder knitr

Description Provides methods to parse, query and serialize information stored in the Resource Description Framework (RDF). RDF is described at <<http://www.w3.org/TR/rdf-primer>>.

This package supports RDF by implementing an R interface to the Redland RDF C library, described at <<http://librdf.org/docs/api/index.html>>. In brief, RDF provides a structured graph consisting of Statements composed of Subject, Predicate, and Object Nodes.

Depends R (>= 3.1.1), methods

Imports roxygen2

Suggests spelling, knitr, testthat, rmarkdown, stringi

SystemRequirements Mac OSX: redland (>= 1.0.14) ; Linux: librdf0 (>= 1.0.14), librdf0-dev (>= 1.0.14)

Collate 'redland.R' 'World.R' 'Node.R' 'Statement.R' 'Storage.R' 'Model.R' 'Parser.R' 'Query.R' 'QueryResults.R' 'Serializer.R' 'mergeNamespace_roclet.R' 'redland-package.R' 'util.R'

addStatement *Add a Statement object to the Model*

Description

Add a Statement object to the Model

Usage

```
addStatement(.Object, statement)

## S4 method for signature 'Model,Statement'
addStatement(.Object, statement)
```

Arguments

| | |
|-----------|----------------------------------|
| .Object | a Model object |
| statement | the Statement that will be added |

Examples

```
world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
model <- new("Model", world, storage, options="")
```

executeQuery *Execute a query*

Description

The initialize query is executed and the result is returned as a QueryResult object

Usage

```
executeQuery(.Object, model)

## S4 method for signature 'Query'
executeQuery(.Object, model)
```

Arguments

| | |
|---------|---|
| .Object | a Query object |
| model | a Model object containing the statements to query |

Value

a QueryResults object

| | |
|-----------|--|
| freeModel | <i>Free memory used by a librdf model.</i> |
|-----------|--|

Description

Free memory used by a librdf model.

Usage

```
freeModel(.Object)

## S4 method for signature 'Model'
freeModel(.Object)
```

Arguments

.Object a Model object

Details

After this method is called, the Model object is no longer usable and should be deleted "rm(model)" and a new object created.

Examples

```
world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
model <- new("Model", world, storage, options="")
# At this point, some operations would be performed with the model.
# See '?redland' for a complete example.
# When the Model object is no longer needed, the resources it has allocated can be freed.
freeModel(model)
rm(model)
```

| | |
|------------|--|
| freeParser | <i>Free memory used by a librdf parser</i> |
|------------|--|

Description

Free memory used by a librdf parser

Usage

```
freeParser(.Object)

## S4 method for signature 'Parser'
freeParser(.Object)
```

Arguments

.Object a Node object

Details

After freeNode is called, the Node object is no longer usable and should be deleted "rm(nodeName)" and a new object created.

Examples

```
world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
model <- new("Model", world, storage, options="")
parser <- new("Parser", world)
filePath <- system.file("extdata/example.rdf", package="redland")
parseFileIntoModel(parser, world, filePath, model)
# At this point, some operations would be performed with the Model that has been populated
# with the parser.
# See '?redland' for a complete example.
# When the parser object is no longer needed, the resources it had allocated can be freed.
freeParser(parser)
rm(parser)
```

freeQuery

Free memory used by a librdf query

Description

Free memory used by a librdf query

Usage

```
freeQuery(.Object)

## S4 method for signature 'Query'
freeQuery(.Object)
```

Arguments

.Object a Query object

Details

After this method is called, the Query object is no longer usable and should be deleted "rm(query)" and a new object created.

Examples

```

world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
model <- new("Model", world, storage, options="")
stmt <- new("Statement", world=world,
  subject="https://orcid.org/0000-0002-2192-403X",
  predicate="http://www.w3.org/ns/prov#Agent",
  object="slaughter",
  objectType="literal", datatype_uri="http://www.w3.org/2001/XMLSchema#string")
status <- addStatement(model, stmt)
queryString <- paste("PREFIX orcid: <https://orcid.org/>",
  "PREFIX dataone: <https://cn.dataone.org/cn/v1/resolve/>",
  "PREFIX prov: <http://www.w3.org/ns/prov#>",
  "SELECT ?a ?c WHERE { ?a prov:Agent ?c . }", sep=" ")
query <- new("Query", world, queryString, base_uri=NULL,
  query_language="sparql", query_uri=NULL)
queryResult <- executeQuery(query, model)
result <- getNextResult(queryResult)

# When the query object is no longer needed, the resources it had allocated can be freed.
freeQuery(query)
rm(query)

```

freeQueryResults

Free memory used by a librdf query results

Description

After this method is called, the QueryResults object is no longer usable and should be deleted with "rm(query)".

Usage

```

freeQueryResults(.Object)

## S4 method for signature 'QueryResults'
freeQueryResults(.Object)

```

Arguments

.Object a QueryResults object

Examples

```

world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
model <- new("Model", world, storage, options="")
stmt <- new("Statement", world=world,
  subject="https://orcid.org/0000-0002-2192-403X",

```

```

predicate="http://www.w3.org/ns/prov#Agent",
object="slaughter",
objectType="literal", datatype_uri="http://www.w3.org/2001/XMLSchema#string")
status <- addStatement(model, stmt)
queryString <- paste("PREFIX orcid: <https://orcid.org/>",
                    "PREFIX dataone: <https://cn.dataone.org/cn/v1/resolve/>",
                    "PREFIX prov: <http://www.w3.org/ns/prov#>",
                    "SELECT ?a ?c WHERE { ?a prov:Agent ?c . }", sep=" ")
query <- new("Query", world, queryString, base_uri=NULL,
            query_language="sparql", query_uri=NULL)
queryResult <- executeQuery(query, model)
result <- getNextResult(queryResult)

# When the queryResult is no longer needed, the resources it had allocated can be freed.
freeQueryResults(queryResult)
rm(queryResult)

```

freeSerializer

Free memory used by a librdf serializer.

Description

Free memory used by a librdf serializer.

Usage

```
freeSerializer(.Object)
```

```
## S4 method for signature 'Serializer'
freeSerializer(.Object)
```

Arguments

.Object a Serializer object

Examples

```

world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
model <- new("Model", world, storage, options="")
filePath <- system.file("extdata/example.rdf", package="redland")
parser <- new("Parser", world)
parseFileIntoModel(parser, world, filePath, model)
# Create the default "rdfxml" serializer
serializer <- new("Serializer", world)
# At this point, some operations would be performed with the Serializer object.
# See '?Serializer' for a complete example.
# When the serializer object is no longer needed, the resources it had allocated can be freed.
freeSerializer(serializer)
rm(serializer)

```

| | |
|---------------|---|
| freeStatement | <i>Free memory used by a librdf statement</i> |
|---------------|---|

Description

Free memory used by a librdf statement

Usage

```
freeStatement(.Object)

## S4 method for signature 'Statement'
freeStatement(.Object)
```

Arguments

.Object a Statement object

Details

After this method is called, the Statement object is no longer usable and should be deleted "rm(statement)" and a new object created. This method frees all resources for the statement, as well as each node in the statement.

Examples

```
world <- new("World")
stmt <- new("Statement", world, subject="http://www.example.com/myevent",
           predicate="http://example.com/occurredAt",
           object="Tue Feb 17 14:05:13 PST 2015")
# At this point, some operations would be performed with the Statement.
# See '?redland' for a complete example.
# When the Statement object is no longer needed, the resources it had allocated can be freed.
freeStatement(stmt)
rm(stmt)
```

| | |
|-------------|--|
| freeStorage | <i>Free memory used by a librdf storage object</i> |
|-------------|--|

Description

After this method is called, the Storage object is no longer usable and should be deleted "rm(storage)" and a new object created.

Usage

```
freeStorage(.Object)

## S4 method for signature 'Storage'
freeStorage(.Object)
```

Arguments

.Object a Storage object to free memory for

Examples

```
world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
# At this point we would perform some operations using the storage object.
# See '?redland' for a complete example.
# When the Storage object is no longer needed, the resources it had allocated can be freed.
status <- freeStorage(storage)
rm(storage)
```

| | |
|-----------|--|
| freeWorld | <i>Free memory used by a librdf world object</i> |
|-----------|--|

Description

Free memory used by a librdf world object

Usage

```
freeWorld(.Object)

## S4 method for signature 'World'
freeWorld(.Object)
```

Arguments

.Object a World object

Details

After this method is called, the World object is no longer usable and should be deleted "rm(world)" and a new object created.

Examples

```
world <- new("World")
# At this point we would perform some operations using the world object.
# When the world object is no longer needed, we can free the resources it has allocated.
result <- freeWorld(world)
rm(world)
```

| | |
|----------------|--|
| getBlankNodeId | <i>Get the blank identifier that has been assigned for a specified Node object</i> |
|----------------|--|

Description

Get the blank identifier that has been assigned for a specified Node object

Usage

```
getBlankNodeId(.Object)

## S4 method for signature 'Node'
getBlankNodeId(.Object)
```

Arguments

.Object a Node object

Details

When a Node object is initialized with no value specified, i.e. `node <- Node("")`, a blank node is created and a locally unique identifier is generated by `librdf`. This method retrieves this identifier and returns it to the caller.

Value

a blank node identifier

Examples

```
world <- new("World")
# a blank node is created with a unique identifier generated by librdf
node <- new("Node", world, blank=NULL)
nodeId <- getBlankNodeId(node)
```

| | |
|---------------|-----------------------------------|
| getNextResult | <i>Get the next query result.</i> |
|---------------|-----------------------------------|

Description

The next query result is returned. .

Usage

```
getNextResult(.Object)

## S4 method for signature 'QueryResults'
getNextResult(.Object)
```

Arguments

.Object a QueryResults object

| | |
|-------------|---|
| getNodeType | <i>Determine the node type and return as a string</i> |
|-------------|---|

Description

A Node has a type that is assigned at initialization and can have one of the following values: 'resource', 'literal', 'blank' and 'unknown'.

Usage

```
getNodeType(.Object)

## S4 method for signature 'Node'
getNodeType(.Object)
```

Arguments

.Object a Node object

Value

a character vector containing the Node type

Examples

```
world <- new("World")
node <- new("Node", world, uri="http://www.example.com")
nodeType <- getNodeTypes(node)
```

| | |
|--------------|--|
| getNodeValue | <i>Get the value of the node as a string</i> |
|--------------|--|

Description

Get the value of the node as a string

Usage

```
getNodeValue(.Object)

## S4 method for signature 'Node'
getNodeValue(.Object)
```

Arguments

.Object a Node object

Details

The value of the node is returned as a string. If the node type is 'blank', then the blank node identifier is returned. If the node type is 'literal', then the literal value is returned with the form "<value>"@<language>, e.g. "¡Hola, amigo! ¿Cómo estás?"@es". If the node type is 'uri' then the value is returned as a string.

Value

a string representation of the Node's value

Examples

```
world <- new("World")
node <- new("Node", world, literal="¡Hola, amigo! ¿Cómo estás?", language="es")
value <- getNodeValue(node)
```

| | |
|---------------------|-----------------------------------|
| getQueryResultLimit | <i>Get the query result limit</i> |
|---------------------|-----------------------------------|

Description

Get the query result limit

Usage

```
getQueryResultLimit(.Object)

## S4 method for signature 'Query'
getQueryResultLimit(.Object)
```

Arguments

.Object a Query object

Value

the query result limit. If a limit is set then the value will be ≥ 0 . If the value is < 0 , no limit is set

| | |
|------------|---------------------------------|
| getResults | <i>Return all query results</i> |
|------------|---------------------------------|

Description

Return all query results

Usage

```
getResults(.Object, model, ...)

## S4 method for signature 'Query'
getResults(.Object, model, formatName = "rdfxml")
```

Arguments

.Object a Query object
 model a Model object
 ... additional parameters
 formatName a string specifying the RDF format name. Currently the supported formats are "rdfxml", "turtle", "json", "csv"

Details

After this method is called, the Query object is no longer usable and should be deleted "rm(query)" and a new object created.

Examples

```
world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
model <- new("Model", world, storage, options="")
stmt <- new("Statement", world=world,
  subject="https://orcid.org/0000-0002-2192-403X",
  predicate="http://www.w3.org/ns/prov#Agent",
  object="slaughter",
  objectType="literal", datatype_uri="http://www.w3.org/2001/XMLSchema#string")
#objectType="literal", language="en")
status <- addStatement(model, stmt)
queryString <- paste("PREFIX orcid: <https://orcid.org/>",
```

```

"PREFIX dataone: <https://cn.dataone.org/cn/v1/resolve/>",
"PREFIX prov: <http://www.w3.org/ns/prov#>",
"SELECT ?a ?c WHERE { ?a prov:Agent ?c . }", sep=" ")
query <- new("Query", world, queryString, base_uri=NULL, query_language="sparql", query_uri=NULL)
# Return all results as a string
results <- getResults(query, model, "rdfxml")
results <- getResults(query, model, "turtle")
results <- getResults(query, model, "json")

# When the query object is no longer needed, the resources it had allocated can be freed.
freeQuery(query)
rm(query)

```

getTermType

Return the redland node type for the specified RDF term in a statement

Description

After a Statement object has been created, this method can be used to determine the RDF type ("uri", "literal", "blank") that has been assigned to the specified RDF term, i.e. "subject", "predicate", "object".

Usage

```

getTermType(.Object, term)

## S4 method for signature 'Statement,character'
getTermType(.Object, term)

```

Arguments

| | |
|---------|--|
| .Object | a Statement object |
| term | the RDF term for which the type will be returned |

Examples

```

world <- new("World")
subject <- new("Node", blank="_:myid1", world)
predicate <- new("Node", uri="http://www.example.com/isa", world)
object <- new("Node", literal="thing", world)
stmt <- new("Statement", world, subject, predicate, object, world)
termType <- getTermType(stmt, "predicate")

```

`initialize,Model-method`

Constructor for a Model object.

Description

Constructor for a Model object.

Usage

```
## S4 method for signature 'Model'  
initialize(.Object, world, storage, options)
```

Arguments

| | |
|----------------------|--|
| <code>.Object</code> | a Node object |
| <code>world</code> | a World object |
| <code>storage</code> | a Storage object |
| <code>options</code> | extra options for model initialization |

Value

the World object

`initialize,Node-method`

Initialize a Node object.

Description

A Node has an associated type corresponding to the RDF component that it is representing. The list of possible types is "resource", "literal" or "blank".

Usage

```
## S4 method for signature 'Node'  
initialize(.Object, world, literal, uri, blank, datatype_uri,  
          language)
```

Arguments

| | |
|--------------|--|
| .Object | the Node object to be initialized |
| world | a World object |
| literal | a literal character value to be assigned to the node |
| uri | a uri character value to be assigned to the node |
| blank | a blank node identifier to be assigned to the node |
| datatype_uri | a uri used to specify the datatype of a literal node, i.e. "http://www.w3.org/2001/XMLSchema#string" |
| language | a character value specifying the RDF language tag (excluding the "@" symbol), i.e. "fr" |

Details

The url=' and 'literal=' arguments determine which type of Node is created. The Node type affects how the Node is processed in serialization, for example a Node created with 'node1 <- new("Node", literal="http://www.example.com")' is processed differently than a Node created with 'node1 <- new("Node", url="http://www.example.com")', with the former being processed as an RDF literal and the latter processed as an RDF resource.

Value

the Node object

Note

Refer to <https://www.w3.org/TR/rdf11-concepts> information on language tags.

```
initialize,Parser-method
```

Initialize a Parser object.

Description

A Parser object is initialized for a specific RDF serialization.

Usage

```
## S4 method for signature 'Parser'
initialize(.Object, world, name = "rdfxml",
  mimeType = "application/rdf+xml", typeUri = as.character(NA))
```

Arguments

| | |
|----------|--|
| .Object | the Parser object |
| world | a World object |
| name | name of the parser factory to use |
| mimeType | a mime type of the syntax of the model |
| typeUri | a URI for the syntax of the model |

Details

The serialization format that are supported by

Value

the Parser object

initialize,Query-method

Initialize the Query object.

Description

Initialize the Query object.

Usage

```
## S4 method for signature 'Query'
initialize(.Object, world, querystring, base_uri = NULL,
          query_language = "sparql", query_uri = NULL)
```

Arguments

| | |
|----------------|---|
| .Object | the Query object |
| world | a World object |
| querystring | a query string for the language specified in 'query_language' |
| base_uri | a URI to prepend to relative URI in the document |
| query_language | the query language to execute the querystring with |
| query_uri | a URI to prepend to terms in the query |

Value

the Query object

`initialize,QueryResults-method`*Initialize the QueryResults object.*

Description

The QueryResults object is initialized with the librdf query result from return value of 'Query.execute()'.

Usage

```
## S4 method for signature 'QueryResults'  
initialize(.Object, results)
```

Arguments

| | |
|----------------------|--------------------------|
| <code>.Object</code> | the QueryResults object. |
| <code>results</code> | a librdf query result |

Details

A QueryResults object is returned by the Query.executeQuery() method, so typically a user does not initialize a QueryResult object by calling new("QueryResult", ...)

Value

the QueryResults object

`initialize,Serializer-method`*Construct a Serializer object.*

Description

Construct a Serializer object.

Usage

```
## S4 method for signature 'Serializer'  
initialize(.Object, world, name = "rdFXML",  
  mimeType = "application/rdf+xml", typeUri = as.character(NA))
```

Arguments

| | |
|-------------|--|
| .Object | the Serializer object |
| world | a World object |
| name | name of a previously created serializer factory to use |
| contentType | a mime type of the syntax of the model |
| uri | a URI for the syntax of the model |

Value

the Serializer object

`initialize,Statement-method`

Construct a Statement object.

Description

Construct a Statement object.

Usage

```
## S4 method for signature 'Statement'
initialize(.Object, world, subject, predicate, object,
  subjectType = as.character(NA), objectType = as.character(NA),
  datatype_uri = as.character(NA), language = as.character(NA))
```

Arguments

| | |
|--------------|---|
| .Object | the Statement object |
| world | a World object |
| subject | a Node object |
| predicate | a Node object |
| object | a Node object |
| subjectType | the Node type of the subject, i.e. "blank", "uri" |
| objectType | the Node type of the object, i.e. "blank", "uri", "literal" |
| datatype_uri | the datatype URI to associate with a object literal value |
| language | a character value specifying the RDF language tag for an object literal value (excluding the "@" symbol), i.e. "fr" |

Value

the Statement object

```
initialize,Storage-method  
    Initialize a Storage object
```

Description

Initialize a Storage object

Usage

```
## S4 method for signature 'Storage'  
initialize(.Object, world, type = "hashes", name = "",  
  options = "hash-type='memory'")
```

Arguments

| | |
|---------|--------------------------|
| .Object | the Storage object |
| world | the World object |
| type | the Redland storage type |
| name | storage instance name |
| options | storage options |

Value

the Storage object

Examples

```
world <- new("World")  
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
```

```
initialize,World-method  
    Initialize the World object.
```

Description

Initialize the World object.

Usage

```
## S4 method for signature 'World'  
initialize(.Object)
```

Arguments

.Object the World object

Value

the World object

`is.null.externalptr` *Determine whether an externalptr object is NULL.*

Description

The pointer is treated as an externalptr and checked via a call in C to see if it is NULL.

Usage

`is.null.externalptr(pointer)`

Arguments

pointer externalptr to be checked for NULL value

Value

logical TRUE if the pointer is NULL, otherwise FALSE

`length,SWIGArray-method`
Return length of a SWIGArray

Description

Return length of a SWIGArray

Usage

```
## S4 method for signature 'SWIGArray'
length(x)
```

Arguments

x the SWIGArray

librdf_copyright_string
Copyright string (multiple lines).

Description

Copyright string (multiple lines).

Usage

```
librdf_copyright_string ( .copy )
```

Arguments

| | |
|-------|----|
| .copy | NA |
|-------|----|

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_copyright_string_get
Return Redland RDF copyright string

Description

Return the Redland RDF copyright

Usage

```
librdf_copyright_string_get (.copy)
```

Arguments

| | |
|-------|---------|
| .copy | logical |
|-------|---------|

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_digest_final *Finish the digesting of data.*

Description

Finish the digesting of data.

Usage

```
librdf_digest_final ( digest )
```

Arguments

digest the digest ("_p_librdf_digest_s")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_digest_init *(Re)initialise the librdf_digest object.*

Description

(Re)initialise the librdf_digest object.

Usage

```
librdf_digest_init ( digest )
```

Arguments

digest the digest ("_p_librdf_digest_s")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_digest_to_string
Get a string representation of the digest object.

Description

Get a string representation of the digest object.

Usage

```
librdf_digest_to_string ( digest )
```

Arguments

digest the digest ("_p_librdf_digest_s")

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_digest_update *Add more data to the librdf_digest object.*

Description

Add more data to the librdf_digest object.

Usage

```
librdf_digest_update ( digest,  
  buf,  
  length )
```

Arguments

| | |
|--------|------------------------------------|
| digest | the digest ("_p_librdf_digest_s") |
| buf | the data buffer ("character") |
| length | the length of the data ("integer") |

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_digest_update_string
Add a string to the librdf_digest object.

Description

Add a string to the librdf_digest object.

Usage

```
librdf_digest_update_string ( digest,  
string )
```

Arguments

| | |
|--------|-----------------------------------|
| digest | the digest ("_p_librdf_digest_s") |
| string | string to add ("character") |

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_free_digest *Destructor - destroy a librdf_digest object.*

Description

Destructor - destroy a librdf_digest object.

Usage

```
librdf_free_digest ( digest )
```

Arguments

| | |
|--------|-----------------------------------|
| digest | the digest ("_p_librdf_digest_s") |
|--------|-----------------------------------|

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

| | |
|------------------|---|
| librdf_free_hash | <i>Destructor - destroy a librdf_hash object.</i> |
|------------------|---|

Description

Destructor - destroy a librdf_hash object.

Usage

```
librdf_free_hash ( hash )
```

Arguments

hash hash object ("_p_librdf_hash_s")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_free_iterator *Destructor - destroy a librdf_iterator object.*

Description

Destructor - destroy a librdf_iterator object.

Usage

```
librdf_free_iterator ( s_arg1 )
```

Arguments

s_arg1 the librdf_iterator object ("`_p_librdf_iterator_s`")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_free_model *Destructor - Destroy a librdf_model object.*

Description

Destructor - Destroy a librdf_model object.

Usage

```
librdf_free_model ( model )
```

Arguments

model librdf_model model to destroy ("`_p_librdf_model_s`")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

| | |
|------------------|--|
| librdf_free_node | <i>Destructor - destroy an librdf_node object.</i> |
|------------------|--|

Description

Destructor - destroy an librdf_node object.

Usage

```
librdf_free_node ( r )
```

Arguments

r librdf_node object ("_p_librdf_node_s")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_free_parser *Destructor - destroys a librdf_parser object.*

Description

Destructor - destroys a librdf_parser object.

Usage

```
librdf_free_parser ( parser )
```

Arguments

parser the parser ("_p_librdf_parser_s")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_free_query *Destructor - destroy a librdf_query object.*

Description

Destructor - destroy a librdf_query object.

Usage

```
librdf_free_query ( query )
```

Arguments

query librdf_query object ("_p_librdf_query")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_free_query_results

Destructor - destroy a librdf_query_results object.

Description

Destructor - destroy a librdf_query_results object.

Usage

```
librdf_free_query_results ( query_results )
```

Arguments

query_results librdf_query_results object ("`_p_librdf_query_results`")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_free_serializer`*Destructor - destroys a librdf_serializer object.*

Description

Destructor - destroys a librdf_serializer object.

Usage

```
librdf_free_serializer ( serializer )
```

Arguments

serializer the serializer ("_p_librdf_serializer_s")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_free_statement` *Destructor - destroy a librdf_statement.*

Description

Destructor - destroy a librdf_statement.

Usage

```
librdf_free_statement ( statement )
```

Arguments

statement librdf_statement object ("_p_librdf_statement_s")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_free_storage *Destructor - destroy a librdf_storage object.*

Description

Destructor - destroy a librdf_storage object.

Usage

```
librdf_free_storage ( storage )
```

Arguments

storage librdf_storage object ("`_p_librdf_storage_s`")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_free_stream *Destructor - destroy an librdf_stream object.*

Description

Destructor - destroy an librdf_stream object.

Usage

```
librdf_free_stream ( stream )
```

Arguments

stream librdf_stream object ("_p_librdf_stream_s")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_free_uri *Destructor - destroy a librdf_uri object.*

Description

Destructor - destroy a librdf_uri object.

Usage

```
librdf_free_uri ( uri )
```

Arguments

uri librdf_uri object ("_p_librdf_uri_s")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

| | |
|-------------------|---|
| librdf_free_world | <i>Terminate the library and frees all allocated resources.</i> |
|-------------------|---|

Description

Terminate the library and frees all allocated resources.

Usage

```
librdf_free_world ( world )
```

Arguments

| | |
|-------|--|
| world | redland world object ("_p_librdf_world_s") |
|-------|--|

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_hash_to_string *Format the hash as a string, suitable for parsing by librdf_hash_from_string.*

Description

Format the hash as a string, suitable for parsing by librdf_hash_from_string.

Usage

```
librdf_hash_to_string ( hash,  
filter )
```

Arguments

| | |
|--------|--|
| hash | librdf_hash object ("_p_librdf_hash_s") |
| filter | NULL terminated list of keys to ignore ("_p_p_char") |

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_internal_test_error

For internal testing, not part of public API

Description

This function is for internal testing of the Redland software and is not part of the public API.

Usage

```
librdf_internal_test_error ( world )
```

Arguments

world librdf_world object ("_p_librdf_world_s")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_internal_test_warning

For internal testing, not part of public API

Description

This function is for internal testing of the Redland software and is not part of the public API.

Usage

```
librdf_internal_test_warning ( world )
```

Arguments

world librdf_world ("_p_librdf_world_s")

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_iterator_end *Test if the iterator has finished.*

Description

Test if the iterator has finished.

Usage

```
librdf_iterator_end ( iterator,  
                    .copy )
```

Arguments

| | |
|----------|---|
| iterator | the librdf_iterator object ("_p_librdf_iterator_s") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_iterator_get_context
Get the context of the current object on the iterator.

Description

Get the context of the current object on the iterator.

Usage

```
librdf_iterator_get_context ( iterator )
```

Arguments

| | |
|----------|---|
| iterator | the librdf_iterator object ("_p_librdf_iterator_s") |
|----------|---|

Value

`_p_librdf_node_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_iterator_get_object`

Get the current object from the iterator.

Description

Get the current object from the iterator.

Usage

```
librdf_iterator_get_object ( iterator )
```

Arguments

`iterator` the librdf_iterator object ("`_p_librdf_iterator_s`")

Value

`_p_librdf_node_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_iterator_next *Move to the next iterator element.*

Description

Move to the next iterator element.

Usage

```
librdf_iterator_next ( iterator,  
  .copy )
```

Arguments

| | |
|----------|---|
| iterator | the librdf_iterator object ("_p_librdf_iterator_s") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_log_message_code
Retrieve error code from log message.

Description

Retrieve error code from log message.

Usage

```
librdf_log_message_code ( message,  
  .copy )
```

Arguments

| | |
|---------|---------------------------------------|
| message | log message ("_p_librdf_log_message") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_log_message_facility

Retrieve facility that generated the message.

Description

Retrieve facility that generated the message.

Usage

```
librdf_log_message_facility ( message,  
                             .copy )
```

Arguments

| | |
|---------|---------------------------------------|
| message | log message ("_p_librdf_log_message") |
| .copy | NA |

Value

integer

References

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_log_message_level`*Retrieve severity of log message.*

Description

Retrieve severity of log message.

Usage

```
librdf_log_message_level ( message,  
                          .copy )
```

Arguments

| | |
|----------------------|--|
| <code>message</code> | log message (" <code>_p_librdf_log_message</code> ") |
| <code>.copy</code> | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_log_message_locator`*Retrieve locator of log entry.*

Description

Retrieve locator of log entry.

Usage

```
librdf_log_message_locator ( message )
```

Arguments

message log message ("_p_librdf_log_message")

Value

_p_raptor_locator

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_log_message_message

Retrieve text message from log entry.

Description

Retrieve text message from log entry.

Usage

```
librdf_log_message_message ( message )
```

Arguments

message log message ("_p_librdf_log_message")

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

| | |
|------------------|--|
| librdf_model_add | <i>Create and add a new statement about a resource to the model.</i> |
|------------------|--|

Description

Create and add a new statement about a resource to the model.

Usage

```
librdf_model_add ( model,  
  subject,  
  predicate,  
  object,  
  .copy )
```

Arguments

| | |
|-----------|--|
| model | model object ("_p_librdf_model_s") |
| subject | librdf_node of subject ("_p_librdf_node_s") |
| predicate | librdf_node of predicate ("_p_librdf_node_s") |
| object | librdf_node of object (literal or resource) ("_p_librdf_node_s") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

librdf_model_add_statement

Add a statement to the model.

Description

Add a statement to the model.

Usage

```
librdf_model_add_statement ( model,  
  statement,  
  .copy )
```

Arguments

| | |
|-----------|---|
| model | model object (" <code>_p_librdf_model_s</code> ") |
| statement | statement object (" <code>_p_librdf_statement_s</code> ") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_model_add_statements

Add a stream of statements to the model.

Description

Add a stream of statements to the model.

Usage

```
librdf_model_add_statements ( model,  
  statement_stream,  
  .copy )
```

Arguments

| | |
|------------------|--|
| model | model object ("_p_librdf_model_s") |
| statement_stream | stream of statements to use ("_p_librdf_stream_s") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_model_add_string_literal_statement

Create and add a new statement about a literal to the model.

Description

Create and add a new statement about a literal to the model.

Usage

```
librdf_model_add_string_literal_statement ( model,
subject,
predicate,
literal,
inStrOrNull,
is_wf_xml,
.copy )
```

Arguments

| | |
|-------------|---|
| model | model object ("_p_librdf_model_s") |
| subject | librdf_node of subject ("_p_librdf_node_s") |
| predicate | librdf_node of predicate ("_p_librdf_node_s") |
| literal | string literal conten ("character") |
| inStrOrNull | language of literal ("character") |
| is_wf_xml | literal is XML ("integer") |
| .copy | NA |

Value

integer

librdf_model_add_typed_literal_statement

Create and add a new statement about a typed literal to the model.

Description

Create and add a new statement about a typed literal to the model.

Usage

```
librdf_model_add_typed_literal_statement ( model,
  subject,
  predicate,
  string,
  inStrOrNull,
  inUriOrNull,
  .copy )
```

Arguments

| | |
|-------------|---|
| model | model object ("_p_librdf_model_s") |
| subject | librdf_node of subject ("_p_librdf_node_s") |
| predicate | librdf_node of predicate ("_p_librdf_node_s") |
| string | string literal content ("character") |
| inStrOrNull | language of literal ("character") |
| inUriOrNull | datatype librdf_uri ("_p_librdf_uri_s") |
| .copy | NA |

Value

integer

librdf_model_as_stream

List the model contents as a stream of statements.

Description

List the model contents as a stream of statements.

Usage

```
librdf_model_as_stream ( model )
```

Arguments

model the model object ("_p_librdf_model_s")

Value

_p_librdf_stream_s

References

<http://librdf.org/docs>

librdf_model_contains_context

Check for a context in the model.

Description

Check for a context in the model.

Usage

```
librdf_model_contains_context ( model,  
context,  
.copy )
```

Arguments

| | |
|---------|---|
| model | the model object (" <code>_p_librdf_model_s</code> ") |
| context | the contest (" <code>_p_librdf_node_s</code> ") |
| .copy | NA |

Value

integer

References

librdf_model_contains_statement

Check for a statement in the model.

Description

Check for a statement in the model.

Usage

```
librdf_model_contains_statement ( model,
                                statement,
                                .copy )
```

Arguments

| | |
|-----------|---|
| model | the model object ("_p_librdf_model_s") |
| statement | the statement ("_p_librdf_statement_s") |
| .copy | NA |

Value

integer

librdf_model_context_add_statement

Add a statement to a model with a context.

Description

Add a statement to a model with a context.

Usage

```
librdf_model_context_add_statement ( model,
                                    context,
                                    statement,
                                    .copy )
```

Arguments

| | |
|-----------|---|
| model | librdf_model object ("_p_librdf_model_s") |
| context | librdf_node context ("_p_librdf_node_s") |
| statement | librdf_statement statement object ("_p_librdf_statement_s") |
| .copy | NA |

Value

integer

librdf_model_context_add_statements

Add statements to a model with a context.

Description

Add statements to a model with a context.

Usage

```
librdf_model_context_add_statements ( model,  
  context,  
  stream,  
  .copy )
```

Arguments

| | |
|---------|---|
| model | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| context | librdf_node context (" <code>_p_librdf_node_s</code> ") |
| stream | librdf_stream stream object (" <code>_p_librdf_stream_s</code> ") |
| .copy | NA |

Value

integer

`librdf_model_context_as_stream`*List all statements in a model context.*

Description

List all statements in a model context.

Usage

```
librdf_model_context_as_stream ( model,  
                                context )
```

Arguments

| | |
|----------------------|--|
| <code>model</code> | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| <code>context</code> | librdf_node context (" <code>_p_librdf_node_s</code> ") |

Value

`_p_librdf_stream_s`

`librdf_model_context_remove_statement`*Remove a statement from a model in a context.*

Description

Remove a statement from a model in a context.

Usage

```
librdf_model_context_remove_statement ( model,  
                                       context,  
                                       statement,  
                                       .copy )
```

Arguments

| | |
|-----------|--|
| model | librdf_model object ("_p_librdf_model_s") |
| context | librdf_node context ("_p_librdf_node_s") |
| statement | librdf_statement statement ("_p_librdf_statement_s") |
| .copy | NA |

Value

integer

librdf_model_context_remove_statements

Remove statements from a model with the given context.

Description

Remove statements from a model with the given context.

Usage

```
librdf_model_context_remove_statements ( model,
context,
.copy )
```

Arguments

| | |
|---------|---|
| model | librdf_model object ("_p_librdf_model_s") |
| context | librdf_node context ("_p_librdf_node_s") |
| .copy | NA |

Value

integer

`librdf_model_find_statements`

Find matching statements in the model.

Description

Find matching statements in the model.

Usage

```
librdf_model_find_statements ( model,  
                               statement )
```

Arguments

| | |
|------------------------|---|
| <code>model</code> | the model object (" <code>_p_librdf_model_s</code> ") |
| <code>statement</code> | the partial statement to match (" <code>_p_librdf_statement_s</code> ") |

Value

`_p_librdf_stream_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

```
librdf_model_find_statements_in_context
```

Search the model for matching statements in a given context.

Description

Search the model for matching statements in a given context.

Usage

```
librdf_model_find_statements_in_context ( model,
statement,
inNodeOrNull )
```

Arguments

| | |
|--------------|---|
| model | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| statement | librdf_statement partial statement to find (" <code>_p_librdf_statement_s</code> ") |
| inNodeOrNull | context librdf_node (or NULL) (" <code>_p_librdf_node_s</code> ") |

Value

`_p_librdf_stream_s`

References

```
librdf_model_get_arc
```

Return one arc (predicate) of an arc in an RDF graph given source (subject) and target (object).

Description

Return one arc (predicate) of an arc in an RDF graph given source (subject) and target (object).

Usage

```
librdf_model_get_arc ( model,  
  source,  
  target )
```

Arguments

| | |
|--------|--|
| model | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| source | librdf_node source (" <code>_p_librdf_node_s</code> ") |
| target | librdf_node target (" <code>_p_librdf_node_s</code> ") |

Value

`_p_librdf_node_s`

References

<http://librdf.org/docs>

`librdf_model_get_arcs` *Return the arcs (predicates) of an arc in an RDF graph given source (subject) and target (object).*

Description

Return the arcs (predicates) of an arc in an RDF graph given source (subject) and target (object).

Usage

```
librdf_model_get_arcs ( model,  
  source,  
  target )
```

Arguments

| | |
|--------|--|
| model | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| source | librdf_node source (" <code>_p_librdf_node_s</code> ") |
| target | librdf_node target (" <code>_p_librdf_node_s</code> ") |

Value

`_p_librdf_iterator_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_model_get_arcs_in`

Return the properties pointing to the given resource.

Description

Return the properties pointing to the given resource.

Usage

```
librdf_model_get_arcs_in ( model,  
node )
```

Arguments

| | |
|--------------------|---|
| <code>model</code> | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| <code>node</code> | librdf_node resource node (" <code>_p_librdf_node_s</code> ") |

Value

`_p_librdf_iterator_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_model_get_arcs_out`*Return the properties pointing from the given resource.*

Description

Return the properties pointing from the given resource.

Usage

```
librdf_model_get_arcs_out ( model,  
node )
```

Arguments

| | |
|-------|---|
| model | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| node | librdf_node resource node (" <code>_p_librdf_node_s</code> ") |

Value

`_p_librdf_iterator_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_model_get_contexts`*Return the list of contexts in the graph.*

Description

Return the list of contexts in the graph.

Usage

```
librdf_model_get_contexts ( model )
```

Arguments

model librdf_model object ("_p_librdf_model_s")

Value

_p_librdf_iterator_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_model_get_feature

Get the value of a graph feature .

Description

Get the value of a graph feature .

Usage

```
librdf_model_get_feature ( model,  
                          feature )
```

Arguments

model librdf_model object ("_p_librdf_model_s")
feature librdf_uri feature property ("_p_librdf_uri_s")

Value

_p_librdf_node_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_model_get_source`

Return one source (subject) of arc in an RDF graph given arc (predicate) and target (object).

Description

Return one source (subject) of arc in an RDF graph given arc (predicate) and target (object).

Usage

```
librdf_model_get_source ( model,  
  arc,  
  target )
```

Arguments

| | |
|--------|--|
| model | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| arc | librdf_node arc (" <code>_p_librdf_node_s</code> ") |
| target | librdf_node target (" <code>_p_librdf_node_s</code> ") |

Value

`_p_librdf_node_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_model_get_sources`

Return the sources (subjects) of arc in an RDF graph given arc (predicate) and target (object).

Description

Return the sources (subjects) of arc in an RDF graph given arc (predicate) and target (object).

Usage

```
librdf_model_get_sources ( model,
  arc,
  target )
```

Arguments

| | |
|--------|---|
| model | librdf_model object ("_p_librdf_model_s") |
| arc | librdf_node arc ("_p_librdf_node_s") |
| target | librdf_node target ("_p_librdf_node_s") |

Value

_p_librdf_iterator_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_model_get_target

Return one target (object) of an arc in an RDF graph given source (subject) and arc (predicate).

Description

Return one target (object) of an arc in an RDF graph given source (subject) and arc (predicate).

Usage

```
librdf_model_get_target ( model,
  source,
  arc )
```

Arguments

| | |
|--------|---|
| model | librdf_model object ("_p_librdf_model_s") |
| source | librdf_node source ("_p_librdf_node_s") |
| arc | librdf_node arc ("_p_librdf_node_s") |

Value

`_p_librdf_node_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_model_get_targets`

Return the targets (objects) of an arc in an RDF graph given source (subject) and arc (predicate).

Description

Return the targets (objects) of an arc in an RDF graph given source (subject) and arc (predicate).

Usage

```
librdf_model_get_targets ( model,  
  source,  
  arc )
```

Arguments

| | |
|---------------------|--|
| <code>model</code> | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| <code>source</code> | librdf_node source (" <code>_p_librdf_node_s</code> ") |
| <code>arc</code> | librdf_node arc (" <code>_p_librdf_node_s</code> ") |

Value

`_p_librdf_iterator_s`

References

<http://librdf.org/docs>

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_model_has_arc_in`*Check if a node has a given property pointing to it.*

Description

Check if a node has a given property pointing to it.

Usage

```
librdf_model_has_arc_in ( model,  
  node,  
  property,  
  .copy )
```

Arguments

| | |
|-----------------------|---|
| <code>model</code> | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| <code>node</code> | librdf_node resource node (" <code>_p_librdf_node_s</code> ") |
| <code>property</code> | librdf_node property node (" <code>_p_librdf_node_s</code> ") |
| <code>.copy</code> | NA |

Value

integer

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_model_has_arc_out`*Check if a node has a given property pointing from it.*

Description

Check if a node has a given property pointing from it.

Usage

```
librdf_model_has_arc_out ( model,  
  node,  
  property,  
  .copy )
```

Arguments

| | |
|-----------------------|---|
| <code>model</code> | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| <code>node</code> | librdf_node resource node (" <code>_p_librdf_node_s</code> ") |
| <code>property</code> | librdf_node property node (" <code>_p_librdf_node_s</code> ") |
| <code>.copy</code> | NA |

Value

integer

librdf_model_load *Load content from a URI into the model.*

Description

Load content from a URI into the model.

Usage

```
librdf_model_load ( model,  
  uri,  
  name,  
  mime_type,  
  type_uri,  
  .copy )
```

Arguments

| | |
|-----------|--|
| model | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| uri | the URI to read the content (" <code>_p_librdf_uri_s</code> ") |
| name | the name of the parser (or NULL) ("character") |
| mime_type | the MIME type of the syntax (NULL if not used) ("character") |
| type_uri | URI identifying the syntax (NULL if not used) (" <code>_p_librdf_uri_s</code> ") |
| .copy | NA |

Value

integer

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_model_query_execute`*Execute a query against the model.*

Description

Execute a query against the model.

Usage

```
librdf_model_query_execute ( model,  
  query )
```

Arguments

| | |
|-------|--|
| model | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| query | librdf_query object (" <code>_p_librdf_query</code> ") |

Value

`_p_librdf_query_results`

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_model_remove_statement`*Remove a known statement from the model.*

Description

Remove a known statement from the model.

Usage

```
librdf_model_remove_statement ( model,  
  statement,  
  .copy )
```

Arguments

| | |
|-----------|---|
| model | the model object ("_p_librdf_model_s") |
| statement | the statement ("_p_librdf_statement_s") |
| .copy | NA |

Value

integer

References

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_model_set_feature

Set the value of a graph feature.

Description

Set the value of a graph feature.

Usage

```
librdf_model_set_feature ( model,
  feature,
  value,
  .copy )
```

Arguments

| | |
|---------|---|
| model | librdf_model object ("_p_librdf_model_s") |
| feature | librdf_uri feature property ("_p_librdf_uri_s") |
| value | librdf_node feature property value ("_p_librdf_node_s") |
| .copy | NA |

Value

integer

librdf_model_size *Get the number of statements in the model.*

Description

Get the number of statements in the model.

Usage

```
librdf_model_size ( model,  
  .copy )
```

Arguments

| | |
|-------|--|
| model | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

| | |
|-------------------|---|
| librdf_model_sync | <i>Synchronise the model to the model implementation.</i> |
|-------------------|---|

Description

Synchronise the model to the model implementation.

Usage

```
librdf_model_sync ( model )
```

Arguments

| | |
|-------|---|
| model | librdf_model object ("_p_librdf_model_s") |
|-------|---|

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

| | |
|------------------------|--|
| librdf_model_to_string | <i>Write serialized model to a string.</i> |
|------------------------|--|

Description

Write serialized model to a string.

Usage

```
librdf_model_to_string ( model,  
uri,  
name,  
mime_type,  
inUriOrNull )
```

Arguments

| | |
|-------------|---|
| model | librdf_model object (" <code>_p_librdf_model_s</code> ") |
| uri | base URI to use in serializing (or NULL if not used) (" <code>_p_librdf_uri_s</code> ") |
| name | the name of the serializer (or NULL for default) ("character") |
| mime_type | the MIME type of the syntax (NULL if not used) ("character") |
| inUriOrNull | URI identifying the syntax (NULL if not used) (" <code>_p_librdf_uri_s</code> ") |

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_model_transaction_commit
Commit a transaction.

Description

Commit a transaction.

Usage

```
librdf_model_transaction_commit ( model,
  .copy )
```

Arguments

| | |
|-------|---|
| model | the model object (" <code>_p_librdf_model_s</code> ") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_model_transaction_rollback
Rollback a transaction.

Description

Rollback a transaction.

Usage

```
librdf_model_transaction_rollback ( model,  
  .copy )
```

Arguments

| | |
|-------|--|
| model | the model object ("_p_librdf_model_s") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_model_transaction_start
Start a transaction

Description

Start a transaction

Usage

```
librdf_model_transaction_start ( model,  
  .copy )
```

Arguments

| | |
|-------|--|
| model | the model object ("_p_librdf_model_s") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_new_digest *Constructor - create a new librdf_digest object.*

Description

Constructor - create a new librdf_digest object.

Usage

```
librdf_new_digest ( world,  
  name )
```

Arguments

| | |
|-------|--|
| world | redland world object ("_p_librdf_world_s") |
| name | the digest name to use to create this digest ("character") |

Value

_p_librdf_digest_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

| | |
|-----------------|---|
| librdf_new_hash | <i>Constructor - create a new librdf_hash object.</i> |
|-----------------|---|

Description

Constructor - create a new librdf_hash object.

Usage

```
librdf_new_hash ( world,
                 name )
```

Arguments

| | |
|-------|--|
| world | redland world object ("_p_librdf_world_s") |
| name | factory name ("character") |

Value

_p_librdf_hash_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_new_hash_from_array_of_strings`*Constructor - create a new librdf_hash object from an array of strings.*

Description

Constructor - create a new librdf_hash object from an array of strings.

Usage

```
librdf_new_hash_from_array_of_strings ( world,  
name,  
string )
```

Arguments

| | |
|--------|---|
| world | redland world object (" <code>_p_librdf_world_s</code> ") |
| name | hash name ("character") |
| string | address of the start of the array of char* pointers ("character") |

Value

`_p_librdf_hash_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_new_hash_from_string`*Constructor - create a new librdf_hash object from a string.*

Description

Constructor - create a new librdf_hash object from a string.

Usage

```
librdf_new_hash_from_string ( world,
                             name,
                             string )
```

Arguments

| | |
|--------|---|
| world | redland world object (" <code>_p_librdf_world_s</code> ") |
| name | hash name ("character") |
| string | hash encoded as a string ("character") |

Value

`_p_librdf_hash_s`

References

<http://librdf.org/docs>

| | |
|------------------|--|
| librdf_new_model | <i>Constructor - create a new storage librdf_model object.</i> |
|------------------|--|

Description

Constructor - create a new storage librdf_model object.

Usage

```
librdf_new_model ( world,
                  storage,
                  options_string )
```

Arguments

| | |
|----------------|--|
| world | redland world object (" <code>_p_librdf_world_s</code> ") |
| storage | librdf_storage to use (" <code>_p_librdf_storage_s</code> ") |
| options_string | options to initialise model ("character") |

Value

`_p_librdf_model_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_new_model_from_model

Copy constructor - create a new librdf_model from an existing one.

Description

Copy constructor - create a new librdf_model from an existing one.

Usage

```
librdf_new_model_from_model ( model )
```

Arguments

model the existing librdf_model ("_p_librdf_model_s")

Value

_p_librdf_model_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_new_model_with_options`*Constructor - Create a new librdf_model with storage.*

Description

Constructor - Create a new librdf_model with storage.

Usage

```
librdf_new_model_with_options ( world,  
storage,  
options )
```

Arguments

| | |
|---------|--|
| world | redland world object (" <code>_p_librdf_world_s</code> ") |
| storage | librdf_storage storage to use (" <code>_p_librdf_storage_s</code> ") |
| options | librdf_hash of options to use (" <code>_p_librdf_hash_s</code> ") |

Value

`_p_librdf_model_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_new_node`*Constructor - create a new librdf_node object with a private identifier.*

Description

Constructor - create a new librdf_node object with a private identifier.

Usage

```
librdf_new_node ( world )
```

Arguments

world redland world object ("_p_librdf_world_s")

Value

_p_librdf_node_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_new_node_from_blank_identifier

Constructor - create a new blank node librdf_node object from a blank node identifier.

Description

Constructor - create a new blank node librdf_node object from a blank node identifier.

Usage

```
librdf_new_node_from_blank_identifier ( world,  
inStrOrNull )
```

Arguments

world redland world object ("_p_librdf_world_s")
inStrOrNull UTF-8 encoded blank node identifier or NULL ("character")

Value

_p_librdf_node_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_new_node_from_literal

Constructor - create a new literal librdf_node object.

Description

Constructor - create a new literal librdf_node object.

Usage

```
librdf_new_node_from_literal ( world,  
string,  
inStrOrNull,  
is_wf_xml )
```

Arguments

| | |
|-------------|--|
| world | redland world object (" <code>_p_librdf_world_s</code> ") |
| string | literal UTF-8 encoded string value ("character") |
| inStrOrNull | literal XML language (or NULL, empty string) ("character") |
| is_wf_xml | non 0 if literal is XML ("integer") |

Value

`_p_librdf_node_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_new_node_from_node`

Copy constructor - create a new librdf_node object from an existing librdf_node object.

Description

Copy constructor - create a new librdf_node object from an existing librdf_node object.

Usage

```
librdf_new_node_from_node ( node )
```

Arguments

node librdf_node object to copy ("_p_librdf_node_s")

Value

_p_librdf_node_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_new_node_from_normalised_uri_string`

Constructor - create a new librdf_node object from a UTF-8 encoded URI string normalised to a new base URI.

Description

Constructor - create a new librdf_node object from a UTF-8 encoded URI string normalised to a new base URI.

Usage

```
librdf_new_node_from_normalised_uri_string ( world,  
uri_string,  
source_uri,  
base_uri )
```

Arguments

| | |
|------------|---|
| world | redland world object ("_p_librdf_world_s") |
| uri_string | UTF-8 encoded string representing a URI ("character") |
| source_uri | source URI ("_p_librdf_uri_s") |
| base_uri | base URI ("_p_librdf_uri_s") |

Value

_p_librdf_node_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_new_node_from_typed_literal

Constructor - create a new typed literal librdf_node object.

Description

Constructor - create a new typed literal librdf_node object.

Usage

```
librdf_new_node_from_typed_literal ( world,
  string,
  inStrOrNull,
  inUriOrNull )
```

Arguments

| | |
|-------------|--|
| world | redland world object ("_p_librdf_world_s") |
| string | literal UTF-8 encoded string value ("character") |
| inStrOrNull | literal XML language (or NULL, empty string) ("character") |
| inUriOrNull | URI of typed literal datatype or NULL ("_p_librdf_uri_s") |

Value

_p_librdf_node_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_new_node_from_uri

Constructor - create a new resource librdf_node object with a given URI.

Description

Constructor - create a new resource librdf_node object with a given URI.

Usage

```
librdf_new_node_from_uri ( world,  
uri )
```

Arguments

| | |
|-------|--|
| world | redland world object ("_p_librdf_world_s") |
| uri | librdf_uri object ("_p_librdf_uri_s") |

Value

_p_librdf_node_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_new_node_from_uri_local_name`

Constructor - create a new resource librdf_node object with a given URI and local name.

Description

Constructor - create a new resource librdf_node object with a given URI and local name.

Usage

```
librdf_new_node_from_uri_local_name ( world,  
uri,  
local_name )
```

Arguments

| | |
|------------|--|
| world | redland world object ("_p_librdf_world_s") |
| uri | librdf_uri object ("_p_librdf_uri_s") |
| local_name | local name to append to URI ("character") |

Value

`_p_librdf_node_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_new_node_from_uri_string`

Constructor - create a new librdf_node object from a URI string.

Description

Constructor - create a new librdf_node object from a URI string.

Usage

```
librdf_new_node_from_uri_string ( world,
                                string )
```

Arguments

| | |
|--------|--|
| world | redland world object ("_p_librdf_world_s") |
| string | string representing a URI ("character") |

Value

_p_librdf_node_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

| | |
|-------------------|---|
| librdf_new_parser | <i>Constructor - create a new librdf_parser object.</i> |
|-------------------|---|

Description

Constructor - create a new librdf_parser object.

Usage

```
librdf_new_parser ( world,
                   name,
                   mime_type,
                   type_uri )
```

Arguments

| | |
|-----------|---|
| world | redland world object ("_p_librdf_world_s") |
| name | the parser factory name (or NULL or empty string if don't care) ("character") |
| mime_type | the MIME type of the syntax (NULL if not used) ("character") |
| type_uri | URI of syntax (NULL if not used) ("_p_librdf_uri_s") |

Value

_p_librdf_parser_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

| | |
|------------------|--|
| librdf_new_query | <i>Constructor - create a new librdf_query object.</i> |
|------------------|--|

Description

Constructor - create a new librdf_query object.

Usage

```
librdf_new_query ( world,
                  name,
                  uri,
                  query_string,
                  base_uri )
```

Arguments

| | |
|--------------|--|
| world | redland world object ("_p_librdf_world_s") |
| name | the name identifying the query language ("character") |
| uri | the URI identifying the query language (or NULL) ("_p_librdf_uri_s") |
| query_string | the query string ("character") |
| base_uri | the base URI of the query string (or NULL) ("_p_librdf_uri_s") |

Value

_p_librdf_query

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_new_query_from_query`

Copy constructor - create a new librdf_query object from an existing one

Description

Copy constructor - create a new librdf_query object from an existing one

Usage

```
librdf_new_query_from_query ( old_query )
```

Arguments

`old_query` the existing query librdf_query to use ("`_p_librdf_query`")

Value

`_p_librdf_query`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_new_serializer` *Constructor - create a new librdf_serializer object.*

Description

Constructor - create a new librdf_serializer object.

Usage

```
librdf_new_serializer ( world,  
  name,  
  mime_type,  
  type_uri )
```

Arguments

| | |
|-----------|---|
| world | redland world object ("_p_librdf_world_s") |
| name | the serializer factory name (or NULL or empty string if don't care) ("character") |
| mime_type | the MIME type of the syntax (NULL if not used) ("character") |
| type_uri | URI of syntax (NULL if not used) ("_p_librdf_uri_s") |

Value

_p_librdf_serializer_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_new_statement *Constructor - create a new empty librdf_statement.*

Description

Constructor - create a new empty librdf_statement.

Usage

```
librdf_new_statement ( world )
```

Arguments

| | |
|-------|--|
| world | redland world object ("_p_librdf_world_s") |
|-------|--|

Value

_p_librdf_statement_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_new_statement_from_nodes`

Constructor - create a new librdf_statement from existing librdf_node objects.

Description

Constructor - create a new librdf_statement from existing librdf_node objects.

Usage

```
librdf_new_statement_from_nodes ( world,  
subject,  
predicate,  
object )
```

Arguments

| | |
|-----------|--|
| world | redland world object ("_p_librdf_world_s") |
| subject | librdf_node ("_p_librdf_node_s") |
| predicate | librdf_node ("_p_librdf_node_s") |
| object | librdf_node ("_p_librdf_node_s") |

Value

`_p_librdf_statement_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_new_statement_from_statement

Copy constructor - create a new librdf_statement from an existing librdf_statement. Creates a deep copy - changes to original statement nodes are not reflected in the copy.

Description

Copy constructor - create a new librdf_statement from an existing librdf_statement. Creates a deep copy - changes to original statement nodes are not reflected in the copy.

Usage

```
librdf_new_statement_from_statement ( statement )
```

Arguments

statement librdf_statement to copy ("`_p_librdf_statement_s`")

Value

`_p_librdf_statement_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_new_storage *Constructor - create a new librdf_storage object.*

Description

Constructor - create a new librdf_storage object.

Usage

```
librdf_new_storage ( world,  
storage_name,  
name,  
options_string )
```

Arguments

world redland world object ("_p_librdf_world_s")
storage_name the storage factory name ("character")
name an identifier for the storage ("character")
options_string options to initialise storage ("character")

Value

_p_librdf_storage_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_new_storage_from_storage

Copy constructor - create a new librdf_storage object from an existing one

Description

Copy constructor - create a new librdf_storage object from an existing one

Usage

```
librdf_new_storage_from_storage ( old_storage )
```

Arguments

old_storage the existing storage librdf_storage to use ("_p_librdf_storage_s")

Value

_p_librdf_storage_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

| | |
|----------------|--|
| librdf_new_uri | <i>Constructor - create a new librdf_uri object from a URI string.</i> |
|----------------|--|

Description

Constructor - create a new librdf_uri object from a URI string.

Usage

```
librdf_new_uri ( world,  
string )
```

Arguments

| | |
|--------|--|
| world | redland world object ("_p_librdf_world_s") |
| string | URI in string form ("character") |

Value

_p_librdf_uri_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_new_uri_from_filename`*Constructor - create a new librdf_uri object from a filename.*

Description

Constructor - create a new librdf_uri object from a filename.

Usage

```
librdf_new_uri_from_filename ( world,  
filename )
```

Arguments

| | |
|----------|---|
| world | Redland librdf_world object ("_p_librdf_world_s") |
| filename | filename ("character") |

Value

_p_librdf_uri_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_new_uri_from_uri`*Copy constructor - create a new librdf_uri object from an existing librdf_uri object.*

Description

Copy constructor - create a new librdf_uri object from an existing librdf_uri object.

Usage

```
librdf_new_uri_from_uri ( uri )
```

Arguments

uri librdf_uri object ("_p_librdf_uri_s")

Value

_p_librdf_uri_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_new_world *Create a new Redland execution environment.*

Description

Create a new Redland execution environment.

Usage

```
librdf_new_world ( )
```

Value

_p_librdf_world_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_node_equals *Compare two librdf_node objects for equality.*

Description

Compare two librdf_node objects for equality.

Usage

```
librdf_node_equals ( first_node,  
                    second_node,  
                    .copy )
```

Arguments

| | |
|-------------|---|
| first_node | first librdf_node node (" <i>_p_librdf_node_s</i> ") |
| second_node | second librdf_node node (" <i>_p_librdf_node_s</i> ") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_node_get_blank_identifier

Get the blank node identifier as a UTF-8 encoded string.

Description

Get the blank node identifier as a UTF-8 encoded string.

Usage

```
librdf_node_get_blank_identifier ( node )
```

Arguments

node the node object ("`_p_librdf_node_s`")

Value

character

References

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_node_get_literal_value

Get the literal value of the node as a UTF-8 encoded string.

Description

Get the literal value of the node as a UTF-8 encoded string.

Usage

```
librdf_node_get_literal_value ( node )
```

Arguments

node the node object ("`_p_librdf_node_s`")

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_node_get_literal_value_as_latin1`*Get the string literal value of the node as ISO Latin-1.*

Description

Get the string literal value of the node as ISO Latin-1.

Usage

```
librdf_node_get_literal_value_as_latin1 ( node )
```

Arguments

node the node object ("_p_librdf_node_s")

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_node_get_literal_value_datatype_uri`*Get the typed literal datatype URI of the literal node.*

Description

Get the typed literal datatype URI of the literal node.

Usage

```
librdf_node_get_literal_value_datatype_uri ( node )
```

Arguments

node the node object ("_p_librdf_node_s")

Value

`_p_librdf_uri_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_node_get_literal_value_is_wf_xml`
Get the XML well-formness property of the node.

Description

Get the XML well-formness property of the node.

Usage

```
librdf_node_get_literal_value_is_wf_xml ( node,  
  .copy )
```

Arguments

| | |
|--------------------|---|
| <code>node</code> | the node object (" <code>_p_librdf_node_s</code> ") |
| <code>.copy</code> | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_node_get_literal_value_language
Get the XML language of the node.

Description

Get the XML language of the node.

Usage

```
librdf_node_get_literal_value_language ( node )
```

Arguments

node the node object ("_p_librdf_node_s")

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_node_get_li_ordinal
Get the node li object ordinal value.

Description

Get the node li object ordinal value.

Usage

```
librdf_node_get_li_ordinal ( node,  
  .copy )
```

Arguments

node the node object ("_p_librdf_node_s")
.copy NA

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_node_get_type *Get the type of the node.*

Description

Get the type of the node.

Usage

```
librdf_node_get_type ( node,  
  .copy )
```

Arguments

| | |
|-------|---|
| node | the node object (" <code>_p_librdf_node_s</code> ") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_node_get_uri *Get the URI for a node object.*

Description

Get the URI for a node object.

Usage

```
librdf_node_get_uri ( node )
```

Arguments

node the node object ("`_p_librdf_node_s`")

Value

`_p_librdf_uri_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_node_is_blank *Check node is a blank nodeID.*

Description

Check node is a blank nodeID.

Usage

```
librdf_node_is_blank ( node,  
                      .copy )
```

Arguments

node the node object ("`_p_librdf_node_s`")
.copy NA

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_node_is_literal

Check node is a literal.

Description

Check node is a literal.

Usage

```
librdf_node_is_literal ( node,  
  .copy )
```

Arguments

| | |
|-------|--------------------------------------|
| node | the node object ("_p_librdf_node_s") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_node_is_resource
Check node is a resource.

Description

Check node is a resource.

Usage

```
librdf_node_is_resource ( node,  
  .copy )
```

Arguments

| | |
|-------|--------------------------------------|
| node | the node object ("_p_librdf_node_s") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_node_to_string *Format the node as a string in a debugging format.*

Description

Format the node as a string in a debugging format.

Usage

```
librdf_node_to_string ( node )
```

Arguments

| | |
|------|--------------------------------------|
| node | the node object ("_p_librdf_node_s") |
|------|--------------------------------------|

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_parser_check_name

Check if a parser name is known

Description

Check if a parser name is known

Usage

```
librdf_parser_check_name ( world,  
name,  
.copy )
```

Arguments

| | |
|-------|---|
| world | redland world object (" <code>_p_librdf_world_s</code> ") |
| name | name of parser ("character") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_parser_get_accept_header`*Get an HTTP Accept value for the parser.*

Description

Get an HTTP Accept value for the parser.

Usage

```
librdf_parser_get_accept_header ( parser )
```

Arguments

| | |
|--------|-------------------------------|
| parser | parser ("_p_librdf_parser_s") |
|--------|-------------------------------|

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_parser_get_feature`*Get the value of a parser feature.*

Description

Get the value of a parser feature.

Usage

```
librdf_parser_get_feature ( parser,  
feature )
```

Arguments

| | |
|---------|--|
| parser | librdf_parser object ("_p_librdf_parser_s") |
| feature | librdf_Uuri feature property ("_p_librdf_uri_s") |

Value

`_p_librdf_node_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_parser_get_namespaces_seen_count`

Get the number of namespaces seen during parsing

Description

Get the number of namespaces seen during parsing

Usage

```
librdf_parser_get_namespaces_seen_count ( parser,  
  .copy )
```

Arguments

| | |
|---------------------|--|
| <code>parser</code> | librdf_parser object (" <code>_p_librdf_parser_s</code> ") |
| <code>.copy</code> | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_parser_get_namespaces_seen_prefix
Get the prefix of namespaces seen during parsing

Description

Get the prefix of namespaces seen during parsing

Usage

```
librdf_parser_get_namespaces_seen_prefix ( parser,  
offset )
```

Arguments

| | |
|--------|---|
| parser | librdf_parser object ("_p_librdf_parser_s") |
| offset | index into list of namespaces ("integer") |

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_parser_get_namespaces_seen_uri
Get the uri of namespaces seen during parsing

Description

Get the uri of namespaces seen during parsing

Usage

```
librdf_parser_get_namespaces_seen_uri ( parser,  
offset )
```

Arguments

| | |
|--------|---|
| parser | librdf_parser object ("_p_librdf_parser_s") |
| offset | index into list of namespaces ("integer") |

Value

_p_librdf_uri_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_parser_guess_name

Get a parser name for content with type or identifier

Description

Get a parser name for content with type or identifier

Usage

```
librdf_parser_guess_name ( mime_type,
  buffer,
  identifier )
```

Arguments

| | |
|------------|---|
| mime_type | MIME type of syntax or NULL ("character") |
| buffer | content buffer or NULL ("character") |
| identifier | content identifier or NULL ("character") |

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_parser_guess_name2`

Get a parser name for content with type or identifier

Description

Get a parser name for content with type or identifier

Usage

```
librdf_parser_guess_name2 ( world,  
mime_type,  
buffer,  
identifier )
```

Arguments

| | |
|-------------------------|--|
| <code>world</code> | librdf_world object (" <code>_p_librdf_world_s</code> ") |
| <code>mime_type</code> | MIME type of syntax or NULL ("character") |
| <code>buffer</code> | content buffer or NULL ("character") |
| <code>identifier</code> | content identifier or NULL ("character") |

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_parser_parse_as_stream`*Parse a URI to a librdf_stream of statements.*

Description

Parse a URI to a librdf_stream of statements.

Usage

```
librdf_parser_parse_as_stream ( parser,  
uri,  
inUriOrNull )
```

Arguments

| | |
|-------------|--|
| parser | the parser (" <code>_p_librdf_parser_s</code> ") |
| uri | the URI to read (" <code>_p_librdf_uri_s</code> ") |
| inUriOrNull | the base URI to use or NULL (" <code>_p_librdf_uri_s</code> ") |

Value

`_p_librdf_stream_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_parser_parse_counted_string_as_stream`*Parse a counted string of content to a librdf_stream of statements.*

Description

Parse a counted string of content to a librdf_stream of statements.

Usage

```
librdf_parser_parse_counted_string_as_stream ( parser ,  
string,  
length,  
base_uri )
```

Arguments

| | |
|----------|--|
| parser | the parser (" <code>_p_librdf_parser_s</code> ") |
| string | the string to parse ("character") |
| length | length of the string content (must be >0) ("integer") |
| base_uri | the base URI to use or NULL (" <code>_p_librdf_uri_s</code> ") |

Value

`_p_librdf_stream_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_parser_parse_counted_string_into_model

Parse a counted string of content into an librdf_model.

Description

Parse a counted string of content into an librdf_model.

Usage

```
librdf_parser_parse_counted_string_into_model ( parser ,  
string,  
length,  
base_uri ,  
model ,  
.copy )
```

Arguments

| | |
|----------|---|
| parser | the parser ("_p_librdf_parser_s") |
| string | the content to parse ("character") |
| length | length of content (must be >0) ("integer") |
| base_uri | the base URI to use or NULL ("_p_librdf_uri_s") |
| model | the model to use ("_p_librdf_model_s") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_parser_parse_into_model

Parse a URI of content into an librdf_model.

Description

Parse a URI of content into an librdf_model.

Usage

```
librdf_parser_parse_into_model ( parser,
  uri,
  inUriOrNull,
  model,
  .copy )
```

Arguments

| | |
|-------------|---|
| parser | the parser ("_p_librdf_parser_s") |
| uri | the URI to read the content ("_p_librdf_uri_s") |
| inUriOrNull | the base URI to use or NULL ("_p_librdf_uri_s") |
| model | the model to use ("_p_librdf_model_s") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_parser_parse_string_as_stream

Parse a string of content to a librdf_stream of statements.

Description

Parse a string of content to a librdf_stream of statements.

Usage

```
librdf_parser_parse_string_as_stream ( parser,  
  string,  
  base_uri )
```

Arguments

| | |
|----------|---|
| parser | the parser ("_p_librdf_parser_s") |
| string | the string to parse ("character") |
| base_uri | the base URI to use or NULL ("_p_librdf_uri_s") |

Value

_p_librdf_stream_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_parser_parse_string_into_model`*Parse a string of content into an librdf_model.*

Description

Parse a string of content into an librdf_model.

Usage

```
librdf_parser_parse_string_into_model ( parser,  
string,  
base_uri,  
model,  
.copy )
```

Arguments

| | |
|----------|--|
| parser | the parser (" <code>_p_librdf_parser_s</code> ") |
| string | the content to parse ("character") |
| base_uri | the base URI to use or NULL (" <code>_p_librdf_uri_s</code> ") |
| model | the model to use (" <code>_p_librdf_model_s</code> ") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_parser_set_feature`*Set the value of a parser feature.*

Description

Set the value of a parser feature.

Usage

```
librdf_parser_set_feature ( parser,  
  feature,  
  value,  
  .copy )
```

Arguments

| | |
|---------|---|
| parser | librdf_parser object ("_p_librdf_parser_s") |
| feature | librdf_uri feature property ("_p_librdf_uri_s") |
| value | librdf_node feature property value ("_p_librdf_node_s") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_query_execute *Run the query on a model.*

Description

Run the query on a model.

Usage

```
librdf_query_execute ( query,  
model )
```

Arguments

| | |
|-------|---|
| query | librdf_query object ("_p_librdf_query") |
| model | model to operate query on ("_p_librdf_model_s") |

Value

_p_librdf_query_results

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_query_get_limit

Get the query-specified limit on results.

Description

Get the query-specified limit on results.

Usage

```
librdf_query_get_limit ( query,  
.copy )
```

Arguments

| | |
|-------|---|
| query | librdf_query query object ("_p_librdf_query") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_query_get_offset

Get the query-specified offset on results.

Description

Get the query-specified offset on results.

Usage

```
librdf_query_get_offset ( query,  
  .copy )
```

Arguments

| | |
|-------|---|
| query | librdf_query query object ("_p_librdf_query") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

```
librdf_query_results_as_stream
```

Get a query result as an RDF graph in librdf_stream form

Description

Get a query result as an RDF graph in librdf_stream form

Usage

```
librdf_query_results_as_stream ( query_results )
```

Arguments

```
query_results  librdf_query_results query_results ("_p_librdf_query_results")
```

Value

```
_p_librdf_stream_s
```

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

```
librdf_query_results_finished
```

Find out if binding results are exhausted.

Description

Find out if binding results are exhausted.

Usage

```
librdf_query_results_finished ( query_results,
                               .copy )
```

Arguments

```
query_results  librdf_query_results query results ("_p_librdf_query_results")
.copy          NA
```

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_query_results_get_bindings_count

Get the number of bound variables in the result.

Description

Get the number of bound variables in the result.

Usage

```
librdf_query_results_get_bindings_count ( query_results,  
  .copy )
```

Arguments

| | |
|---------------|--|
| query_results | librdf_query_results query results ("_p_librdf_query_results") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_query_results_get_binding_name

Get binding name for the current result.

Description

Get binding name for the current result.

Usage

```
librdf_query_results_get_binding_name ( query_results,  
offset )
```

Arguments

query_results librdf_query_results query results ("`_p_librdf_query_results`")
offset offset of binding name into array of known names ("`integer`")

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_query_results_get_binding_value

Get one binding value for the current result.

Description

Get one binding value for the current result.

Usage

```
librdf_query_results_get_binding_value ( query_results,  
offset )
```

Arguments

query_results librdf_query_results query results ("_p_librdf_query_results")
offset offset of binding name into array of known names ("integer")

Value

_p_librdf_node_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_query_results_get_binding_value_by_name

Get one binding value for a given name in the current result.

Description

Get one binding value for a given name in the current result.

Usage

```
librdf_query_results_get_binding_value_by_name ( query_results,  
name )
```

Arguments

query_results librdf_query_results query results ("_p_librdf_query_results")
name variable name ("character")

Value

_p_librdf_node_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_query_results_get_boolean
Get boolean query result.

Description

Get boolean query result.

Usage

```
librdf_query_results_get_boolean ( query_results,  
  .copy )
```

Arguments

```
query_results  librdf_query_results query_results ("_p_librdf_query_results")  
.copy          NA
```

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_query_results_get_count
Get number of bindings so far.

Description

Get number of bindings so far.

Usage

```
librdf_query_results_get_count ( query_results,  
  .copy )
```

Arguments

| | |
|---------------|--|
| query_results | librdf_query_results query results ("_p_librdf_query_results") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_query_results_is_bindings

Test if librdf_query_results is variable bindings format.

Description

Test if librdf_query_results is variable bindings format.

Usage

```
librdf_query_results_is_bindings ( query_results,  
  .copy )
```

Arguments

| | |
|---------------|---|
| query_results | librdf_query_results object ("_p_librdf_query_results") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_query_results_is_boolean

Test if librdf_query_results is boolean format.

Description

Test if librdf_query_results is boolean format.

Usage

```
librdf_query_results_is_boolean ( query_results,  
  .copy )
```

Arguments

| | |
|---------------|---|
| query_results | librdf_query_results object ("_p_librdf_query_results") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_query_results_is_graph

Test if librdf_query_results is RDF graph format.

Description

Test if librdf_query_results is RDF graph format.

Usage

```
librdf_query_results_is_graph ( query_results,  
  .copy )
```

Arguments

query_results librdf_query_results object ("*_p_librdf_query_results*")
.copy NA

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_query_results_is_syntax

Test if librdf_query_results is a syntax.

Description

Test if librdf_query_results is a syntax.

Usage

```
librdf_query_results_is_syntax ( query_results,  
                                .copy )
```

Arguments

query_results librdf_query_results object ("*_p_librdf_query_results*")
.copy NA

Value

integer

```
librdf_query_results_next
```

Move to the next result.

Description

Move to the next result.

Usage

```
librdf_query_results_next ( query_results,  
  .copy )
```

Arguments

```
query_results  librdf_query_results query results ("_p_librdf_query_results")  
.copy          NA
```

Value

integer

```
librdf_query_results_to_file
```

Write a query results to a file.

Description

Write a query results to a file.

Usage

```
librdf_query_results_to_file ( query_results,  
  name,  
  format_uri,  
  base_uri,  
  .copy )
```

Arguments

| | |
|---------------|---|
| query_results | librdf_query_results object ("_p_librdf_query_results") |
| name | filename to write to ("character") |
| format_uri | URI of syntax to format to ("_p_librdf_uri_s") |
| base_uri | Base URI of output formatted syntax (or NULL) ("_p_librdf_uri_s") |
| .copy | NA |

Value

integer

librdf_query_results_to_file2

Write a query results to a file.

Description

Write a query results to a file.

Usage

```
librdf_query_results_to_file2 ( query_results,
  name,
  mime_type,
  format_uri,
  base_uri,
  .copy )
```

Arguments

| | |
|---------------|---|
| query_results | librdf_query_results object ("_p_librdf_query_results") |
| name | filename to write to ("character") |
| mime_type | mime type (or NULL) ("character") |
| format_uri | URI of syntax to format to (or NULL) ("_p_librdf_uri_s") |
| base_uri | Base URI of output formatted syntax (or NULL) ("_p_librdf_uri_s") |
| .copy | NA |

Value

integer

librdf_query_results_to_string

Turn a query results into a string.

Description

Turn a query results into a string.

Usage

```
librdf_query_results_to_string ( query_results,  
format_uri,  
base_uri )
```

Arguments

| | |
|---------------|--|
| query_results | librdf_query_results object (" <i>_p_librdf_query_results</i> ") |
| format_uri | URI of syntax to format to (" <i>_p_librdf_uri_s</i> ") |
| base_uri | Base URI of output formatted syntax (or NULL) (" <i>_p_librdf_uri_s</i> ") |

Value

character

`librdf_query_results_to_string2`*Turn a query results into a string.*

Description

Turn a query results into a string.

Usage

```
librdf_query_results_to_string2 ( query_results,  
  name,  
  mime_type,  
  format_uri,  
  base_uri )
```

Arguments

| | |
|----------------------------|--|
| <code>query_results</code> | librdf_query_results object (" <code>_p_librdf_query_results</code> ") |
| <code>name</code> | format name ("character") |
| <code>mime_type</code> | format mime type (or NULL) ("character") |
| <code>format_uri</code> | URI of syntax to format to (or NULL) (" <code>_p_librdf_uri_s</code> ") |
| <code>base_uri</code> | Base URI of output formatted syntax (or NULL) (" <code>_p_librdf_uri_s</code> ") |

Value

character

librdf_query_set_limit

Set the query-specified limit on results.

Description

Set the query-specified limit on results.

Usage

```
librdf_query_set_limit ( query,  
  limit,  
  .copy )
```

Arguments

| | |
|-------|---|
| query | librdf_query query object (" <code>_p_librdf_query</code> ") |
| limit | the limit on results, ≥ 0 to set a limit, < 0 to have no limit ("integer") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

librdf_query_set_offset

Set the query-specified offset on results.

Description

Set the query-specified offset on results.

Usage

```
librdf_query_set_offset ( query,  
  offset,  
  .copy )
```

Arguments

| | |
|--------|--|
| query | librdf_query query object ("_p_librdf_query") |
| offset | offset for results, >=0 to set an offset, <0 to have no offset ("integer") |
| .copy | NA |

Value

integer

References

librdf_serializer_check_name

Check if a serializer name is known

Description

Check if a serializer name is known

Usage

```
librdf_serializer_check_name ( world,  
  name,  
  .copy )
```

Arguments

| | |
|-------|--|
| world | redland world object ("_p_librdf_world_s") |
| name | name of serializer ("character") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

librdf_serializer_get_feature

Get the value of a serializer feature.

Description

Get the value of a serializer feature.

Usage

```
librdf_serializer_get_feature ( serializer,  
feature )
```

Arguments

| | |
|------------|--|
| serializer | serializer object ("_p_librdf_serializer_s") |
| feature | URI of feature ("_p_librdf_uri_s") |

Value

`_p_librdf_node_s`

References

<http://librdf.org/docs>

See Also

```
librdf_serializer_serialize_model_to_file
```

Write a serialized librdf_model to a file.

Description

Write a serialized librdf_model to a file.

Usage

```
librdf_serializer_serialize_model_to_file ( serializer,  
name,  
inUriOrNull,  
model,  
.copy )
```

Arguments

| | |
|-------------|---|
| serializer | the serializer ("_p_librdf_serializer_s") |
| name | filename to serialize to ("character") |
| inUriOrNull | the base URI to use (or NULL) ("_p_librdf_uri_s") |
| model | the librdf_model model to use ("_p_librdf_model_s") |
| .copy | NA |

Value

integer

```
librdf_serializer_serialize_model_to_string
```

Write a serialized librdf_model to a string. The returned string must be freed by the caller using librdf_free_memory().

Description

Write a serialized librdf_model to a string. The returned string must be freed by the caller using librdf_free_memory().

Usage

```
librdf_serializer_serialize_model_to_string ( serializer,
inUriOrNull,
model )
```

Arguments

| | |
|-------------|---|
| serializer | the serializer ("_p_librdf_serializer_s") |
| inUriOrNull | the base URI to use (or NULL) ("_p_librdf_uri_s") |
| model | the librdf_model model to use ("_p_librdf_model_s") |

Value

character

```
librdf_serializer_serialize_stream_to_file
```

Write a librdf_stream to a file.

Description

Write a librdf_stream to a file.

Usage

```
librdf_serializer_serialize_stream_to_file ( serializer,  
name,  
base_uri,  
stream,  
.copy )
```

Arguments

| | |
|------------|--|
| serializer | the serializer ("_p_librdf_serializer_s") |
| name | filename to serialize to ("character") |
| base_uri | the base URI to use (or NULL) ("_p_librdf_uri_s") |
| stream | the librdf_stream stream to use ("_p_librdf_stream_s") |
| .copy | NA |

Value

integer

librdf_serializer_serialize_stream_to_string
Write a librdf_stream to a string.

Description

Write a librdf_stream to a string.

Usage

```
librdf_serializer_serialize_stream_to_string ( serializer,  
base_uri,  
stream )
```

Arguments

| | |
|------------|--|
| serializer | the serializer ("_p_librdf_serializer_s") |
| base_uri | the base URI to use (or NULL) ("_p_librdf_uri_s") |
| stream | the librdf_stream stream to use ("_p_librdf_stream_s") |

Value

character

librdf_serializer_set_feature

Set the value of a serializer feature.

Description

Set the value of a serializer feature.

Usage

```
librdf_serializer_set_feature ( serializer,
feature,
value,
.copy )
```

Arguments

| | |
|------------|--|
| serializer | serializer object ("_p_librdf_serializer_s") |
| feature | URI of feature ("_p_librdf_uri_s") |
| value | value to set ("_p_librdf_node_s") |
| .copy | NA |

Value

integer

References

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_serializer_set_namespace

Set a namespace URI/prefix mapping.

Description

Set a namespace URI/prefix mapping.

Usage

```
librdf_serializer_set_namespace ( serializer,  
                                nspace,  
                                prefix,  
                                .copy )
```

Arguments

| | |
|------------|--|
| serializer | serializer object ("_p_librdf_serializer_s") |
| nspace | URI of namespace or NULL ("_p_librdf_uri_s") |
| prefix | prefix to use or NULL ("character") |
| .copy | NA |

Value

integer

librdf_short_copyright_string
Short copyright string (one line).

Description

Short copyright string (one line).

Usage

```
librdf_short_copyright_string ( .copy )
```

Arguments

| | |
|-------|----|
| .copy | NA |
|-------|----|

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_short_copyright_string_get
Return Redland librdf copyright string

Description

Return Redland librdf copyright string

Usage

```
librdf_short_copyright_string_get( .copy )
```

Arguments

| | |
|-------|---------|
| .copy | logical |
|-------|---------|

Value

character

References

<http://librdf.org/docs>

See Also

librdf_statement_equals

Check if two statements are equal.

Description

Check if two statements are equal.

Usage

```
librdf_statement_equals ( statement1,  
  statement2,  
  .copy )
```

Arguments

| | |
|------------|--|
| statement1 | first librdf_statement (" <i>_p_librdf_statement_s</i> ") |
| statement2 | second librdf_statement (" <i>_p_librdf_statement_s</i> ") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_statement_get_object
Get the statement object.

Description

Get the statement object.

Usage

```
librdf_statement_get_object ( statement )
```

Arguments

statement librdf_statement object ("_p_librdf_statement_s")

Value

_p_librdf_node_s

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_statement_get_predicate
Get the statement predicate.

Description

Get the statement predicate.

Usage

```
librdf_statement_get_predicate ( statement )
```

Arguments

statement librdf_statement object ("_p_librdf_statement_s")

Value

`_p_librdf_node_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_statement_get_subject`

Get the statement subject.

Description

Get the statement subject.

Usage

```
librdf_statement_get_subject ( statement )
```

Arguments

`statement` `librdf_statement` object ("`_p_librdf_statement_s`")

Value

`_p_librdf_node_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_statement_is_complete

Check if statement is a complete and legal RDF triple.

Description

Check if statement is a complete and legal RDF triple.

Usage

```
librdf_statement_is_complete ( statement,  
                             .copy )
```

Arguments

| | |
|-----------|--|
| statement | librdf_statement object (" <code>_p_librdf_statement_s</code> ") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_statement_match

Match a statement against a 'partial' statement.

Description

Match a statement against a 'partial' statement.

Usage

```
librdf_statement_match ( statement,  
                        partial_statement,  
                        .copy )
```

Arguments

| | |
|-------------------|--|
| statement | statement (" <code>_p_librdf_statement_s</code> ") |
| partial_statement | statement with possible empty parts (" <code>_p_librdf_statement_s</code> ") |
| .copy | NA |

Value

integer

References

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_statement_set_object
Set the statement object.

Description

Set the statement object.

Usage

```
librdf_statement_set_object ( statement,  
object )
```

Arguments

| | |
|-----------|--|
| statement | librdf_statement object (" <code>_p_librdf_statement_s</code> ") |
| object | librdf_node of object (" <code>_p_librdf_node_s</code> ") |

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

```
librdf_statement_set_predicate  
    Set the statement predicate.
```

Description

Set the statement predicate.

Usage

```
librdf_statement_set_predicate ( statement,  
                                predicate )
```

Arguments

| | |
|-----------|---|
| statement | librdf_statement object ("_p_librdf_statement_s") |
| predicate | librdf_node of predicate ("_p_librdf_node_s") |

Value

void

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_statement_set_subject
Set the statement subject.

Description

Set the statement subject.

Usage

```
librdf_statement_set_subject ( statement,  
                             subject )
```

Arguments

| | |
|-----------|--|
| statement | librdf_statement object (" <code>_p_librdf_statement_s</code> ") |
| subject | librdf_node of subject (" <code>_p_librdf_node_s</code> ") |

Value

void

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_statement_to_string
Format the librdf_statement as a string.

Description

Format the librdf_statement as a string.

Usage

```
librdf_statement_to_string ( statement )
```

Arguments

statement the statement ("`_p_librdf_statement_s`")

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_stream_end` *Test if the stream has ended.*

Description

Test if the stream has ended.

Usage

```
librdf_stream_end ( stream,  
                  .copy )
```

Arguments

stream librdf_stream object ("`_p_librdf_stream_s`")
.copy NA

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_stream_get_context`*Get the context of the current object on the stream.*

Description

Get the context of the current object on the stream.

Usage

```
librdf_stream_get_context ( stream )
```

Arguments

`stream` the librdf_stream object ("_p_librdf_stream_s")

Value

`_p_librdf_node_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_stream_get_object`*Get the current librdf_statement in the stream.*

Description

Get the current librdf_statement in the stream.

Usage

```
librdf_stream_get_object ( stream )
```

Arguments

`stream` librdf_stream object ("_p_librdf_stream_s")

Value

`_p_librdf_statement_s`

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_stream_next` *Move to the next librdf_statement in the stream.*

Description

Move to the next librdf_statement in the stream.

Usage

```
librdf_stream_next ( stream,  
                  .copy )
```

Arguments

| | |
|---------------------|--|
| <code>stream</code> | librdf_stream object (" <code>_p_librdf_stream_s</code> ") |
| <code>.copy</code> | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_uri_compare *Compare two librdf_uri objects lexicographically.*

Description

Compare two librdf_uri objects lexicographically.

Usage

```
librdf_uri_compare ( first_uri,  
                    second_uri,  
                    .copy )
```

Arguments

| | |
|------------|--|
| first_uri | librdf_uri object 1 or NULL (" <i>_p_librdf_uri_s</i> ") |
| second_uri | librdf_uri object 2 or NULL (" <i>_p_librdf_uri_s</i> ") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_uri_equals *Compare two librdf_uri objects for equality.*

Description

Compare two librdf_uri objects for equality.

Usage

```
librdf_uri_equals ( first_uri,  
                   second_uri,  
                   .copy )
```

Arguments

| | |
|------------|---|
| first_uri | librdf_uri object 1 ("_p_librdf_uri_s") |
| second_uri | librdf_uri object 2 ("_p_librdf_uri_s") |
| .copy | NA |

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_uri_to_string *Format the URI as a string.*

Description

Format the URI as a string.

Usage

```
librdf_uri_to_string ( uri )
```

Arguments

| | |
|-----|---------------------------------------|
| uri | librdf_uri object ("_p_librdf_uri_s") |
|-----|---------------------------------------|

Value

character

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_version_decimal`*Library full version as a decimal integer.*

Description

Library full version as a decimal integer.

Usage

```
librdf_version_decimal ( .copy )
```

Arguments

| | |
|--------------------|----|
| <code>.copy</code> | NA |
|--------------------|----|

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_version_decimal_get`*Return Redland librdf copyright*

Description

Return Redland librdf copyright

Usage

```
librdf_version_decimal_get ( .copy )
```

Arguments

| | |
|--------------------|---------|
| <code>.copy</code> | logical |
|--------------------|---------|

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_version_major *Library major version number as a decimal integer.*

Description

Library major version number as a decimal integer.

Usage

```
librdf_version_major ( .copy )
```

Arguments

.copy NA

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_version_major_get`*Return the Redland librdf major version number*

Description

Return the Redland librdf major version number

Usage

```
librdf_version_major_get ( .copy )
```

Arguments

`.copy` logical

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_version_minor` *Library minor version number as a decimal integer.*

Description

Library minor version number as a decimal integer.

Usage

```
librdf_version_minor ( .copy )
```

Arguments

`.copy` NA

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

librdf_version_minor_get

Return the Redland librdf minor version number

Description

Return the Redland librdf minor version number

Usage

```
librdf_version_minor_get ( .copy )
```

Arguments

.copy logical

Value

integer

References

<http://librdf.org/docs>

See Also

This R function is a wrapper function that directly calls the the Redland RDF C libraries. For more information about Redland RDF, view the online documentation indicated in the 'References' section.

`librdf_version_release`*Library release version number as a decimal integer.*

Description

Library release version number as a decimal integer.

Usage

```
librdf_version_release ( .copy )
```

Arguments

| | |
|--------------------|----|
| <code>.copy</code> | NA |
|--------------------|----|

Value

integer

`librdf_version_release_get`*Return the Redland librdf release version number*

Description

Return the Redland librdf release version number

Usage

```
librdf_version_release_get ( .copy )
```

Arguments

| | |
|--------------------|---------|
| <code>.copy</code> | logical |
|--------------------|---------|

Value

integer

References

librdf_version_string *Library full version as a string.*

Description

Library full version as a string.

Usage

```
librdf_version_string ( .copy )
```

Arguments

.copy NA

Value

character

References

`librdf_version_string_get`*Return the Redland librdf version as a string.*

Description

Return the Redland librdf version as a string.

Usage

```
librdf_version_string_get ( .copy )
```

Arguments

| | |
|--------------------|---------|
| <code>.copy</code> | logical |
|--------------------|---------|

Value

character

References

`librdf_world_get_feature`*Get the value of a world feature.*

Description

Get the value of a world feature.

Usage

```
librdf_world_get_feature ( world,  
feature )
```

Arguments

| | |
|----------------------|--|
| <code>world</code> | librdf_world object (" <code>_p_librdf_world_s</code> ") |
| <code>feature</code> | librdf_uri feature property (" <code>_p_librdf_uri_s</code> ") |

Value

`_p_librdf_node_s`

| | |
|--------------------------------|--|
| <code>librdf_world_open</code> | <i>Open a created redland world environment.</i> |
|--------------------------------|--|

Description

Open a created redland world environment.

Usage

```
librdf_world_open ( world )
```

Arguments

`world` redland world object ("`_p_librdf_world_s`")

Value

void

References

`librdf_world_set_feature`*Set the value of a world feature.*

Description

Set the value of a world feature.

Usage

```
librdf_world_set_feature ( world,  
  feature,  
  value,  
  .copy )
```

Arguments

| | |
|----------------------|--|
| <code>world</code> | librdf_world object (" <code>_p_librdf_world_s</code> ") |
| <code>feature</code> | librdf_uri feature property (" <code>_p_librdf_uri_s</code> ") |
| <code>value</code> | librdf_node feature property value (" <code>_p_librdf_node_s</code> ") |
| <code>.copy</code> | NA |

Value

integer

librdf_world_set_logger

Set the world log handling function.

Description

Set the world log handling function.

Usage

```
librdf_world_set_logger ( world,  
user_data,  
log_handler )
```

Arguments

| | |
|-------------|--|
| world | redland world object ("_p_librdf_world_s") |
| user_data | user data to pass to function ("_p_void") |
| log_handler | pointer to the function ("_p_librdf_log_func") |

Value

void

mergeNamespace_roclet *A custom Roxygen roclet that adds Redland RDF functions to NAMESPACE file generated by Roxygen.*

Description

The redland package uses the SWIG (Simplified Wrapper and Interface Generator) to create the bindings between the Redland RDF C/C++ libraries and R. SWIG creates a NAMESPACE file that contains the function names for the librdf wrapper that it creates, but as of swig 3.0.2 this NAMESPACE file is incorrect and will also be overwritten by Roxygen when 'roxygenize()' or 'devtools::document()' is called, as the wrapper R code doesn't contain Roxygen export annotations used by Roxygen to build the namespace file. To allow for building a NAMESPACE file from all programs in the redland package, this roclet determines the set of wrapper R functions and adds these to the Roxygen generated NAMESPACE file that contains all names from the native R code in the redland package.

Usage

```
mergeNamespace_roclet(x, ...)
```

Arguments

```
x          a roclet
...        additional parameters
```

Details

The following line must be present in the DESCRIPTION file for this roclet to be called automatically when 'roxygen2::roxygenize()' or 'devtools::document()' is called:

```
Roxygen: list(roclets = c("collate", "rd", "namespace", "mergeNamespace_roclet"))
```

The 'namespace' roclet must always run before the 'mergeNamespace' roclet.

Examples

```
## Not run:
roxygen2::roxygenize()
devtools::document()

## End(Not run)
```

Model-class

A Redland Model object

Description

A Model object is used to store the statements (triples) of an RDF model.

Details

A Model may be created manually by creating [Statement](#) and adding them to the Model using [addStatement](#), or a Model may be read in from a previously saved file using [parseFileIntoModel](#). Once a Model is created, it can be queried using [Query](#).

Slots

librdf_model A redland model object

Methods

- [Model-initialize](#): Initialize a Model object
- [addStatement](#): Add a Statement object to the Model
- [freeModel](#): Free memory used by a librdf model object

See Also

View examples of creating models by viewing the 'redland_overview' vignette: `vignette("redland_overview")`

[redland](#): redland package

Examples

```
world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
model <- new("Model", world, storage, options="")
```

Node-class

A Redland Node, used to store one node in an RDF triple statement.

Description

A Node represents a RDF Resource, Property, Literal or an RDF blank Node.

Slots

librdf_node A redland node object

Methods

- [Node-initialize](#): Initialize a Node object.
- [getNodeType](#): Determine the node type and return as a string.
- [getNodeValue](#): Determine the node type and return as a string.
- [getBlankNodeId](#): Get the value of the node as a string.

See Also

[redland](#): redland package

Examples

```

world <- new("World")
# a blank node is created with a unique identifier generated by librdf
node <- new("Node", world)
# a blank node is created with a unique identifier generated by librdf
node <- new("Node", world, blank=NULL)
# a blank node is created with the user specified identifier, i.e. "_:id1"
node <- new("Node", world, blank="someid")
# a node type of 'literal' is created
node <- new("Node", world, literal="A Node Value")
# a Node type of 'resource' is created
node <- new("Node", world, uri="http://www.example.com")
# Create a literal node, specifying a language encoding
node <- new("Node", world, literal="Gérard de La Martinière", language="fr")

```

parseFileIntoModel *Parse the contents of a file into a model*

Description

The contents of a the specified file are read and parsed into the initialized Parser object

Usage

```

parseFileIntoModel(.Object, world, filePath, model, ...)

## S4 method for signature 'Parser,World,character,Model'
parseFileIntoModel(.Object, world,
  filePath, model, baseUri = as.character(NA))

```

Arguments

| | |
|----------|--|
| .Object | a Parser object |
| world | a World object |
| filePath | a file that contains the RDF content |
| model | a Model object to parse the RDF content into |
| ... | (Additional parameters) |
| baseUri | a base URI (i.e. XML base) to apply to the model |

Details

The parser factory name specified during initialization determines how the content is parsed, for example, if 'rdfxml' was specified during parser initialization, then the parser expects RDF/XML content as specified in the W3C recommendation (<http://www.w3.org/TR/REC-rdf-syntax>)

Examples

```

world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
model <- new("Model", world, storage, options="")
# Create the default "rdfxml" parser
parser <- new("Parser", world)
filePath <- system.file("extdata/example.rdf", package="redland")
parseFileIntoModel(parser, world, filePath, model)

```

 Parser-class

An RDF Parser object

Description

The Parser class provides methods to parse RDF content into a Redland RDF model.

Slots

librdf_parser A redland parser object

Methods

- [Parser-initialize](#): Initialize a Parser object.
- [parseFileIntoModel](#): Parse the contents of a file into a model.
- [freeParser](#): Free memory used by a librdf parser.

See Also

[redland](#): redland package

Examples

```

world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
model <- new("Model", world, storage, options="")
# Create the default "rdfxml" parser
parser <- new("Parser", world)
filePath <- system.file("extdata/example.rdf", package="redland")
parseFileIntoModel(parser, world, filePath, model)

```

Query-class

Query an RDF model

Description

The Query class is used to execute a query on a Model object using the default query language SPARQL. For more information, please refer to <http://librdf.org/rasqal/> for details on supported query languages.

Details

A Query is executed using the executeQuery method, which returns a QueryResults object that can be iterated over the query solution sequence.

Slots

librdf_query A redland query object

librdf_world A redland world object

Methods

- `Query-initialize`: Initialize a Query object.
- `executeQuery`: Execute a query.
- `setQueryResultLimit`: Set limit on returned query results.
- `getQueryResultLimit`: Get the query result limit.
- `getResults`: Return all query results.
- `writeResults`: Write query results to a file.
- `freeParser`: Free memory used by a librdf query.

query <- new("Query", world, queryString, base_uri=NULL, query_language="sparql", query_uri=NULL)
queryResult <- executeQuery(query, model)
result <- getNextResult(queryResult)

```

QueryResults-class *A Redland QueryResults object is used to inspect query results from a Query object.*

Description

The QueryResults object contains the RDF statements that were returned from a query on an RDF model.

Slots

librdf_query_results A redland query object

Methods

- [QueryResults-initialize](#): Initialize a QueryResults object.
- [getNextResult](#): Get the next query result.
- [freeQueryResults](#): Free memory used by a librdf query result.

redland

*Create, query and write RDF graphs.***Description**

The R package *redland* provides methods to create, query and write information stored in the Resource Description Framework (RDF). This package is implemented as R scripts that provide an R interface (aka "wrapper") to the Redland RDF C libraries. Documentation for the redland R package classes and functions are available from the standard R help facility, for example, `'help("Node-class")'`, `'?getNodeType'`, etc.

An overview of the redland R package is available with the R command: `'vignette("redland_overview")'`.

The Redland C library functions are described at <http://librdf.org/docs/api/index.html>.

An introduction to RDF can be found at <http://www.w3.org/TR/rdf-primer>.

Details

The redland R package classes and the corresponding Redland C library types are shown in the following table:

| Concept | Redland C type | redland R class | Purpose |
|--------------------|----------------------|------------------------------|--|
| Resource / Literal | librdf_node | Node | RDF Model & Syntax nodes |
| Statement / Triple | librdf_statement | Statement | RDF Model & Syntax arcs (statements, triples) |
| Model | librdf_model | Model | Set of Statements usually held in one Storage. |
| Node | librdf_node | Node | The subject, predicate or object of a Statement |
| Storage | librdf_storage | Storage | Storage for Models either persistent or in-memory. |
| Parser | librdf_parser | Parser | Syntax parsers delivering Stream of Statements or writing to a |
| Query | librdf_query | Query | Querying of an Model delivering a QueryResults |
| QueryResults | librdf_query_results | QueryResults | Results of applying an Query to a Model giving either variable |
| Serializer | librdf_serializer | Serializer | Serializes a Model into a syntax such as RDF/XML |
| World | librdf_world | World | RDF wrapper class handling Redland startup/shutdown |

Note

In order to communicate with the Redland RDF C libraries, the redland R package uses an interface layer that is created with the software package *Simplified Wrapper and Interface Generator (SWIG)*. The relationship between the redland R package and the Redland C libraries is:

User script -> redland R package -> SWIG R interface -> Redland C libraries -> RDF data

It is recommended that the redland package R classes be used to interact with RDF, as these higher level classes take care of many of the details of communicating with the Redland C libraries. However, all of the lower level R interface functions generated by SWIG are made available by the redland package. These interface functions usually have names beginning with `'librdf_'`, `'rasqal_'` or `'raptor_'` and are usually the same name as the underlying C library function. Documentation for the R SWIG interface functions can be found via R help i.e. `'?librdf_iterator'`.

Author(s)

Matthew B. Jones (NCEAS) and Peter Slaughter (NCEAS)

Examples

```
# This example creates the necessary R objects to hold an RDF model and reads
# in a file that contains RDF/XML statements. This model is then queried for
# and the query results inspected.
world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
model <- new("Model", world, storage, options="")
filePath <- system.file("extdata/example.rdf", package="redland")
parser <- new("Parser", world)
parseFileIntoModel(parser, world, filePath, model)
queryString <- paste("PREFIX dc: <http://purl.org/dc/elements/1.1/> ",
                    "SELECT ?a ?c WHERE { ?a dc:description ?c . }", sep="")
query <- new("Query", world, queryString, base_uri=NULL,
            query_language="sparql", query_uri=NULL)
# Get first (and only, in this case) result
queryResult <- executeQuery(query, model)
result <- getNextResult(queryResult)
```

roclet_output.roclet_mergeNamespace

*Roxygen output function that merges a base NAMESPACE file with the
Roxygen dynamically created NAMESPACE file*

Description

The 'roclet_output' function handles output of the results from the 'roc_process' function. This function merges the NAMESPACE file created by the 'namespace' roclet with the list of Redland RDF functions determined by the 'roc_process' function.

Usage

```
## S3 method for class 'roclet_mergeNamespace'
roclet_output(roclet, results, base_path, ...)
```

Arguments

| | |
|-----------|---|
| roclet | the currently running roclet |
| results | the list of items to process that was generated by the roc_process.mergedNamespace function |
| base_path | the base directory path of the package |
| ... | additional parameters |

```
roclet_process.roclet_mergeNamespace
```

Roxygen process function for the 'mergeNamespace' roclet

Description

This function is called by the Roxygen2 roxygenize function.

Usage

```
## S3 method for class 'roclet_mergeNamespace'
roclet_process(roclet, partita, base_path,
  global_options = list())
```

Arguments

| | |
|----------------|---|
| roclet | the currently running roclet |
| partita | a list of all .R files in the package being roxygenized (not used by this roclet) |
| base_path | the top directory of the R package |
| global_options | unused by this roclet |

Details

This function loads the Redland interface file and tests each loaded function to see if it should be exported via the NAMESPACE file.

```
Serializer-class      An RDF Serializer object.
```

Description

The Serializer class provides methods to convert a Model object to other forms, for example, write out a Model to a file.

Slots

```
librdf_serializer    A redland statement object
```

Methods

- [Serializer-initialize](#): Initialize a Serializer object.
- [setNameSpace](#): Set a namespace for the serializer.
- [serializeToCharacter](#): Serialize a model to a character vector.
- [serializeToFile](#): Serialize a model to a file.
- [freeSerializer](#): Free memory used by a librdf serializer.

See Also

[redland](#): redland package

Examples

```
world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
model <- new("Model", world, storage, options="")
filePath <- system.file("extdata/example.rdf", package="redland")
parser <- new("Parser", world)
parseFileIntoModel(parser, world, filePath, model)
# Create the default "rdfxml" serializer
serializer <- new("Serializer", world)
# Add a namespace definition to the serializer
status <- setNameSpace(serializer, world, namespace="http://purl.org/dc/elements/1.1/", prefix="dc")
rdf <- serializeToCharacter(serializer, world, model, baseUri="")
```

serializeToCharacter *Serialize a model to a character vector.*

Description

Serialize a model to a character vector.

Usage

```
serializeToCharacter(.Object, world, model, ...)

## S4 method for signature 'Serializer,World,Model'
serializeToCharacter(.Object, world, model,
  baseUri = as.character(NA))
```

Arguments

| | |
|---------|---|
| .Object | a Serializer object |
| world | a World object |
| model | a Model object |
| ... | Additional parameters |
| baseUri | a URI to prepend to relative URIs in the document |

Value

a character vector containing the serialized model

| | |
|-----------------|-------------------------------------|
| serializeToFile | <i>Serialize a model to a file.</i> |
|-----------------|-------------------------------------|

Description

Serialize a model to a file.

Usage

```
serializeToFile(.Object, world, model, filePath, ...)
```

```
## S4 method for signature 'Serializer,World,Model,character'
serializeToFile(.Object, world,
  model, filePath, baseUri = as.character(NA))
```

Arguments

| | |
|----------|--|
| .Object | a Serializer object |
| world | a World object |
| model | a Model object |
| filePath | a file path that the serialized model will be written to |
| ... | Additional parameters |
| baseUri | a base URI to use for the serialization |

Value

an integer containing the return status where non zero indicates an error occurred during serialization

| | |
|--------------|--|
| setNameSpace | <i>Set a namespace for the serializer.</i> |
|--------------|--|

Description

Set a namespace for the serializer.

Usage

```
setNameSpace(.Object, world, namespace, prefix)
```

```
## S4 method for signature 'Serializer,World,character,character'
setNameSpace(.Object, world,
  namespace, prefix)
```

Arguments

| | |
|-----------|--|
| .Object | a Serializer object |
| world | a World object |
| namespace | the namespace to add to the serializer |
| prefix | the namespace prefix to associate with the namespace |

setQueryResultLimit *Set limit on returned query results*

Description

Set limit on returned query results

Usage

```
setQueryResultLimit(.Object, limit)

## S4 method for signature 'Query'
setQueryResultLimit(.Object, limit)
```

Arguments

| | |
|---------|--|
| .Object | a Query object |
| limit | the result set limit. Specify a value >= to have a limit, or a value < 0 to have no limit. |

Statement-class *An RDF Statement object*

Description

A Statement object is created using the provided subject, predicate and object.

Details

A Statement object can be created from Node objects that are provided for the subject, predicate and object. An alternative way to create a Statement object is to provide the subject, predicate and object as character values. If this later method is used, the character values will be evaluated to determine the appropriate RDF type for the subject and object. Note that the RDF type for the predicate will always be 'uri' (aka 'resource'). If the automatic determination of RDF types is not desired, then the subjectType and objectType parameters can be specified to explicitly set the RDF types.

Slots

`librdf_statement` A redland statement object

Methods

- [Statement-initialize](#): Initialize a Statement object.
- [getTermType](#): Return the redland node type for the specified RDF term in a statement.
- [freeStatement](#): Free memory used by a librdf statement.

See Also

[redland](#): redland package

Examples

```
world <- new("World")
# Create nodes manually and add to the statment
subject <- new("Node", blank="_:myid1", world)
predicate <- new("Node", uri="http://www.example.com/isa", world)
object <- new("Node", literal="thing", world)
stmt <- new("Statement", world, subject, predicate, object)

# Create the statement specifying node values directly
stmt <- new("Statement", world, subject="http://www.example.com/myevent",
           predicate="http://example.com/occurredAt",
           object="Tue Feb 17 14:05:13 PST 2015")
stmt <- new("Statement", world, subject=NULL,
           predicate="http://www.example.com/hasAddr",
           object="http://www.nothing.com", objectType="literal")
stmt <- new("Statement", world, subject="http://www.example.com/BobSmith",
           predicate="http://www.example.com/says",
           object="¡Hola, amigo! ¿Cómo estás?",
           objectType="literal",
           language="es")
```

Storage-class

A Redland Storage object

Description

A Redland Storage object

Slots

`librdf_storage` A redland storage object

type the storage type to create, i.e. "hashes", "mysql", "postgresql", ...

Methods

- [Storage-initialize](#): Initialize a Storage object
- [freeStorage](#): Free memory used by a librdf storage object

See Also

[redland](#): redland package

Examples

```
world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
```

World-class

A Redland World object, used to initialize the Redland RDF library.

Description

A World object is the top level object in the Redland RDF library implementation, so it contains all other objects needed to process RDF Models.

Slots

librdf_world A redland world object

Methods

- [World-initialize](#): Initialize a World object
- [freeWorld](#): Free memory used by a librdf world object

See Also

[redland](#): redland package

Examples

```
world <- new("World")
```

| | |
|--------------|---------------------------------------|
| writeResults | <i>Write query results to a file.</i> |
|--------------|---------------------------------------|

Description

Write query results to a file.

Usage

```
writeResults(.Object, model, ...)

## S4 method for signature 'Query'
writeResults(.Object, model, file,
             mimeType = "application/x-turtle", format_uri = NULL, base_uri = NULL)
```

Arguments

| | |
|------------|---|
| .Object | a Query object |
| model | a Model object |
| ... | additional parameters |
| file | a string specifying the output file |
| mimeType | a string specifying the mimeType of the output file. Currently supported values are "application/x-turtle", "text/plain", "application/json", "text/html" |
| format_uri | (not currently used) |
| base_uri | (not currently used) |

Details

After this method is called, the Query object is no longer usable and should be deleted "rm(query)" and a new object created.

Examples

```
world <- new("World")
storage <- new("Storage", world, "hashes", name="", options="hash-type='memory'")
model <- new("Model", world, storage, options="")
stmt <- new("Statement", world=world,
           subject="https://orcid.org/0000-0002-2192-403X",
           predicate="http://www.w3.org/ns/prov#Agent",
           object="slaughter",
           objectType="literal", datatype_uri="http://www.w3.org/2001/XMLSchema#string")
status <- addStatement(model, stmt)
queryString <- paste("PREFIX orcid: <https://orcid.org/>",
                    "PREFIX dataone: <https://cn.dataone.org/cn/v1/resolve/>",
                    "PREFIX prov: <http://www.w3.org/ns/prov#>",
                    "SELECT ?a ?c WHERE { ?a prov:Agent ?c . }", sep=" ")
query <- new("Query", world, queryString, base_uri=NULL, query_language="sparql", query_uri=NULL)
```

```

# Return all results as a string
tf <- tempfile()
writeResults(query, model, file=tf, mimeType="application/x-turtle")

# When the query object is no longer needed, the resources it had allocated can be freed.
freeQuery(query)
rm(query)

```

[,ExternalReference-method

Subset a list of ExternalReferences

Description

Subset a list of ExternalReferences

Usage

```

## S4 method for signature 'ExternalReference'
x[i, j, ..., drop = TRUE]

```

Arguments

| | |
|------|------------------------------|
| x | a list of ExternalReferences |
| i | row subscript |
| j | column subscript |
| ... | additional arguments |
| drop | a logical |

[<- ,ExternalReference-method

Assign values in a list of ExternalReferences

Description

Assign values in a list of ExternalReferences

Usage

```

## S4 replacement method for signature 'ExternalReference'
x[i, j, ...] <- value

```

Arguments

| | |
|-------|------------------------------|
| x | a list of ExternalReferences |
| i | row subscript |
| j | column subscript |
| ... | additional arguments |
| value | a value to assign |
