

Package ‘CVXR’

November 7, 2019

Type Package

Title Disciplined Convex Optimization

Version 0.99-7

VignetteBuilder knitr

URL <https://cvxr.rbind.io>, <https://www.cvxgrp.org/CVXR/>

BugReports <https://github.com/cvxgrp/CVXR/issues>

Description An object-oriented modeling language for disciplined convex programming (DCP). It allows the user to formulate convex optimization problems in a natural way following mathematical convention and DCP rules. The system analyzes the problem, verifies its convexity, converts it into a canonical form, and hands it off to an appropriate solver to obtain the solution.

Depends R (>= 3.4.0)

Imports methods, R6, Matrix, Rcpp (>= 0.12.12), bit64, gmp, Rmpfr, R.utils, ECOSolveR (>= 0.5.3), scs (>= 1.3), stats

Suggests knitr, rmarkdown, testthat, nnls, reticulate, lpSolveAPI, Rglpk, slam

LinkingTo Rcpp, RcppEigen

CVXR-package

*CVXR: Disciplined Convex Optimization in R***Description**

CVXR is an R package that provides an object-oriented modeling language for convex optimization, similar to CVX, CVXPY, YALMIP, and Convex.jl. This domain specific language (DSL) allows the user to formulate convex optimization problems in a natural mathematical syntax rather than the restrictive standard form required by most solvers. The user specifies an objective and set of constraints by combining constants, variables, and parameters using a library of functions with known mathematical properties. CVXR then applies signed disciplined convex programming (DCP) to verify the problem's convexity. Once verified, the problem is converted into standard conic form using graph implementations and passed to a cone solver such as ECOS or SCS.

*,Expression,Expression-method

*Elementwise Multiplication***Description**

The elementwise product of two expressions. The first expression must be constant.

Usage

```
## S4 method for signature 'Expression,Expression'
e1 * e2

## S4 method for signature 'Expression,ConstVal'
e1 * e2

## S4 method for signature 'ConstVal,Expression'
e1 * e2

mul_elemwise(lh_const, rh_exp)
```

Arguments

e1, e2 The [Expression](#) objects or numeric constants to multiply elementwise.
lh_const A constant [Expression](#), vector, or matrix representing the left-hand value.
rh_exp An [Expression](#), vector, or matrix representing the right-hand value.

Value

An [Expression](#) representing the elementwise product of the inputs.

Examples

```
A <- Variable(2,2)
c <- cbind(c(1,-1), c(2,-2))
expr <- mul_elemwise(c, A)
obj <- Minimize(norm_inf(expr))
prob <- Problem(obj, list(A == 5))
result <- solve(prob)
result$value
result$getValue(expr)
```

+,Expression,missing-method

The AddExpression class.

Description

This class represents the sum of any number of expressions.

Usage

```
## S4 method for signature 'Expression,missing'
e1 + e2

## S4 method for signature 'Expression,Expression'
```

```
e1 + e2

## S4 method for signature 'Expression,ConstVal'
e1 + e2

## S4 method for signature 'ConstVal,Expression'
e1 + e2

## S4 method for signature 'AddExpression'
to_numeric(object, values)

## S4 method for signature 'AddExpression'
size_from_args(object)

## S4 method for signature 'AddExpression'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

e1, e2	The Expression objects or numeric constants to add.
object	An AddExpression object.
values	A list of arguments to the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- to_numeric: Sum all the values.
- size_from_args: The size of the expression.
- graph_implementation: The graph implementation of the expression.

Slots

arg_groups A list of [Expressions](#) and numeric data.frame, matrix, or vector objects.

-,Expression,missing-method

The NegExpression class.

Description

This class represents the negation of an affine expression.

Usage

```

## S4 method for signature 'Expression,missing'
e1 - e2

## S4 method for signature 'Expression,Expression'
e1 - e2

## S4 method for signature 'Expression,ConstVal'
e1 - e2

## S4 method for signature 'ConstVal,Expression'
e1 - e2

## S4 method for signature 'NegExpression'
to_numeric(object, values)

## S4 method for signature 'NegExpression'
size_from_args(object)

## S4 method for signature 'NegExpression'
sign_from_args(object)

## S4 method for signature 'NegExpression'
is_incr(object, idx)

## S4 method for signature 'NegExpression'
is_decr(object, idx)

## S4 method for signature 'NegExpression'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

e1, e2	The Expression objects or numeric constants to subtract.
object	A NegExpression object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- to_numeric: Negate the value.
- size_from_args: The size of the expression.

- sign_from_args: The sign of the expression.
- is_incr: The expression is not weakly increasing in any argument.
- is_decr: The expression is weakly decreasing in every argument.
- graph_implementation: The graph implementation of the expression.

.build_matrix_0 *Get the sparse flag field for the LinOp object*

Description

Get the sparse flag field for the LinOp object

Usage

```
.build_matrix_0(xp, v)
```

Arguments

xp	the LinOpVector Object XPtr
v	the id_to_col named int vector in R with integer names

Value

a XPtr to ProblemData Object

.build_matrix_1 *Get the sparse flag field for the LinOp object*

Description

Get the sparse flag field for the LinOp object

Usage

```
.build_matrix_1(xp, v1, v2)
```

Arguments

xp	the LinOpVector Object XPtr
v1	the id_to_col named int vector in R with integer names
v2	the constr_offsets vector of offsets (an int vector in R)

Value

a XPtr to ProblemData Object

`.LinOpVector__new` *Create a new LinOpVector object.*

Description

Create a new LinOpVector object.

Usage

`.LinOpVector__new()`

Value

an external ptr (Rcpp::XPtr) to a LinOp object instance.

`.LinOpVector__push_back`
Perform a push back operation on the args field of LinOp

Description

Perform a push back operation on the args field of LinOp

Usage

`.LinOpVector__push_back(xp, yp)`

Arguments

<code>xp</code>	the LinOpVector Object XPtr
<code>yp</code>	the LinOp Object XPtr to push

`.LinOp_at_index` *Return the LinOp element at index i (0-based)*

Description

Return the LinOp element at index i (0-based)

Usage

`.LinOp_at_index(lvec, i)`

Arguments

<code>lvec</code>	the LinOpVector Object XPtr
<code>i</code>	the index

.LinOp__args_push_back

Perform a push back operation on the args field of LinOp

Description

Perform a push back operation on the args field of LinOp

Usage

.LinOp__args_push_back(xp, yp)

Arguments

xp	the LinOp Object XPtr
yp	the LinOp Object XPtr to push

.LinOp__get_dense_data

Get the field dense_data for the LinOp object

Description

Get the field dense_data for the LinOp object

Usage

.LinOp__get_dense_data(xp)

Arguments

xp	the LinOp Object XPtr
----	-----------------------

Value

a MatrixXd object

.LinOp__get_id *Get the id field of the LinOp Object*

Description

Get the id field of the LinOp Object

Usage

`.LinOp__get_id(xp)`

Arguments

`xp` the LinOp Object XPtr

Value

the value of the id field of the LinOp Object

.LinOp__get_size *Get the field size for the LinOp object*

Description

Get the field size for the LinOp object

Usage

`.LinOp__get_size(xp)`

Arguments

`xp` the LinOp Object XPtr

Value

an integer vector

.LinOp__get_slice *Get the slice field of the LinOp Object*

Description

Get the slice field of the LinOp Object

Usage

.LinOp__get_slice(xp)

Arguments

xp the LinOp Object XPtr

Value

the value of the slice field of the LinOp Object

.LinOp__get_sparse *Get the sparse flag field for the LinOp object*

Description

Get the sparse flag field for the LinOp object

Usage

.LinOp__get_sparse(xp)

Arguments

xp the LinOp Object XPtr

Value

TRUE or FALSE

`.LinOp__get_sparse_data`

Get the field named sparse_data from the LinOp object

Description

Get the field named sparse_data from the LinOp object

Usage

`.LinOp__get_sparse_data(xp)`

Arguments

xp the LinOp Object XPtr

Value

a [dgCMatrix-class](#) object

`.LinOp__get_type`

Get the field named type for the LinOp object

Description

Get the field named type for the LinOp object

Usage

`.LinOp__get_type(xp)`

Arguments

xp the LinOp Object XPtr

Value

an integer value for type

.LinOp__new *Create a new LinOp object.*

Description

Create a new LinOp object.

Usage

.LinOp__new()

Value

an external ptr (Rcpp::XPtr) to a LinOp object instance.

.LinOp__set_dense_data *Set the field dense_data of the LinOp object*

Description

Set the field dense_data of the LinOp object

Usage

.LinOp__set_dense_data(xp, denseMat)

Arguments

xp	the LinOp Object XPtr
denseMat	a standard matrix object in R

.LinOp__set_size *Set the field size of the LinOp object*

Description

Set the field size of the LinOp object

Usage

.LinOp__set_size(xp, value)

Arguments

xp	the LinOp Object XPtr
value	an integer vector object in R

.LinOp__set_slice *Set the slice field of the LinOp Object*

Description

Set the slice field of the LinOp Object

Usage

```
.LinOp__set_slice(xp, value)
```

Arguments

xp	the LinOp Object XPtr
value	a list of integer vectors, e.g. <code>list(1:10, 2L, 11:15)</code>

Value

the value of the slice field of the LinOp Object

.LinOp__set_sparse *Set the flag sparse of the LinOp object*

Description

Set the flag sparse of the LinOp object

Usage

```
.LinOp__set_sparse(xp, sparseSEXP)
```

Arguments

xp	the LinOp Object XPtr
sparseSEXP	an R boolean

`.LinOp__set_sparse_data`

Set the field named sparse_data of the LinOp object

Description

Set the field named sparse_data of the LinOp object

Usage

`.LinOp__set_sparse_data(xp, sparseMat)`

Arguments

xp the LinOp Object XPtr
sparseMat a [dgCMatrix-class](#) object

`.LinOp__set_type`

Set the field named type for the LinOp object

Description

Set the field named type for the LinOp object

Usage

`.LinOp__set_type(xp, typeValue)`

Arguments

xp the LinOp Object XPtr
typeValue an integer value

`.LinOp__size_push_back`

Perform a push back operation on the size field of LinOp

Description

Perform a push back operation on the size field of LinOp

Usage

`.LinOp__size_push_back(xp, intVal)`

Arguments

<code>xp</code>	the LinOp Object XPtr
<code>intVal</code>	the integer value to push back

`.LinOp__slice_push_back`

Perform a push back operation on the slice field of LinOp

Description

Perform a push back operation on the slice field of LinOp

Usage

`.LinOp__slice_push_back(xp, intVec)`

Arguments

<code>xp</code>	the LinOp Object XPtr
<code>intVec</code>	an integer vector to push back

.ProblemData__get_const_to_row

Get the const_to_row field of the ProblemData Object

Description

Get the const_to_row field of the ProblemData Object

Usage

.ProblemData__get_const_to_row(xp)

Arguments

xp the ProblemData Object XPtr

Value

the const_to_row field as a named integer vector where the names are integers converted to characters

.ProblemData__get_const_vec

Get the const_vec field from the ProblemData Object

Description

Get the const_vec field from the ProblemData Object

Usage

.ProblemData__get_const_vec(xp)

Arguments

xp the ProblemData Object XPtr

Value

a numeric vector of the field const_vec from the ProblemData Object

.ProblemData__get_I *Get the I field of the ProblemData Object*

Description

Get the I field of the ProblemData Object

Usage

`.ProblemData__get_I(xp)`

Arguments

xp the ProblemData Object XPtr

Value

an integer vector of the field I from the ProblemData Object

.ProblemData__get_id_to_col
Get the id_to_col field of the ProblemData Object

Description

Get the id_to_col field of the ProblemData Object

Usage

`.ProblemData__get_id_to_col(xp)`

Arguments

xp the ProblemData Object XPtr

Value

the id_to_col field as a named integer vector where the names are integers converted to characters

.ProblemData__get_J *Get the J field of the ProblemData Object*

Description

Get the J field of the ProblemData Object

Usage

.ProblemData__get_J(xp)

Arguments

xp the ProblemData Object XPtr

Value

an integer vector of the field J from the ProblemData Object

.ProblemData__get_V *Get the V field of the ProblemData Object*

Description

Get the V field of the ProblemData Object

Usage

.ProblemData__get_V(xp)

Arguments

xp the ProblemData Object XPtr

Value

a numeric vector of doubles (the field V) from the ProblemData Object

`.ProblemData__new` *Create a new ProblemData object.*

Description

Create a new ProblemData object.

Usage

`.ProblemData__new()`

Value

an external ptr (Rcpp::XPtr) to a ProblemData object instance.

`.ProblemData__set_const_to_row`
Set the const_to_row map of the ProblemData Object

Description

Set the const_to_row map of the ProblemData Object

Usage

`.ProblemData__set_const_to_row(xp, iv)`

Arguments

`xp` the ProblemData Object XPtr
`iv` a named integer vector with names being integers converted to characters

.ProblemData__set_const_vec

Set the const_vec field in the ProblemData Object

Description

Set the const_vec field in the ProblemData Object

Usage

.ProblemData__set_const_vec(xp, cvp)

Arguments

xp the ProblemData Object XPtr
cvp a numeric vector of values for const_vec field of the ProblemData object

.ProblemData__set_I *Set the I field in the ProblemData Object*

Description

Set the I field in the ProblemData Object

Usage

.ProblemData__set_I(xp, ip)

Arguments

xp the ProblemData Object XPtr
ip an integer vector of values for field I of the ProblemData object

`.ProblemData__set_id_to_col`

Set the id_to_col field of the ProblemData Object

Description

Set the id_to_col field of the ProblemData Object

Usage

`.ProblemData__set_id_to_col(xp, iv)`

Arguments

<code>xp</code>	the ProblemData Object XPtr
<code>iv</code>	a named integer vector with names being integers converted to characters

`.ProblemData__set_J` *Set the J field in the ProblemData Object*

Description

Set the J field in the ProblemData Object

Usage

`.ProblemData__set_J(xp, jp)`

Arguments

<code>xp</code>	the ProblemData Object XPtr
<code>jp</code>	an integer vector of the values for field J of the ProblemData object

.ProblemData__set_V *Set the V field in the ProblemData Object*

Description

Set the V field in the ProblemData Object

Usage

.ProblemData__set_V(xp, vp)

Arguments

xp the ProblemData Object XPtr
vp a numeric vector of values for field V

/,Expression,Expression-method
The DivExpression class.

Description

This class represents one expression divided by another expression.

Usage

```
## S4 method for signature 'Expression,Expression'  
e1 / e2  
  
## S4 method for signature 'Expression,ConstVal'  
e1 / e2  
  
## S4 method for signature 'ConstVal,Expression'  
e1 / e2  
  
## S4 method for signature 'DivExpression'  
is_quadratic(object)  
  
## S4 method for signature 'DivExpression'  
size_from_args(object)  
  
## S4 method for signature 'DivExpression'  
is_incr(object, idx)  
  
## S4 method for signature 'DivExpression'
```

```
is_decr(object, idx)

## S4 method for signature 'DivExpression'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

<code>e1, e2</code>	The Expression objects or numeric constants to divide. The denominator, <code>e2</code> , must be a scalar constant.
<code>object</code>	A DivExpression object.
<code>idx</code>	An index into the atom.
<code>arg_objs</code>	A list of linear expressions for each argument.
<code>size</code>	A vector with two elements representing the size of the resulting expression.
<code>data</code>	A list of additional data required by the atom.

Methods (by generic)

- `is_quadratic`: Is the left-hand expression quadratic and the right-hand expression constant?
- `size_from_args`: The size of the left-hand expression.
- `is_incr`: Is the right-hand expression positive?
- `is_decr`: Is the right-hand expression negative?
- `graph_implementation`: The graph implementation of the expression.

`<=,Expression,Expression-method`
The `LeqConstraint` class.

Description

This class represents a \leq inequality constraint.

Usage

```
## S4 method for signature 'Expression,Expression'
e1 <= e2

## S4 method for signature 'Expression,ConstVal'
e1 <= e2

## S4 method for signature 'ConstVal,Expression'
e1 <= e2

## S4 method for signature 'Expression,Expression'
e1 < e2
```

```
## S4 method for signature 'Expression,ConstVal'
e1 < e2

## S4 method for signature 'ConstVal,Expression'
e1 < e2

## S4 method for signature 'Expression,Expression'
e1 >= e2

## S4 method for signature 'Expression,ConstVal'
e1 >= e2

## S4 method for signature 'ConstVal,Expression'
e1 >= e2

## S4 method for signature 'Expression,Expression'
e1 > e2

## S4 method for signature 'Expression,ConstVal'
e1 > e2

## S4 method for signature 'ConstVal,Expression'
e1 > e2

LeqConstraint(lh_exp, rh_exp)

## S4 method for signature 'LeqConstraint'
as.character(x)

## S4 method for signature 'LeqConstraint'
id(object)

## S4 method for signature 'LeqConstraint'
size(object)

## S4 method for signature 'LeqConstraint'
is_dcp(object)

## S4 method for signature 'LeqConstraint'
canonicalize(object)

## S4 method for signature 'LeqConstraint'
variables(object)

## S4 method for signature 'LeqConstraint'
parameters(object)
```

```
## S4 method for signature 'LeqConstraint'
constants(object)
```

```
## S4 method for signature 'LeqConstraint'
residual(object)
```

```
## S4 method for signature 'LeqConstraint'
value(object)
```

```
## S4 method for signature 'LeqConstraint'
violation(object)
```

Arguments

e1, e2	The Expression objects or numeric constants to compare.
lh_exp	An Expression , numeric element, vector, or matrix representing the left-hand side of the inequality.
rh_exp	An Expression , numeric element, vector, or matrix representing the right-hand side of the inequality.
x, object	A LeqConstraint object.

Methods (by generic)

- id: The `constr_id` of the constraint.
- size: The size of the left-hand expression minus the right-hand expression.
- is_dcp: The constraint is DCP if the left-hand expression is convex and the right-hand expression is concave.
- canonicalize: The graph implementation of the object. Marks the top level constraint as the `dual_holder` so the dual value will be saved to the [LeqConstraint](#).
- variables: List of [Variable](#) objects in the constraint.
- parameters: List of [Parameter](#) objects in the constraint.
- constants: List of [Constant](#) objects in the constraint.
- residual: The elementwise maximum of the left-hand expression minus the right-hand expression, i.e. $\max_{\text{elemwise}}(\text{lh_exp} - \text{rh_exp}, 0)$.
- value: A logical value indicating whether the constraint holds. Tolerance is currently set at $1e-4$.
- violation: A matrix representing the amount by which the constraint is off, i.e. the numeric value of the residual expression.

Slots

`constr_id` (Internal) A unique integer identification number used internally.

`lh_exp` An [Expression](#), numeric element, vector, or matrix representing the left-hand side of the inequality.

rh_exp An [Expression](#), numeric element, vector, or matrix representing the right-hand side of the inequality.

args (Internal) A list that holds lh_exp and rh_exp for internal use.

.expr (Internal) An [Expression](#) representing $lh_exp - rh_exp$ for internal use.

dual_variable (Internal) A [Variable](#) representing the dual variable associated with the constraint.

==,Expression,Expression-method
The EqConstraint class.

Description

This class represents a equality constraint.

Usage

```
## S4 method for signature 'Expression,Expression'
e1 == e2

## S4 method for signature 'Expression,ConstVal'
e1 == e2

## S4 method for signature 'ConstVal,Expression'
e1 == e2

EqConstraint(lh_exp, rh_exp)

## S4 method for signature 'EqConstraint'
is_dcp(object)

## S4 method for signature 'EqConstraint'
residual(object)

## S4 method for signature 'EqConstraint'
canonicalize(object)
```

Arguments

e1, e2	The Expression objects or numeric constants to compare.
lh_exp	An Expression , numeric element, vector, or matrix representing the left-hand side of the inequality.
rh_exp	An Expression , numeric element, vector, or matrix representing the right-hand side of the inequality.
object	An EqConstraint object.

Methods (by generic)

- `is_dcp`: The constraint is DCP if the left-hand and right-hand expressions are affine.
- `residual`: The absolute value of the left-hand minus the right-hand expression, i.e. `abs(lh_exp - rh_exp)`.
- `canonicalize`: The graph implementation of the object. Marks the top level constraint as the `dual_holder` so the dual value will be saved to the [EqConstraint](#).

Slots

`constr_id` (Internal) A unique integer identification number used internally.

`lh_exp` An [Expression](#), numeric element, vector, or matrix representing the left-hand side of the inequality.

`rh_exp` An [Expression](#), numeric element, vector, or matrix representing the right-hand side of the inequality.

`args` (Internal) A list that holds `lh_exp` and `rh_exp` for internal use.

`.expr` (Internal) An [Expression](#) representing `lh_exp - rh_exp` for internal use.

`dual_variable` (Internal) A [Variable](#) representing the dual variable associated with the constraint.

abs, Expression-method *Absolute Value*

Description

The elementwise absolute value.

Usage

```
## S4 method for signature 'Expression'
abs(x)
```

Arguments

`x` An [Expression](#).

Value

An [Expression](#) representing the absolute value of the input.

Examples

```
A <- Variable(2,2)
prob <- Problem(Minimize(sum(abs(A))), list(A <= -2))
result <- solve(prob)
result$value
result$getValue(A)
```

 Abs-class

The Abs class.

Description

This class represents the elementwise absolute value.

Usage

```

Abs(x)

## S4 method for signature 'Abs'
to_numeric(object, values)

## S4 method for signature 'Abs'
sign_from_args(object)

## S4 method for signature 'Abs'
is_atom_convex(object)

## S4 method for signature 'Abs'
is_atom_concave(object)

## S4 method for signature 'Abs'
is_incr(object, idx)

## S4 method for signature 'Abs'
is_decr(object, idx)

## S4 method for signature 'Abs'
is_pwl(object)

## S4 method for signature 'Abs'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x	An Expression object.
object	An Abs object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `to_numeric`: The elementwise absolute value of the input.
- `sign_from_args`: The atom is positive.
- `is_atom_convex`: The atom is convex.
- `is_atom_concave`: The atom is not concave.
- `is_incr`: A logical value indicating whether the atom is weakly increasing.
- `is_decr`: A logical value indicating whether the atom is weakly decreasing.
- `is_pwl`: Is x piecewise linear?
- `graph_implementation`: The graph implementation of the atom.

Slots

x An [Expression](#) object.

AffAtom-class

The AffAtom class.

Description

This virtual class represents an affine atomic expression.

Usage

```
## S4 method for signature 'AffAtom'
sign_from_args(object)
```

```
## S4 method for signature 'AffAtom'
is_atom_convex(object)
```

```
## S4 method for signature 'AffAtom'
is_atom_concave(object)
```

```
## S4 method for signature 'AffAtom'
is_incr(object, idx)
```

```
## S4 method for signature 'AffAtom'
is_decr(object, idx)
```

```
## S4 method for signature 'AffAtom'
is_quadratic(object)
```

```
## S4 method for signature 'AffAtom'
is_pwl(object)
```

Arguments

object	An AffAtom object.
idx	An index into the atom.

Methods (by generic)

- `sign_from_args`: The sign of the atom.
- `is_atom_convex`: The atom is convex.
- `is_atom_concave`: The atom is concave.
- `is_incr`: The atom is weakly increasing in every argument.
- `is_decr`: The atom is not weakly decreasing in any argument.
- `is_quadratic`: Is every argument quadratic?
- `is_pwl`: Is every argument piecewise linear?

AffineProd-class *The AffineProd class.*

Description

This class represents the product of two affine expressions.

Usage

```
AffineProd(x, y)

## S4 method for signature 'AffineProd'
validate_args(object)

## S4 method for signature 'AffineProd'
to_numeric(object, values)

## S4 method for signature 'AffineProd'
size_from_args(object)

## S4 method for signature 'AffineProd'
sign_from_args(object)

## S4 method for signature 'AffineProd'
is_atom_convex(object)

## S4 method for signature 'AffineProd'
is_atom_concave(object)

## S4 method for signature 'AffineProd'
```

```

is_incr(object, idx)

## S4 method for signature 'AffineProd'
is_decr(object, idx)

## S4 method for signature 'AffineProd'
is_quadratic(object)

```

Arguments

x	An Expression or numeric constant representing the left-hand value.
y	An Expression or numeric constant representing the right-hand value.
object	An AffineProd object.
values	A list of arguments to the atom.
idx	An index into the atom.

Methods (by generic)

- `validate_args`: Check dimensions of arguments and linearity.
- `to_numeric`: The product of two affine expressions.
- `size_from_args`: The size of the atom.
- `sign_from_args`: Default to rules for times.
- `is_atom_convex`: Affine times affine is not convex.
- `is_atom_concave`: Affine times affine is not concave.
- `is_incr`: A logical value indicating whether the atom is weakly increasing in `idx`.
- `is_decr`: A logical value indicating whether the atom is weakly decreasing in `idx`.
- `is_quadratic`: The affine product is always quadratic.

Slots

x	An Expression or numeric constant representing the left-hand value.
y	An Expression or numeric constant representing the right-hand value.

affine_prod

Affine Product

Description

The product of two affine expressions.

Usage

```
affine_prod(x, y)
```

Arguments

- x An [Expression](#) or numeric constant representing the left-hand value.
- y An [Expression](#) or numeric constant representing the right-hand value.

Value

An [Expression](#) representing the product of x and y.

Atom-class	<i>The Atom class.</i>
------------	------------------------

Description

This virtual class represents atomic expressions in CVXR.

Usage

```
## S4 method for signature 'Atom'  
validate_args(object)  
  
## S4 method for signature 'Atom'  
size(object)  
  
## S4 method for signature 'Atom'  
dim(x)  
  
## S4 method for signature 'Atom'  
nrow(x)  
  
## S4 method for signature 'Atom'  
ncol(x)  
  
## S4 method for signature 'Atom'  
is_positive(object)  
  
## S4 method for signature 'Atom'  
is_negative(object)  
  
## S4 method for signature 'Atom'  
is_convex(object)  
  
## S4 method for signature 'Atom'  
is_concave(object)  
  
## S4 method for signature 'Atom'  
canonicalize(object)
```

```

## S4 method for signature 'Atom'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

## S4 method for signature 'Atom'
variables(object)

## S4 method for signature 'Atom'
parameters(object)

## S4 method for signature 'Atom'
constants(object)

## S4 method for signature 'Atom'
value(object)

## S4 method for signature 'Atom'
grad(object)

## S4 method for signature 'Atom'
domain(object)

```

Arguments

x, object	An Atom object.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Raises an error if the arguments are invalid.
- `size`: The `c(row,col)` dimensions of the atom.
- `dim`: The `c(row,col)` dimensions of the atom.
- `nrow`: The number of rows in the atom.
- `ncol`: The number of columns in the atom.
- `is_positive`: A logical value indicating whether the atom is positive.
- `is_negative`: A logical value indicating whether the atom is negative.
- `is_convex`: A logical value indicating whether the atom is convex.
- `is_concave`: A logical value indicating whether the atom is concave.
- `canonicalize`: Represent the atom as an affine objective and conic constraints.
- `graph_implementation`: The graph implementation of the atom.
- `variables`: List of [Variable](#) objects in the atom.

- parameters: List of [Parameter](#) objects in the atom.
- constants: List of [Constant](#) objects in the atom.
- value: The value of the atom.
- grad: The (sub/super)-gradient of the atom with respect to each variable.
- domain: A list of constraints describing the closure of the region where the expression is finite.

AxisAtom-class	<i>The AxisAtom class.</i>
----------------	----------------------------

Description

This virtual class represents atomic expressions that can be applied along an axis in CVXR.

Usage

```
## S4 method for signature 'AxisAtom'
size_from_args(object)

## S4 method for signature 'AxisAtom'
get_data(object)

## S4 method for signature 'AxisAtom'
validate_args(object)
```

Arguments

object An [Atom](#) object.

Methods (by generic)

- size_from_args: The size of the atom determined from its arguments.
- get_data: A list containing axis.
- validate_args: Check that the new shape has the same number of entries as the old.

Slots

expr A numeric element, data.frame, matrix, vector, or Expression.

axis (Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.

BinaryOperator-class *The BinaryOperator class.*

Description

This base class represents expressions involving binary operators.

Usage

```
## S4 method for signature 'BinaryOperator'
to_numeric(object, values)

## S4 method for signature 'BinaryOperator'
sign_from_args(object)
```

Arguments

object A [BinaryOperator](#) object.
values A list of arguments to the atom.

Methods (by generic)

- to_numeric: Apply the binary operator to the values.
- sign_from_args: The sign of the expression.

Slots

lh_exp The [Expression](#) on the left-hand side of the operator.
rh_exp The [Expression](#) on the right-hand side of the operator.
op_name A character string indicating the binary operation.

bmat *Block Matrix*

Description

Constructs a block matrix from a list of lists. Each internal list is stacked horizontally, and the internal lists are stacked vertically.

Usage

```
bmat(block_lists)
```

Arguments

`block_lists` A list of lists containing [Expression](#) objects, matrices, or vectors, which represent the blocks of the block matrix.

Value

An [Expression](#) representing the block matrix.

Examples

```
x <- Variable()
expr <- bmat(list(list(matrix(1, nrow = 3, ncol = 1), matrix(2, nrow = 3, ncol = 2)),
                 list(matrix(3, nrow = 1, ncol = 2), x)
              ))
prob <- Problem(Minimize(sum_entries(expr)), list(x >= 0))
result <- solve(prob)
result$value
```

Bool-class	<i>The Bool class.</i>
------------	------------------------

Description

This class represents a boolean variable.

Usage

```
Bool(rows = 1, cols = 1, name = NA_character_)
```

```
## S4 method for signature 'Bool'
as.character(x)
```

```
## S4 method for signature 'Bool'
canonicalize(object)
```

```
## S4 method for signature 'Bool'
is_positive(object)
```

```
## S4 method for signature 'Bool'
is_negative(object)
```

Arguments

`rows` The number of rows in the variable.

`cols` The number of columns in the variable.

`name` (Optional) A character string representing the name of the variable.

`x, object` A [Bool](#) object.

Methods (by generic)

- `canonicalize`: Enforce that the variable be boolean.
- `is_positive`: A boolean variable is always positive or zero.
- `is_negative`: A boolean variable is never negative.

Slots

`id` (Internal) A unique identification number used internally.

`rows` The number of rows in the variable.

`cols` The number of columns in the variable.

`name` (Optional) A character string representing the name of the variable.

`primal_value` (Internal) The primal value of the variable stored internally.

Examples

```
x <- Bool(3, name = "indicator") ## Boolean 3-vector
y <- Bool(3, 3) ## Matrix boolean
name(x)
as.character(x)
canonicalize(y)
is_positive(x)
is_negative(y)
```

BoolConstr-class

The BoolConstr class.

Description

This class represents a boolean constraint, $X_{ij} \in \{0, 1\}$ for all i, j .

Usage

```
BoolConstr(lin_op)
```

```
## S4 method for signature 'BoolConstr'
format_constr(object, eq_constr, leq_constr, dims,
  solver)
```

```
## S4 method for signature 'BoolConstr'
size(object)
```

Arguments

lin_op	A list representing the linear operator equal to the <code>.noncvx_var</code> .
object	A BoolConstr object.
eq_constr	A list of the equality constraints in the canonical problem.
leq_constr	A list of the inequality constraints in the canonical problem.
dims	A list with the dimensions of the conic constraints.
solver	A string representing the solver to be called.

Methods (by generic)

- `format_constr`: Format SDP constraints as inequalities for the solver.
- `size`: The dimensions of the semidefinite cone.

Slots

<code>constr_id</code> (Internal)	A unique integer identification number used internally.
<code>lin_op</code>	A list representing the linear operator equal to the <code>.noncvx_var</code> .
<code>.noncvx_var</code> (Internal)	A list representing the variable constrained to be elementwise boolean.

CallbackParam-class *The CallbackParam class.*

Description

This class represents a parameter whose value is obtained by evaluating a function.

Usage

```
CallbackParam(callback, rows = 1, cols = 1, name = NA_character_,
              sign = UNKNOWN)
```

```
## S4 method for signature 'CallbackParam'
value(object)
```

```
## S4 method for signature 'CallbackParam'
get_data(object)
```

Arguments

callback	A numeric element, vector, matrix, or data.frame
rows	The number of rows in the parameter.
cols	The number of columns in the parameter.
name	(Optional) A character string representing the name of the parameter.
sign	A character string indicating the sign of the parameter. Must be "ZERO", "POSITIVE", "NEGATIVE", or "UNKNOWN".
object	A CallbackParam object.

Methods (by generic)

- `get_data`: Returns `list(callback, rows, cols, name, sign string)`.

Slots

`callback` A numeric element, vector, matrix, or `data.frame`.

Examples

```
x <- Variable(2)
dim <- size(x)
y <- CallbackParam(value(x), dim[1], dim[2], sign = "POSITIVE")
get_data(y)
```

Canonical-class

The Canonical class.

Description

This virtual class represents a canonical expression.

Usage

```
## S4 method for signature 'Canonical'
canonicalize(object)

## S4 method for signature 'Canonical'
variables(object)

## S4 method for signature 'Canonical'
parameters(object)

## S4 method for signature 'Canonical'
constants(object)

## S4 method for signature 'Canonical'
get_data(object)
```

Arguments

`object` A [Canonical](#) object.

Methods (by generic)

- canonicalize: The graph implementation of the input.
- variables: List of [Variable](#) objects in the expression.
- parameters: List of [Parameter](#) objects in the expression.
- constants: List of [Constant](#) objects in the expression.
- get_data: Information needed to reconstruct the expression aside from its arguments.

 canonicalize

Canonicalize

Description

Computes the graph implementation of a canonical expression.

Usage

```
canonicalize(object)
```

```
canonical_form(object)
```

Arguments

object A [Canonical](#) object.

Value

A list of list(affine expression, list(constraints)).

 cdiac

*Global Monthly and Annual Temperature Anomalies (degrees C),
1850-2015 (Relative to the 1961-1990 Mean) (May 2016)*

Description

Global Monthly and Annual Temperature Anomalies (degrees C), 1850-2015 (Relative to the 1961-1990 Mean) (May 2016)

Usage

```
cdiac
```

Format

A data frame with 166 rows and 14 variables:

year Year
jan Anomaly for month of January
feb Anomaly for month of February
mar Anomaly for month of March
apr Anomaly for month of April
may Anomaly for month of May
jun Anomaly for month of June
jul Anomaly for month of July
aug Anomaly for month of August
sep Anomaly for month of September
oct Anomaly for month of October
nov Anomaly for month of November
dec Anomaly for month of December
annual Annual anomaly for the year

Source

References

<https://ess-dive.lbl.gov/>

cone-methods

Second-Order Cone Methods

Description

The number of elementwise cones or the size of a single cone in a second-order cone constraint.

Usage

num_cones(object)

cone_size(object)

Arguments

object An [SOCAxis](#) object.

Value

The number of cones, or the size of a cone.

Constant-class	<i>The Constant class.</i>
----------------	----------------------------

Description

This class represents a constant.

Coerce an R object or expression into the [Constant](#) class.

Usage

```
Constant(value)
```

```
## S4 method for signature 'Constant'  
as.character(x)
```

```
## S4 method for signature 'Constant'  
constants(object)
```

```
## S4 method for signature 'Constant'  
get_data(object)
```

```
## S4 method for signature 'Constant'  
value(object)
```

```
## S4 method for signature 'Constant'  
grad(object)
```

```
## S4 method for signature 'Constant'  
size(object)
```

```
## S4 method for signature 'Constant'  
is_positive(object)
```

```
## S4 method for signature 'Constant'  
is_negative(object)
```

```
## S4 method for signature 'Constant'  
canonicalize(object)
```

```
as.Constant(expr)
```

Arguments

value	A numeric element, vector, matrix, or data.frame. Vectors are automatically cast into a matrix column.
-------	--

x, object	A Constant object.
-----------	------------------------------------

expr	An Expression , numeric element, vector, matrix, or data.frame.
------	---

Value

A [Constant](#) representing the input as a constant.

Methods (by generic)

- `constants`: Returns itself as a constant.
- `get_data`: A list with the value of the constant.
- `value`: The value of the constant.
- `grad`: An empty list since the gradient of a constant is zero.
- `size`: The `c(row, col)` dimensions of the constant.
- `is_positive`: A logical value indicating whether all elements of the constant are non-negative.
- `is_negative`: A logical value indicating whether all elements of the constant are non-positive.
- `canonicalize`: The canonical form of the constant.

Slots

`value` A numeric element, vector, matrix, or data.frame. Vectors are automatically cast into a matrix column.

`is_1D_array` (Internal) A logical value indicating whether the value is a vector or 1-D matrix.

`sparse` (Internal) A logical value indicating whether the value is a sparse matrix.

`size` (Internal) A vector of containing the number of rows and columns.

`is_pos` (Internal) A logical value indicating whether all elements are non-negative.

`is_neg` (Internal) A logical value indicating whether all elements are non-positive.

Examples

```
x <- Constant(5)
y <- Constant(diag(3))
get_data(y)
value(y)
is_positive(y)
size(y)
as.Constant(y)
```

Constraint-class

The Constraint class.

Description

This virtual class represents a mathematical constraint.

Slots

`constr_id` (Internal) A unique integer identification number used internally.

conv	<i>Discrete Convolution</i>
------	-----------------------------

Description

The 1-D discrete convolution of two vectors.

Usage

```
conv(lh_exp, rh_exp)
```

Arguments

lh_exp An [Expression](#) or vector representing the left-hand value.
rh_exp An [Expression](#) or vector representing the right-hand value.

Value

An [Expression](#) representing the convolution of the input.

Examples

```
x <- Variable(5)
h <- matrix(stats::rnorm(2), nrow = 2, ncol = 1)
prob <- Problem(Minimize(sum(conv(h, x))))
result <- solve(prob)
result$value
result$getValue(x)
```

Conv-class	<i>The Conv class.</i>
------------	------------------------

Description

This class represents the 1-D discrete convolution of two vectors.

Usage

```
Conv(lh_exp, rh_exp)

## S4 method for signature 'Conv'
validate_args(object)

## S4 method for signature 'Conv'
to_numeric(object, values)
```

```

## S4 method for signature 'Conv'
size_from_args(object)

## S4 method for signature 'Conv'
sign_from_args(object)

## S4 method for signature 'Conv'
is_incr(object, idx)

## S4 method for signature 'Conv'
is_decr(object, idx)

## S4 method for signature 'Conv'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

lh_exp	An Expression or R numeric data representing the left-hand vector.
rh_exp	An Expression or R numeric data representing the right-hand vector.
object	A Conv object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check both arguments are vectors and the first is a constant.
- `to_numeric`: The convolution of the two values.
- `size_from_args`: The size of the atom.
- `sign_from_args`: The sign of the atom.
- `is_incr`: Is the left-hand expression positive?
- `is_decr`: Is the left-hand expression negative?
- `graph_implementation`: The graph implementation of the atom.

Slots

lh_exp An [Expression](#) or R numeric data representing the left-hand vector.
rh_exp An [Expression](#) or R numeric data representing the right-hand vector.

 CumSum-class

The CumSum class.

Description

This class represents the cumulative sum.

Usage

```
CumSum(expr, axis = 2)

## S4 method for signature 'CumSum'
to_numeric(object, values)

## S4 method for signature 'CumSum'
size_from_args(object)

## S4 method for signature 'CumSum'
validate_args(object)

## S4 method for signature 'CumSum'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

expr	An Expression to be summed.
axis	(Optional) The dimension across which to apply the function: 1 indicates rows, and 2 indicates columns. The default is 2.
object	A CumSum object.
values	A list of arguments to the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `to_numeric`: The cumulative sum of the values along the specified axis.
- `size_from_args`: The size of the atom.
- `validate_args`: Check that axis is either 1 or 2.
- `graph_implementation`: The graph implementation of the atom.

Slots

expr An [Expression](#) to be summed.

axis (Optional) The dimension across which to apply the function: 1 indicates rows, and 2 indicates columns. The default is 2.

cumsum_axis

Cumulative Sum

Description

The cumulative sum, $\sum_{i=1}^k x_i$ for $k = 1, \dots, n$. When calling `cumsum`, matrices are automatically flattened into column-major order before the sum is taken.

Usage

```
cumsum_axis(expr, axis = 2)
```

```
## S4 method for signature 'Expression'
cumsum(x)
```

Arguments

axis (Optional) The dimension across which to apply the function: 1 indicates rows, and 2 indicates columns. The default is 2.

x, expr An [Expression](#), vector, or matrix.

Examples

```
val <- cbind(c(1,2), c(3,4))
value(cumsum(Constant(val)))
value(cumsum_axis(Constant(val)))

x <- Variable(2,2)
prob <- Problem(Minimize(cumsum(x)[4]), list(x == val))
result <- solve(prob)
result$value
result$getValue(cumsum(x))
```

curvature	<i>Curvature of Expression</i>
-----------	--------------------------------

Description

The curvature of an expression.

Usage

```
curvature(object)
```

Arguments

object An [Expression](#) object.

Value

A string indicating the curvature of the expression, either "CONSTANT", "AFFINE", "CONVEX", "CONCAVE", or "UNKNOWN".

Examples

```
x <- Variable()
c <- Constant(5)

curvature(c)
curvature(x)
curvature(x^2)
curvature(sqrt(x))
curvature(log(x^3) + sqrt(x))
```

curvature-atom	<i>Curvature of an Atom</i>
----------------	-----------------------------

Description

Determine if an atom is convex, concave, or affine.

Usage

```
is_atom_convex(object)

is_atom_concave(object)

is_atom_affine(object)
```

```
## S4 method for signature 'Atom'
is_atom_convex(object)

## S4 method for signature 'Atom'
is_atom_concave(object)

## S4 method for signature 'Atom'
is_atom_affine(object)
```

Arguments

object A [Atom](#) object.

Value

A logical value.

Examples

```
x <- Variable()

is_atom_convex(x^2)
is_atom_convex(sqrt(x))
is_atom_convex(log(x))

is_atom_concave(-abs(x))
is_atom_concave(x^2)
is_atom_concave(sqrt(x))

is_atom_affine(2*x)
is_atom_affine(x^2)
```

curvature-comp

Curvature of Composition

Description

Determine whether a composition is non-decreasing or non-increasing in an index.

Usage

```
is_incr(object, idx)

is_decr(object, idx)

## S4 method for signature 'Atom'
is_incr(object, idx)

## S4 method for signature 'Atom'
is_decr(object, idx)
```

Arguments

object A [Atom](#) object.
idx An index into the atom.

Value

A logical value.

Examples

```
x <- Variable()
is_incr(log(x), 1)
is_incr(x^2, 1)
is_decr(min(x), 1)
is_decr(abs(x), 1)
```

curvature-methods *Curvature Properties*

Description

Determine if an expression is constant, affine, convex, concave, quadratic, or piecewise linear (pwl).

Usage

```
is_constant(object)
is_affine(object)
is_convex(object)
is_concave(object)
is_quadratic(object)
is_pwl(object)
```

Arguments

object An [Expression](#) object.

Value

A logical value.

Examples

```

x <- Variable()
c <- Constant(5)

is_constant(c)
is_constant(x)

is_affine(c)
is_affine(x)
is_affine(x^2)

is_convex(c)
is_convex(x)
is_convex(x^2)
is_convex(sqrt(x))

is_concave(c)
is_concave(x)
is_concave(x^2)
is_concave(sqrt(x))

is_quadratic(x^2)
is_quadratic(sqrt(x))

is_pwl(c)
is_pwl(x)
is_pwl(x^2)

```

cvxr_norm

Matrix Norm (Alternative)

Description

A wrapper on the different norm atoms. This is different from the standard "norm" method in the R base package. If $p = 2$, $axis = NA$, and x is a matrix, this returns the maximum singular value.

Usage

```
cvxr_norm(x, p = 2, axis = NA_real_)
```

Arguments

<code>x</code>	An Expression or numeric constant representing a vector or matrix.
<code>p</code>	The type of norm. May be a number (p-norm), "inf" (infinity-norm), "nuc" (nuclear norm), or "fro" (Frobenius norm). The default is $p = 2$.
<code>axis</code>	(Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.

Value

An [Expression](#) representing the norm.

See Also

[norm](#)

diag,Expression-method

Matrix Diagonal

Description

Extracts the diagonal from a matrix or makes a vector into a diagonal matrix.

Usage

```
## S4 method for signature 'Expression'  
diag(x = 1, nrow, ncol)
```

Arguments

x An [Expression](#), vector, or square matrix.
nrow, ncol (Optional) Dimensions for the result when x is not a matrix.

Value

An [Expression](#) representing the diagonal vector or matrix.

Examples

```
C <- Variable(3,3)  
obj <- Maximize(C[1,3])  
constraints <- list(diag(C) == 1, C[1,2] == 0.6, C[2,3] == -0.3, C == Semidef(3))  
prob <- Problem(obj, constraints)  
result <- solve(prob)  
result$value  
result$getValue(C)
```

DiagMat-class

The DiagMat class.

Description

This class represents the extraction of the diagonal from a square matrix.

Usage

```
DiagMat(expr)

## S4 method for signature 'DiagMat'
to_numeric(object, values)

## S4 method for signature 'DiagMat'
size_from_args(object)

## S4 method for signature 'DiagMat'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

expr	An Expression representing the matrix whose diagonal we are interested in.
object	A DiagMat object.
values	A list of arguments to the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `to_numeric`: Extract the diagonal from a square matrix constant.
- `size_from_args`: The size of the atom.
- `graph_implementation`: The graph implementation of the atom.

Slots

expr An [Expression](#) representing the matrix whose diagonal we are interested in.

DiagVec-class *The DiagVec class.*

Description

This class represents the conversion of a vector into a diagonal matrix.

Usage

```
DiagVec(expr)

## S4 method for signature 'DiagVec'
to_numeric(object, values)

## S4 method for signature 'DiagVec'
size_from_args(object)

## S4 method for signature 'DiagVec'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

expr	An Expression representing the vector to convert.
object	A DiagVec object.
values	A list of arguments to the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- to_numeric: Convert the vector constant into a diagonal matrix.
- size_from_args: The size of the atom.
- graph_implementation: The graph implementation of the atom.

Slots

expr An [Expression](#) representing the vector to convert.

 diff,Expression-method

Lagged and Iterated Differences

Description

The lagged and iterated differences of a vector. If x is length n , this function returns a length $n - k$ vector of the k th order difference between the lagged terms. `diff(x)` returns the vector of differences between adjacent elements in the vector, i.e. $[x[2] - x[1], x[3] - x[2], \dots]$. `diff(x, 1, 2)` is the second-order differences vector, equivalently `diff(diff(x))`. `diff(x, 1, 0)` returns the vector x unchanged. `diff(x, 2)` returns the vector of differences $[x[3] - x[1], x[4] - x[2], \dots]$, equivalent to $x[(1+\text{lag}):n] - x[1:(n-\text{lag})]$.

Usage

```
## S4 method for signature 'Expression'
diff(x, lag = 1, differences = 1, ...)
```

Arguments

<code>x</code>	An Expression .
<code>lag</code>	An integer indicating which lag to use.
<code>differences</code>	An integer indicating the order of the difference.
<code>...</code>	(Optional) Addition axis argument, specifying the dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is <code>axis = 1</code> .

Value

An [Expression](#) representing the k th order difference.

Examples

```
## Problem data
m <- 101
L <- 2
h <- L/(m-1)

## Form objective and constraints
x <- Variable(m)
y <- Variable(m)
obj <- sum(y)
constr <- list(x[1] == 0, y[1] == 1, x[m] == 1, y[m] == 1, diff(x)^2 + diff(y)^2 <= h^2)

## Solve the catenary problem
prob <- Problem(Minimize(obj), constr)
result <- solve(prob)
```

```
## Plot and compare with ideal catenary
xs <- result$getValue(x)
ys <- result$getValue(y)
plot(c(0, 1), c(0, 1), type = 'n', xlab = "x", ylab = "y")
lines(xs, ys, col = "blue", lwd = 2)
grid()
```

domain

Domain

Description

A list of constraints describing the closure of the region where the expression is finite.

Usage

```
domain(object)
```

Arguments

object An [Expression](#) object.

Value

A list of [Constraint](#) objects.

Examples

```
a <- Variable(name = "a")
dom <- domain(p_norm(a, -0.5))
prob <- Problem(Minimize(a), dom)
result <- solve(prob)
result$value

b <- Variable()
dom <- domain(kl_div(a, b))
result <- solve(Problem(Minimize(a + b), dom))
result$getValue(a)
result$getValue(b)

A <- Variable(2, 2, name = "A")
dom <- domain(lambda_max(A))
A0 <- rbind(c(1,2), c(3,4))
result <- solve(Problem(Minimize(norm2(A - A0)), dom))
result$getValue(A)

dom <- domain(log_det(A + diag(rep(1,2))))
prob <- Problem(Minimize(sum(diag(A))), dom)
result <- solve(prob, solver = "SCS")
result$value
```

dspop

Direct Standardization: Population

Description

Randomly generated data for direct standardization example. Sex was drawn from a Bernoulli distribution, and age was drawn from a uniform distribution on 10,...,60. The response was drawn from a normal distribution with a mean that depends on sex and age, and a variance of 1.

Usage

dspop

Format

A data frame with 1000 rows and 3 variables:

y Response variable

sex Sex of individual, coded male (0) and female (1)

age Age of individual

See Also

[dssamp](#)

dssamp

Direct Standardization: Sample

Description

A sample of [dspop](#) for direct standardization example. The sample is skewed such that young males are overrepresented in comparison to the population.

Usage

dssamp

Format

A data frame with 100 rows and 3 variables:

y Response variable

sex Sex of individual, coded male (0) and female (1)

age Age of individual

See Also

[dspop](#)

ECOS-class	<i>The ECOS class.</i>
------------	------------------------

Description

This class is an interface for the ECOS solver.

Usage

```
ECOS()

## S4 method for signature 'ECOS'
lp_capable(solver)

## S4 method for signature 'ECOS'
socp_capable(solver)

## S4 method for signature 'ECOS'
sdp_capable(solver)

## S4 method for signature 'ECOS'
exp_capable(solver)

## S4 method for signature 'ECOS'
mip_capable(solver)

## S4 method for signature 'ECOS'
name(object)

## S4 method for signature 'ECOS'
import_solver(solver)

## S4 method for signature 'ECOS'
Solver.solve(solver, objective, constraints, cached_data,
             warm_start, verbose, ...)

## S4 method for signature 'ECOS'
format_results(solver, results_dict, data, cached_data)
```

Arguments

object, solver	An ECOS object.
objective	A list representing the canonicalized objective.
constraints	A list of canonicalized constraints.
cached_data	A list mapping solver name to cached problem data.

warm_start	A logical value indicating whether the previous solver result should be used to warm start.
verbose	A logical value indicating whether to print solver output.
...	Additional arguments to the solver.
results_dict	A list containing the solver output.
data	A list containing information about the problem.

Methods (by generic)

- `lp_capable`: ECOS can handle linear programs.
- `socp_capable`: ECOS can handle second-order cone programs.
- `sdp_capable`: ECOS cannot handle semidefinite programs.
- `exp_capable`: ECOS can handle exponential cone programs.
- `mip_capable`: ECOS cannot handle mixed-integer programs.
- `name`: The name of the solver.
- `import_solver`: Imports the ECOSolveR library.
- `Solver.solve`: Call the solver on the canonicalized problem.
- `format_results`: Convert raw solver output into standard list of results.

Examples

```
ecos <- ECOS()
lp_capable(ecos)
sdp_capable(ecos)
socp_capable(ecos)
exp_capable(ecos)
mip_capable(ecos)
```

ECOS_BB-class *The ECOS_BB class.*

Description

This class is an interface for the ECOS BB (branch-and-bound) solver.

Usage

```
ECOS_BB()  
  
## S4 method for signature 'ECOS_BB'  
lp_capable(solver)  
  
## S4 method for signature 'ECOS_BB'  
socp_capable(solver)  
  
## S4 method for signature 'ECOS_BB'  
sdp_capable(solver)  
  
## S4 method for signature 'ECOS_BB'  
exp_capable(solver)  
  
## S4 method for signature 'ECOS_BB'  
mip_capable(solver)  
  
## S4 method for signature 'ECOS_BB'  
name(object)  
  
## S4 method for signature 'ECOS_BB'  
Solver.solve(solver, objective, constraints,  
             cached_data, warm_start, verbose, ...)
```

Arguments

object, solver	A ECOS_BB object.
objective	A list representing the canonicalized objective.
constraints	A list of canonicalized constraints.
cached_data	A list mapping solver name to cached problem data.
warm_start	A logical value indicating whether the previous solver result should be used to warm start.
verbose	A logical value indicating whether to print solver output.
...	Additional arguments to the solver.

Methods (by generic)

- `lp_capable`: ECOS_BB can handle linear programs.
- `socp_capable`: ECOS_BB can handle second-order cone programs.
- `sdp_capable`: ECOS_BB cannot handle semidefinite programs.
- `exp_capable`: ECOS_BB cannot handle exponential cone programs.
- `mip_capable`: ECOS_BB can handle mixed-integer programs.
- `name`: The name of the solver.
- `Solver.solve`: Call the solver on the canonicalized problem.

[ECOS_solve](#) and the [ECOS Official Repository](#).

Examples

```
ecos_bb <- ECOS_BB()
lp_capable(ecos_bb)
sdp_capable(ecos_bb)
socp_capable(ecos_bb)
exp_capable(ecos_bb)
mip_capable(ecos_bb)
```

Elementwise-class *The Elementwise class.*

Description

This virtual class represents an elementwise atom.

Usage

```
## S4 method for signature 'Elementwise'
validate_args(object)

## S4 method for signature 'Elementwise'
size_from_args(object)
```

Arguments

`object` An [Elementwise](#) object.

Methods (by generic)

- `validate_args`: Check all the shapes are the same or can be promoted.
- `size_from_args`: Size is the same as the sum of the arguments' sizes.

entr	<i>Entropy Function</i>
------	-------------------------

Description

The elementwise entropy function, $-x \log(x)$.

Usage

```
entr(x)
```

Arguments

`x` An [Expression](#), vector, or matrix.

Value

An [Expression](#) representing the entropy of the input.

Examples

```
x <- Variable(5)
obj <- Maximize(sum(entr(x)))
prob <- Problem(obj, list(sum(x) == 1))
result <- solve(prob)
result$getValue(x)
```

Entr-class	<i>The Entr class.</i>
------------	------------------------

Description

This class represents the elementwise operation $-x \log(x)$.

Usage

```

Entr(x)

## S4 method for signature 'Entr'
to_numeric(object, values)

## S4 method for signature 'Entr'
sign_from_args(object)

## S4 method for signature 'Entr'
is_atom_convex(object)

## S4 method for signature 'Entr'
is_atom_concave(object)

## S4 method for signature 'Entr'
is_incr(object, idx)

## S4 method for signature 'Entr'
is_decr(object, idx)

## S4 method for signature 'Entr'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x	An Expression or numeric constant.
object	An Entr object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- to_numeric: The elementwise entropy function evaluated at the value.
- sign_from_args: The sign of the atom is unknown.
- is_atom_convex: The atom is not convex.
- is_atom_concave: The atom is concave.
- is_incr: The atom is weakly increasing.
- is_decr: The atom is weakly decreasing.
- graph_implementation: The graph implementation of the atom.

Slots

- x An [Expression](#) or numeric constant.

exp, Expression-method *Natural Exponential*

Description

The elementwise natural exponential.

Usage

```
## S4 method for signature 'Expression'  
exp(x)
```

Arguments

- x An [Expression](#).

Value

An [Expression](#) representing the natural exponential of the input.

Examples

```
x <- Variable(5)  
obj <- Minimize(sum(exp(x)))  
prob <- Problem(obj, list(sum(x) == 1))  
result <- solve(prob)  
result$getValue(x)
```

Exp-class *The Exp class.*

Description

This class represents the elementwise natural exponential e^x .

Usage

```

Exp(x)

## S4 method for signature 'Exp'
to_numeric(object, values)

## S4 method for signature 'Exp'
sign_from_args(object)

## S4 method for signature 'Exp'
is_atom_convex(object)

## S4 method for signature 'Exp'
is_atom_concave(object)

## S4 method for signature 'Exp'
is_incr(object, idx)

## S4 method for signature 'Exp'
is_decr(object, idx)

## S4 method for signature 'Exp'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x	An Expression object.
object	An Exp object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `to_numeric`: The matrix with each element exponentiated.
- `sign_from_args`: The atom is positive.
- `is_atom_convex`: The atom is convex.
- `is_atom_concave`: The atom is not concave.
- `is_incr`: The atom is weakly increasing.
- `is_decr`: The atom is not weakly decreasing.
- `graph_implementation`: The graph implementation of the atom.

Slots

x An [Expression](#) object.

ExpCone-class	<i>The ExpCone class.</i>
---------------	---------------------------

Description

This class represents a reformulated exponential cone constraint operating elementwise on a, b, c .

Usage

```
ExpCone(a, b, c)
```

```
## S4 method for signature 'ExpCone'
size(object)
```

```
## S4 method for signature 'ExpCone'
as.character(x)
```

```
## S4 method for signature 'ExpCone'
variables(object)
```

```
## S4 method for signature 'ExpCone'
format_constr(object, eq_constr, leq_constr, dims,
  solver)
```

Arguments

a	The variable a in the exponential cone.
b	The variable b in the exponential cone.
c	The variable c in the exponential cone.
x, object	A ExpCone object.
eq_constr	A list of the equality constraints in the canonical problem.
leq_constr	A list of the inequality constraints in the canonical problem.
dims	A list with the dimensions of the conic constraints.
solver	A string representing the solver to be called.

Details

Original cone:

$$K = \{(a, b, c) | b > 0, be^{a/b} \leq c\} \cup \{(a, b, c) | a \leq 0, b = 0, c \geq 0\}$$

Reformulated cone:

$$K = \{(a, b, c) | b, c > 0, b \log(b) + a \leq b \log(c)\} \cup \{(a, b, c) | a \leq 0, b = 0, c \geq 0\}$$

Methods (by generic)

- size: The size of the x argument.
- variables: List of [Variable](#) objects in the exponential cone.
- format_constr: Format exponential cone constraints for the solver.

Slots

constr_id (Internal) A unique integer identification number used internally.

a The variable a in the exponential cone.

b The variable b in the exponential cone.

c The variable c in the exponential cone.

Expression-class *The Expression class.*

Description

This class represents a mathematical expression.

Usage

```
## S4 method for signature 'Expression'
value(object)
```

```
## S4 method for signature 'Expression'
grad(object)
```

```
## S4 method for signature 'Expression'
domain(object)
```

```
## S4 method for signature 'Expression'
as.character(x)
```

```
## S4 method for signature 'Expression'
name(object)
```

```
## S4 method for signature 'Expression'
curvature(object)
```

```
## S4 method for signature 'Expression'
is_constant(object)
```

```
## S4 method for signature 'Expression'
is_affine(object)
```

```
## S4 method for signature 'Expression'  
is_convex(object)  
  
## S4 method for signature 'Expression'  
is_concave(object)  
  
## S4 method for signature 'Expression'  
is_dcp(object)  
  
## S4 method for signature 'Expression'  
is_quadratic(object)  
  
## S4 method for signature 'Expression'  
is_pwl(object)  
  
## S4 method for signature 'Expression'  
is_zero(object)  
  
## S4 method for signature 'Expression'  
is_positive(object)  
  
## S4 method for signature 'Expression'  
is_negative(object)  
  
## S4 method for signature 'Expression'  
size(object)  
  
## S4 method for signature 'Expression'  
is_scalar(object)  
  
## S4 method for signature 'Expression'  
is_vector(object)  
  
## S4 method for signature 'Expression'  
is_matrix(object)  
  
## S4 method for signature 'Expression'  
nrow(x)  
  
## S4 method for signature 'Expression'  
ncol(x)
```

Arguments

x, object An [Expression](#) object.

Methods (by generic)

- value: The value of the expression.

- `grad`: The (sub/super)-gradient of the expression with respect to each variable.
- `domain`: A list of constraints describing the closure of the region where the expression is finite.
- `name`: The string representation of the expression.
- `curvature`: The curvature of the expression.
- `is_constant`: The expression is constant if it contains no variables or is identically zero.
- `is_affine`: The expression is affine if it is constant or both convex and concave.
- `is_convex`: A logical value indicating whether the expression is convex.
- `is_concave`: A logical value indicating whether the expression is concave.
- `is_dcp`: The expression is DCP if it is convex or concave.
- `is_quadratic`: A logical value indicating whether the expression is quadratic.
- `is_pwl`: A logical value indicating whether the expression is piecewise linear.
- `is_zero`: The expression is zero if it is both positive and negative.
- `is_positive`: A logical value indicating whether the expression is positive.
- `is_negative`: A logical value indicating whether the expression is negative.
- `size`: The $c(\text{row}, \text{col})$ dimensions of the expression.
- `is_scalar`: The expression is scalar if $\text{rows} = \text{cols} = 1$.
- `is_vector`: The expression is a vector if $\min(\text{rows}, \text{cols}) = 1$.
- `is_matrix`: The expression is a matrix if $\text{rows} > 1$ and $\text{cols} > 1$.
- `nrow`: Number of rows in the expression.
- `ncol`: Number of columns in the expression.

 expression-parts

Parts of an Expression

Description

List the variables, parameters, or constants in a canonical expression.

Usage

`variables(object)`

`parameters(object)`

`constants(object)`

Arguments

`object` A [Canonical](#) expression.

Value

A list of [Variable](#), [Parameter](#), or [Constant](#) objects.

Examples

```
m <- 50
n <- 10
beta <- Variable(n)
y <- matrix(rnorm(m), nrow = m)
X <- matrix(rnorm(m*n), nrow = m, ncol = n)
lambda <- Parameter()

expr <- sum_squares(y - X %*% beta) + lambda*p_norm(beta, 1)
variables(expr)
parameters(expr)
constants(expr)
lapply(constants(expr), function(c) { value(c) })
```

format_constr

Format Constraints

Description

Format constraints for the solver.

Usage

```
format_constr(object, eq_constr, leq_constr, dims, solver)
```

Arguments

object	A Constraint object.
eq_constr	A list of the equality constraints in the canonical problem.
leq_constr	A list of the inequality constraints in the canonical problem.
dims	A list with the dimensions of the conic constraints.
solver	A string representing the solver to be called.

Value

A list containing equality constraints, inequality constraints, and dimensions.

format_results	<i>Format Solver Results</i>
----------------	------------------------------

Description

Converts the solver output into standard form.

Usage

```
format_results(solver, results_dict, data, cached_data)
```

Arguments

solver	A Solver object.
results_dict	A list containing the solver output.
data	A list containing information about the problem.
cached_data	A list mapping solver name to cached problem data.

Value

A list containing the solver output in standard form.

GeoMean-class	<i>The GeoMean class.</i>
---------------	---------------------------

Description

This class represents the (weighted) geometric mean of vector x with optional powers given by p .

Usage

```
GeoMean(x, p = NA_real_, max_denom = 1024)
```

```
## S4 method for signature 'GeoMean'
validate_args(object)
```

```
## S4 method for signature 'GeoMean'
to_numeric(object, values)
```

```
## S4 method for signature 'GeoMean'
size_from_args(object)
```

```
## S4 method for signature 'GeoMean'
sign_from_args(object)
```

```

## S4 method for signature 'GeoMean'
is_atom_convex(object)

## S4 method for signature 'GeoMean'
is_atom_concave(object)

## S4 method for signature 'GeoMean'
is_incr(object, idx)

## S4 method for signature 'GeoMean'
is_decr(object, idx)

## S4 method for signature 'GeoMean'
get_data(object)

## S4 method for signature 'GeoMean'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x	An Expression or numeric vector.
p	(Optional) A vector of weights for the weighted geometric mean. The default is a vector of ones, giving the unweighted geometric mean $x_1^{1/n} \cdots x_n^{1/n}$.
max_denom	(Optional) The maximum denominator to use in approximating $p/\text{sum}(p)$ with w . If w is not an exact representation, increasing <code>max_denom</code> may offer a more accurate representation, at the cost of requiring more convex inequalities to represent the geometric mean. Defaults to 1024.
object	A GeoMean object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Details

$$(x_1^{p_1} \cdots x_n^{p_n})^{\frac{1}{\sum p_i}}$$

The geometric mean includes an implicit constraint that $x_i \geq 0$ whenever $p_i > 0$. If $p_i = 0$, x_i will be unconstrained. The only exception to this rule occurs when p has exactly one nonzero element, say p_i , in which case $\text{GeoMean}(x, p)$ is equivalent to x_i (without the nonnegativity constraint). A specific case of this is when $x \in \mathbf{R}^1$.

Methods (by generic)

- `validate_args`: Empty function since validation of arguments is done during atom initialization.
- `to_numeric`: The (weighted) geometric mean of the elements of `x`.
- `size_from_args`: The atom is a scalar.
- `sign_from_args`: The atom is non-negative.
- `is_atom_convex`: The atom is not convex.
- `is_atom_concave`: The atom is concave.
- `is_incr`: The atom is weakly increasing in every argument.
- `is_decr`: The atom is not weakly decreasing in any argument.
- `get_data`: Returns `list(w, dyadic completion, tree of dyads)`.
- `graph_implementation`: The graph implementation of the atom.

Slots

- `x` An [Expression](#) or numeric vector.
- `p` (Optional) A vector of weights for the weighted geometric mean. The default is a vector of ones, giving the **unweighted** geometric mean $x_1^{1/n} \cdots x_n^{1/n}$.
- `max_denom` (Optional) The maximum denominator to use in approximating $p/\text{sum}(p)$ with `w`. If `w` is not an exact representation, increasing `max_denom` may offer a more accurate representation, at the cost of requiring more convex inequalities to represent the geometric mean. Defaults to 1024.
- `w` (Internal) A list of `bigq` objects that represent a rational approximation of $p/\text{sum}(p)$.
- `approx_error` (Internal) The error in approximating $p/\text{sum}(p)$ with `w`, given by $\|p/\mathbf{1}^T p - w\|_\infty$.

 geo_mean

Geometric Mean

Description

The (weighted) geometric mean of vector x with optional powers given by p .

Usage

```
geo_mean(x, p = NA_real_, max_denom = 1024)
```

Arguments

- `x` An [Expression](#) or vector.
- `p` (Optional) A vector of weights for the weighted geometric mean. Defaults to a vector of ones, giving the **unweighted** geometric mean $x_1^{1/n} \cdots x_n^{1/n}$.
- `max_denom` (Optional) The maximum denominator to use in approximating $p/\text{sum}(p)$ with `w`. If `w` is not an exact representation, increasing `max_denom` may offer a more accurate representation, at the cost of requiring more convex inequalities to represent the geometric mean. Defaults to 1024.

Details

$$(x_1^{p_1} \cdots x_n^{p_n})^{\frac{1}{\sum p_i}}$$

The geometric mean includes an implicit constraint that $x_i \geq 0$ whenever $p_i > 0$. If $p_i = 0$, x_i will be unconstrained. The only exception to this rule occurs when p has exactly one nonzero element, say p_i , in which case $\text{geo_mean}(x, p)$ is equivalent to x_i (without the nonnegativity constraint). A specific case of this is when $x \in \mathbf{R}^1$.

Value

An [Expression](#) representing the geometric mean of the input.

Examples

```
x <- Variable(2)
cost <- geo_mean(x)
prob <- Problem(Maximize(cost), list(sum(x) <= 1))
result <- solve(prob)
result$value
result$getValue(x)

x <- Variable(5)
p <- c(0.07, 0.12, 0.23, 0.19, 0.39)
prob <- Problem(Maximize(geo_mean(x,p)), list(p_norm(x) <= 1))
result <- solve(prob)
result$value
result$getValue(x)
```

get_data

Get Expression Data

Description

Get information needed to reconstruct the expression aside from its arguments.

Usage

```
get_data(object)
```

Arguments

object A [Expression](#) object.

Value

A list containing data.

get_gurobiglue	<i>Get our gurobiglue handle</i>
----------------	----------------------------------

Description

Get the gurobiglue handle or fail if not available

Usage

```
get_gurobiglue()
```

Value

the gurobiglue handle

Examples

```
## Not run:  
  get_gurobiglue  
  
## End(Not run)
```

get_id	<i>Get ID</i>
--------	---------------

Description

Get the next identifier value.

Usage

```
get_id()
```

Value

A new unique integer identifier.

Examples

```
## Not run:  
  get_id()  
  
## End(Not run)
```

get_mosekglue	<i>Get our mosekglue handle</i>
---------------	---------------------------------

Description

Get the mosekglue handle or fail if not available

Usage

```
get_mosekglue()
```

Value

the mosekglue handle

Examples

```
## Not run:  
  get_mosekglue  
  
## End(Not run)
```

get_np	<i>Get numpy handle</i>
--------	-------------------------

Description

Get the numpy handle or fail if not available

Usage

```
get_np()
```

Value

the numpy handle

Examples

```
## Not run:  
  get_np  
  
## End(Not run)
```

get_problem_data	<i>Get Problem Data</i>
------------------	-------------------------

Description

Get the problem data used in the call to the solver.

Usage

```
get_problem_data(object, solver)
```

Arguments

object	A Problem object.
solver	A string indicating the solver that the problem data is for. Call <code>installed_solvers()</code> to see all available.

Value

A list of arguments for the solver.

Examples

```
a <- Variable(name = "a")
data <- get_problem_data(Problem(Maximize(exp(a) + 2)), "SCS")
data[["dims"]]
data[["c"]]
data[["A"]]

x <- Variable(2, name = "x")
data <- get_problem_data(Problem(Minimize(p_norm(x) + 3)), "ECOS")
data[["dims"]]
data[["c"]]
data[["A"]]
data[["G"]]
```

get_sp	<i>Get scipy handle</i>
--------	-------------------------

Description

Get the scipy handle or fail if not available

Usage

```
get_sp()
```

Value

the scipy handle

Examples

```
## Not run:
  get_sp

## End(Not run)
```

 GLPK-class

The GLPK class

Description

This class is an interface for Gnu Linear Programming Toolkit solver

Usage

```
GLPK()

## S4 method for signature 'GLPK'
lp_capable(solver)

## S4 method for signature 'GLPK'
socp_capable(solver)

## S4 method for signature 'GLPK'
sdp_capable(solver)

## S4 method for signature 'GLPK'
exp_capable(solver)

## S4 method for signature 'GLPK'
mip_capable(solver)

## S4 method for signature 'GLPK'
name(object)

## S4 method for signature 'GLPK'
import_solver(solver)

## S4 method for signature 'GLPK'
Solver.solve(solver, objective, constraints, cached_data,
  warm_start, verbose, ...)

## S4 method for signature 'GLPK'
format_results(solver, results_dict, data, cached_data)
```

Arguments

object, solver	A GLPK object.
objective	A list representing the canonicalized objective.
constraints	A list of canonicalized constraints.
cached_data	A list mapping solver name to cached problem data.
warm_start	A logical value indicating whether the previous solver result should be used to warm start.
verbose	A logical value indicating whether to print solver output.
...	Additional arguments to the solver.
results_dict	A list containing the solver output.
data	A list containing information about the problem.

Methods (by generic)

- `lp_capable`: GLPK can handle linear programs.
- `socp_capable`: GLPK can handle second-order cone programs.
- `sdp_capable`: GLPK can handle semidefinite programs.
- `exp_capable`: GLPK cannot handle exponential cone programs.
- `mip_capable`: GLPK cannot handle mixed-integer programs.
- `name`: The name of the solver.
- `import_solver`: Imports the Rgpkk library.
- `Solver.solve`: Call the solver on the canonicalized problem.
- `format_results`: Convert raw solver output into standard list of results.

See Also

the [Gnu GLPK site](#).

grad

Sub/Super-Gradient

Description

The (sub/super)-gradient of the expression with respect to each variable. Matrix expressions are vectorized, so the gradient is a matrix. NA indicates variable values are unknown or outside the domain.

Usage

grad(object)

Arguments

object An [Expression](#) object.

Value

A list mapping each variable to a sparse matrix.

Examples

```
x <- Variable(2, name = "x")
A <- Variable(2, 2, name = "A")

value(x) <- c(-3,4)
expr <- p_norm(x, 2)
grad(expr)

value(A) <- rbind(c(3,-4), c(4,3))
expr <- p_norm(A, 0.5)
grad(expr)

value(A) <- cbind(c(1,2), c(-1,0))
expr <- abs(A)
grad(expr)
```

graph_implementation *Graph Implementation*

Description

Reduces the atom to an affine expression and list of constraints.

Usage

```
graph_implementation(object, arg_objs, size, data)
```

Arguments

object An [Expression](#) object.
arg_objs A list of linear expressions for each argument.
size A vector with two elements representing the size of the resulting expression.
data A list of additional data required by the atom.

Value

A list of list(LinOp for objective, list of constraints), where LinOp is a list representing the linear operator.

GUROBI-class

The GUROBI class.

Description

This class is an interface for the commercial GUROBI solver.

Usage

```

GUROBI()

## S4 method for signature 'GUROBI'
lp_capable(solver)

## S4 method for signature 'GUROBI'
socp_capable(solver)

## S4 method for signature 'GUROBI'
sdp_capable(solver)

## S4 method for signature 'GUROBI'
exp_capable(solver)

## S4 method for signature 'GUROBI'
mip_capable(solver)

## S4 method for signature 'GUROBI'
name(object)

## S4 method for signature 'GUROBI'
import_solver(solver)

## S4 method for signature 'GUROBI'
Solver.solve(solver, objective, constraints,
             cached_data, warm_start, verbose, ...)

```

Arguments

<code>object, solver</code>	A GUROBI object.
<code>objective</code>	A list representing the canonicalized objective.
<code>constraints</code>	A list of canonicalized constraints.
<code>cached_data</code>	A list mapping solver name to cached problem data.
<code>warm_start</code>	A logical value indicating whether the previous solver result should be used to warm start.
<code>verbose</code>	A logical value indicating whether to print solver output.
<code>...</code>	Additional arguments to the solver.

Methods (by generic)

- `lp_capable`: GUROBI can handle linear programs.
- `socp_capable`: GUROBI can handle second-order cone programs.
- `sdp_capable`: GUROBI cannot handle semidefinite programs.
- `exp_capable`: GUROBI cannot handle exponential cone programs.
- `mip_capable`: GUROBI can handle mixed-integer programs.
- `name`: The name of the solver.
- `import_solver`: Imports the reticulate library to use the python solver.
- `Solver.solve`: Call the solver on the canonicalized problem.

harmonic_mean

Harmonic Mean

Description

The harmonic mean, $(\frac{1}{n} \sum_{i=1}^n x_i^{-1})^{-1}$. For a matrix, the function is applied over all entries.

Usage

```
harmonic_mean(x)
```

Arguments

`x` An [Expression](#), vector, or matrix.

Value

An [Expression](#) representing the harmonic mean of the input.

Examples

```
x <- Variable()
prob <- Problem(Maximize(harmonic_mean(x)), list(x >= 0, x <= 5))
result <- solve(prob)
result$value
result$getValue(x)
```

hstack

Horizontal Concatenation

Description

The horizontal concatenation of expressions. This is equivalent to `cbind` when applied to objects with the same number of rows.

Usage

```
hstack(...)
```

Arguments

... [Expression](#) objects, vectors, or matrices. All arguments must have the same number of rows.

Value

An [Expression](#) representing the concatenated inputs.

Examples

```
x <- Variable(2)
y <- Variable(3)
c <- matrix(1, nrow = 1, ncol = 5)
prob <- Problem(Minimize(c %*% t(hstack(t(x), t(y)))), list(x == c(1,2), y == c(3,4,5)))
result <- solve(prob)
result$value
```

```
c <- matrix(1, nrow = 1, ncol = 4)
prob <- Problem(Minimize(c %*% t(hstack(t(x), t(x)))), list(x == c(1,2)))
result <- solve(prob)
result$value
```

```
A <- Variable(2,2)
C <- Variable(3,2)
c <- matrix(1, nrow = 2, ncol = 2)
prob <- Problem(Minimize(sum_entries(hstack(t(A), t(C)))), list(A >= 2*c, C == -2))
result <- solve(prob)
result$value
result$getValue(A)
```

```
D <- Variable(3,3)
expr <- hstack(C, D)
obj <- expr[1,2] + sum(hstack(expr, expr))
constr <- list(C >= 0, D >= 0, D[1,1] == 2, C[1,2] == 3)
prob <- Problem(Minimize(obj), constr)
result <- solve(prob)
result$value
```

```
result$getValue(C)
result$getValue(D)
```

HStack-class	<i>The HStack class.</i>
--------------	--------------------------

Description

Horizontal concatenation of values.

Usage

```
HStack(...)

## S4 method for signature 'HStack'
validate_args(object)

## S4 method for signature 'HStack'
to_numeric(object, values)

## S4 method for signature 'HStack'
size_from_args(object)

## S4 method for signature 'HStack'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

...	Expression objects or matrices. All arguments must have the same number of rows.
object	A HStack object.
values	A list of arguments to the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check all arguments have the same height.
- `to_numeric`: Horizontally concatenate the values using `cbind`.
- `size_from_args`: The size of the atom.
- `graph_implementation`: The graph implementation of the atom.

Slots

... [Expression](#) objects or matrices. All arguments must have the same number of rows.

huber

*Huber Function***Description**

The elementwise Huber function, $Huber(x, M) =$

- $2M|x| - M^2$ for $|x| \geq |M|$
- $|x|^2$ for $|x| \leq |M|$.

Usage

```
huber(x, M = 1)
```

Arguments

- `x` An [Expression](#), vector, or matrix.
- `M` (Optional) A positive scalar value representing the threshold. Defaults to 1.

Value

An [Expression](#) representing the Huber function evaluated at the input.

Examples

```
n <- 10
m <- 450
p <- 0.1 # Fraction of responses with sign flipped

# Generate problem data
beta_true <- 5*matrix(stats::rnorm(n), nrow = n)
X <- matrix(stats::rnorm(m*n), nrow = m, ncol = n)
y_true <- X %%% beta_true
eps <- matrix(stats::rnorm(m), nrow = m)

# Randomly flip sign of some responses
factor <- 2*rbinom(m, size = 1, prob = 1-p) - 1
y <- factor * y_true + eps

# Huber regression
beta <- Variable(n)
obj <- sum(huber(y - X %%% beta, 1))
prob <- Problem(Minimize(obj))
result <- solve(prob)
result$getValue(beta)
```

Huber-class	<i>The Huber class.</i>
-------------	-------------------------

Description

This class represents the elementwise Huber function, $Huber(x, M) =$

- $2M|x| - M^2$ for $|x| \geq |M|$
- $|x|^2$ for $|x| \leq |M|$.

Usage

```
Huber(x, M = 1)

## S4 method for signature 'Huber'
validate_args(object)

## S4 method for signature 'Huber'
to_numeric(object, values)

## S4 method for signature 'Huber'
sign_from_args(object)

## S4 method for signature 'Huber'
is_atom_convex(object)

## S4 method for signature 'Huber'
is_atom_concave(object)

## S4 method for signature 'Huber'
is_incr(object, idx)

## S4 method for signature 'Huber'
is_decr(object, idx)

## S4 method for signature 'Huber'
get_data(object)

## S4 method for signature 'Huber'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

x	An Expression object.
M	A positive scalar value representing the threshold. Defaults to 1.
object	A Huber object.

values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check that M is a non-negative constant.
- `to_numeric`: The Huber function evaluated elementwise on the input value.
- `sign_from_args`: The atom is positive.
- `is_atom_convex`: The atom is convex.
- `is_atom_concave`: The atom is not concave.
- `is_incr`: A logical value indicating whether the atom is weakly increasing.
- `is_decr`: A logical value indicating whether the atom is weakly decreasing.
- `get_data`: A list containing the parameter M.
- `graph_implementation`: The graph implementation of the atom.

Slots

- x An [Expression](#) or numeric constant.
- M A positive scalar value representing the threshold. Defaults to 1.

id	<i>Identification Number</i>
----	------------------------------

Description

A unique identification number used internally to keep track of variables and constraints. Should not be modified by the user.

Usage

`id(object)`

Arguments

object A [Variable](#) or [Constraint](#) object.

Value

A non-negative integer identifier.

See Also[get_id](#) [setIdCounter](#)**Examples**

```
x <- Variable()
constr <- (x >= 5)
id(x)
id(constr)
```

import_solver	<i>Import Solver</i>
---------------	----------------------

Description

Import the R library that interfaces with the specified solver.

Usage

```
import_solver(solver)
```

Arguments

solver A [Solver](#) object.

Examples

```
import_solver(ECOS())
import_solver(SCS())
```

installed_solvers	<i>Installed Solvers</i>
-------------------	--------------------------

Description

Installed Solvers

Usage

```
installed_solvers()
```

Value

The names of all the installed solvers.

Int-class

The Int class.

Description

This class represents an integer variable.

Usage

```
Int(rows = 1, cols = 1, name = NA_character_)

## S4 method for signature 'Int'
as.character(x)

## S4 method for signature 'Int'
canonicalize(object)
```

Arguments

rows	The number of rows in the variable.
cols	The number of columns in the variable.
name	(Optional) A character string representing the name of the variable.
x, object	An Int object.

Methods (by generic)

- canonicalize: Enforce that the variable be an integer.

Slots

id (Internal) A unique identification number used internally.
rows The number of rows in the variable.
cols The number of columns in the variable.
name (Optional) A character string representing the name of the variable.
primal_value (Internal) The primal value of the variable stored internally.

Examples

```
x <- Int(3, name = "i") ## 3-int variable
y <- Int(3, 3, name = "j") # Matrix variable
as.character(y)
id(y)
is_positive(x)
is_negative(x)
size(y)
name(y)
```

```

value(y) <- matrix(1:9, nrow = 3)
value(y)
grad(y)
variables(y)
canonicalize(y)

```

IntConstr-class	<i>The IntConstr class.</i>
-----------------	-----------------------------

Description

This class represents an integer constraint, $X_{ij} \in \mathbf{Z}$ for all i, j .

Usage

```
IntConstr(lin_op)
```

Arguments

`lin_op` A list representing the linear operator equal to the `.noncvx_var`.

Slots

`constr_id` (Internal) A unique integer identification number used internally.

`lin_op` A list representing the linear operator equal to the `.noncvx_var`.

`.noncvx_var` (Internal) A list representing the variable constrained to be elementwise integer.

inv_pos	<i>Reciprocal Function</i>
---------	----------------------------

Description

The elementwise reciprocal function, $\frac{1}{x}$

Usage

```
inv_pos(x)
```

Arguments

`x` An [Expression](#), vector, or matrix.

Value

An [Expression](#) representing the reciprocal of the input.

Examples

```
A <- Variable(2,2)
val <- cbind(c(1,2), c(3,4))
prob <- Problem(Minimize(inv_pos(A)[1,2]), list(A == val))
result <- solve(prob)
result$value
```

is_dcp

*DCP Compliance***Description**

Determine if a problem or expression complies with the disciplined convex programming rules.

Usage

```
is_dcp(object)
```

Arguments

object A [Problem](#) or [Expression](#) object.

Value

A logical value indicating whether the problem or expression is DCP compliant, i.e. no unknown curvatures.

Examples

```
x <- Variable()
prob <- Problem(Minimize(x^2), list(x >= 5))
is_dcp(prob)
solve(prob)
```

is_qp

*Is Problem a QP?***Description**

Determine if a problem is a quadratic program.

Usage

```
is_qp(object)
```

Arguments

object A [Problem](#) object.

Value

A logical value indicating whether the problem is a quadratic program.

KLDiv-class	<i>The KLDiv class.</i>
-------------	-------------------------

Description

The elementwise KL-divergence $x \log(x/y) - x + y$.

Usage

```
KLDiv(x, y)

## S4 method for signature 'KLDiv'
to_numeric(object, values)

## S4 method for signature 'KLDiv'
sign_from_args(object)

## S4 method for signature 'KLDiv'
is_atom_convex(object)

## S4 method for signature 'KLDiv'
is_atom_concave(object)

## S4 method for signature 'KLDiv'
is_incr(object, idx)

## S4 method for signature 'KLDiv'
is_decr(object, idx)

## S4 method for signature 'KLDiv'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

x An [Expression](#) or numeric constant.
y An [Expression](#) or numeric constant.
object A [KLDiv](#) object.
values A list of arguments to the atom.

idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- to_numeric: The KL-divergence evaluated elementwise on the input value.
- sign_from_args: The atom is positive.
- is_atom_convex: The atom is convex.
- is_atom_concave: The atom is not concave.
- is_incr: The atom is not monotonic in any argument.
- is_decr: The atom is not monotonic in any argument.
- graph_implementation: The graph implementation of the atom.

Slots

- x An [Expression](#) or numeric constant.
- y An [Expression](#) or numeric constant.

kl_div	<i>Kullback-Leibler Divergence</i>
--------	------------------------------------

Description

The elementwise Kullback-Leibler divergence, $x \log(x/y) - x + y$.

Usage

kl_div(x, y)

Arguments

- x An [Expression](#), vector, or matrix.
- y An [Expression](#), vector, or matrix.

Value

An [Expression](#) representing the KL-divergence of the input.

Examples

```

n <- 5
alpha <- seq(10, n-1+10)/n
beta <- seq(10, n-1+10)/n
P_tot <- 0.5
W_tot <- 1.0

P <- Variable(n)
W <- Variable(n)
R <- kl_div(alpha*W, alpha*(W + beta*P)) - alpha*beta*P
obj <- sum(R)
constr <- list(P >= 0, W >= 0, sum(P) == P_tot, sum(W) == W_tot)
prob <- Problem(Minimize(obj), constr)
result <- solve(prob)

result$value
result$getValue(P)
result$getValue(W)

```

Kron-class

*The Kron class.***Description**

This class represents the kronecker product.

Usage

```

Kron(lh_exp, rh_exp)

## S4 method for signature 'Kron'
validate_args(object)

## S4 method for signature 'Kron'
to_numeric(object, values)

## S4 method for signature 'Kron'
size_from_args(object)

## S4 method for signature 'Kron'
sign_from_args(object)

## S4 method for signature 'Kron'
is_incr(object, idx)

## S4 method for signature 'Kron'
is_decr(object, idx)

```

```
## S4 method for signature 'Kron'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

lh_exp	An Expression or numeric constant representing the left-hand matrix.
rh_exp	An Expression or numeric constant representing the right-hand matrix.
object	A Kron object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check both arguments are vectors and the first is a constant.
- `to_numeric`: The kronecker product of the two values.
- `size_from_args`: The size of the atom.
- `sign_from_args`: The sign of the atom.
- `is_incr`: Is the left-hand expression positive?
- `is_decr`: Is the right-hand expression negative?
- `graph_implementation`: The graph implementation of the atom.

Slots

lh_exp An [Expression](#) or numeric constant representing the left-hand matrix.
rh_exp An [Expression](#) or numeric constant representing the right-hand matrix.

kronecker,Expression,ANY-method
Kronecker Product

Description

The generalized kronecker product of two matrices.

Usage

```
## S4 method for signature 'Expression,ANY'
kronecker(X, Y, FUN = "*",
  make.dimnames = FALSE, ...)

## S4 method for signature 'ANY,Expression'
kronecker(X, Y, FUN = "*",
  make.dimnames = FALSE, ...)

## S4 method for signature 'Expression,ANY'
X %x% Y

## S4 method for signature 'ANY,Expression'
X %x% Y
```

Arguments

X	An Expression or matrix.
Y	An Expression or matrix.
FUN	Hardwired to "*" for the kronecker product.
make.dimnames	(Unimplemented) Dimension names are not supported in Expression objects.
...	(Unimplemented) Optional arguments.

Value

An [Expression](#) that represents the kronecker product.

Examples

```
X <- cbind(c(1,2), c(3,4))
Y <- Variable(2,2)
val <- cbind(c(5,6), c(7,8))

obj <- X %x% Y
prob <- Problem(Minimize(kronecker(X,Y)[1,1]), list(Y == val))
result <- solve(prob)
result$value
result$getValue(kronecker(X,Y))
```

LambdaMax-class

The LambdaMax class.

Description

The maximum eigenvalue of a matrix, $\lambda_{\max}(A)$.

Usage

```

LambdaMax(A)

## S4 method for signature 'LambdaMax'
validate_args(object)

## S4 method for signature 'LambdaMax'
to_numeric(object, values)

## S4 method for signature 'LambdaMax'
size_from_args(object)

## S4 method for signature 'LambdaMax'
sign_from_args(object)

## S4 method for signature 'LambdaMax'
is_atom_convex(object)

## S4 method for signature 'LambdaMax'
is_atom_concave(object)

## S4 method for signature 'LambdaMax'
is_incr(object, idx)

## S4 method for signature 'LambdaMax'
is_decr(object, idx)

## S4 method for signature 'LambdaMax'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

A	An Expression or numeric matrix.
object	A LambdaMax object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check that A is square.
- `to_numeric`: The largest eigenvalue of A. Requires that A be symmetric.
- `size_from_args`: The atom is a scalar.

- sign_from_args: The sign of the atom is unknown.
- is_atom_convex: The atom is convex.
- is_atom_concave: The atom is not concave.
- is_incr: The atom is not monotonic in any argument.
- is_decr: The atom is not monotonic in any argument.
- graph_implementation: The graph implementation of the atom.

Slots

A An [Expression](#) or numeric matrix.

lambda_max	<i>Maximum Eigenvalue</i>
------------	---------------------------

Description

The maximum eigenvalue of a matrix, $\lambda_{\max}(A)$.

Usage

```
lambda_max(A)
```

Arguments

A An [Expression](#) or matrix.

Value

An [Expression](#) representing the maximum eigenvalue of the input.

Examples

```
A <- Variable(2,2)
prob <- Problem(Minimize(lambda_max(A)), list(A >= 2))
result <- solve(prob)
result$value
result$getValue(A)

obj <- Maximize(A[2,1] - A[1,2])
prob <- Problem(obj, list(lambda_max(A) <= 100, A[1,1] == 2, A[2,2] == 2, A[2,1] == 2))
result <- solve(prob)
result$value
result$getValue(A)
```

lambda_min	<i>Minimum Eigenvalue</i>
------------	---------------------------

Description

The minimum eigenvalue of a matrix, $\lambda_{\min}(A)$.

Usage

```
lambda_min(A)
```

Arguments

A An [Expression](#) or matrix.

Value

An [Expression](#) representing the minimum eigenvalue of the input.

Examples

```
A <- Variable(2,2)
val <- cbind(c(5,7), c(7,-3))
prob <- Problem(Maximize(lambda_min(A)), list(A == val))
result <- solve(prob)
result$value
result$getValue(A)
```

lambda_sum_largest	<i>Sum of Largest Eigenvalues</i>
--------------------	-----------------------------------

Description

The sum of the largest k eigenvalues of a matrix.

Usage

```
lambda_sum_largest(A, k)
```

Arguments

A An [Expression](#) or matrix.
k The number of eigenvalues to sum over.

Value

An [Expression](#) representing the sum of the largest k eigenvalues of the input.

Examples

```
C <- Variable(3,3)
val <- cbind(c(1,2,3), c(2,4,5), c(3,5,6))
prob <- Problem(Minimize(lambda_sum_largest(C,2)), list(C == val))
result <- solve(prob)
result$value
result$getValue(C)
```

lambda_sum_smallest	<i>Sum of Smallest Eigenvalues</i>
---------------------	------------------------------------

Description

The sum of the smallest k eigenvalues of a matrix.

Usage

```
lambda_sum_smallest(A, k)
```

Arguments

A	An Expression or matrix.
k	The number of eigenvalues to sum over.

Value

An [Expression](#) representing the sum of the smallest k eigenvalues of the input.

Examples

```
C <- Variable(3,3)
val <- cbind(c(1,2,3), c(2,4,5), c(3,5,6))
prob <- Problem(Maximize(lambda_sum_smallest(C,2)), list(C == val))
result <- solve(prob)
result$value
result$getValue(C)
```

Leaf-class

The Leaf class.

Description

This class represents a leaf node, i.e. a Variable, Constant, or Parameter.

Usage

```
## S4 method for signature 'Leaf'  
variables(object)
```

```
## S4 method for signature 'Leaf'  
parameters(object)
```

```
## S4 method for signature 'Leaf'  
constants(object)
```

```
## S4 method for signature 'Leaf'  
is_convex(object)
```

```
## S4 method for signature 'Leaf'  
is_concave(object)
```

```
## S4 method for signature 'Leaf'  
is_quadratic(object)
```

```
## S4 method for signature 'Leaf'  
is_pwl(object)
```

```
## S4 method for signature 'Leaf'  
domain(object)
```

```
## S4 method for signature 'Leaf'  
validate_val(object, val)
```

Arguments

object A [Leaf](#) object.

val The assigned value.

Methods (by generic)

- variables: List of [Variable](#) objects in the leaf node.
- parameters: List of [Parameter](#) objects in the leaf node.
- constants: List of [Constant](#) objects in the leaf node.

- `is_convex`: A logical value indicating whether the leaf node is convex.
- `is_concave`: A logical value indicating whether the leaf node is concave.
- `is_quadratic`: A logical value indicating whether the leaf node is quadratic.
- `is_pwl`: A logical value indicating whether the leaf node is piecewise linear.
- `domain`: A list of constraints describing the closure of the region where the leaf node is finite. Default is the full domain.
- `validate_val`: Check that `val` satisfies symbolic attributes of leaf.

Slots

`args` A list containing the arguments.

log,Expression-method *Logarithms*

Description

The elementwise logarithm. `log` computes the logarithm, by default the natural logarithm, `log10` computes the common (i.e., base 10) logarithm, and `log2` computes the binary (i.e., base 2) logarithms. The general form `log(x,base)` computes logarithms with base `base`. `log1p` computes elementwise the function $\log(1 + x)$.

Usage

```
## S4 method for signature 'Expression'
log(x, base = exp(1))
```

```
## S4 method for signature 'Expression'
log10(x)
```

```
## S4 method for signature 'Expression'
log2(x)
```

```
## S4 method for signature 'Expression'
log1p(x)
```

Arguments

<code>x</code>	An Expression .
<code>base</code>	(Optional) A positive number that is the base with respect to which the logarithm is computed. Defaults to e .

Value

An [Expression](#) representing the exponentiated input.

Examples

```

# Log in objective
x <- Variable(2)
obj <- Maximize(sum(log(x)))
constr <- list(x <= matrix(c(1, exp(1))))
prob <- Problem(obj, constr)
result <- solve(prob)
result$value
result$getValue(x)

# Log in constraint
obj <- Minimize(sum(x))
constr <- list(log2(x) >= 0, x <= matrix(c(1,1)))
prob <- Problem(obj, constr)
result <- solve(prob)
result$value
result$getValue(x)

# Index into log
obj <- Maximize(log10(x)[2])
constr <- list(x <= matrix(c(1, exp(1))))
prob <- Problem(obj, constr)
result <- solve(prob)
result$value

# Scalar log
obj <- Maximize(log1p(x[2]))
constr <- list(x <= matrix(c(1, exp(1))))
prob <- Problem(obj, constr)
result <- solve(prob)
result$value

```

Log-class

The Log class.

Description

This class represents the elementwise natural logarithm $\log(x)$.

Usage

```

Log(x)

## S4 method for signature 'Log'
to_numeric(object, values)

## S4 method for signature 'Log'
sign_from_args(object)

```

```

## S4 method for signature 'Log'
is_atom_convex(object)

## S4 method for signature 'Log'
is_atom_concave(object)

## S4 method for signature 'Log'
is_incr(object, idx)

## S4 method for signature 'Log'
is_decr(object, idx)

## S4 method for signature 'Log'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x	An Expression or numeric constant.
object	A Log object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `to_numeric`: The elementwise natural logarithm of the input value.
- `sign_from_args`: The sign of the atom is unknown.
- `is_atom_convex`: The atom is not convex.
- `is_atom_concave`: The atom is concave.
- `is_incr`: The atom is weakly increasing.
- `is_decr`: The atom is not weakly decreasing.
- `graph_implementation`: The graph implementation of the atom.

Slots

x An [Expression](#) or numeric constant.

 Log1p-class

The Log1p class.

Description

This class represents the elementwise operation $\log(1 + x)$.

Usage

```
Log1p(x)

## S4 method for signature 'Log1p'
to_numeric(object, values)

## S4 method for signature 'Log1p'
sign_from_args(object)

## S4 method for signature 'Log1p'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

x	An Expression or numeric constant.
object	A Log1p object.
values	A list of arguments to the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `to_numeric`: The elementwise natural logarithm of one plus the input value.
- `sign_from_args`: The sign of the atom.
- `graph_implementation`: The graph implementation of the atom.

Slots

x An [Expression](#) or numeric constant.

LogDet-class	<i>The LogDet class.</i>
--------------	--------------------------

Description

The natural logarithm of the determinant of a matrix, $\log \det(A)$.

Usage

```

LogDet(A)

## S4 method for signature 'LogDet'
validate_args(object)

## S4 method for signature 'LogDet'
to_numeric(object, values)

## S4 method for signature 'LogDet'
size_from_args(object)

## S4 method for signature 'LogDet'
sign_from_args(object)

## S4 method for signature 'LogDet'
is_atom_convex(object)

## S4 method for signature 'LogDet'
is_atom_concave(object)

## S4 method for signature 'LogDet'
is_incr(object, idx)

## S4 method for signature 'LogDet'
is_decr(object, idx)

## S4 method for signature 'LogDet'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

A	An Expression or numeric matrix.
object	A LogDet object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.

size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check that A is square.
- `to_numeric`: The log-determinant of SDP matrix A. This is the sum of logs of the eigenvalues and is equivalent to the nuclear norm of the matrix logarithm of A.
- `size_from_args`: The atom is a scalar.
- `sign_from_args`: The atom is non-negative.
- `is_atom_convex`: The atom is not convex.
- `is_atom_concave`: The atom is concave.
- `is_incr`: The atom is not monotonic in any argument.
- `is_decr`: The atom is not monotonic in any argument.
- `graph_implementation`: The graph implementation of the atom.

Slots

A An [Expression](#) or numeric matrix.

logistic	<i>Logistic Function</i>
----------	--------------------------

Description

The elementwise logistic function, $\log(1+e^x)$. This is a special case of $\log(\text{sum}(\text{exp}))$ that evaluates to a vector rather than to a scalar, which is useful for logistic regression.

Usage

`logistic(x)`

Arguments

x An [Expression](#), vector, or matrix.

Value

An [Expression](#) representing the logistic function evaluated at the input.

Examples

```

n <- 20
m <- 1000
sigma <- 45

beta_true <- stats::rnorm(n)
idxs <- sample(n, size = 0.8*n, replace = FALSE)
beta_true[idxs] <- 0
X <- matrix(stats::rnorm(m*n, 0, 5), nrow = m, ncol = n)
y <- sign(X %>% beta_true + stats::rnorm(m, 0, sigma))

beta <- Variable(n)
X_sign <- apply(X, 2, function(x) { ifelse(y <= 0, -1, 1) * x })
obj <- -sum(logistic(-X[y <= 0,] %>% beta)) - sum(logistic(X[y == 1,] %>% beta))
prob <- Problem(Maximize(obj))
result <- solve(prob)

log_odds <- result$getValue(X %>% beta)
beta_res <- result$getValue(beta)
y_probs <- 1/(1 + exp(-X %>% beta_res))
log(y_probs/(1 - y_probs))

```

Logistic-class

The Logistic class.

Description

This class represents the elementwise operation $\log(1 + e^x)$. This is a special case of $\log(\text{sum}(\text{exp}))$ that evaluates to a vector rather than to a scalar, which is useful for logistic regression.

Usage

```

Logistic(x)

## S4 method for signature 'Logistic'
to_numeric(object, values)

## S4 method for signature 'Logistic'
sign_from_args(object)

## S4 method for signature 'Logistic'
is_atom_convex(object)

## S4 method for signature 'Logistic'
is_atom_concave(object)

## S4 method for signature 'Logistic'
is_incr(object, idx)

```

```
## S4 method for signature 'Logistic'
is_decr(object, idx)

## S4 method for signature 'Logistic'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

x	An Expression or numeric constant.
object	A Logistic object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `to_numeric`: Evaluates e^x elementwise, adds one, and takes the natural logarithm.
- `sign_from_args`: The atom is positive.
- `is_atom_convex`: The atom is convex.
- `is_atom_concave`: The atom is not concave.
- `is_incr`: The atom is weakly increasing.
- `is_decr`: The atom is not weakly decreasing.
- `graph_implementation`: The graph implementation of the atom.

Slots

x An [Expression](#) or numeric constant.

LogSumExp-class

The LogSumExp class.

Description

The natural logarithm of the sum of the elementwise exponential, $\log \sum_{i=1}^n e^{x_i}$.

Usage

```

LogSumExp(x, axis = NA_real_)

## S4 method for signature 'LogSumExp'
to_numeric(object, values)

## S4 method for signature 'LogSumExp'
sign_from_args(object)

## S4 method for signature 'LogSumExp'
is_atom_convex(object)

## S4 method for signature 'LogSumExp'
is_atom_concave(object)

## S4 method for signature 'LogSumExp'
is_incr(object, idx)

## S4 method for signature 'LogSumExp'
is_decr(object, idx)

## S4 method for signature 'LogSumExp'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x	An Expression representing a vector or matrix.
axis	(Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.
object	A LogSumExp object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- to_numeric: Evaluates e^x elementwise, sums, and takes the natural log.
- sign_from_args: The atom is positive.
- is_atom_convex: The atom is convex.
- is_atom_concave: The atom is not concave.
- is_incr: The atom is monotonically non-decreasing.
- is_decr: The atom is not monotonically non-increasing.
- graph_implementation: The graph implementation of the atom.

Slots

x An [Expression](#) representing a vector or matrix.

axis (Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.

log_det

Log-Determinant

Description

The natural logarithm of the determinant of a matrix, $\log \det(A)$.

Usage

```
log_det(A)
```

Arguments

A An [Expression](#) or matrix.

Value

An [Expression](#) representing the log-determinant of the input.

Examples

```
x <- t(data.frame(c(0.55, 0.25, -0.2, -0.25, -0.0, 0.4),
                  c(0.0, 0.35, 0.2, -0.1, -0.3, -0.2)))
n <- nrow(x)
m <- ncol(x)

A <- Variable(n,n)
b <- Variable(n)
obj <- Maximize(log_det(A))
constr <- lapply(1:m, function(i) { p_norm(A %*% as.matrix(x[,i]) + b) <= 1 })
prob <- Problem(obj, constr)
result <- solve(prob)
result$value
```

log_sum_exp	<i>Log-Sum-Exponential</i>
-------------	----------------------------

Description

The natural logarithm of the sum of the elementwise exponential, $\log \sum_{i=1}^n e^{x_i}$.

Usage

```
log_sum_exp(x, axis = NA_real_)
```

Arguments

x An [Expression](#), vector, or matrix.

axis (Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.

Value

An [Expression](#) representing the log-sum-exponential of the input.

Examples

```
A <- Variable(2,2)
val <- cbind(c(5,7), c(0,-3))
prob <- Problem(Minimize(log_sum_exp(A)), list(A == val))
result <- solve(prob)
result$getValue(A)
```

LPSOLVE-class	<i>The LPSOLVE class</i>
---------------	--------------------------

Description

This class is an interface for Gnu Linear Programming Toolkit solver

Usage

```
LPSOLVE()

## S4 method for signature 'LPSOLVE'
lp_capable(solver)

## S4 method for signature 'LPSOLVE'
socp_capable(solver)
```

```

## S4 method for signature 'LPSOLVE'
sdp_capable(solver)

## S4 method for signature 'LPSOLVE'
exp_capable(solver)

## S4 method for signature 'LPSOLVE'
mip_capable(solver)

## S4 method for signature 'LPSOLVE'
name(object)

## S4 method for signature 'LPSOLVE'
import_solver(solver)

## S4 method for signature 'LPSOLVE'
Solver.solve(solver, objective, constraints,
             cached_data, warm_start, verbose, ...)

## S4 method for signature 'LPSOLVE'
format_results(solver, results_dict, data, cached_data)

```

Arguments

<code>object, solver</code>	A LPSOLVE object.
<code>objective</code>	A list representing the canonicalized objective.
<code>constraints</code>	A list of canonicalized constraints.
<code>cached_data</code>	A list mapping solver name to cached problem data.
<code>warm_start</code>	A logical value indicating whether the previous solver result should be used to warm start.
<code>verbose</code>	A logical value indicating whether to print solver output.
<code>...</code>	Additional arguments to the solver.
<code>results_dict</code>	A list containing the solver output.
<code>data</code>	A list containing information about the problem.

Methods (by generic)

- `lp_capable`: LPSOLVE can handle linear programs.
- `socp_capable`: LPSOLVE can handle second-order cone programs.
- `sdp_capable`: LPSOLVE can handle semidefinite programs.
- `exp_capable`: LPSOLVE cannot handle exponential cone programs.
- `mip_capable`: LPSOLVE cannot handle mixed-integer programs.
- `name`: The name of the solver.
- `import_solver`: Imports the Rmosek library.
- `Solver.solve`: Call the solver on the canonicalized problem.
- `format_results`: Convert raw solver output into standard list of results.

See Also

the [CRAN IpSolveAPI package](#).

MatrixFrac-class *The MatrixFrac class.*

Description

The matrix fraction function $tr(X^T P^{-1} X)$.

Usage

```
MatrixFrac(X, P)

## S4 method for signature 'MatrixFrac'
validate_args(object)

## S4 method for signature 'MatrixFrac'
to_numeric(object, values)

## S4 method for signature 'MatrixFrac'
size_from_args(object)

## S4 method for signature 'MatrixFrac'
sign_from_args(object)

## S4 method for signature 'MatrixFrac'
is_atom_convex(object)

## S4 method for signature 'MatrixFrac'
is_atom_concave(object)

## S4 method for signature 'MatrixFrac'
is_incr(object, idx)

## S4 method for signature 'MatrixFrac'
is_decr(object, idx)

## S4 method for signature 'MatrixFrac'
is_quadratic(object)

## S4 method for signature 'MatrixFrac'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

X	An Expression or numeric matrix.
P	An Expression or numeric matrix.
object	A MatrixFrac object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check that the dimensions of x and P match.
- `to_numeric`: The trace of $X^T P^{-1} X$.
- `size_from_args`: The atom is a scalar.
- `sign_from_args`: The atom is positive.
- `is_atom_convex`: The atom is convex.
- `is_atom_concave`: The atom is not concave.
- `is_incr`: The atom is not monotonic in any argument.
- `is_decr`: The atom is not monotonic in any argument.
- `is_quadratic`: True if x is affine and P is constant.
- `graph_implementation`: The graph implementation of the atom.

Slots

X	An Expression or numeric matrix.
P	An Expression or numeric matrix.

matrix_frac

Matrix Fraction

Description

$$\text{tr}(X^T P^{-1} X).$$

Usage

```
matrix_frac(X, P)
```

Arguments

X	An Expression or matrix. Must have the same number of rows as P.
P	An Expression or matrix. Must be an invertible square matrix.

Value

An [Expression](#) representing the matrix fraction evaluated at the input.

Examples

```
## Not run:
m <- 100
n <- 80
r <- 70

A <- matrix(stats::rnorm(m*n), nrow = m, ncol = n)
b <- matrix(stats::rnorm(m), nrow = m, ncol = 1)
G <- matrix(stats::rnorm(r*n), nrow = r, ncol = n)
h <- matrix(stats::rnorm(r), nrow = r, ncol = 1)

# ||Ax-b||^2 = x^T (A^T A) x - 2(A^T b)^T x + ||b||^2
P <- t(A) %*% A
q <- -2 * t(A) %*% b
r <- t(b) %*% b
Pinv <- base::solve(P)

x <- Variable(n)
obj <- matrix_frac(x, Pinv) + t(q) %*% x + r
constr <- list(G %*% x == h)
prob <- Problem(Minimize(obj), constr)
result <- solve(prob)
result$value

## End(Not run)
```

matrix_trace

Matrix Trace

Description

The sum of the diagonal entries in a matrix.

Usage

```
matrix_trace(expr)
```

Arguments

expr An [Expression](#) or matrix.

Value

An [Expression](#) representing the trace of the input.

Examples

```

C <- Variable(3,3)
val <- cbind(3:5, 6:8, 9:11)
prob <- Problem(Maximize(matrix_trace(C)), list(C == val))
result <- solve(prob)
result$value

```

MaxElemwise-class	<i>The MaxElemwise class.</i>
-------------------	-------------------------------

Description

This class represents the elementwise maximum.

Usage

```

MaxElemwise(arg1, arg2, ...)

## S4 method for signature 'MaxElemwise'
to_numeric(object, values)

## S4 method for signature 'MaxElemwise'
sign_from_args(object)

## S4 method for signature 'MaxElemwise'
is_atom_convex(object)

## S4 method for signature 'MaxElemwise'
is_atom_concave(object)

## S4 method for signature 'MaxElemwise'
is_incr(object, idx)

## S4 method for signature 'MaxElemwise'
is_decr(object, idx)

## S4 method for signature 'MaxElemwise'
is_pwl(object)

## S4 method for signature 'MaxElemwise'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

arg1	The first Expression in the maximum operation.
arg2	The second Expression in the maximum operation.

...	Additional Expression objects in the maximum operation.
object	A MaxElemwise object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `to_numeric`: The elementwise maximum.
- `sign_from_args`: The sign of the atom.
- `is_atom_convex`: The atom is convex.
- `is_atom_concave`: The atom is not concave.
- `is_incr`: The atom is weakly increasing.
- `is_decr`: The atom is not weakly decreasing.
- `is_pwl`: Are all the arguments piecewise linear?
- `graph_implementation`: The graph implementation of the atom.

Slots

- `arg1` The first [Expression](#) in the maximum operation.
- `arg2` The second [Expression](#) in the maximum operation.
- ... Additional [Expression](#) objects in the maximum operation.

MaxEntries-class	<i>The MaxEntries class.</i>
------------------	------------------------------

Description

The maximum of an expression.

Usage

```
MaxEntries(x, axis = NA_real_)

## S4 method for signature 'MaxEntries'
to_numeric(object, values)

## S4 method for signature 'MaxEntries'
sign_from_args(object)

## S4 method for signature 'MaxEntries'
```

```

is_atom_convex(object)

## S4 method for signature 'MaxEntries'
is_atom_concave(object)

## S4 method for signature 'MaxEntries'
is_incr(object, idx)

## S4 method for signature 'MaxEntries'
is_decr(object, idx)

## S4 method for signature 'MaxEntries'
is_pwl(object)

## S4 method for signature 'MaxEntries'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x	An Expression representing a vector or matrix.
axis	(Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.
object	A MaxEntries object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- to_numeric: The largest entry in x.
- sign_from_args: The sign of the atom.
- is_atom_convex: The atom is convex.
- is_atom_concave: The atom is not concave.
- is_incr: The atom is weakly increasing in every argument.
- is_decr: The atom is not weakly decreasing in any argument.
- is_pwl: Is x piecewise linear?
- graph_implementation: The graph implementation of the atom.

Slots

x	An Expression representing a vector or matrix.
axis	(Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.

Maximize-class	<i>The Maximize class.</i>
----------------	----------------------------

Description

This class represents an optimization objective for maximization.

Usage

```
Maximize(expr)

## S4 method for signature 'Maximize'
canonicalize(object)

## S4 method for signature 'Maximize'
is_dcp(object)

## S4 method for signature 'Maximize'
is_quadratic(object)
```

Arguments

`expr` A scalar [Expression](#) to maximize.
`object` A [Maximize](#) object.

Methods (by generic)

- `canonicalize`: Negates the target expression's objective.
- `is_dcp`: A logical value indicating whether the objective is concave.
- `is_quadratic`: A logical value indicating whether the objective is quadratic.

Slots

`expr` A scalar [Expression](#) to maximize.

Examples

```
x <- Variable(3)
alpha <- c(0.8, 1.0, 1.2)
obj <- sum(log(alpha + x))
constr <- list(x >= 0, sum(x) == 1)
prob <- Problem(Maximize(obj), constr)
result <- solve(prob)
result$value
result$getValue(x)
```

max_elemwise	<i>Elementwise Maximum</i>
--------------	----------------------------

Description

The elementwise maximum.

Usage

```
max_elemwise(arg1, arg2, ...)
```

Arguments

arg1	An Expression , vector, or matrix.
arg2	An Expression , vector, or matrix.
...	Additional Expression objects, vectors, or matrices.

Value

An [Expression](#) representing the elementwise maximum of the inputs.

Examples

```
c <- matrix(c(1,-1))
prob <- Problem(Minimize(max_elemwise(t(c), 2, 2 + t(c))[2]))
result <- solve(prob)
result$value
```

max_entries	<i>Maximum</i>
-------------	----------------

Description

The maximum of an expression.

Usage

```
max_entries(x, axis = NA_real_)

## S3 method for class 'Expression'
max(..., na.rm = FALSE)
```

Arguments

x	An Expression , vector, or matrix.
axis	(Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.
...	Numeric scalar, vector, matrix, or Expression objects.
na.rm	(Unimplemented) A logical value indicating whether missing values should be removed.

Value

An [Expression](#) representing the maximum of the input.

Examples

```
x <- Variable(2)
val <- matrix(c(-5,-10))
prob <- Problem(Minimize(max_entries(x)), list(x == val))
result <- solve(prob)
result$value

A <- Variable(2,2)
val <- rbind(c(-5,2), c(-3,1))
prob <- Problem(Minimize(max_entries(A, axis = 1)[2,1]), list(A == val))
result <- solve(prob)
result$value
```

mean.Expression	<i>Arithmetic Mean</i>
-----------------	------------------------

Description

The arithmetic mean of an expression.

Usage

```
## S3 method for class 'Expression'
mean(x, trim = 0, na.rm = FALSE, ...)
```

Arguments

x	An Expression object.
trim	(Unimplemented) The fraction (0 to 0.5) of observations to be trimmed from each end of x before the mean is computed.
na.rm	(Unimplemented) A logical value indicating whether missing values should be removed.
...	(Unimplemented) Optional arguments.

Value

An [Expression](#) representing the mean of the input.

Examples

```
A <- Variable(2,2)
val <- cbind(c(-5,2), c(-3,1))
prob <- Problem(Minimize(mean(A)), list(A == val))
result <- solve(prob)
result$value
```

Minimize-class

The Minimize class.

Description

This class represents an optimization objective for minimization.

Usage

```
Minimize(expr)

## S4 method for signature 'Minimize'
canonicalize(object)

## S4 method for signature 'Minimize'
variables(object)

## S4 method for signature 'Minimize'
parameters(object)

## S4 method for signature 'Minimize'
constants(object)

## S4 method for signature 'Minimize'
is_dcp(object)

## S4 method for signature 'Minimize'
value(object)
```

Arguments

`expr` A scalar [Expression](#) to minimize.
`object` A [Minimize](#) object.

Methods (by generic)

- canonicalize: Pass on the target expression's objective and constraints.
- variables: List of [Variable](#) objects in the objective.
- parameters: List of [Parameter](#) objects in the objective.
- constants: List of [Constant](#) objects in the objective.
- is_dcp: A logical value indicating whether the objective is convex.
- value: The value of the objective expression.

Slots

expr A scalar [Expression](#) to minimize.

min_elemwise	<i>Elementwise Minimum</i>
--------------	----------------------------

Description

The elementwise minimum.

Usage

```
min_elemwise(arg1, arg2, ...)
```

Arguments

arg1	An Expression , vector, or matrix.
arg2	An Expression , vector, or matrix.
...	Additional Expression objects, vectors, or matrices.

Value

An [Expression](#) representing the elementwise minimum of the inputs.

Examples

```
a <- cbind(c(-5,2), c(-3,-1))
b <- cbind(c(5,4), c(-1,2))
prob <- Problem(Minimize(min_elemwise(a, 0, b)[1,2]))
result <- solve(prob)
result$value
```

min_entries	<i>Minimum</i>
-------------	----------------

Description

The minimum of an expression.

Usage

```
min_entries(x, axis = NA_real_)

## S3 method for class 'Expression'
min(..., na.rm = FALSE)
```

Arguments

x	An Expression , vector, or matrix.
axis	(Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.
...	Numeric scalar, vector, matrix, or Expression objects.
na.rm	(Unimplemented) A logical value indicating whether missing values should be removed.

Value

An [Expression](#) representing the minimum of the input.

Examples

```
A <- Variable(2,2)
val <- cbind(c(-5,2), c(-3,1))
prob <- Problem(Maximize(min_entries(A)), list(A == val))
result <- solve(prob)
result$value
```

mixed_norm	<i>Mixed Norm</i>
------------	-------------------

Description

$$l_{p,q}(x) = \left(\sum_{i=1}^n \left(\sum_{j=1}^m |x_{i,j}| \right)^{q/p} \right)^{1/q}.$$

Usage

```
mixed_norm(X, p = 2, q = 1)
```

Arguments

X	An Expression , vector, or matrix.
p	The type of inner norm.
q	The type of outer norm.

Value

An [Expression](#) representing the $l_{p,q}$ norm of the input.

Examples

```
A <- Variable(2,2)
val <- cbind(c(3,3), c(4,4))
prob <- Problem(Minimize(mixed_norm(A,2,1)), list(A == val))
result <- solve(prob)
result$value
result$getValue(A)

val <- cbind(c(1,4), c(5,6))
prob <- Problem(Minimize(mixed_norm(A,1,Inf)), list(A == val))
result <- solve(prob)
result$value
result$getValue(A)
```

MOSEK-class

The MOSEK class.

Description

This class is an interface for the commercial MOSEK solver.

Usage

```
MOSEK()

## S4 method for signature 'MOSEK'
lp_capable(solver)

## S4 method for signature 'MOSEK'
socp_capable(solver)

## S4 method for signature 'MOSEK'
sdp_capable(solver)

## S4 method for signature 'MOSEK'
exp_capable(solver)
```

```

## S4 method for signature 'MOSEK'
mip_capable(solver)

## S4 method for signature 'MOSEK'
name(object)

## S4 method for signature 'MOSEK'
import_solver(solver)

## S4 method for signature 'MOSEK'
Solver.solve(solver, objective, constraints, cached_data,
             warm_start, verbose, ...)

```

Arguments

object, solver	A MOSEK object.
objective	A list representing the canonicalized objective.
constraints	A list of canonicalized constraints.
cached_data	A list mapping solver name to cached problem data.
warm_start	A logical value indicating whether the previous solver result should be used to warm start.
verbose	A logical value indicating whether to print solver output.
...	Additional arguments to the solver.

Methods (by generic)

- `lp_capable`: MOSEK can handle linear programs.
- `socp_capable`: MOSEK can handle second-order cone programs.
- `sdp_capable`: MOSEK can handle semidefinite programs.
- `exp_capable`: MOSEK cannot handle exponential cone programs.
- `mip_capable`: MOSEK cannot handle mixed-integer programs.
- `name`: The name of the solver.
- `import_solver`: Imports the `reticulate` library to use the python solver.
- `Solver.solve`: Call the solver on the canonicalized problem.

MulElemwise-class *The MulElemwise class.*

Description

This class represents the elementwise multiplication of two expressions. The first expression must be constant.

Usage

```
MulElemwise(lh_const, rh_exp)

## S4 method for signature 'MulElemwise'
validate_args(object)

## S4 method for signature 'MulElemwise'
to_numeric(object, values)

## S4 method for signature 'MulElemwise'
size_from_args(object)

## S4 method for signature 'MulElemwise'
sign_from_args(object)

## S4 method for signature 'MulElemwise'
is_incr(object, idx)

## S4 method for signature 'MulElemwise'
is_decr(object, idx)

## S4 method for signature 'MulElemwise'
is_quadratic(object)

## S4 method for signature 'MulElemwise'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

lh_const	A constant Expression or numeric value.
rh_exp	An Expression .
object	A MulElemwise object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check the first argument is a constant.
- `to_numeric`: Multiply the values elementwise.
- `size_from_args`: The size of the atom.
- `sign_from_args`: The sign of the atom.
- `is_incr`: Is the left-hand constant positive?
- `is_decr`: Is the left-hand constant negative?
- `is_quadratic`: Is the right-hand expression quadratic?
- `graph_implementation`: The graph implementation of the atom.

Slots

`lh_const` A constant [Expression](#) or numeric value.

`rh_exp` An [Expression](#).

<code>name</code>	<i>Variable, Parameter, or Expression Name</i>
-------------------	--

Description

The string representation of a variable, parameter, or expression.

Usage

```
name(object)
```

Arguments

`object` A [Variable](#), [Parameter](#), or [Expression](#) object.

Value

For [Variable](#) or [Parameter](#) objects, the value in the name slot. For [Expression](#) objects, a string indicating the nested atoms and their respective arguments.

Examples

```
x <- Variable()
y <- Variable(3, name = "yVar")
```

```
name(x)
name(y)
```

neg *Elementwise Negative*

Description

The elementwise absolute negative portion of an expression, $-\min(x_i, 0)$. This is equivalent to `-min_elemwise(x, 0)`.

Usage

```
neg(x)
```

Arguments

x An [Expression](#), vector, or matrix.

Value

An [Expression](#) representing the negative portion of the input.

Examples

```
x <- Variable(2)
val <- matrix(c(-3,3))
prob <- Problem(Minimize(neg(x)[1]), list(x == val))
result <- solve(prob)
result$value
```

NonlinearConstraint-class
The NonlinearConstraint class.

Description

This class represents a nonlinear inequality constraint, $f(x) \leq 0$ where f is twice-differentiable.

Usage

```
NonlinearConstraint(f, vars_)

## S4 method for signature 'NonlinearConstraint'
variables(object)
```

Arguments

f	A nonlinear function.
vars_	A list of variables involved in the function.
object	A NonlinearConstraint object.

Methods (by generic)

- variables: The variables involved in the function in order, i.e. $f(\text{vars}_) = f(\text{vstack}(\text{variables}))$.

Slots

constr_id (Internal)	A unique integer identification number used internally.
f	A nonlinear function.
vars_	A list of variables involved in the function.
.x_size (Internal)	The dimensions of a column vector with number of elements equal to the total elements in all the variables.

NonNegative-class	<i>The NonNegative class.</i>
-------------------	-------------------------------

Description

This class represents a variable constrained to be non-negative.

Usage

```
NonNegative(rows = 1, cols = 1, name = NA_character_)
```

```
## S4 method for signature 'NonNegative'
as.character(x)
```

```
## S4 method for signature 'NonNegative'
canonicalize(object)
```

```
## S4 method for signature 'NonNegative'
is_positive(object)
```

```
## S4 method for signature 'NonNegative'
is_negative(object)
```

Arguments

rows	The number of rows in the variable.
cols	The number of columns in the variable.
name	(Optional) A character string representing the name of the variable.
x, object	A NonNegative object.

Methods (by generic)

- `canonicalize`: Enforce that the variable be non-negative.
- `is_positive`: Always true since the variable is non-negative.
- `is_negative`: Always false since the variable is non-negative.

Slots

`id` (Internal) A unique identification number used internally.
`rows` The number of rows in the variable.
`cols` The number of columns in the variable.
`name` (Optional) A character string representing the name of the variable.
`primal_value` (Internal) The primal value of the variable stored internally.

Examples

```
x <- NonNegative(3, 3)
as.character(x)
canonicalize(x)
is_positive(x)
is_negative(x)
```

norm, Expression, character-method
Matrix Norm

Description

The matrix norm, which can be the 1-norm ("1"), infinity-norm ("I"), Frobenius norm ("F"), maximum modulus of all the entries ("M"), or the spectral norm ("2"), as determined by the value of type.

Usage

```
## S4 method for signature 'Expression,character'
norm(x, type)
```

Arguments

<code>x</code>	An Expression .
<code>type</code>	A character indicating the type of norm desired. <ul style="list-style-type: none"> • "O", "o" or "1" specifies the 1-norm (maximum absolute column sum). • "I" or "i" specifies the infinity-norm (maximum absolute row sum). • "F" or "f" specifies the Frobenius norm (Euclidean norm of the vectorized <code>x</code>). • "M" or "m" specifies the maximum modulus of all the elements in <code>x</code>. • "2" specifies the spectral norm, which is the largest singular value of <code>x</code>.

Value

An [Expression](#) representing the norm of the input.

See Also

The [p_norm](#) function calculates the vector p-norm.

Examples

```
C <- Variable(3,2)
val <- Constant(rbind(c(1,2), c(3,4), c(5,6)))
prob <- Problem(Minimize(norm(C, "F")), list(C == val))
result <- solve(prob, solver = "SCS")
result$value
```

 norm1

1-Norm

Description

$$\|x\|_1 = \sum_{i=1}^n |x_i|.$$

Usage

```
norm1(x, axis = NA_real_)
```

Arguments

`x` An [Expression](#), vector, or matrix.

`axis` (Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.

Value

An [Expression](#) representing the 1-norm of the input.

Examples

```
a <- Variable()
prob <- Problem(Minimize(norm1(a)), list(a <= -2))
result <- solve(prob)
result$value
result$getValue(a)

prob <- Problem(Maximize(-norm1(a)), list(a <= -2))
result <- solve(prob)
result$value
result$getValue(a)
```

```
x <- Variable(2)
z <- Variable(2)
prob <- Problem(Minimize(norm1(x - z) + 5), list(x >= c(2,3), z <= c(-1,-4)))
result <- solve(prob)
result$value
result$getValue(x[1] - z[1])
```

norm2

Euclidean Norm

Description

$$\|x\|_2 = \left(\sum_{i=1}^n x_i^2\right)^{1/2}.$$

Usage

```
norm2(x, axis = NA_real_)
```

Arguments

x An [Expression](#), vector, or matrix.

axis (Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.

Value

An [Expression](#) representing the Euclidean norm of the input.

Examples

```
a <- Variable()
prob <- Problem(Minimize(norm2(a)), list(a <= -2))
result <- solve(prob)
result$value
result$getValue(a)

prob <- Problem(Maximize(-norm2(a)), list(a <= -2))
result <- solve(prob)
result$value
result$getValue(a)

x <- Variable(2)
z <- Variable(2)
prob <- Problem(Minimize(norm2(x - z) + 5), list(x >= c(2,3), z <= c(-1,-4)))
result <- solve(prob)
result$value
result$getValue(x)
result$getValue(z)
```

```

prob <- Problem(Minimize(norm2(t(x - z)) + 5), list(x >= c(2,3), z <= c(-1,-4)))
result <- solve(prob)
result$value
result$getValue(x)
result$getValue(z)

```

NormNuc-class

The NormNuc class.

Description

The nuclear norm, i.e. sum of the singular values of a matrix.

Usage

```

NormNuc(A)

## S4 method for signature 'NormNuc'
to_numeric(object, values)

## S4 method for signature 'NormNuc'
size_from_args(object)

## S4 method for signature 'NormNuc'
sign_from_args(object)

## S4 method for signature 'NormNuc'
is_atom_convex(object)

## S4 method for signature 'NormNuc'
is_atom_concave(object)

## S4 method for signature 'NormNuc'
is_incr(object, idx)

## S4 method for signature 'NormNuc'
is_decr(object, idx)

## S4 method for signature 'NormNuc'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

A	An Expression representing a matrix.
object	A NormNuc object.
values	A list of arguments to the atom.

idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- to_numeric: The nuclear norm (i.e., the sum of the singular values) of A.
- size_from_args: The atom is a scalar.
- sign_from_args: The atom is positive.
- is_atom_convex: The atom is convex.
- is_atom_concave: The atom is not concave.
- is_incr: The atom is not monotonic in any argument.
- is_decr: The atom is not monotonic in any argument.
- graph_implementation: The graph implementation of the atom.

Slots

A An [Expression](#) representing a matrix.

norm_inf	<i>Infinity-Norm</i>
----------	----------------------

Description

$$\|x\|_{\infty} = \max_{i=1,\dots,n} |x_i|.$$

Usage

```
norm_inf(x, axis = NA_real_)
```

Arguments

x	An Expression , vector, or matrix.
axis	(Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.

Value

An [Expression](#) representing the infinity-norm of the input.

Examples

```
a <- Variable()
b <- Variable()
c <- Variable()

prob <- Problem(Minimize(norm_inf(a)), list(a >= 2))
result <- solve(prob)
result$value
result$getValue(a)

prob <- Problem(Minimize(3*norm_inf(a + 2*b) + c), list(a >= 2, b <= -1, c == 3))
result <- solve(prob)
result$value
result$getValue(a + 2*b)
result$getValue(c)

prob <- Problem(Maximize(-norm_inf(a)), list(a <= -2))
result <- solve(prob)
result$value
result$getValue(a)

x <- Variable(2)
z <- Variable(2)
prob <- Problem(Minimize(norm_inf(x - z) + 5), list(x >= c(2,3), z <= c(-1,-4)))
result <- solve(prob)
result$value
result$getValue(x[1] - z[1])
```

norm_nuc

Nuclear Norm

Description

The nuclear norm, i.e. sum of the singular values of a matrix.

Usage

```
norm_nuc(A)
```

Arguments

A An [Expression](#) or matrix.

Value

An [Expression](#) representing the nuclear norm of the input.

Examples

```
C <- Variable(3,3)
val <- cbind(3:5, 6:8, 9:11)
prob <- Problem(Minimize(norm_nuc(C)), list(C == val))
result <- solve(prob)
result$value
```

Objective-arith

Arithmetic Operations on Objectives

Description

Add, subtract, multiply, or divide optimization objectives.

Usage

```
## S4 method for signature 'Minimize,missing'
e1 - e2

## S4 method for signature 'Minimize,Minimize'
e1 + e2

## S4 method for signature 'Minimize,Maximize'
e1 + e2

## S4 method for signature 'Minimize,numeric'
e1 + e2

## S4 method for signature 'numeric,Minimize'
e1 + e2

## S4 method for signature 'Minimize,Minimize'
e1 - e2

## S4 method for signature 'Minimize,Maximize'
e1 - e2

## S4 method for signature 'Minimize,numeric'
e1 - e2

## S4 method for signature 'numeric,Minimize'
e1 - e2

## S4 method for signature 'Minimize,numeric'
e1 * e2

## S4 method for signature 'Maximize,numeric'
```

```

e1 * e2

## S4 method for signature 'numeric,Minimize'
e1 * e2

## S4 method for signature 'Minimize,numeric'
e1 / e2

## S4 method for signature 'Maximize,missing'
e1 - e2

## S4 method for signature 'Maximize,Maximize'
e1 + e2

## S4 method for signature 'Maximize,Minimize'
e1 + e2

```

Arguments

e1 The left-hand [Minimize](#), [Maximize](#), or numeric value.
e2 The right-hand [Minimize](#), [Maximize](#), or numeric value.

Value

A [Minimize](#) or [Maximize](#) object.

Parameter-class	<i>The Parameter class.</i>
-----------------	-----------------------------

Description

This class represents a parameter, either scalar or a matrix.

Usage

```

Parameter(rows = 1, cols = 1, name = NA_character_, sign = UNKNOWN,
  value = NA_real_)

## S4 method for signature 'Parameter'
as.character(x)

## S4 method for signature 'Parameter'
get_data(object)

## S4 method for signature 'Parameter'
name(object)

```

```

## S4 method for signature 'Parameter'
size(object)

## S4 method for signature 'Parameter'
is_positive(object)

## S4 method for signature 'Parameter'
is_negative(object)

## S4 method for signature 'Parameter'
grad(object)

## S4 method for signature 'Parameter'
parameters(object)

## S4 method for signature 'Parameter'
value(object)

## S4 replacement method for signature 'Parameter'
value(object) <- value

## S4 method for signature 'Parameter'
canonicalize(object)

```

Arguments

rows	The number of rows in the parameter.
cols	The number of columns in the parameter.
name	(Optional) A character string representing the name of the parameter.
sign	(Optional) A character string indicating the sign of the parameter. Must be "ZERO", "POSITIVE", "NEGATIVE", or "UNKNOWN". Defaults to "UNKNOWN".
value	(Optional) A numeric element, vector, matrix, or data.frame. Defaults to NA and may be changed with <code>value<-</code> later.
x, object	A Parameter object.

Methods (by generic)

- `get_data`: Returns `list(rows, cols, name, sign string, value)`.
- `name`: The name of the parameter.
- `size`: The `c(rows, cols)` dimensions of the parameter.
- `is_positive`: Is the parameter non-negative?
- `is_negative`: Is the parameter non-positive?
- `grad`: An empty list since the gradient of a parameter is zero.
- `parameters`: Returns itself as a parameter.

- value: The value of the parameter.
- value<-: Set the value of the parameter.
- canonicalize: The canonical form of the parameter.

Slots

id (Internal) A unique integer identification number used internally.

rows The number of rows in the parameter.

cols The number of columns in the parameter.

name (Optional) A character string representing the name of the parameter.

sign_str A character string indicating the sign of the parameter. Must be "ZERO", "POSITIVE", "NEGATIVE", or "UNKNOWN".

value (Optional) A numeric element, vector, matrix, or data.frame. Defaults to NA and may be changed with value<- later.

Examples

```
x <- Parameter(3, name = "x0", sign="NEGATIVE") ## 3-vec negative
is_positive(x)
is_negative(x)
size(x)
```

Pnorm-class

The Pnorm class.

Description

This class represents the vector p-norm.

Usage

```
Pnorm(x, p = 2, axis = NA_real_, max_denom = 1024)

## S4 method for signature 'Pnorm'
validate_args(object)

## S4 method for signature 'Pnorm'
name(object)

## S4 method for signature 'Pnorm'
get_data(object)

## S4 method for signature 'Pnorm'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x	An Expression representing a vector or matrix.
p	A number greater than or equal to 1, or equal to positive infinity.
axis	(Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.
max_denom	The maximum denominator considered in forming a rational approximation for p .
object	A Pnorm object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Details

If given a matrix variable, Pnorm will treat it as a vector and compute the p-norm of the concatenated columns.

For $p \geq 1$, the p-norm is given by

$$\|x\|_p = \left(\sum_{i=1}^n |x_i|^p \right)^{1/p}$$

with domain $x \in \mathbf{R}^n$. For $p < 1, p \neq 0$, the p-norm is given by

$$\|x\|_p = \left(\sum_{i=1}^n x_i^p \right)^{1/p}$$

with domain $x \in \mathbf{R}_+^n$.

- Note that the "p-norm" is actually a **norm** only when $p \geq 1$ or $p = +\infty$. For these cases, it is convex.
- The expression is undefined when $p = 0$.
- Otherwise, when $p < 1$, the expression is concave, but not a true norm.

Methods (by generic)

- `validate_args`: Check that the arguments are valid.
- `name`: The name and arguments of the atom.
- `to_numeric`: The p-norm of x .
- `sign_from_args`: The atom is positive.
- `is_atom_convex`: The atom is convex if $p \geq 1$.
- `is_atom_concave`: The atom is concave if $p < 1$.
- `is_incr`: The atom is weakly increasing if $p < 1$ or $p \geq 1$ and x is positive.
- `is_decr`: The atom is weakly decreasing if $p \geq 1$ and x is negative.
- `is_pwl`: The atom is piecewise linear only if x is piecewise linear, and either $p = 1$ or $p = \infty$.
- `get_data`: Returns `list(p,axis)`.
- `graph_implementation`: The graph implementation of the atom.

Slots

- `x` An [Expression](#) representing a vector or matrix.
- `p` A number greater than or equal to 1, or equal to positive infinity.
- `max_denom` The maximum denominator considered in forming a rational approximation for p .
- `axis` (Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.
- `.approx_error` (Internal) The absolute difference between p and its rational approximation.

pos	<i>Elementwise Positive</i>
-----	-----------------------------

Description

The elementwise positive portion of an expression, $\max(x_i, 0)$. This is equivalent to `max_elementwise(x, 0)`.

Usage

```
pos(x)
```

Arguments

x An [Expression](#), vector, or matrix.

Value

An [Expression](#) representing the positive portion of the input.

Examples

```
x <- Variable(2)
val <- matrix(c(-3,2))
prob <- Problem(Minimize(pos(x)[1]), list(x == val))
result <- solve(prob)
result$value
```

Power-class	<i>The Power class.</i>
-------------	-------------------------

Description

This class represents the elementwise power function $f(x) = x^p$. If `expr` is a CVXR expression, then `expr^p` is equivalent to `Power(expr, p)`.

Usage

```
Power(x, p, max_denom = 1024)

## S4 method for signature 'Power'
validate_args(object)

## S4 method for signature 'Power'
get_data(object)

## S4 method for signature 'Power'
```

```

to_numeric(object, values)

## S4 method for signature 'Power'
sign_from_args(object)

## S4 method for signature 'Power'
is_atom_convex(object)

## S4 method for signature 'Power'
is_atom_concave(object)

## S4 method for signature 'Power'
is_constant(object)

## S4 method for signature 'Power'
is_incr(object, idx)

## S4 method for signature 'Power'
is_decr(object, idx)

## S4 method for signature 'Power'
is_quadratic(object)

## S4 method for signature 'Power'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x	The Expression to be raised to a power.
p	A numeric value indicating the scalar power.
max_denom	The maximum denominator considered in forming a rational approximation of p.
object	A Power object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Details

#' For $p = 0$, $f(x) = 1$, constant, positive. For $p = 1$, $f(x) = x$, affine, increasing, same sign as x . For $p = 2, 4, 8, \dots$, $f(x) = |x|^p$, convex, signed monotonicity, positive. For $p < 0$ and $f(x) =$

- x^p for $x > 0$
- $+\infty x \leq 0$

, this function is convex, decreasing, and positive. For $0 < p < 1$ and $f(x) =$

- x^p for $x \geq 0$
- $-\infty x < 0$

, this function is concave, increasing, and positive. For $p > 1, p \neq 2, 4, 8, \dots$ and $f(x) =$

- x^p for $x \geq 0$
- $+\infty x < 0$

, this function is convex, increasing, and positive.

Methods (by generic)

- `validate_args`: Verification of arguments happens during initialization.
- `get_data`: A list containing the output of `pow_low`, `pow_mid`, or `pow_high` depending on the input power.
- `to_numeric`: Throw an error if the power is negative and cannot be handled.
- `sign_from_args`: The sign of the atom.
- `is_atom_convex`: Is $p \leq 0$ or $p \geq 1$?
- `is_atom_concave`: Is $p \geq 0$ or $p \leq 1$?
- `is_constant`: A logical value indicating whether the atom is constant.
- `is_incr`: A logical value indicating whether the atom is weakly increasing.
- `is_decr`: A logical value indicating whether the atom is weakly decreasing.
- `is_quadratic`: A logical value indicating whether the atom is quadratic.
- `graph_implementation`: The graph implementation of the atom.

Slots

x The [Expression](#) to be raised to a power.

p A numeric value indicating the scalar power.

max_denom The maximum denominator considered in forming a rational approximation of p.

Description

Add, subtract, multiply, or divide DCP optimization problems.

Usage

```
## S4 method for signature 'Problem,missing'
e1 + e2

## S4 method for signature 'Problem,missing'
e1 - e2

## S4 method for signature 'Problem,numeric'
e1 + e2

## S4 method for signature 'numeric,Problem'
e1 + e2

## S4 method for signature 'Problem,Problem'
e1 + e2

## S4 method for signature 'Problem,numeric'
e1 - e2

## S4 method for signature 'numeric,Problem'
e1 - e2

## S4 method for signature 'Problem,Problem'
e1 - e2

## S4 method for signature 'Problem,numeric'
e1 * e2

## S4 method for signature 'numeric,Problem'
e1 * e2

## S4 method for signature 'Problem,numeric'
e1 / e2
```

Arguments

e1 The left-hand [Problem](#) object.

e2 The right-hand [Problem](#) object.

Value

A [Problem](#) object.

Problem-class	<i>The Problem class.</i>
---------------	---------------------------

Description

This class represents a convex optimization problem.

Usage

```
Problem(objective, constraints = list())

## S4 method for signature 'Problem'
objective(object)

## S4 replacement method for signature 'Problem'
objective(object) <- value

## S4 method for signature 'Problem'
constraints(object)

## S4 replacement method for signature 'Problem'
constraints(object) <- value

## S4 method for signature 'Problem'
value(object)

## S4 replacement method for signature 'Problem'
value(object) <- value

## S4 method for signature 'Problem'
is_dcp(object)

## S4 method for signature 'Problem'
is_qp(object)

## S4 method for signature 'Problem'
canonicalize(object)

## S4 method for signature 'Problem'
variables(object)

## S4 method for signature 'Problem'
parameters(object)

## S4 method for signature 'Problem'
constants(object)
```

```

## S4 method for signature 'Problem'
size_metrics(object)

## S4 method for signature 'Problem,character'
get_problem_data(object, solver)

## S4 method for signature 'Problem'
unpack_results(object, solver, results_dict)

```

Arguments

objective	A Minimize or Maximize object representing the optimization objective.
constraints	(Optional) A list of Constraint objects representing constraints on the optimization variables.
object	A Problem object.
value	A Minimize or Maximize object (objective), list of Constraint objects (constraints), or numeric scalar (value).
solver	A string indicating the solver that the problem data is for. Call <code>installed_solvers()</code> to see all available.
results_dict	A list containing the solver output.

Methods (by generic)

- objective: The objective of the problem.
- objective<-: Set the value of the problem objective.
- constraints: A list of the constraints of the problem.
- constraints<-: Set the value of the problem constraints.
- value: The value from the last time the problem was solved.
- value<-: Set the value of the optimal objective.
- is_dcp: A logical value indicating whether the problem satisfies DCP rules.
- is_qp: A logical value indicating whether the problem is a quadratic program.
- canonicalize: The graph implementation of the problem.
- variables: List of [Variable](#) objects in the problem.
- parameters: List of [Parameter](#) objects in the problem.
- constants: List of [Constant](#) objects in the problem.
- size_metrics: Information about the size of the problem.
- get_problem_data: Get the problem data passed to the specified solver.
- unpack_results: Parses the output from a solver and updates the problem state, including the status, objective value, and values of the primal and dual variables. Assumes the results are from the given solver.

Slots

objective A [Minimize](#) or [Maximize](#) object representing the optimization objective.
constraints (Optional) A list of constraints on the optimization variables.
value (Internal) Used internally to hold the value of the optimization objective at the solution.
status (Internal) Used internally to hold the status of the problem solution.
.cached_data (Internal) Used internally to hold cached matrix data.
.separable_problems (Internal) Used internally to hold separable problem data.
.size_metrics (Internal) Used internally to hold size metrics.
.solver_stats (Internal) Used internally to hold solver statistics.

Examples

```

x <- Variable(2)
p <- Problem(Minimize(p_norm(x, 2)), list(x >= 0))
is_dcp(p)
x <- Variable(2)
A <- matrix(c(1,-1,-1, 1), nrow = 2)
p <- Problem(Minimize(quad_form(x, A)), list(x >= 0))
is_qp(p)
  
```

 problem-parts

Parts of a Problem

Description

Get and set the objective, constraints, or size metrics (get only) of a problem.

Usage

```

objective(object)

objective(object) <- value

constraints(object)

constraints(object) <- value

size_metrics(object)
  
```

Arguments

object A [Problem](#) object.
value The value to assign to the slot.

Value

For getter functions, the requested slot of the object. `x <- Variable()` `prob <- Problem(Minimize(x^2), list(x >= 5))` `objective(prob)` `constraints(prob)` `size_metrics(prob)`
`objective(prob) <- Maximize(sqrt(x))` `constraints(prob) <- list(x <= 10)` `objective(prob)` `constraints(prob)`

psolve

*Solve a DCP Problem***Description**

Solve a DCP compliant optimization problem.

Usage

```
psolve(object, solver, ignore_dcp = FALSE, warm_start = FALSE,
       verbose = FALSE, parallel = FALSE, ...)
```

```
## S4 method for signature 'Problem'
psolve(object, solver, ignore_dcp = FALSE,
       warm_start = FALSE, verbose = FALSE, parallel = FALSE, ...)
```

```
## S3 method for class 'Problem'
solve(a, b, ...)
```

Arguments

<code>object, a</code>	A Problem object.
<code>solver, b</code>	(Optional) A string indicating the solver to use. Defaults to "ECOS".
<code>ignore_dcp</code>	(Optional) A logical value indicating whether to override the DCP check for a problem.
<code>warm_start</code>	(Optional) A logical value indicating whether the previous solver result should be used to warm start.
<code>verbose</code>	(Optional) A logical value indicating whether to print additional solver output.
<code>parallel</code>	(Optional) A logical value indicating whether to solve in parallel if the problem is separable.
<code>...</code>	Additional options that will be passed to the specific solver. In general, these options will override any default settings imposed by CVXR.

Value

A list containing the solution to the problem:

`status` The status of the solution. Can be "optimal", "optimal_inaccurate", "infeasible", "infeasible_inaccurate", "unbounded", "unbounded_inaccurate", or "solver_error".

`value` The optimal value of the objective function.

solver The name of the solver.
solve_time The time (in seconds) it took for the solver to solve the problem.
setup_time The time (in seconds) it took for the solver to set up the problem.
num_iters The number of iterations the solver had to go through to find a solution.
getValue A function that takes a [Variable](#) object and retrieves its primal value.
getDualValue A function that takes a [Constraint](#) object and retrieves its dual value(s).

Examples

```

a <- Variable(name = "a")
prob <- Problem(Minimize(norm_inf(a)), list(a >= 2))
result <- psolve(prob, solver = "ECOS", verbose = TRUE)
result$status
result$value
result$getValue(a)
result$getDualValue(constraints(prob)[[1]])
  
```

p_norm

P-Norm

Description

The vector p-norm. If given a matrix variable, p_norm will treat it as a vector and compute the p-norm of the concatenated columns.

Usage

```
p_norm(x, p = 2, axis = NA_real_, max_denom = 1024)
```

Arguments

x An [Expression](#), vector, or matrix.
p A number greater than or equal to 1, or equal to positive infinity.
axis (Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.
max_denom The maximum denominator considered in forming a rational approximation for p .

Details

For $p \geq 1$, the p-norm is given by

$$\|x\|_p = \left(\sum_{i=1}^n |x_i|^p \right)^{1/p}$$

with domain $x \in \mathbf{R}^n$. For $p < 1, p \neq 0$, the p-norm is given by

$$\|x\|_p = \left(\sum_{i=1}^n x_i^p \right)^{1/p}$$

with domain $x \in \mathbf{R}_+^n$.

- Note that the "p-norm" is actually a **norm** only when $p \geq 1$ or $p = +\infty$. For these cases, it is convex.
- The expression is undefined when $p = 0$.
- Otherwise, when $p < 1$, the expression is concave, but not a true norm.

Value

An [Expression](#) representing the p-norm of the input.

Examples

```
x <- Variable(3)
prob <- Problem(Minimize(p_norm(x,2)))
result <- solve(prob)
result$value
result$getValue(x)

prob <- Problem(Minimize(p_norm(x,Inf)))
result <- solve(prob)
result$value
result$getValue(x)

a <- c(1.0, 2, 3)
prob <- Problem(Minimize(p_norm(x,1.6)), list(t(x) %*% a >= 1))
result <- solve(prob)
result$value
result$getValue(x)

prob <- Problem(Minimize(sum(abs(x - a))), list(p_norm(x,-1) >= 0))
result <- solve(prob)
result$value
result$getValue(x)
```

QuadOverLin-class *The QuadOverLin class.*

Description

This class represents the sum of squared entries in X divided by a scalar y, $\sum_{i,j} X_{i,j}^2 / y$.

Usage

```

QuadOverLin(x, y)

## S4 method for signature 'QuadOverLin'
validate_args(object)

## S4 method for signature 'QuadOverLin'
to_numeric(object, values)

## S4 method for signature 'QuadOverLin'
size_from_args(object)

## S4 method for signature 'QuadOverLin'
sign_from_args(object)

## S4 method for signature 'QuadOverLin'
is_atom_convex(object)

## S4 method for signature 'QuadOverLin'
is_atom_concave(object)

## S4 method for signature 'QuadOverLin'
is_incr(object, idx)

## S4 method for signature 'QuadOverLin'
is_decr(object, idx)

## S4 method for signature 'QuadOverLin'
is_quadratic(object)

## S4 method for signature 'QuadOverLin'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x	An Expression or numeric matrix.
y	A scalar Expression or numeric constant.
object	A QuadOverLin object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check the dimensions of the arguments.
- `to_numeric`: The sum of the entries of x squared over y .
- `size_from_args`: The atom is a scalar.
- `sign_from_args`: The atom is positive.
- `is_atom_convex`: The atom is convex.
- `is_atom_concave`: The atom is not concave.
- `is_incr`: A logical value indicating whether the atom is weakly increasing.
- `is_decr`: A logical value indicating whether the atom is weakly decreasing.
- `is_quadratic`: True if x is affine and y is constant.
- `graph_implementation`: The graph implementation of the atom.

Slots

- x An [Expression](#) or numeric matrix.
- y A scalar [Expression](#) or numeric constant.

quad_form

Quadratic Form

Description

The quadratic form, $x^T P x$.

Usage

```
quad_form(x, P)
```

Arguments

- x An [Expression](#) or vector.
- P An [Expression](#) or matrix.

Value

An [Expression](#) representing the quadratic form evaluated at the input.

Examples

```

x <- Variable(2)
P <- rbind(c(4,0), c(0,9))
prob <- Problem(Minimize(quad_form(x,P)), list(x >= 1))
result <- solve(prob)
result$value
result$getValue(x)

A <- Variable(2,2)
c <- c(1,2)
prob <- Problem(Minimize(quad_form(c,A)), list(A >= 1))
result <- solve(prob)
result$value
result$getValue(A)

```

quad_over_lin

Quadratic over Linear

Description

$$\sum_{i,j} X_{i,j}^2 / y.$$

Usage

```
quad_over_lin(x, y)
```

Arguments

x An [Expression](#), vector, or matrix.

y A scalar [Expression](#) or numeric constant.

Value

An [Expression](#) representing the quadratic over linear function value evaluated at the input.

Examples

```

x <- Variable(3,2)
y <- Variable()
val <- cbind(c(-1,2,-2), c(-1,2,-2))
prob <- Problem(Minimize(quad_over_lin(x,y)), list(x == val, y <= 2))
result <- solve(prob)
result$value
result$getValue(x)
result$getValue(y)

```

Rdict-class

*The Rdict class.***Description**

A simple, internal dictionary composed of a list of keys and a list of values. These keys/values can be any type, including nested lists, S4 objects, etc. Incredibly inefficient hack, but necessary for the geometric mean atom, since it requires mixed numeric/gmp objects.

Usage

```
Rdict(keys = list(), values = list())

## S4 method for signature 'Rdict'
x$name

## S4 method for signature 'Rdict'
length(x)

## S4 method for signature 'ANY,Rdict'
is.element(e1, set)

## S4 method for signature 'Rdict,ANY,ANY,ANY'
x[i, j, ..., drop = TRUE]

## S4 replacement method for signature 'Rdict,ANY,ANY,ANY'
x[i, j, ...] <- value
```

Arguments

keys	A list of keys.
values	A list of values corresponding to the keys.
x, set	A Rdict object.
name	Either "keys" for a list of keys, "values" for a list of values, or "items" for a list of lists where each nested list is a (key, value) pair.
e1	The element to search the dictionary of values for.
i	A key into the dictionary.
j, drop, ...	Unused arguments.
value	The value to assign to key i.

Slots

keys	A list of keys.
values	A list of values corresponding to the keys.

Rdictdefault-class *The Rdictdefault class.*

Description

This is a subclass of [Rdict](#) that contains an additional slot for a default function, which assigns a value to an input key. Only partially implemented, but working well enough for the geometric mean. Will be combined with [Rdict](#) later.

Usage

```
Rdictdefault(keys = list(), values = list(), default)
```

```
## S4 method for signature 'Rdictdefault,ANY,ANY,ANY'  
x[i, j, ..., drop = TRUE]
```

Arguments

keys	A list of keys.
values	A list of values corresponding to the keys.
default	A function that takes as input a key and outputs a value to assign to that key.
x	A Rdictdefault object.
i	A key into the dictionary.
j, drop, ...	Unused arguments.

Slots

keys	A list of keys.
values	A list of values corresponding to the keys.
default	A function that takes as input a key and outputs a value to assign to that key.

See Also

[Rdict](#)

resetOptions	<i>Reset Options</i>
--------------	----------------------

Description

Reset the global package variable `.CVXR.options`.

Usage

```
resetOptions()
```

Value

The default value of CVXR package global `.CVXR.options`.

Examples

```
## Not run:
  resetOptions()

## End(Not run)
```

Reshape-class	<i>The Reshape class.</i>
---------------	---------------------------

Description

This class represents the reshaping of an expression. The operator vectorizes the expression, then unvectorizes it into the new shape. Entries are stored in column-major order.

Usage

```
Reshape(expr, rows, cols)

## S4 method for signature 'Reshape'
  validate_args(object)

## S4 method for signature 'Reshape'
  to_numeric(object, values)

## S4 method for signature 'Reshape'
  size_from_args(object)

## S4 method for signature 'Reshape'
  get_data(object)
```

```
## S4 method for signature 'Reshape'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

expr	An Expression or numeric matrix.
rows	The new number of rows.
cols	The new number of columns.
object	A Reshape object.
values	A list of arguments to the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check the new shape has the same number of entries as the old.
- `to_numeric`: Reshape the value into the specified dimensions.
- `size_from_args`: The `c(rows, cols)` of the new expression.
- `get_data`: Returns `list(rows, cols)`.
- `graph_implementation`: The graph implementation of the atom.

Slots

expr	An Expression or numeric matrix.
rows	The new number of rows.
cols	The new number of columns.

reshape_expr	<i>Reshape an Expression</i>
--------------	------------------------------

Description

This function vectorizes an expression, then unvectorizes it into a new shape. Entries are stored in column-major order.

Usage

```
reshape_expr(expr, rows, cols)
```

Arguments

expr	An Expression , vector, or matrix.
rows	The new number of rows.
cols	The new number of columns.

Value

An [Expression](#) representing the reshaped input.

Examples

```
x <- Variable(4)
mat <- cbind(c(1,-1), c(2,-2))
vec <- matrix(1:4)
expr <- reshape_expr(x,2,2)
obj <- Minimize(sum(mat %*% expr))
prob <- Problem(obj, list(x == vec))
result <- solve(prob)
result$value

A <- Variable(2,2)
c <- 1:4
expr <- reshape_expr(A,4,1)
obj <- Minimize(t(expr) %*% c)
constraints <- list(A == cbind(c(-1,-2), c(3,4)))
prob <- Problem(obj, constraints)
result <- solve(prob)
result$value
result$getValue(expr)
result$getValue(reshape_expr(expr,2,2))

C <- Variable(3,2)
expr <- reshape_expr(C,2,3)
mat <- rbind(c(1,-1), c(2,-2))
C_mat <- rbind(c(1,4), c(2,5), c(3,6))
obj <- Minimize(sum(mat %*% expr))
prob <- Problem(obj, list(C == C_mat))
result <- solve(prob)
result$value
result$getValue(expr)

a <- Variable()
c <- cbind(c(1,-1), c(2,-2))
expr <- reshape_expr(c * a,1,4)
obj <- Minimize(expr %*% (1:4))
prob <- Problem(obj, list(a == 2))
result <- solve(prob)
result$value
result$getValue(expr)

expr <- reshape_expr(c * a,4,1)
```

```
obj <- Minimize(t(expr) %**% (1:4))
prob <- Problem(obj, list(a == 2))
result <- solve(prob)
result$value
result$getValue(expr)
```

residual-methods *Constraint Residual*

Description

The residual expression of a constraint, i.e. the amount by which it is violated, and the value of that violation. For instance, if our constraint is $g(x) \leq 0$, the residual is $\max(g(x), 0)$ applied elementwise.

Usage

```
residual(object)

violation(object)
```

Arguments

object A [Constraint](#) object.

Value

A [Expression](#) representing the residual, or the value of this expression.

RMulExpression-class *The RMulExpression class.*

Description

This class represents the matrix product of an expression with a constant on the right.

Usage

```
## S4 method for signature 'RMulExpression'
is_incr(object, idx)

## S4 method for signature 'RMulExpression'
is_decr(object, idx)

## S4 method for signature 'RMulExpression'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

object	A RMulExpression object.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `is_incr`: Is the right-hand expression positive?
- `is_decr`: Is the right-hand expression negative?
- `graph_implementation`: The graph implementation of the expression.

[MulExpression](#)

scalene	<i>Scalene Function</i>
---------	-------------------------

Description

The elementwise weighted sum of the positive and negative portions of an expression, $\alpha \max(x_i, 0) - \beta \min(x_i, 0)$. This is equivalent to `alpha*pos(x) + beta*neg(x)`.

Usage

```
scalene(x, alpha, beta)
```

Arguments

x	An Expression , vector, or matrix.
alpha	The weight on the positive portion of x.
beta	The weight on othe negative portion of x.

Value

An [Expression](#) representing the scalene function evaluated at the input.

Examples

```
## Not run:
A <- Variable(2,2)
val <- cbind(c(-5,2), c(-3,1))
prob <- Problem(Minimize(scalene(A,2,3)[1,1]), list(A == val))
result <- solve(prob)
result$value
result$getValue(scalene(A, 0.7, 0.3))

## End(Not run)
```

SCS-class

*The SCS class.***Description**

This class is an interface for the SCS solver.

Usage

```
SCS()

## S4 method for signature 'SCS'
lp_capable(solver)

## S4 method for signature 'SCS'
socp_capable(solver)

## S4 method for signature 'SCS'
sdp_capable(solver)

## S4 method for signature 'SCS'
exp_capable(solver)

## S4 method for signature 'SCS'
mip_capable(solver)

## S4 method for signature 'SCS'
name(object)

## S4 method for signature 'SCS'
import_solver(solver)

## S4 method for signature 'SCS'
Solver.solve(solver, objective, constraints, cached_data,
             warm_start, verbose, ...)

## S4 method for signature 'SCS'
format_results(solver, results_dict, data, cached_data)
```

Arguments

<code>object, solver</code>	A SCS object.
<code>objective</code>	A list representing the canonicalized objective.
<code>constraints</code>	A list of canonicalized constraints.
<code>cached_data</code>	A list mapping solver name to cached problem data.
<code>warm_start</code>	A logical value indicating whether the previous solver result should be used to warm start.
<code>verbose</code>	A logical value indicating whether to print solver output.
<code>...</code>	Additional arguments to the solver.
<code>results_dict</code>	A list containing the solver output.
<code>data</code>	A list containing information about the problem.

Methods (by generic)

- `lp_capable`: SCS can handle linear programs.
- `socp_capable`: SCS can handle second-order cone programs.
- `sdp_capable`: SCS can handle semidefinite programs.
- `exp_capable`: SCS can handle exponential cone programs.
- `mip_capable`: SCS cannot handle mixed-integer programs.
- `name`: The name of the solver.
- `import_solver`: Imports the `scs` library.
- `Solver.solve`: Call the solver on the canonicalized problem.
- `format_results`: Convert raw solver output into standard list of results.

lp_capable(scs)
sdp_capable(scs)
socp_capable(scs)
exp_capable(scs)
mip_capable(scs)
```

SDP-class

*The SDP class.***Description**

This class represents a semidefinite cone constraint, the set of all symmetric matrices such that the quadratic form $x^T Ax$ is non-negative for all x .

$$\{\text{symmetric } A \mid x^T Ax \geq 0 \text{ for all } x\}$$

Usage

```
SDP(A, enforce_sym = TRUE, constr_id)

## S4 method for signature 'SDP'
as.character(x)

## S4 method for signature 'SDP'
size(object)

## S4 method for signature 'SDP'
format_constr(object, eq_constr, leq_constr, dims, solver)
```

Arguments

A	The matrix variable constrained to be semidefinite.
enforce_sym	A logical value indicating whether symmetry constraints should be added.
constr_id	(Internal) A unique integer identification number used internally.
x, object	A SDP object.
eq_constr	A list of the equality constraints in the canonical problem.
leq_constr	A list of the inequality constraints in the canonical problem.
dims	A list with the dimensions of the conic constraints.
solver	A string representing the solver to be called.

Methods (by generic)

- size: The dimensions of the semidefinite cone.
- format_constr: Format SDP constraints as inequalities for the solver.

Slots

constr_id (Internal) A unique integer identification number used internally.
A The matrix variable constrained to be semidefinite.
enforce_sym A logical value indicating whether symmetry constraints should be added.

Semidef	<i>Positive Semidefinite Variable</i>
---------	---------------------------------------

Description

An expression representing a positive semidefinite matrix.

Usage

```
Semidef(n, name = NA_character_)
```

Arguments

n	The number of rows/columns in the matrix.
name	(Optional) A character string representing the name of the variable.

Value

An [Expression](#) representing the positive semidefinite matrix.

Examples

```
x <- Semidef(5) ## 5 by 5 semidefinite matrix expression
```

SemidefUpperTri-class	<i>The SemidefUpperTri class.</i>
-----------------------	-----------------------------------

Description

This class represents the upper triangular part of a positive semidefinite variable.

Usage

```
SemidefUpperTri(n, name = NA_character_)

## S4 method for signature 'SemidefUpperTri'
as.character(x)

## S4 method for signature 'SemidefUpperTri'
get_data(object)

## S4 method for signature 'SemidefUpperTri'
canonicalize(object)

## S4 method for signature 'SymmetricUpperTri'
canonicalize(object)
```

Arguments

- n The number of rows/columns in the matrix.
- name (Optional) A character string representing the name of the variable.
- x, object A [SemidefUpperTri](#) object.

Methods (by generic)

- `get_data`: Returns `list(n, name)`.
- `canonicalize`: Enforce that the variable be positive semidefinite.
- `canonicalize`: Enforce that the variable be symmetric.

Slots

- `id` (Internal) A unique identification number used internally.
- `n` The number of rows/columns in the matrix.
- `rows` The number of rows in the variable.
- `cols` The number of columns in the variable.
- `name` (Optional) A character string representing the name of the variable.
- `primal_value` (Internal) The primal value of the variable stored internally.

Examples

```
x <- SemidefUpperTri(3)
as.character(x)
get_data(x)
canonicalize(x)
```

setIdCounter

Set ID Counter

Description

Set the CVXR variable/constraint identification number counter.

Usage

```
setIdCounter(value = 0L)
```

Arguments

- value The value to assign as ID.

Value

the changed value of the package global `.CVXR.options`.

Examples

```
## Not run:
  setIdCounter(value = 0L)

## End(Not run)
```

SigmaMax-class	<i>The SigmaMax class.</i>
----------------	----------------------------

Description

The maximum singular value of a matrix.

Usage

```
SigmaMax(A = A)

## S4 method for signature 'SigmaMax'
to_numeric(object, values)

## S4 method for signature 'SigmaMax'
size_from_args(object)

## S4 method for signature 'SigmaMax'
sign_from_args(object)

## S4 method for signature 'SigmaMax'
is_atom_convex(object)

## S4 method for signature 'SigmaMax'
is_atom_concave(object)

## S4 method for signature 'SigmaMax'
is_incr(object, idx)

## S4 method for signature 'SigmaMax'
is_decr(object, idx)

## S4 method for signature 'SigmaMax'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

A	An Expression or matrix.
object	A SigmaMax object.

values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- to_numeric: The largest singular value of A.
- size_from_args: The atom is a scalar.
- sign_from_args: The atom is positive.
- is_atom_convex: The atom is convex.
- is_atom_concave: The atom is concave.
- is_incr: The atom is not monotonic in any argument.
- is_decr: The atom is not monotonic in any argument.
- graph_implementation: The graph implementation of the atom.

Slots

A An [Expression](#) or numeric matrix.

sigma_max

Maximum Singular Value

Description

The maximum singular value of a matrix.

Usage

sigma_max(A = A)

Arguments

A An [Expression](#) or matrix.

Value

An [Expression](#) representing the maximum singular value.

Examples

```
C <- Variable(3,2)
val <- rbind(c(1,2), c(3,4), c(5,6))
obj <- sigma_max(C)
constr <- list(C == val)
prob <- Problem(Minimize(obj), constr)
result <- solve(prob, solver = "SCS")
result$value
result$getValue(C)
```

sign, Expression-method

Sign of Expression

Description

The sign of an expression.

Usage

```
## S4 method for signature 'Expression'
sign(x)
```

Arguments

x An [Expression](#) object.

Value

A string indicating the sign of the expression, either "ZERO", "POSITIVE", "NEGATIVE", or "UNKNOWN".

sign-methods

Sign Properties

Description

Determine if an expression is positive, negative, or zero.

Usage

```
is_zero(object)
```

```
is_positive(object)
```

```
is_negative(object)
```

Arguments

object An [Expression](#) object.

Value

A logical value.

Examples

```
pos <- Constant(1)
neg <- Constant(-1)
zero <- Constant(0)
unknown <- Variable()
```

```
is_zero(pos)
is_zero(-zero)
is_zero(unknown)
is_zero(pos + neg)
```

```
is_positive(pos + zero)
is_positive(pos * neg)
is_positive(pos - neg)
is_positive(unknown)
```

```
is_negative(-pos)
is_negative(pos + neg)
is_negative(neg * zero)
is_negative(neg - pos)
```

sign_from_args

Atom Sign

Description

Determine the sign of an atom based on its arguments.

Usage

```
sign_from_args(object)
```

```
## S4 method for signature 'Atom'
sign_from_args(object)
```

Arguments

object An [Atom](#) object.

Value

A logical vector `c(is positive, is negative)` indicating the sign of the atom.

size	<i>Size of Expression</i>
------	---------------------------

Description

The size of an expression.

Usage

```
size(object)
```

```
## S4 method for signature 'ListOExpr'
size(object)
```

Arguments

object An [Expression](#) object.

Value

A vector with two elements `c(row, col)` representing the dimensions of the expression.

Examples

```
x <- Variable()
y <- Variable(3)
z <- Variable(3,2)

size(x)
size(y)
size(z)
size(x + y)
size(z - x)
```

size-methods	<i>Size Properties</i>
--------------	------------------------

Description

Determine if an expression is a scalar, vector, or matrix.

Usage

```
is_scalar(object)
```

```
is_vector(object)
```

```
is_matrix(object)
```

Arguments

object An [Expression](#) object.

Value

A logical value.

Examples

```
x <- Variable()
y <- Variable(3)
z <- Variable(3,2)
```

```
is_scalar(x)
is_scalar(y)
is_scalar(x + y)
```

```
is_vector(x)
is_vector(y)
is_vector(2*z)
```

```
is_matrix(x)
is_matrix(y)
is_matrix(z)
is_matrix(z - x)
```

SizeMetrics-class *The SizeMetrics class.*

Description

This class contains various metrics regarding the problem size.

Usage

```
SizeMetrics(problem)
```

Arguments

problem A [Problem](#) object.

Slots

num_scalar_variables The number of scalar variables in the problem.

num_scalar_data The number of constants used across all matrices and vectors in the problem. Some constants are not apparent when the problem is constructed. For example, the sum_squares expression is a wrapper for a quad_over_lin expression with a constant 1 in the denominator.

`num_scalar_eq_constr` The number of scalar equality constraints in the problem.
`num_scalar_leq_constr` The number of scalar inequality constraints in the problem.
`max_data_dimension` The longest dimension of any data block constraint or parameter.
`max_big_small_squared` The maximum value of $(\text{big})(\text{small})^2$ over all data blocks of the problem, where (big) is the larger dimension and (small) is the smaller dimension for each data block.

<code>size_from_args</code>	<i>Atom Size</i>
-----------------------------	------------------

Description

Determine the size of an atom based on its arguments.

Usage

```

size_from_args(object)

## S4 method for signature 'Atom'
size_from_args(object)
  
```

Arguments

`object` A [Atom](#) object.

Value

A numeric vector $c(\text{row}, \text{col})$ indicating the size of the atom.

SOC-class	<i>The SOC class.</i>
-----------	-----------------------

Description

This class represents a second-order cone constraint, i.e. $\|x\|_2 \leq t$.

Usage

```

SOC(t, x_elems)

## S4 method for signature 'SOC'
as.character(x)

## S4 method for signature 'SOC'
format_constr(object, eq_constr, leq_constr, dims, solver)

## S4 method for signature 'SOC'
size(object)
  
```

Arguments

<code>t</code>	The scalar part of the second-order constraint.
<code>x_elems</code>	A list containing the elements of the vector part of the constraint.
<code>x, object</code>	A SOC object.
<code>eq_constr</code>	A list of the equality constraints in the canonical problem.
<code>leq_constr</code>	A list of the inequality constraints in the canonical problem.
<code>dims</code>	A list with the dimensions of the conic constraints.
<code>solver</code>	A string representing the solver to be called.

Methods (by generic)

- `format_constr`: Format SOC constraints as inequalities for the solver.
- `size`: The dimensions of the second-order cone.

Slots

<code>constr_id</code> (Internal)	A unique integer identification number used internally.
<code>t</code>	The scalar part of the second-order constraint.
<code>x_elems</code>	A list containing the elements of the vector part of the constraint.

SOCAxis-class

The SOCAxis class.

Description

This class represents a second-order cone constraint for each row/column. It Assumes t is a vector the same length as X 's rows (columns) for axis == 1 (2).

Usage

```
SOCAxis(t, X, axis)

## S4 method for signature 'SOCAxis'
as.character(x)

## S4 method for signature 'SOCAxis'
format_constr(object, eq_constr, leq_constr, dims,
              solver)

## S4 method for signature 'SOCAxis'
num_cones(object)

## S4 method for signature 'SOCAxis'
cone_size(object)

## S4 method for signature 'SOCAxis'
size(object)
```

Arguments

t	The scalar part of the second-order constraint.
X	A matrix whose rows/columns are each a cone.
axis	The dimension across which to take the slice: 1 indicates rows, and 2 indicates columns.
x, object	A SOCAxis object.
eq_constr	A list of the equality constraints in the canonical problem.
leq_constr	A list of the inequality constraints in the canonical problem.
dims	A list with the dimensions of the conic constraints.
solver	A string representing the solver to be called.

Methods (by generic)

- `format_constr`: Format SOC constraints as inequalities for the solver.
- `num_cones`: The number of elementwise cones.
- `cone_size`: The dimensions of a single cone.
- `size`: The dimensions of the (elementwise) second-order cones.

Slots

<code>constr_id</code> (Internal)	A unique integer identification number used internally.
t	The scalar part of the second-order constraint.
<code>x_elems</code>	A list containing X, a matrix whose rows/columns are each a cone.
axis	The dimension across which to take the slice: 1 indicates rows, and 2 indicates columns.

 Solver-capable

Solver Capabilities

Description

Determine if a solver is capable of solving a linear program (LP), second-order cone program (SOCP), semidefinite program (SDP), exponential cone program (EXP), or mixed-integer program (MIP).

Usage

```
lp_capable(solver)
socp_capable(solver)
sdp_capable(solver)
exp_capable(solver)
mip_capable(solver)
```

Arguments

`solver` A [Solver](#) object.

Value

A logical value.

Examples

```
lp_capable(ECOS())
socp_capable(ECOS())
sdp_capable(ECOS())
exp_capable(ECOS())
mip_capable(ECOS())
```

Solver-class

The Solver class.

Description

This virtual class represents the generic interface for a solver.

Usage

```
## S4 method for signature 'Solver'
validate_solver(solver, constraints)

## S4 method for signature 'Solver'
nonlin_constr(solver)

## S4 method for signature 'Solver'
Solver.solve(solver, objective, constraints,
             cached_data, warm_start, verbose, ...)

## S4 method for signature 'Solver'
format_results(solver, results_dict, data, cached_data)
```

Arguments

`solver` A [Solver](#) object.

`constraints` A list of canonicalized constraints.

`objective` A list representing the canonicalized objective.

`cached_data` A list mapping solver name to cached problem data.

`warm_start` A logical value indicating whether the previous solver result should be used to warm start.

`verbose` A logical value indicating whether to print solver output.

... Additional arguments to the solver.
 results_dict A list containing the solver output.
 data A list containing information about the problem.

Methods (by generic)

- `validate_solver`: Verify the solver can solve the problem.
- `nonlin_constr`: A logical value indicating whether nonlinear constraints are needed.
- `Solver.solve`: Call the solver on the canonicalized problem.
- `format_results`: Convert raw solver output into standard list of results.

`Solver.choose_solver` *Choose a Solver*

Description

Determines the appropriate solver.

Usage

`Solver.choose_solver(constraints)`

Arguments

`constraints` A list of canonicalized constraints.

Value

A [Solver](#) object.

`Solver.solve` *Call to Solver*

Description

Returns the result of the call to the solver.

Usage

`Solver.solve(solver, objective, constraints, cached_data, warm_start, verbose, ...)`

Arguments

<code>solver</code>	A Solver object.
<code>objective</code>	A list representing the canonicalized objective.
<code>constraints</code>	A list of canonicalized constraints.
<code>cached_data</code>	A list mapping solver name to cached problem data.
<code>warm_start</code>	A logical value indicating whether the previous solver result should be used to warm start.
<code>verbose</code>	A logical value indicating whether to print solver output.
<code>...</code>	Additional arguments to the solver.

Value

A list containing the status, optimal value, primal variable, and dual variables for the equality and inequality constraints.

`SolverStats-class` *The SolverStats class.*

Description

This class contains the miscellaneous information that is returned by a solver after solving, but that is not captured directly by the [Problem](#) object.

Usage

```
SolverStats(results_dict = list(), solver_name = NA_character_)
```

Arguments

<code>results_dict</code>	A list containing the results returned by the solver.
<code>solver_name</code>	The name of the solver.

Value

A list containing

<code>solver_name</code>	The name of the solver.
<code>solve_time</code>	The time (in seconds) it took for the solver to solve the problem.
<code>setup_time</code>	The time (in seconds) it took for the solver to set up the problem.
<code>num_iters</code>	The number of iterations the solver had to go through to find a solution.

Slots

<code>solver_name</code>	The name of the solver.
<code>solve_time</code>	The time (in seconds) it took for the solver to solve the problem.
<code>setup_time</code>	The time (in seconds) it took for the solver to set up the problem.
<code>num_iters</code>	The number of iterations the solver had to go through to find a solution.

sqrt, Expression-method
Square Root

Description

The elementwise square root.

Usage

```
## S4 method for signature 'Expression'
sqrt(x)
```

Arguments

x An [Expression](#).

Value

An [Expression](#) representing the square root of the input. `A <- Variable(2,2) val <- cbind(c(2,4), c(16,1)) prob <- Problem(Maximize(sqrt(A)[1,2]), list(A == val)) result <- solve(prob) result$value`

Sqrt-class *The Sqrt class.*

Description

This class represents the elementwise square root \sqrt{x} .

Usage

```
Sqrt(x)

## S4 method for signature 'Sqrt'
validate_args(object)

## S4 method for signature 'Sqrt'
to_numeric(object, values)

## S4 method for signature 'Sqrt'
get_data(object)

## S4 method for signature 'Sqrt'
sign_from_args(object)
```

```

## S4 method for signature 'Sqrt'
is_atom_convex(object)

## S4 method for signature 'Sqrt'
is_atom_concave(object)

## S4 method for signature 'Sqrt'
is_incr(object, idx)

## S4 method for signature 'Sqrt'
is_decr(object, idx)

## S4 method for signature 'Sqrt'
is_quadratic(object)

## S4 method for signature 'Sqrt'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x	An Expression object.
object	A Sqrt object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Verification of arguments happens during initialization.
- `to_numeric`: The elementwise square root of the input value.
- `get_data`: A list containing the output of `pow_mid`.
- `sign_from_args`: The atom is positive.
- `is_atom_convex`: The atom is not convex.
- `is_atom_concave`: The atom is concave.
- `is_incr`: The atom is weakly increasing.
- `is_decr`: The atom is not weakly decreasing.
- `is_quadratic`: Is x constant?
- `graph_implementation`: The graph implementation of the atom.

Slots

x An [Expression](#) object.

square	<i>Square Function</i>
--------	------------------------

Description

The elementwise square function. This is equivalent to `power(x, 2)`.

Usage

```
square(x)
```

Arguments

`x` An [Expression](#), vector, or matrix.

Value

An [Expression](#) representing the square of the input.

Examples

```
m <- 30
n <- 20
A <- matrix(stats::rnorm(m*n), nrow = m, ncol = n)
b <- matrix(stats::rnorm(m), nrow = m, ncol = 1)

x <- Variable(n)
obj <- Minimize(sum(square(A %*% x - b)))
constr <- list(0 <= x, x <= 1)
prob <- Problem(obj, constr)
result <- solve(prob)
result$value
result$getValue(x)
```

Square-class	<i>The Square class.</i>
--------------	--------------------------

Description

This class represents the elementwise square x^2 .

Usage

```

Square(x)

## S4 method for signature 'Square'
validate_args(object)

## S4 method for signature 'Square'
to_numeric(object, values)

## S4 method for signature 'Square'
get_data(object)

## S4 method for signature 'Square'
sign_from_args(object)

## S4 method for signature 'Square'
is_atom_convex(object)

## S4 method for signature 'Square'
is_atom_concave(object)

## S4 method for signature 'Square'
is_incr(object, idx)

## S4 method for signature 'Square'
is_decr(object, idx)

## S4 method for signature 'Square'
is_quadratic(object)

## S4 method for signature 'Square'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x	An Expression object.
object	A Square object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Verification of arguments happens during initialization.

- to_numeric: The elementwise square of the input value.
- get_data: A list containing the output of pow_high.
- sign_from_args: The atom is positive.
- is_atom_convex: The atom is convex.
- is_atom_concave: The atom is not concave.
- is_incr: A logical value indicating whether the atom is weakly increasing.
- is_decr: A logical value indicating whether the atom is weakly decreasing.
- is_quadratic: Is x affine?
- graph_implementation: The graph implementation of the atom.

Slots

- x An [Expression](#) object.

status_map, ECOS-method

ECOS Status Map

Description

Map of ECOS status to CVXR status.

Usage

```
## S4 method for signature 'ECOS'
status_map(solver, status)
```

Arguments

solver	A ECOS object.
status	An exit code returned by ECOS: ECOS_OPTIMAL (0) Problem solved to optimality. ECOS_PINF (1) Found certificate of primal infeasibility. ECOS_DINF (2) Found certificate of dual infeasibility. ECOS_INACC_OFFSET (10) Offset exitflag at inaccurate results. ECOS_MAXIT (-1) Maximum number of iterations reached. ECOS_NUMERICS (-2) Search direction unreliable. ECOS_OUTCONE (-3) s or z got outside the cone, numerics? ECOS_SIGINT (-4) Solver interrupted by a signal/ctrl-c. ECOS_FATAL (-7) Unknown problem in solver.

Value

A string indicating the status, either "optimal", "infeasible", "unbounded", "optimal_inaccurate", "infeasible_inaccurate", "unbounded_inaccurate", or "solver_error".

status_map, GLPK-method

GLPK Status Map

Description

Map of GLPK status to CVXR status.

Usage

```
## S4 method for signature 'GLPK'  
status_map(solver, status)
```

Arguments

`solver` A [GLPK](#) object.
`status` An exit code returned by GLPK.

Value

A string indicating the status, either "optimal", "infeasible", "unbounded", "optimal_inaccurate", "infeasible_inaccurate", "unbounded_inaccurate", or "solver_error".

status_map, GUROBI-method

GUROBI Status Map

Description

Map of GUROBI status to CVXR status.

Usage

```
## S4 method for signature 'GUROBI'  
status_map(solver, status)
```

Arguments

`solver` A [GUROBI](#) object.
`status` An exit code returned by GUROBI. See the [GUROBI documentation](#) for details.

Value

A string indicating the status, either "optimal", "infeasible", "unbounded", "optimal_inaccurate", "infeasible_inaccurate", "unbounded_inaccurate", or "solver_error".

status_map,LPSOLVE-method

LPSOLVE Status Map

Description

Map of LPSOLVE status to CVXR status.

Usage

```
## S4 method for signature 'LPSOLVE'
status_map(solver, status)
```

Arguments

solver A [LPSOLVE](#) object.
 status An exit code returned by LPSOLVE.

Value

A string indicating the status, either "optimal", "infeasible", "unbounded", "optimal_inaccurate", "infeasible_inaccurate", "unbounded_inaccurate", or "solver_error".

status_map,MOSEK-method

MOSEK Status Map

Description

Map of MOSEK status to CVXR status.

Usage

```
## S4 method for signature 'MOSEK'
status_map(solver, status)
```

Arguments

solver A [MOSEK](#) object.
 status An exit code returned by MOSEK. See the [MOSEK documentation](#) for details.

Value

A string indicating the status, either "optimal", "infeasible", "unbounded", "optimal_inaccurate", "infeasible_inaccurate", "unbounded_inaccurate", or "solver_error".

status_map,SCS-method *SCS Status Map*

Description

Map of SCS status to CVXR status.

Usage

```
## S4 method for signature 'SCS'
status_map(solver, status)
```

Arguments

solver	A SCS object.
status	An exit code returned by SCS.

Value

A string indicating the status, either "optimal", "infeasible", "unbounded", "optimal_inaccurate", "infeasible_inaccurate", "unbounded_inaccurate", or "solver_error".

SumEntries-class *The SumEntries class.*

Description

This class represents the sum of all entries in a vector or matrix.

Usage

```
SumEntries(expr, axis = NA_real_)

## S4 method for signature 'SumEntries'
to_numeric(object, values)

## S4 method for signature 'SumEntries'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

expr	An Expression representing a vector or matrix.
axis	(Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.
object	A SumEntries object.
values	A list of arguments to the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `to_numeric`: Sum the entries along the specified axis.
- `graph_implementation`: The graph implementation of the atom.

Slots

expr	An Expression representing a vector or matrix.
axis	(Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.

SumLargest-class	<i>The SumLargest class.</i>
------------------	------------------------------

Description

The sum of the largest k values of a matrix.

Usage

```
SumLargest(x, k)

## S4 method for signature 'SumLargest'
validate_args(object)

## S4 method for signature 'SumLargest'
to_numeric(object, values)

## S4 method for signature 'SumLargest'
size_from_args(object)

## S4 method for signature 'SumLargest'
sign_from_args(object)
```

```

## S4 method for signature 'SumLargest'
is_atom_convex(object)

## S4 method for signature 'SumLargest'
is_atom_concave(object)

## S4 method for signature 'SumLargest'
is_incr(object, idx)

## S4 method for signature 'SumLargest'
is_decr(object, idx)

## S4 method for signature 'SumLargest'
get_data(object)

## S4 method for signature 'SumLargest'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x	An Expression or numeric matrix.
k	The number of largest values to sum over.
object	A SumLargest object.
values	A list of arguments to the atom.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check that `k` is a positive integer.
- `to_numeric`: The sum of the `k` largest entries of the vector or matrix.
- `size_from_args`: The atom is a scalar.
- `sign_from_args`: The sign of the atom.
- `is_atom_convex`: The atom is convex.
- `is_atom_concave`: The atom is not concave.
- `is_incr`: The atom is weakly increasing in every argument.
- `is_decr`: The atom is not weakly decreasing in any argument.
- `get_data`: A list containing `k`.
- `graph_implementation`: The graph implementation of the atom.

Slots

- x An [Expression](#) or numeric matrix.
- k The number of largest values to sum over.

sum_entries

Sum of Entries

Description

The sum of entries in a vector or matrix.

Usage

```
sum_entries(expr, axis = NA_real_)

## S3 method for class 'Expression'
sum(..., na.rm = FALSE)
```

Arguments

expr	An Expression , vector, or matrix.
axis	(Optional) The dimension across which to apply the function: 1 indicates rows, 2 indicates columns, and NA indicates rows and columns. The default is NA.
...	Numeric scalar, vector, matrix, or Expression objects.
na.rm	(Unimplemented) A logical value indicating whether missing values should be removed.

Value

An [Expression](#) representing the sum of the entries of the input.

Examples

```
x <- Variable(2)
prob <- Problem(Minimize(sum_entries(x)), list(t(x) >= matrix(c(1,2), nrow = 1, ncol = 2)))
result <- solve(prob)
result$value
result$getValue(x)

C <- Variable(3,2)
prob <- Problem(Maximize(sum_entries(C)), list(C[2:3,] <= 2, C[1,] == 1))
result <- solve(prob)
result$value
result$getValue(C)
```

sum_largest	<i>Sum of Largest Values</i>
-------------	------------------------------

Description

The sum of the largest k values of a vector or matrix.

Usage

```
sum_largest(x, k)
```

Arguments

x An [Expression](#), vector, or matrix.
k The number of largest values to sum over.

Value

An [Expression](#) representing the sum of the largest k values of the input.

Examples

```
m <- 300
n <- 9
X <- matrix(stats::rnorm(m*n), nrow = m, ncol = n)
X <- cbind(rep(1,m), X)
b <- c(0, 0.8, 0, 1, 0.2, 0, 0.4, 1, 0, 0.7)
y <- X %*% b + stats::rnorm(m)

beta <- Variable(n+1)
obj <- sum_largest((y - X %*% beta)^2, 100)
prob <- Problem(Minimize(obj))
result <- solve(prob)
result$getValue(beta)
```

sum_smallest	<i>Sum of Smallest Values</i>
--------------	-------------------------------

Description

The sum of the smallest k values of a vector or matrix.

Usage

```
sum_smallest(x, k)
```

Arguments

- x An [Expression](#), vector, or matrix.
- k The number of smallest values to sum over.

Value

An [Expression](#) representing the sum of the smallest k values of the input.

Examples

```
m <- 300
n <- 9
X <- matrix(stats::rnorm(m*n), nrow = m, ncol = n)
X <- cbind(rep(1,m), X)
b <- c(0, 0.8, 0, 1, 0.2, 0, 0.4, 1, 0, 0.7)
factor <- 2*rbinom(m, size = 1, prob = 0.8) - 1
y <- factor * (X %**% b) + stats::rnorm(m)

beta <- Variable(n+1)
obj <- sum_smallest(y - X %**% beta, 200)
prob <- Problem(Maximize(obj), list(0 <= beta, beta <= 1))
result <- solve(prob)
result$getValue(beta)
```

sum_squares

Sum of Squares

Description

The sum of the squared entries in a vector or matrix.

Usage

```
sum_squares(expr)
```

Arguments

- expr An [Expression](#), vector, or matrix.

Value

An [Expression](#) representing the sum of squares of the input.

Examples

```

m <- 30
n <- 20
A <- matrix(stats::rnorm(m*n), nrow = m, ncol = n)
b <- matrix(stats::rnorm(m), nrow = m, ncol = 1)

x <- Variable(n)
obj <- Minimize(sum_squares(A %*% x - b))
constr <- list(0 <= x, x <= 1)
prob <- Problem(obj, constr)
result <- solve(prob)

result$value
result$getValue(x)
result$getDualValue(constr[[1]])

```

Symmetric

*Symmetric Variable***Description**

An expression representing a symmetric matrix.

Usage

```
Symmetric(n, name = NA_character_)
```

Arguments

n The number of rows/columns in the matrix.

name (Optional) A character string representing the name of the variable.

Value

An [Expression](#) representing the symmetric matrix.

Examples

```
x <- Symmetric(3, name="s3")
```

 SymmetricUpperTri-class

The SymmetricUpperTri class.

Description

This class represents the upper triangular part of a symmetric variable.

Usage

```
SymmetricUpperTri(n, name = NA_character_)

## S4 method for signature 'SymmetricUpperTri'
as.character(x)

## S4 method for signature 'SymmetricUpperTri'
get_data(object)
```

Arguments

`n` The number of rows/columns in the matrix.
`name` (Optional) A character string representing the name of the variable.
`x, object` A [SymmetricUpperTri](#) object.

Methods (by generic)

- `get_data`: Returns `list(n, name)`.

Slots

`id` (Internal) A unique identification number used internally.
`n` The number of rows/columns in the matrix.
`rows` The number of rows in the variable.
`cols` The number of columns in the variable.
`name` (Optional) A character string representing the name of the variable.
`primal_value` (Internal) The primal value of the variable stored internally.

Examples

```
x <- SymmetricUpperTri(3, name="s3")
name(x)
get_data(x)
```

t.Expression	<i>Matrix Transpose</i>
--------------	-------------------------

Description

The transpose of a matrix.

Usage

```
## S3 method for class 'Expression'
t(x)

## S4 method for signature 'Expression'
t(x)
```

Arguments

x An [Expression](#) representing a matrix.

Value

An [Expression](#) representing the transposed matrix.

Examples

```
x <- Variable(3, 4)
t(x)
```

to_numeric	<i>Numeric Value of Atom</i>
------------	------------------------------

Description

Returns the numeric value of the atom evaluated on the specified arguments.

Usage

```
to_numeric(object, values)
```

Arguments

object An [Atom](#) object.
 values A list of arguments to the atom.

Value

A numeric scalar, vector, or matrix.

Trace-class

*The Trace class.***Description**

This class represents the sum of the diagonal entries in a matrix.

Usage

```
Trace(expr)

## S4 method for signature 'Trace'
validate_args(object)

## S4 method for signature 'Trace'
to_numeric(object, values)

## S4 method for signature 'Trace'
size_from_args(object)

## S4 method for signature 'Trace'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

expr	An Expression representing a matrix.
object	A Trace object.
values	A list of arguments to the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check the argument is a square matrix.
- `to_numeric`: Sum the diagonal entries.
- `size_from_args`: The atom is a scalar.
- `graph_implementation`: The graph implementation of the atom.

Slots

expr An [Expression](#) representing a matrix.

Transpose-class	<i>The Transpose class.</i>
-----------------	-----------------------------

Description

This class represents the matrix transpose.

Usage

```
## S4 method for signature 'Transpose'
to_numeric(object, values)

## S4 method for signature 'Transpose'
size_from_args(object)

## S4 method for signature 'Transpose'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

object	A Transpose object.
values	A list of arguments to the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `to_numeric`: The transpose of the given value.
- `size_from_args`: The size of the atom.
- `graph_implementation`: The graph implementation of the atom.

tv	<i>Total Variation</i>
----	------------------------

Description

The total variation of a vector, matrix, or list of matrices. Uses L1 norm of discrete gradients for vectors and L2 norm of discrete gradients for matrices.

Usage

```
tv(value, ...)
```

Arguments

value An [Expression](#), vector, or matrix.
 ... (Optional) [Expression](#) objects or numeric constants that extend the third dimension of value.

Value

An [Expression](#) representing the total variation of the input.

Examples

```
rows <- 10
cols <- 10
Uorig <- matrix(sample(0:255, size = rows * cols, replace = TRUE), nrow = rows, ncol = cols)

# Known is 1 if the pixel is known, 0 if the pixel was corrupted
Known <- matrix(0, nrow = rows, ncol = cols)
for(i in 1:rows) {
  for(j in 1:cols) {
    if(stats::runif(1) > 0.7)
      Known[i,j] <- 1
  }
}
Ucorr <- Known %**% Uorig

# Recover the original image using total variation in-painting
U <- Variable(rows, cols)
obj <- Minimize(tv(U))
constraints <- list(Known * U == Known * Ucorr)
prob <- Problem(obj, constraints)
result <- solve(prob, solver = "SCS")
result$getValue(U)
```

UnaryOperator-class *The UnaryOperator class.*

Description

This base class represents expressions involving unary operators.

Slots

expr The [Expression](#) that is being operated upon.
 op_name A character string indicating the unary operation.

unpack_results	<i>Parse output from a solver and updates problem state</i>
----------------	---

Description

Updates problem status, problem value, and primal and dual variable values

Usage

```
unpack_results(object, solver, results_dict)
```

Arguments

object	A Problem object.
solver	A character string specifying the solver such as "ECOS", "SCS" etc.
results_dict	the solver output

Value

A list containing the solution to the problem:

status The status of the solution. Can be "optimal", "optimal_inaccurate", "infeasible", "infeasible_inaccurate", "unbounded", "unbounded_inaccurate", or "solver_error".

value The optimal value of the objective function.

solver The name of the solver.

solve_time The time (in seconds) it took for the solver to solve the problem.

setup_time The time (in seconds) it took for the solver to set up the problem.

num_iters The number of iterations the solver had to go through to find a solution.

getValue A function that takes a [Variable](#) object and retrieves its primal value.

getDualValue A function that takes a [Constraint](#) object and retrieves its dual value(s).

Examples

```
## Not run:
x <- Variable(2)
obj <- Minimize(x[1] + cvxr_norm(x, 1))
constraints <- list(x >= 2)
prob1 <- Problem(obj, constraints)
# Solve with ECOS.
ecos_data <- get_problem_data(prob1, "ECOS")
# Call ECOS solver interface directly
ecos_output <- ECOSolveR::ECOS_solve(
  c = ecos_data[["c"]],
  G = ecos_data[["G"]],
  h = ecos_data[["h"]],
  dims = ecos_data[["dims"]],
```

```

        A = ecos_data[["A"]],
        b = ecos_data[["b"]]
    )
# Unpack raw solver output.
res1 <- unpack_results(prob1, "ECOS", ecos_output)
# Without DCP validation (so be sure of your math), above is equivalent to:
# res1 <- solve(prob1, solver = "ECOS")
X <- Semidef(2)
Fmat <- rbind(c(1,0), c(0,-1))
obj <- Minimize(sum_squares(X - Fmat))
prob2 <- Problem(obj)
scs_data <- get_problem_data(prob2, "SCS")
scs_output <- scs::scs(
    A = scs_data[['A']],
    b = scs_data[['b']],
    obj = scs_data[['c']],
    cone = scs_data[['dims']]
)
res2 <- unpack_results(prob2, "SCS", scs_output)
# Without DCP validation (so be sure of your math), above is equivalent to:
# res2 <- solve(prob2, solver = "SCS")

## End(Not run)

```

UpperTri-class

The UpperTri class.

Description

The vectorized strictly upper triangular entries of a matrix.

Usage

```

UpperTri(expr)

## S4 method for signature 'UpperTri'
validate_args(object)

## S4 method for signature 'UpperTri'
to_numeric(object, values)

## S4 method for signature 'UpperTri'
size_from_args(object)

## S4 method for signature 'UpperTri'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

expr	An Expression or numeric matrix.
object	An UpperTri object.
values	A list of arguments to the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check the argument is a square matrix.
- `to_numeric`: Vectorize the upper triangular entries.
- `size_from_args`: The size of the atom.
- `graph_implementation`: The graph implementation of the atom.

Slots

expr An [Expression](#) or numeric matrix.

upper_tri	<i>Upper Triangle of a Matrix</i>
-----------	-----------------------------------

Description

The vectorized strictly upper triangular entries of a matrix.

Usage

```
upper_tri(expr)
```

Arguments

expr An [Expression](#) or matrix.

Value

An [Expression](#) representing the upper triangle of the input.

Examples

```
C <- Variable(3,3)
val <- cbind(3:5, 6:8, 9:11)
prob <- Problem(Maximize(upper_tri(C)[3,1]), list(C == val))
result <- solve(prob)
result$value
result$getValue(upper_tri(C))
```

validate_args	<i>Validate Arguments</i>
---------------	---------------------------

Description

Validate an atom's arguments, returning an error if any are invalid.

Usage

```
validate_args(object)
```

Arguments

object	An Atom object.
--------	---------------------------------

validate_solver	<i>Validate Solver</i>
-----------------	------------------------

Description

Raises an exception if the solver cannot solve the problem.

Usage

```
validate_solver(solver, constraints)
```

Arguments

solver	A Solver object.
constraints	A list of canonicalized constraints

validate_val	<i>Validate Value</i>
--------------	-----------------------

Description

Check that the value satisfies a [Leaf](#)'s symbolic attributes.

Usage

```
validate_val(object, val)
```

Arguments

object	A Leaf object.
val	The assigned value.

Value

The value converted to proper matrix type.

value-methods	<i>Get or Set Value</i>
---------------	-------------------------

Description

Get or set the value of a variable, parameter, expression, or problem.

Usage

```
value(object)
value(object) <- value
```

Arguments

object	A Variable , Parameter , Expression , or Problem object.
value	A numeric scalar, vector, or matrix to assign to the object.

Value

The numeric value of the variable, parameter, or expression. If any part of the mathematical object is unknown, return NA.

Examples

```
lambda <- Parameter()
value(lambda)

value(lambda) <- 5
value(lambda)
```

Variable-class	<i>The Variable class.</i>
----------------	----------------------------

Description

This class represents an optimization variable.

Usage

```
Variable(rows = 1, cols = 1, name = NA_character_)

## S4 method for signature 'Variable'
as.character(x)

## S4 method for signature 'Variable'
id(object)

## S4 method for signature 'Variable'
is_positive(object)

## S4 method for signature 'Variable'
is_negative(object)

## S4 method for signature 'Variable'
size(object)

## S4 method for signature 'Variable'
get_data(object)

## S4 method for signature 'Variable'
name(object)

## S4 method for signature 'Variable'
value(object)

## S4 replacement method for signature 'Variable'
value(object) <- value

## S4 method for signature 'Variable'
grad(object)

## S4 method for signature 'Variable'
variables(object)

## S4 method for signature 'Variable'
canonicalize(object)
```

Arguments

rows	The number of rows in the variable.
cols	The number of columns in the variable.
name	(Optional) A character string representing the name of the variable.
x, object	A Variable object.
value	The value to assign to the primal variable.

Methods (by generic)

- `id`: The unique ID of the variable.
- `is_positive`: A logical value indicating whether the variable is positive.
- `is_negative`: A logical value indicating whether the variable is negative.
- `size`: The `c(row, col)` dimensions of the variable.
- `get_data`: Returns `list(rows, cols, name)`.
- `name`: The name of the variable.
- `value`: The value of the variable.
- `value<-`: Set the value of the primal variable.
- `grad`: The sub/super-gradient of the variable represented as a sparse matrix.
- `variables`: Returns itself as a variable.
- `canonicalize`: The canonical form of the variable.

Slots

`id` (Internal) A unique identification number used internally.
`rows` The number of rows in the variable.
`cols` The number of columns in the variable.
`name` (Optional) A character string representing the name of the variable.
`primal_value` (Internal) The primal value of the variable stored internally.

Examples

```
x <- Variable(3, name = "x0") ## 3-int variable
y <- Variable(3, 3, name = "y0") # Matrix variable
as.character(y)
id(y)
is_positive(x)
is_negative(x)
size(y)
name(y)
value(y) <- matrix(1:9, nrow = 3)
value(y)
grad(y)
variables(y)
canonicalize(y)
```

vec	<i>Vectorization of a Matrix</i>
-----	----------------------------------

Description

Flattens a matrix into a vector in column-major order.

Usage

```
vec(X)
```

Arguments

X An [Expression](#) or matrix.

Value

An [Expression](#) representing the vectorized matrix.

Examples

```
A <- Variable(2,2)
c <- 1:4
expr <- vec(A)
obj <- Minimize(t(expr) %% c)
constraints <- list(A == cbind(c(-1,-2), c(3,4)))
prob <- Problem(obj, constraints)
result <- solve(prob)
result$value
result$getValue(expr)
```

vstack	<i>Vertical Concatenation</i>
--------	-------------------------------

Description

The vertical concatenation of expressions. This is equivalent to `rbind` when applied to objects with the same number of columns.

Usage

```
vstack(...)
```

Arguments

... [Expression](#) objects, vectors, or matrices. All arguments must have the same number of columns.

Value

An [Expression](#) representing the concatenated inputs.

Examples

```
x <- Variable(2)
y <- Variable(3)
c <- matrix(1, nrow = 1, ncol = 5)
prob <- Problem(Minimize(c %**% vstack(x, y)), list(x == c(1,2), y == c(3,4,5)))
result <- solve(prob)
result$value
```

```
c <- matrix(1, nrow = 1, ncol = 4)
prob <- Problem(Minimize(c %**% vstack(x, x)), list(x == c(1,2)))
result <- solve(prob)
result$value
```

```
A <- Variable(2,2)
C <- Variable(3,2)
c <- matrix(1, nrow = 2, ncol = 2)
prob <- Problem(Minimize(sum(vstack(A, C))), list(A >= 2*c, C == -2))
result <- solve(prob)
result$value
```

```
B <- Variable(2,2)
c <- matrix(1, nrow = 1, ncol = 2)
prob <- Problem(Minimize(sum(vstack(c %**% A, c %**% B))), list(A >= 2, B == -2))
result <- solve(prob)
result$value
```

VStack-class

The VStack class.

Description

Vertical concatenation of values.

Usage

```
VStack(...)
```

```
## S4 method for signature 'VStack'
validate_args(object)
```

```
## S4 method for signature 'VStack'
to_numeric(object, values)
```

```
## S4 method for signature 'VStack'
size_from_args(object)
```

```
## S4 method for signature 'VStack'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

...	Expression objects or matrices. All arguments must have the same number of columns.
object	A VStack object.
values	A list of arguments to the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check all arguments have the same width.
- `to_numeric`: Vertically concatenate the values using `rbind`.
- `size_from_args`: The size of the atom.
- `graph_implementation`: The graph implementation of the atom.

Slots

... [Expression](#) objects or matrices. All arguments must have the same number of columns.

[,Expression,missing,missing,ANY-method
The Index class.

Description

This class represents indexing or slicing into a matrix.

Usage

```
## S4 method for signature 'Expression,missing,missing,ANY'
x[i, j, ..., drop = TRUE]

## S4 method for signature 'Expression,index,missing,ANY'
x[i, j, ..., drop = TRUE]

## S4 method for signature 'Expression,missing,index,ANY'
x[i, j, ..., drop = TRUE]
```

```

## S4 method for signature 'Expression,index,index,ANY'
x[i, j, ..., drop = TRUE]

## S4 method for signature 'Expression,matrix,index,ANY'
x[i, j, ..., drop = TRUE]

## S4 method for signature 'Expression,index,matrix,ANY'
x[i, j, ..., drop = TRUE]

## S4 method for signature 'Expression,matrix,matrix,ANY'
x[i, j, ..., drop = TRUE]

## S4 method for signature 'Expression,matrix,missing,ANY'
x[i, j, ..., drop = TRUE]

Index(expr, key)

## S4 method for signature 'Index'
to_numeric(object, values)

## S4 method for signature 'Index'
size_from_args(object)

## S4 method for signature 'Index'
get_data(object)

## S4 method for signature 'Index'
graph_implementation(object, arg_objs, size,
  data = NA_real_)

```

Arguments

x, object	An Index object.
i, j	The row and column indices of the slice.
...	(Unimplemented) Optional arguments.
drop	(Unimplemented) A logical value indicating whether the result should be coerced to the lowest possible dimension.
expr	An Expression representing a vector or matrix.
key	A list containing the start index, end index, and step size of the slice.
values	A list of arguments to the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- to_numeric: The index/slice into the given value.

- `size_from_args`: The size of the atom.
- `get_data`: A list containing key.
- `graph_implementation`: The graph implementation of the atom.

Slots

`expr` An [Expression](#) representing a vector or matrix.

`key` A list containing the start index, end index, and step size of the slice.

%%,Expression,Expression-method

The MulExpression class.

Description

This class represents the matrix product of two linear expressions. See [MulElemwise](#) for the elementwise product.

Usage

```
## S4 method for signature 'Expression,Expression'
x %% y
```

```
## S4 method for signature 'Expression,ConstVal'
x %% y
```

```
## S4 method for signature 'ConstVal,Expression'
x %% y
```

```
## S4 method for signature 'MulExpression'
validate_args(object)
```

```
## S4 method for signature 'MulExpression'
size_from_args(object)
```

```
## S4 method for signature 'MulExpression'
is_incr(object, idx)
```

```
## S4 method for signature 'MulExpression'
is_decr(object, idx)
```

```
## S4 method for signature 'MulExpression'
graph_implementation(object, arg_objs, size,
  data = NA_real_)
```

Arguments

x, y	The Expression objects or numeric constants to multiply.
object	A MulExpression object.
idx	An index into the atom.
arg_objs	A list of linear expressions for each argument.
size	A vector with two elements representing the size of the resulting expression.
data	A list of additional data required by the atom.

Methods (by generic)

- `validate_args`: Check the dimensions.
- `size_from_args`: The size of the expression.
- `is_incr`: Is the left-hand expression positive?
- `is_decr`: Is the left-hand expression negative?
- `graph_implementation`: The graph implementation of the expression.

See Also

[MulElemwise](#)

`%>>%` *The PSDConstraint class.*

Description

This class represents the positive semidefinite constraint, $X \succeq Y$, i.e. $z^T(X - Y)z \geq 0$ for all z .

Usage

```
e1 %>>% e2
```

```
e1 %<<% e2
```

```
## S4 method for signature 'Expression,Expression'
e1 %>>% e2
```

```
## S4 method for signature 'Expression,ConstVal'

PSDConstraint(lh_exp, rh_exp)

## S4 method for signature 'PSDConstraint'
is_dcp(object)

## S4 method for signature 'PSDConstraint'
residual(object)

## S4 method for signature 'PSDConstraint'
canonicalize(object)

```

Arguments

e1, e2	The Expression objects or numeric constants to compare.
lh_exp	An Expression , numeric element, vector, or matrix representing the left-hand side of the inequality.
rh_exp	An Expression , numeric element, vector, or matrix representing the right-hand side of the inequality.
object	A PSDConstraint object.

Methods (by generic)

- `is_dcp`: The constraint is DCP if the left-hand and right-hand expressions are affine.
- `residual`: A [Expression](#) representing the residual of the constraint.
- `canonicalize`: The graph implementation of the object. Marks the top level constraint as the `dual_holder` so the dual value will be saved to the [PSDConstraint](#).

Slots

<code>constr_id</code>	(Internal) A unique integer identification number used internally.
<code>lh_exp</code>	An Expression , numeric element, vector, or matrix representing the left-hand side of the inequality.
<code>rh_exp</code>	An Expression , numeric element, vector, or matrix representing the right-hand side of the inequality.
<code>args</code>	(Internal) A list that holds <code>lh_exp</code> and <code>rh_exp</code> for internal use.
<code>.expr</code>	(Internal) An Expression representing <code>lh_exp - rh_exp</code> for internal use.
<code>dual_variable</code>	(Internal) A Variable representing the dual variable associated with the constraint.

^,Expression,numeric-method
Elementwise Power

Description

Raises each element of the input to the power p . If `expr` is a CVXR expression, then `expr^p` is equivalent to `power(expr, p)`.

Usage

```
## S4 method for signature 'Expression,numeric'
e1 ^ e2

power(x, p, max_denom = 1024)
```

Arguments

<code>e1</code>	An Expression object to exponentiate.
<code>e2</code>	The power of the exponential. Must be a numeric scalar.
<code>x</code>	An Expression , vector, or matrix.
<code>p</code>	A scalar value indicating the exponential power.
<code>max_denom</code>	The maximum denominator considered in forming a rational approximation of p .

Details

For $p = 0$ and $f(x) = 1$, this function is constant and positive. For $p = 1$ and $f(x) = x$, this function is affine, increasing, and the same sign as x . For $p = 2, 4, 8, \dots$ and $f(x) = |x|^p$, this function is convex, positive, with signed monotonicity. For $p < 0$ and $f(x) =$

- x^p for $x > 0$
- $+\infty x \leq 0$

, this function is convex, decreasing, and positive. For $0 < p < 1$ and $f(x) =$

- x^p for $x \geq 0$
- $-\infty x < 0$

, this function is concave, increasing, and positive. For $p > 1, p \neq 2, 4, 8, \dots$ and $f(x) =$

- x^p for $x \geq 0$
- $+\infty x < 0$

, this function is convex, increasing, and positive.

Examples

```
## Not run:  
x <- Variable()  
prob <- Problem(Minimize(power(x,1.7) + power(x,-2.3) - power(x,0.45)))  
result <- solve(prob)  
result$value  
result$getValue(x)  
  
## End(Not run)
```
