Title Automated Phylogenetic Sequence Cluster Identification from
'GenBank'

Version 1.0.0

Maintainer Dom Bennett <dominic.john.bennett@gmail.com>

Description A pipeline for the identification, within taxonomic groups, of orthologous sequence clusters from 'GenBank' <<https://www.ncbi.nlm.nih.gov/genbank/>> as the first step in a phylogenetic analysis. The pipeline depends on a local alignment search tool and is, therefore, not dependent on differences in gene naming conventions and naming errors.

Description

Given a BLAST output, filters query-subject pairs such that only HSPs with a coverage greater than `mncvrg` (specified in the pipeline parameters) remain. Filters both: query-subject and subject-query pairs, if one of the coverages is insufficient. HSP coverage is obtained from the BLAST column `qcovs`.

Usage

blast_filter(blast_res, ps)
```

Arguments

<code>blast_res</code>	BLAST results
<code>ps</code>	Parameters list, generated with <code>parameters()</code>

Value

Calculate word frequencies

Description

For all sequences in a cluster(s) calculate the frequency of separate words in either the sequence definitions or the reported feature name.

Usage

```
calc_wrdfrq(phylota, cid, min_frq = 0.1, min_nchar = 1, type = c("dfln",
  "nm"), ignr_pttrn = "[^a-z0-9]")
```

Arguments

phylota	Phylota object
cid	Cluster ID(s)
min_frq	Minimum frequency
min_nchar	Minimum number of characters for a word
type	Definitions (dfln) or features (nm)
ignr_pttrn	Ignore pattern, REGEX for text to ignore.

Details

By default, anything that is not alphanumeric is ignored. 'dfln' and 'nm' match the slot names in a SeqRec, see `list_seqrec_slots()`.

Value

mxnds	The maximum number of nodes descending from a taxonomic group. If there are more than this number, nodes at the lower taxonomic level are analysed.
mdlthrs	'Model organism threshold'. Taxa with more sequences than this number will be considered model organisms and a random mdlthrs subset of their sequences will be downloaded.
mnsql	The minimum length of sequence in nucleotide base pairs to download.
mxsql	The maximum length of sequence in nucleotide base pairs to download. Any longer sequences will be ignored.
mxrtry	The maximum number of attempts to make when downloading.
mxsqs	The maximum number of sequences to BLAST in all-vs-all searches. If there are more sequences for a node, BLAST is performed at the lower taxonomic level.
mxevl	The maximum E-value for a successful BLAST.
mncvrg	The maximum percentile coverage defining an overlapping BLAST hit. Sequences with BLAST matches with lower values are not considered orthologous.
btchsz	Batch size when querying NCBI
date	Date when pipeline was initiated

plot_phylota_treemap *Plot treemap of Phylota object*

Description

Treemaps show relative size with boxes. The user can explore which taxa or clusters are most represented either by sequence or cluster number. If cluster IDs are provided, the plot is made for clusters. If taxonomic IDs are provided, the plot is made for taxa.

Usage

```

plot_phylota_treemap(phylota, cids = NULL, txids = NULL, cnms = cids,
                    txnms = txids, with_labels = TRUE, area = c("ntx", "nsq", "ncl"),
                    fill = c("NULL", "typ", "ntx", "nsq", "ncl"))

```

Arguments

phylota	Phylota object
cids	Cluster IDs
txids	Taxonomic IDs
cnms	Cluster names
txnms	Taxonomic names
with_labels	Show names per box?
area	What determines the size per box?
fill	What determines the coloured fill per box?

Details

The function can take a long time to run for large Phylota objects over many taxonomic IDs because searches are made across lineages. The idea of the function is to assess the data dominance of specific clusters and taxa.

run *Run phylotaR pipeline*

Description

Run the entire phylotaR pipeline. All generated files will be stored in the wd. The process can be stopped at anytime and restarted with `restart`. `nstages` must be a numeric value representing the number of stages that will be run. Stages are run in the following order: 1 - taxise, 2 - download, 3 - cluster and 4 - cluster2.

For example, specifying `nstages = 3`, will run taxise, download and cluster. Stages can also be run individually, see linked functions below.

Usage

```
run(wd, nstages = 4)
```

Arguments

wd	Working directory
nstages	Number of total stages to run, max 4.

sids_get *Return random set of sequence IDs*

Description

For a given txid return a random set of sequences associated.

Usage

```
sids_get(txid, direct, ps, retmax = 100, hrdmx = 1e+05)
```

Arguments

txid	NCBI taxon identifier
direct	Node-level only or subtree as well? Default FALSE.
ps	Parameters list, generated with parameters()
retmax	Maximum number of sequences when querying model organisms. The smaller the more random, the larger the faster.
hrdmx	Absolute maximum number of sequence IDs to download in a single query.

Details

For model organisms downloading all IDs can take long time or even cause an xml parsing error. For any search with more than hrdmx sequences, this function will run multiple small searches downloading retmax seq IDs at a time with different restart values to generate a semi-random vector of sequence IDs. For all other searches, all IDs will be retrieved. Note, it makes no sense for mdlthrs in parameters to be greater than hrdmx in this function.

Value

vector of IDs

Description

Write out sequences, as .fasta, for a given vector of IDs.

Usage

```
write_sq(phylota, outfile, sid, sq_nm = sid, width = 80)
```

phylota	Phylota
outfile	Output file
sid	Sequence ID(s)
sq_nm	Sequence name(s)
width	Maximum number of characters in a line, integer

Details

The user can control the output definition lines of the sequences using the sq_nm. By default sequences IDs are used. Note, ensure the sq_nm are in the same order as sid.
