

# Package ‘binaryGP’

September 19, 2017

**Type** Package

**Title** Fit and Predict a Gaussian Process Model with (Time-Series)  
Binary Response

**Version** 0.2

**Date** 2017-09-17

**Author** Chih-Li Sung

**Maintainer** Chih-Li Sung <iamdfchile@gmail.com>

**Description** Allows the estimation and prediction for binary Gaussian process model. The mean function can be assumed to have time-series structure. The estimation methods for the unknown parameters are based on penalized quasi-likelihood/penalized quasi-partial likelihood and restricted maximum likelihood. The predicted probability and its confidence interval are computed by Metropolis-Hastings algorithm. More details can be seen in Sung et al (2017) <arXiv:1705.02511>.

**License** GPL-2 | GPL-3

**LazyData** TRUE

**Imports** Rcpp (>= 0.12.0), lhs (>= 0.10), logitnorm (>= 0.8.29), nloptr (>= 1.0.4), GPfit (>= 1.0-0), stats, graphics, utils, methods

**LinkingTo** Rcpp, RcppArmadillo

**RoxygenNote** 5.0.1

**Depends** R (>= 2.14.1)

**NeedsCompilation** yes

**Repository** CRAN

**Date/Publication** 2017-09-19 08:34:21 UTC

binaryGP\_fit

*Binary Gaussian Process (with/without time-series)***Description**

The function fits Gaussian process models with binary response. The models can also include time-series term if a time-series binary response is observed. The estimation methods are based on PQL/PQPL and REML (for mean function and correlation parameter, respectively).

**Usage**

```
binaryGP_fit(X, Y, R = 0, L = 0, corr = list(type = "exponential", power =
  2), nugget = 1e-10, constantMean = FALSE, orthogonalGP = FALSE,
  converge.tol = 1e-10, maxit = 15, maxit.PQPL = 20, maxit.REML = 100,
  xtol_rel = 1e-10, standardize = FALSE, verbose = TRUE)
```

**Arguments**

X	a design matrix with dimension n by d.
Y	a response matrix with dimension n by T. The values in the matrix are 0 or 1. If no time-series, T = 1. If time-series is included, i.e., T > 1, the first column is the response vector of time 1, and second column is the response vector of time 2, and so on.
R	a positive integer specifying the order of autoregression only if time-series is included. The default is 1.
L	a positive integer specifying the order of interaction between X and previous Y only if time-series is included. The value couldn't nbe larger than R. The default is 1.
corr	a list of parameters for the specifying the correlation to be used. Either exponential correlation function or Matern correlation function can be used. See <a href="#">corr_matrix</a> for details.
nugget	a positive value to use for the nugget. If NULL, a nugget will be estimated. The default is 1e-10.
constantMean	logical. TRUE indicates that the Gaussian process will have a constant mean, plus time-series structure if R or T is greater than one; otherwise the mean function will be a linear regression in X, plus an intercept term and time-series structure.
orthogonalGP	logical. TRUE indicates that the orthogonal Gaussian process will be used. Only available when corr is list(type = "exponential", power = 2).
converge.tol	convergence tolerance. It converges when relative difference with respect to $\eta_t$ is smaller than the tolerance. The default is 1e-10.
maxit	a positive integer specifying the maximum number of iterations for estimation to be performed before the estimates are convergent. The default is 15.
maxit.PQPL	a positive integer specifying the maximum number of iterations for PQL/PQPL estimation to be performed before the estimates are convergent. The default is 20.

maxit.REML	a positive integer specifying the maximum number of iterations in lbfgs for REML estimation to be performed before the estimates are convergent. The default is 100.
xtol_rel	a positive value specifying the convergence tolerance for lbfgs. The default is 1e-10.
standardize	logical. If TRUE, each column of X will be standardized into $[0, 1]$ . The default is FALSE.
verbose	logical. If TRUE, additional diagnostics are printed. The default is TRUE.

## Details

Consider the model

$$\text{logit}(p_t(x)) = \eta_t(x) = \sum_{r=1}^R \varphi_r y_{t-r}(\mathbf{x}) + \alpha_0 + \mathbf{x}'\boldsymbol{\alpha} + \sum_{l=1}^L \gamma_l \mathbf{x} y_{t-l}(\mathbf{x}) + Z_t(\mathbf{x}),$$

where  $p_t(x) = Pr(y_t(x) = 1)$  and  $Z_t(\cdot)$  is a Gaussian process with zero mean, variance  $\sigma^2$ , and correlation function  $R_{\boldsymbol{\theta}}(\cdot, \cdot)$  with unknown correlation parameters  $\boldsymbol{\theta}$ . The power exponential correlation function is used and defined by

$$R_{\boldsymbol{\theta}}(\mathbf{x}_i, \mathbf{x}_j) = \exp\left\{-\sum_{l=1}^d \frac{(x_{il} - x_{jl})^p}{\theta_l}\right\},$$

where  $p$  is given by power. The parameters in the mean functions including  $\varphi_r, \alpha_0, \boldsymbol{\alpha}, \gamma_l$  are estimated by PQL/PQPL, depending on whether the mean function has the time-series structure. The parameters in the Gaussian process including  $\boldsymbol{\theta}$  and  $\sigma^2$  are estimated by REML. If orthogonalGP is TRUE, then orthogonal covariance function (Plumlee and Joseph, 2016) is employed. More details can be seen in Sung et al. (unpublished).

## Value

alpha_hat	a vector of coefficient estimates for the linear relationship with X.
varphi_hat	a vector of autoregression coefficient estimates.
gamma_hat	a vector of the interaction effect estimates.
theta_hat	a vector of correlation parameters.
sigma_hat	a value of sigma estimate (standard deviation).
nugget_hat	if nugget is NULL, then return a nugget estimate, otherwise return nugget.
orthogonalGP	orthogonalGP.
X	data X.
Y	data Y.
R	order of autoregression.
L	order of interaction between X and previous Y.
corr	a list of parameters for the specifying the correlation to be used.
Model.mat	model matrix.

eta_hat	eta_hat.
standardize	standardize.
mean.x	mean of each column of X. Only available when standardize=TRUE, otherwise mean.x=NULL.
scale.x	max(x)-min(x) of each column of X. Only available when standardize=TRUE, otherwise scale.x=NULL.

predict.binaryGP

*Predictions of Binary Gaussian Process*

---

## Description

The function computes the predicted response and its variance as well as its confidence interval.

## Usage

```

## S3 method for class 'binaryGP'
predict(object, xnew, conf.level = 0.95,
        sim.number = 101, ...)

```

## Arguments

object	a class binaryGP object estimated by binaryGP_fit.
xnew	a testing matrix with dimension n_new by d in which each row corresponds to a predictive location.
conf.level	a value from 0 to 1 specifying the level of confidence interval. The default is 0.95.
sim.number	a positive integer specifying the simulation number for Monte-Carlo method. The default is 101.
...	for compatibility with generic method predict.

**Value**

mean	a matrix with dimension <code>n_new</code> by <code>T</code> displaying predicted responses at locations <code>xnew</code> .
var	a matrix with dimension <code>n_new</code> by <code>T</code> displaying predictive variances at locations <code>xnew</code> .
upper .bound	a matrix with dimension <code>n_new</code> by <code>T</code> displaying upper bounds with <code>conf.level</code> confidence level.
lower .bound	a matrix with dimension <code>n_new</code> by <code>T</code> displaying lower bounds with <code>conf.level</code> confidence level.
<code>y_pred</code>	a matrix with dimension <code>n_new</code> by <code>T</code> displaying predicted binary responses at locations <code>xnew</code> .

*Print Fitted results of Binary Gaussian Process*

---

### Description

The function shows the estimation results by `binaryGP_fit`.

**Usage**

```
## S3 method for class 'binaryGP'
print(x, ...)
```

**Arguments**

`x` a class `binaryGP` object estimated by `binaryGP_fit`.  
`...` for compatibility with generic method `print`.

**Value**

a list of estimates by `binaryGP_fit`.

**Author(s)**

Chih-Li Sung <iamdfchile@gmail.com>

*Summary of Fitting a Binary Gaussian Process*

---

## Description

The function summarizes estimation and significance results by `binaryGP_fit`.

## Usage

```
## S3 method for class 'binaryGP'
summary(object, ...)
```

## Arguments

`object` a class `binaryGP` object estimated by `binaryGP_fit`.  
`...` for compatibility with generic method `summary`.

## Value

A table including the estimates by `binaryGP_fit`, and the corresponding standard deviations, Z-values and p-values.
