Package 'mlr3'

August 7, 2020

Title Machine Learning in R - Next Generation

Version 0.5.0

Description Efficient, object-oriented programming on the building blocks of machine learning. Provides 'R6' objects for tasks, learners, resamplings, and measures. The package is geared towards scalability and larger datasets by supporting parallelization and out-of-memory data-backends like databases. While 'mlr3' focuses on the core computational operations, add-on packages provide additional functionality.

`mlr3-package` *mlr3: Machine Learning in R - Next Generation*

Description

Efficient, object-oriented programming on the building blocks of machine learning. Provides 'R6' objects for tasks, learners, resamplings, and measures. The package is geared towards scalability and larger datasets by supporting parallelization and out-of-memory data-backends like databases. While 'mlr3' focuses on the core computational operations, add-on packages provide additional functionality.

---

as_benchmark_result *Convert to BenchmarkResult*

Description

Simple S3 method to convert objects to a BenchmarkResult.

Usage

```
as_benchmark_result(x, ...)

## S3 method for class 'ResampleResult'
as_benchmark_result(x, ...)
```

Arguments

x	(any) Object to dispatch on, e.g. a ResampleResult.
...	(any) Currently not used.

Value

(BenchmarkResult).

---

as_data_backend.data.frame *Create a Data Backend*

Description

Wraps a DataBackend around data.

Usage

```
## S3 method for class 'data.frame'
as_data_backend(data, primary_key = NULL, keep_rownames = FALSE, ...)

## S3 method for class 'Matrix'
as_data_backend(data, primary_key = NULL, dense = NULL, ...)

as_data_backend(data, primary_key = NULL, ...)
```

Arguments

data	any Data to create a DataBackend from. For a `data.frame()` (this includes `tibble()` from **tibble** and `data.table::data.table()`), a DataBackendDataTable is created. See `methods("as_data_backend")` for possible input formats. Package **mlr3db** extends this function with a method for lazy table objects implemented in **dbplyr**. This allows to interface many different data base systems such as SQL servers.
primary_key	(`character(1)` | `integer()`) Name of the primary key column, or integer vector of row ids.
keep_rownames	(`logical(1)` | `character(1)`) If `TRUE` or a single string, keeps the row names of `data` as a new column. The column is named like the provided string, defaulting to `"..rownames"` for `keep_rownames == TRUE`. Note that the created column will be used as a regular feature by the task unless you manually change the column role. Also see `data.table::as.data.table()`.

...	(any) Additional arguments passed to the respective DataBackend method.
dense	(data.frame()). Dense data.

Value

DataBackend.

See Also

Other DataBackend: DataBackendDataTable, DataBackendMatrix, DataBackend

Examples

```
# create a new backend using the iris data:
as_data_backend(iris)
```

---

benchmark *Benchmark Multiple Learners on Multiple Tasks*

Description

Runs a benchmark on arbitrary combinations of tasks (Task), learners (Learner), and resampling strategies (Resampling), possibly in parallel.

Usage

```
benchmark(design, store_models = FALSE)
```

Arguments

design	(data.frame()) Data frame (or data.table::data.table()) with three columns: "task", "learner", and "resampling". Each row defines a resampling by providing a Task, Learner and an instantiated Resampling strategy. The helper function benchmark_grid() can assist in generating an exhaustive design (see examples) and instantiate the Resamplings per Task.
store_models	(logical(1)) Keep the fitted model after the test set has been predicted? Set to TRUE if you want to further analyse the models or want to extract information like variable importance.

Value

BenchmarkResult.

Parallelization

This function can be parallelized with the **future** package. One job is one resampling iteration, and all jobs are send to an apply function from **future.apply** in a single batch. To select a parallel backend, use `future::plan()`.

Progress Bars

This function supports progress bars via the package **progressr**. Simply wrap the function in `progressr::with_progress()` to enable them. We recommend to use package **progress** as backend; enable with `progressr::handlers("progress")`.

Logging

The **mlr3** uses the **lgr** package for logging. **lgr** supports multiple log levels which can be queried with `getOption("lgr.log_levels")`.

To suppress output and reduce verbosity, you can lower the log from the default level `"info"` to `"warn"`:

```
lgr::get_logger("mlr3")$set_threshold("warn")
```

To get additional log output for debugging, increase the log level to `"debug"` or `"trace"`:

```
lgr::get_logger("mlr3")$set_threshold("debug")
```

To log to a file or a data base, see the documentation of lgr::lgr-package.

Note

The fitted models are discarded after the predictions have been scored in order to reduce memory consumption. If you need access to the models for later analysis, set `store_models` to `TRUE`.

Examples

```
# benchmarking with benchmark_grid()
tasks = lapply(c("iris", "sonar"), tsk)
learners = lapply(c("classif.featureless", "classif.rpart"), lrn)
resamplings = rsmp("cv", folds = 3)

design = benchmark_grid(tasks, learners, resamplings)
print(design)

set.seed(123)
bmr = benchmark(design)

## Data of all resamplings
head(as.data.table(bmr))

## Aggregated performance values
aggr = bmr$aggregate()
print(aggr)
```

```
## Extract predictions of first resampling result
rr = aggr$resample_result[[1]]
as.data.table(rr$prediction())

# Benchmarking with a custom design:
# - fit classif.featureless on iris with a 3-fold CV
# - fit classif.rpart on sonar using a holdout
tasks = list(tsk("iris"), tsk("sonar"))
learners = list(lrn("classif.featureless"), lrn("classif.rpart"))
resamplings = list(rsmp("cv", folds = 3), rsmp("holdout"))

design = data.table::data.table(
  task = tasks,
  learner = learners,
  resampling = resamplings
)

## Instantiate resamplings
design$resampling = Map(
  function(task, resampling) resampling$clone()$instantiate(task),
  task = design$task, resampling = design$resampling
)

## Run benchmark
bmr = benchmark(design)
print(bmr)

## Get the training set of the 2nd iteration of the featureless learner on iris
rr = bmr$aggregate()[learner_id == "classif.featureless"]$resample_result[[1]]
rr$resampling$train_set(2)
```

`BenchmarkResult` *Container for Benchmarking Results*

Description

This is the result container object returned by `benchmark()`. A BenchmarkResult consists of the data row-binded data of multiple ResampleResults, which can easily be re-constructed.

Note that all stored objects are accessed by reference. Do not modify any object without cloning it first.

S3 Methods

- `as.data.table(bmr)`
  BenchmarkResult -> `data.table::data.table()`
  Returns a copy of the internal data.
- `c(...)`
  (BenchmarkResult, ...) -> BenchmarkResult
  Combines multiple objects convertible to BenchmarkResult into a new BenchmarkResult.

- `friedman.test(y,...)`
  BenchmarkResult -> `"htest"`
  Applies `friedman.test()` on the benchmark result, returning an object of class `"htest"`.

Public fields

`data` (`data.table::data.table()`)
Internal data storage with one row per resampling iteration. Can be joined with $rr_data by joining on column `"hash"`. We discourage users to directly work with this table.

`rr_data` (`data.table::data.table()`)
Internal data storage with one row per ResampleResult (instead of one row per resampling iteration as in $data).

Package develops may opt to add additional columns here. These columns are preserved in all mutators.

Can be combined with $data by (left) joining on the key column `"hash"`. E.g., **mlr3tuning** stores additional information for the optimization path in this table.

Active bindings

`task_type` (`character(1)`)
Task type of objects in the `BenchmarkResult`. All stored objects (Task, Learner, Prediction) in a single `BenchmarkResult` are required to have the same task type, e.g., `"classif"` or `"regr"`. This is `NULL` for empty BenchmarkResults.

`tasks` (`data.table::data.table()`)
Table of included Tasks with three columns:

- `"task_hash"` (`character(1)`),
- `"task_id"` (`character(1)`), and
- `"task"` (Task).

`learners` (`data.table::data.table()`)
Table of included Learners with three columns:

- `"learner_hash"` (`character(1)`),
- `"learner_id"` (`character(1)`), and
- `"learner"` (Learner).

Note that it is not feasible to access learned models via this getter, as the training task would be ambiguous. For this reason the returned learner are reseted before they are returned. Instead, select a row from the table returned by $score().

`resamplings` (`data.table::data.table()`)
Table of included Resamplings with three columns:

- `"resampling_hash"` (`character(1)`),
- `"resampling_id"` (`character(1)`), and
- `"resampling"` (Resampling).

`n_resample_results` (`integer(1)`)
Returns the total number of stored ResampleResults.

`uhashes` (`character()`)
Set of (unique) hashes of all included ResampleResults.

Methods

Public methods:

- BenchmarkResult$new()
- BenchmarkResult$help()
- BenchmarkResult$format()
- BenchmarkResult$print()
- BenchmarkResult$combine()
- BenchmarkResult$score()
- BenchmarkResult$aggregate()
- BenchmarkResult$filter()
- BenchmarkResult$resample_result()
- BenchmarkResult$clone()

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
BenchmarkResult$new(data = data.table())
```

Arguments:

`data` (data.table::data.table())

Table with data for one resampling iteration per row, with at least the following columns:

- `"task"` (Task),
- `"learner"` (Learner),
- `"resampling"` (Resampling),
- `"iteration"` (`integer(1)`),
- `"prediction"` (Prediction), and
- `"uhash"` (`character(1)`).

Column `"uhash"` is the unique hash of the corresponding ResampleResult. Additional columns are kept in the resulting object, but otherwise ignored by BenchmarkResult.

Method `help()`**:** Opens the help page for this object.

Usage:

```
BenchmarkResult$help()
```

Method `format()`**:** Helper for print outputs.

Usage:

```
BenchmarkResult$format()
```

Method `print()`**:** Printer.

Usage:

```
BenchmarkResult$print()
```

Method `combine()`**:** Fuses a second BenchmarkResult into itself, mutating the BenchmarkResult in-place. If the second BenchmarkResult `bmr` is `NULL`, simply returns `self`. Note that you can alternatively use the combine function `c()` which calls this method internally.

Usage:

```
BenchmarkResult$combine(bmr)
```

Arguments:

`bmr` (BenchmarkResult)
A second BenchmarkResult object.

Returns: Returns the object itself, but modified **by reference**. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method `score()`**:** Returns a table with one row for each resampling iteration, including all involved objects: Task, Learner, Resampling, iteration number (`integer(1)`), and Prediction. If `ids` is set to `TRUE`, character column of extracted ids are added to the table for convenient filtering: `"task_id"`, `"learner_id"`, and `"resampling_id"`.

Additionally calculates the provided performance measures and binds the performance scores as extra columns. These columns are named using the id of the respective Measure.

Usage:

```
BenchmarkResult$score(measures = NULL, ids = TRUE)
```

Arguments:

`measures` (Measure | list of Measure)
Measure(s) to calculate.

`ids` (`logical(1)`)
Adds object ids (`"task_id"`, `"learner_id"`, `"resampling_id"`) as extra character columns for convenient subsetting.

Returns: `data.table::data.table()`.

Method `aggregate()`**:** Returns a result table where resampling iterations are combined into ResampleResults. A column with the aggregated performance score is added for each Measure, named with the id of the respective measure.

For convenience, different flags can be set to extract more information from the returned ResampleResult:

Usage:

```
BenchmarkResult$aggregate(
  measures = NULL,
  ids = TRUE,
  uhashes = FALSE,
  params = FALSE,
  conditions = FALSE
)
```

Arguments:

`measures` (Measure | list of Measure)
Measure(s) to calculate.

`ids` (`logical(1)`)
Adds object ids (`"task_id"`, `"learner_id"`, `"resampling_id"`) as extra character columns for convenient subsetting.

`uhashes` (`logical(1)`)
Adds the uhash values of the ResampleResult as extra character column `"uhash"`.

`params (logical(1))`
: Adds the hyperparameter values as extra list column `"params"`. You can unnest them with `mlr3misc::unnest()`.

`conditions (logical(1))`
: Adds the number of resampling iterations with at least one warning as extra integer column `"warnings"`, and the number of resampling iterations with errors as extra integer column `"errors"`.

Returns: `data.table::data.table()`.

Method `filter()`**:** Subsets the benchmark result. If `task_ids` is not `NULL`, keeps all tasks with provided task ids while discards all others. Same procedure for `learner_ids` and `resampling_ids`.

Usage:

```
BenchmarkResult$filter(
  task_ids = NULL,
  learner_ids = NULL,
  resampling_ids = NULL
)
```

Arguments:

`task_ids (character())`
: Ids of Tasks to keep.

`learner_ids (character())`
: Ids of Learners to keep.

`resampling_ids (character())`
: Ids of Resamplings to keep.

Returns: Returns the object itself, but modified **by reference**. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method `resample_result()`**:** Retrieve the i-th ResampleResult, by position or by unique hash `uhash`. `i` and `uhash` are mutually exclusive.

Usage:

```
BenchmarkResult$resample_result(i = NULL, uhash = NULL)
```

Arguments:

`i (integer(1))`
: The iteration value to filter for.

`uhash (logical(1))`
: The `ushash` value to filter for.

Returns: ResampleResult.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
BenchmarkResult$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Examples

```
set.seed(123)
learners = list(
  lrn("classif.featureless", predict_type = "prob"),
  lrn("classif.rpart", predict_type = "prob")
)

design = benchmark_grid(
  tasks = list(tsk("sonar"), tsk("spam")),
  learners = learners,
  resamplings = rsmp("cv", folds = 3)
)
print(design)

bmr = benchmark(design)
print(bmr)

bmr$tasks
bmr$learners

# first 5 individual resamplings
head(as.data.table(bmr, measures = c("classif.acc", "classif.auc")), 5)

# aggregate results
bmr$aggregate()

# aggregate results with hyperparameters as separate columns
mlr3misc::unnest(bmr$aggregate(params = TRUE), "params")

# extract resample result for classif.rpart
rr = bmr$aggregate()[learner_id == "classif.rpart", resample_result][[1]]
print(rr)

# access the confusion matrix of the first resampling iteration
rr$predictions()[[1]]$confusion
```

---

benchmark_grid *Generate a Benchmark Grid Design*

Description

Takes a lists of Task, a list of Learner and a list of Resampling to generate a design in an `expand.grid()` fashion (a.k.a. cross join or Cartesian product).

Resampling strategies are not allowed to be instantiated when passing the argument, and instead will be instantiated per task internally. The only exception to this rule applies if all tasks have exactly the same number of rows, and the resamplings are all instantiated for such tasks.

Usage

```
benchmark_grid(tasks, learners, resamplings)
```

Arguments

tasks	(list of Task).
learners	(list of Learner).
resamplings	(list of Resampling).

Value

(data.table::data.table()) with the cross product of the input vectors.

Examples

```
tasks = list(tsk("iris"), tsk("sonar"))
learners = list(lrn("classif.featureless"), lrn("classif.rpart"))
resamplings = list(rsmp("cv"), rsmp("subsampling"))
benchmark_grid(tasks, learners, resamplings)
```

DataBackend *DataBackend*

Description

This is the abstract base class for data backends.

Data backends provide a layer of abstraction for various data storage systems. It is not recommended to work directly with the DataBackend. Instead, all data access is handled transparently via the Task.

This package comes with two implementations for backends:

- DataBackendDataTable which stores the data as data.table::data.table().
- DataBackendMatrix which stores the data as sparse Matrix::sparseMatrix().

To connect to out-of-memory database management systems such as SQL servers, see the extension package **mlr3db**.

The required set of fields and methods to implement a custom DataBackend is listed in the respective sections (see DataBackendDataTable or DataBackendMatrix for exemplary implementations of the interface).

Public fields

`primary_key (character(1))`
: Column name of the primary key column of unique integer row ids.

`data_formats (character())`
: Set of supported formats, e.g. "data.table" or "Matrix".

Active bindings

`hash (character(1))`
: Hash (unique identifier) for this object.

Methods

Public methods:

- `DataBackend$new()`
- `DataBackend$format()`
- `DataBackend$print()`

Method `new()`**:** Creates a new instance of this R6 class.
Note: This object is typically constructed via a derived classes, e.g. DataBackendDataTable or DataBackendMatrix, or via the S3 method `as_data_backend()`.

Usage:

```
DataBackend$new(data, primary_key, data_formats = "data.table")
```

Arguments:

`data` (any)
: The format of the input data depends on the specialization. E.g., DataBackendDataTable expects a `data.table::data.table()` and DataBackendMatrix expects a `Matrix::Matrix()` from **Matrix**.

`primary_key` (`character(1)`)
: Each DataBackend needs a way to address rows, which is done via a column of unique integer values, referenced here by `primary_key`. The use of this variable may differ between backends.

`data_formats` (`character()`)
: Set of supported data formats which can be processed during $train() and $predict(), e.g. `"data.table"`.

Method `format()`**:** Helper for print outputs.

Usage:

```
DataBackend$format()
```

Method `print()`**:** Printer.

Usage:

```
DataBackend$print()
```

See Also

Extension Packages: **mlr3db**

Other DataBackend: `DataBackendDataTable`, `DataBackendMatrix`, `as_data_backend.data.frame()`

Examples

```
data = data.table::data.table(id = 1:5, x = runif(5),
  y = sample(letters[1:3], 5, replace = TRUE))

b = DataBackendDataTable$new(data, primary_key = "id")
print(b)
b$head(2)
b$data(rows = 1:2, cols = "x")
b$distinct(rows = b$rownames, "y")
b$missings(rows = b$rownames, cols = names(data))
```

DataBackendDataTable *DataBackend for data.table*

Description

DataBackend for **data.table** which serves as an efficient in-memory data base.

Super class

`mlr3::DataBackend` -> `DataBackendDataTable`

Public fields

`compact_seq logical(1)`
: If `TRUE`, row ids are a natural sequence from 1 to `nrow(data)` (determined internally). In this case, row lookup uses faster positional indices instead of equi joins.

Active bindings

`rownames (integer())`
: Returns vector of all distinct row identifiers, i.e. the contents of the primary key column.

`colnames (character())`
: Returns vector of all column names, including the primary key column.

`nrow (integer(1))`
: Number of rows (observations).

`ncol (integer(1))`
: Number of columns (variables), including the primary key column.

Methods

Public methods:

- `DataBackendDataTable$new()`
- `DataBackendDataTable$data()`
- `DataBackendDataTable$head()`
- `DataBackendDataTable$distinct()`
- `DataBackendDataTable$missings()`

Method `new()`**:** Creates a new instance of this R6 class.

Note that `DataBackendDataTable` does not copy the input data, while `as_data_backend()` calls `data.table::copy()`. `as_data_backend()` also takes care about casting to a `data.table()` and adds a primary key column if necessary.

Usage:

```
DataBackendDataTable$new(data, primary_key)
```

Arguments:

`data` (`data.table::data.table()`)
The input `data.table()`.

`primary_key` (`character(1)` | `integer()`)
Name of the primary key column, or integer vector of row ids.

Method `data()`: Returns a slice of the data in the specified format. Currently, the only supported formats are `"data.table"` and `"Matrix"`. The rows must be addressed as vector of primary key values, columns must be referred to via column names. Queries for rows with no matching row id and queries for columns with no matching column name are silently ignored. Rows are guaranteed to be returned in the same order as `rows`, columns may be returned in an arbitrary order. Duplicated row ids result in duplicated rows, duplicated column names lead to an exception.

Usage:

```
DataBackendDataTable$data(rows, cols, data_format = "data.table")
```

Arguments:

`rows` `integer()`
Row indices.

`cols` `character()`
Column names.

`data_format` (`character(1)`)
Desired data format, e.g. `"data.table"` or `"Matrix"`.

Method `head()`: Retrieve the first `n` rows.

Usage:

```
DataBackendDataTable$head(n = 6L)
```

Arguments:

`n` (`integer(1)`)
Number of rows.

Returns: `data.table::data.table()` of the first `n` rows.

Method `distinct()`: Returns a named list of vectors of distinct values for each column specified. If `na_rm` is `TRUE`, missing values are removed from the returned vectors of distinct values. Non-existing rows and columns are silently ignored.

Usage:

```
DataBackendDataTable$distinct(rows, cols, na_rm = TRUE)
```

Arguments:

`rows` `integer()`
Row indices.

`cols` `character()`
Column names.

`na_rm` `logical(1)`
Whether to remove NAs or not.

Returns: Named `list()` of distinct values.

Method `missings()`: Returns the number of missing values per column in the specified slice of data. Non-existing rows and columns are silently ignored.

Usage:

```
DataBackendDataTable$missings(rows, cols)
```

Arguments:

`rows integer()`
: Row indices.

`cols character()`
: Column names.

Returns: Total of missing values per column (named `numeric()`).

See Also

Other DataBackend: `DataBackendMatrix`, `DataBackend`, `as_data_backend.data.frame()`

Examples

```
data = as.data.table(iris)
data$id = seq_len(nrow(iris))
b = DataBackendDataTable$new(data = data, primary_key = "id")
print(b)
b$head()
b$data(rows = 100:101, cols = "Species")

b$nrow
head(b$rownames)

b$ncol
b$colnames

# alternative construction
as_data_backend(iris)
```

DataBackendMatrix *DataBackend for Matrix*

Description

DataBackend for **Matrix**. Data is split into a (numerical) sparse part and an optional dense part. These parts are automatically merged to a sparse format during $data(). Note that merging both parts potentially comes with a data loss, as all dense columns are converted to numeric columns.

Super class

`mlr3::DataBackend` -> `DataBackendMatrix`

Active bindings

`rownames (integer())`
: Returns vector of all distinct row identifiers, i.e. the contents of the primary key column.

`colnames (character())`
: Returns vector of all column names, including the primary key column.

`nrow (integer(1))`
: Number of rows (observations).

`ncol (integer(1))`
: Number of columns (variables), including the primary key column.

Methods

Public methods:

- `DataBackendMatrix$new()`
- `DataBackendMatrix$data()`
- `DataBackendMatrix$head()`
- `DataBackendMatrix$distinct()`
- `DataBackendMatrix$missings()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
DataBackendMatrix$new(data, dense = NULL, primary_key = NULL)
```

Arguments:

`data Matrix::Matrix()`
: The input `Matrix::Matrix()`.

`dense data.frame()`. Dense data, converted to `data.table::data.table()`.

`primary_key (character(1) | integer())`
: Name of the primary key column, or integer vector of row ids.

Method `data()`**:** Returns a slice of the data in the specified format. Currently, the only supported formats are `"data.table"` and `"Matrix"`. The rows must be addressed as vector of primary key values, columns must be referred to via column names. Queries for rows with no matching row id and queries for columns with no matching column name are silently ignored. Rows are guaranteed to be returned in the same order as `rows`, columns may be returned in an arbitrary order. Duplicated row ids result in duplicated rows, duplicated column names lead to an exception.

Usage:

```
DataBackendMatrix$data(rows, cols, data_format = "data.table")
```

Arguments:

`rows integer()`
: Row indices.

`cols character()`
: Column names.

`data_format (character(1))`
: Desired data format, e.g. `"data.table"` or `"Matrix"`.

Method `head()`**:** Retrieve the first `n` rows.

Usage:

```
DataBackendMatrix$head(n = 6L)
```

Arguments:

`n (integer(1))`
: Number of rows.

Returns: `data.table::data.table()` of the first `n` rows.

Method `distinct()`**:** Returns a named list of vectors of distinct values for each column specified. If `na_rm` is `TRUE`, missing values are removed from the returned vectors of distinct values. Non-existing rows and columns are silently ignored.

Usage:

```
DataBackendMatrix$distinct(rows, cols, na_rm = TRUE)
```

Arguments:

`rows integer()`
: Row indices.

`cols character()`
: Column names.

`na_rm logical(1)`
: Whether to remove NAs or not.

Returns: Named `list()` of distinct values.

Method `missings()`**:** Returns the number of missing values per column in the specified slice of data. Non-existing rows and columns are silently ignored.

Usage:

```
DataBackendMatrix$missings(rows, cols)
```

Arguments:

`rows integer()`
: Row indices.

`cols character()`
: Column names.

Returns: Total of missing values per column (named `numeric()`).

See Also

Other DataBackend: `DataBackendDataTable`, `DataBackend`, `as_data_backend.data.frame()`

Examples

```
requireNamespace("Matrix")
data = Matrix::Matrix(sample(0:1, 20, replace = TRUE), ncol = 2)
colnames(data) = c("x1", "x2")
dense = data.frame(
  ..row_id = 1:10,
  num = runif(10),
```

```
  fact = factor(sample(c("a", "b"), 10, replace = TRUE), levels = c("a", "b"))
)

b = as_data_backend(data, dense = dense, primary_key = "..row_id")
b$head()
b$data(1:3, b$colnames, data_format = "Matrix")
b$data(1:3, b$colnames, data_format = "data.table")
```

`default_measures` *Get a Default Measure*

Description

Gets the default measures using the information in mlr_reflections$default_measures:

- `"classif.ce"` for classification (`"classif"`).
- `"regr.mse"` for regression (`"regr"`).
- Add-on package may register additional default measures for their own task types.

Usage

```
default_measures(task_type)
```

Arguments

`task_type`	(`character(1)`) Get the default measure for the task type `task_type`, e.g., `"classif"` or `"regr"`. If `task_type` is `NULL`, an empty list is returned.

Value

list of Measure.

Examples

```
default_measures("classif")
default_measures("regr")
```

`Learner` *Learner Class*

Description

This is the abstract base class for learner objects like LearnerClassif and LearnerRegr.

Learners are build around the three following key parts:

- Methods $train() and $predict() which call internal methods (either public method $train_internal()/$predict_internal() (soft deprecated) or private methods $.train()/$.predict()).
- A paradox::ParamSet which stores meta-information about available hyperparameters, and also stores hyperparameter settings.
- Meta-information about the requirements and capabilities of the learner.
- The fitted model stored in field $model, available after calling $train().

Predefined learners are stored in the dictionary mlr_learners, e.g. `classif.rpart` or `regr.rpart`.

More classification and regression learners are implemented in the add-on package **mlr3learners**. Learners for survival analysis (or more general, for probabilistic regression) can be found in **mlr3proba**. The dictionary mlr_learners gets automatically populated with the new learners as soon as the respective packages are loaded.

More (experimental) learners can be found on GitHub: `https://github.com/mlr3learners/`. A guide on how to extend **mlr3** with custom learners can be found in the mlr3book.

Optional Extractors

Specific learner implementations are free to implement additional getters to ease the access of certain parts of the model in the inherited subclasses.

For the following operations, extractors are standardized:

- `importance(...)`: Returns the feature importance score as numeric vector. The higher the score, the more important the variable. The returned vector is named with feature names and sorted in decreasing order. Note that the model might omit features it has not used at all. The learner must be tagged with property `"importance"`. To filter variables using the importance scores, see package **mlr3filters**.
- `selected_features(...)`: Returns a subset of selected features as `character()`. The learner must be tagged with property `"selected_features"`.
- `oob_error(...)`: Returns the out-of-bag error of the model as `numeric(1)`. The learner must be tagged with property `"oob_error"`.

Setting Hyperparameters

All information about hyperparameters is stored in the slot `param_set` which is a paradox::ParamSet. The printer gives an overview about the ids of available hyperparameters, their storage type, lower and upper bounds, possible levels (for factors), default values and assigned values. To set hyperparameters, assign a named list to the subslot `values`:

```
lrn = lrn("classif.rpart")
lrn$param_set$values = list(minsplit = 3, cp = 0.01)
```

Note that this operation replaces all previously set hyperparameter values. If you only intend to change one specific hyperparameter value and leave the others as-is, you can use the helper function `mlr3misc::insert_named()`:

```
lrn$param_set$values = mlr3misc::insert_named(lrn$param_set$values, list(cp = 0.001))
```

If the learner has additional hyperparameters which are not encoded in the ParamSet, you can easily extend the learner. Here, we add a factor hyperparameter with id `"foo"` and possible levels `"a"` and `"b"`:

```
lrn$param_set$add(paradox::ParamFct$new("foo", levels = c("a", "b")))
```

Public fields

`id (character(1))`
: Identifier of the object. Used in tables, plot and text output.

`state (NULL | named list())`
: Current (internal) state of the learner. Contains all information gathered during `train()` and `predict()`. It is not recommended to access elements from `state` directly. This is an internal data structure which may change in the future.

`task_type (character(1))`
: Task type, e.g. `"classif"` or `"regr"`.

  For a complete list of possible task types (depending on the loaded packages), see `mlr_reflections$task_types$type`

`predict_types (character())`
: Stores the possible predict types the learner is capable of. A complete list of candidate predict types, grouped by task type, is stored in `mlr_reflections$learner_predict_types`.

`feature_types (character())`
: Stores the feature types the learner can handle, e.g. `"logical"`, `"numeric"`, or `"factor"`. A complete list of candidate feature types, grouped by task type, is stored in `mlr_reflections$task_feature_types`.

`properties (character())`
: Stores a set of properties/capabilities the learner has. A complete list of candidate properties, grouped by task type, is stored in `mlr_reflections$learner_properties`.

`data_formats (character())`
: Supported data format, e.g. `"data.table"` or `"Matrix"`.

`packages (character(1))`
: Set of required packages. These packages are loaded, but not attached.

`predict_sets (character())`
: During `resample()`/`benchmark()`, a Learner can predict on multiple sets. Per default, a learner only predicts observations in the test set (`predict_sets == "test"`). To change this behaviour, set `predict_sets` to a non-empty subset of {"train", "test"}. Each set yields a separate Prediction object. Those be combined via getters in ResampleResult/BenchmarkResult, or Measures can be altered to operate on specific subsets of the calculated prediction sets.

`fallback` (Learner)
: Learner which is fitted to impute predictions in case that either the model fitting or the prediction of the top learner is not successful. Requires you to enable encapsulation, otherwise errors are not caught and the execution is terminated before the fallback learner kicks in.

`man` (`character(1)`)
: String in the format [pkg]::[topic] pointing to a manual page for this object. Defaults to `NA`, but can be set by child classes.

Active bindings

`model` (`any`)
: The fitted model. Only available after $train() has been called.

`timings` (named `numeric(2)`)
: Elapsed time in seconds for the steps `"train"` and `"predict"`. Measured via `mlr3misc::encapsulate()`.

`log` (`data.table::data.table()`)
: Returns the output (including warning and errors) as table with columns
  - `"stage"` ("train" or "predict"),
  - `"class"` ("output", "warning", or "error"), and
  - `"msg"` (`character()`).

`warnings` (`character()`)
: Logged warnings as vector.

`errors` (`character()`)
: Logged errors as vector.

`hash` (`character(1)`)
: Hash (unique identifier) for this object.

`predict_type` (`character(1)`)
: Stores the currently active predict type, e.g. `"response"`. Must be an element of $predict_types.

`param_set` (paradox::ParamSet)
: Set of hyperparameters.

`encapsulate` (named `character()`)
: Controls how to execute the code in internal train and predict methods. Must be a named character vector with names `"train"` and `"predict"`. Possible values are `"none"`, `"evaluate"` (requires package **evaluate**) and `"callr"` (requires package **callr**). See `mlr3misc::encapsulate()` for more details.

Methods

Public methods:

- `Learner$new()`
- `Learner$format()`
- `Learner$print()`
- `Learner$help()`
- `Learner$train()`
- `Learner$predict()`

- Learner$predict_newdata()
- Learner$reset()
- Learner$clone()

Method `new()`**:** Creates a new instance of this R6 class.

Note that this object is typically constructed via a derived classes, e.g. LearnerClassif or LearnerRegr.

Usage:

```
Learner$new(
  id,
  task_type,
  param_set = ParamSet$new(),
  predict_types = character(),
  feature_types = character(),
  properties = character(),
  data_formats = "data.table",
  packages = character(),
  man = NA_character_
)
```

Arguments:

`id (character(1))`
: Identifier for the new instance.

`task_type (character(1))`
: Type of task, e.g. `"regr"` or `"classif"`. Must be an element of mlr_reflections$task_types$type.

`param_set (paradox::ParamSet)`
: Set of hyperparameters.

`predict_types (character())`
: Supported predict types. Must be a subset of `mlr_reflections$learner_predict_types`.

`feature_types (character())`
: Feature types the learner operates on. Must be a subset of `mlr_reflections$task_feature_types`.

`properties (character())`
: Set of properties of the Learner. Must be a subset of `mlr_reflections$learner_properties`.
The following properties are currently standardized and understood by learners in **mlr3**:
  - `"missings"`: The learner can handle missing values in the data.
  - `"weights"`: The learner supports observation weights.
  - `"importance"`: The learner supports extraction of importance scores, i.e. comes with an $importance() extractor function (see section on optional extractors in Learner).
  - `"selected_features"`: The learner supports extraction of the set of selected features, i.e. comes with a $selected_features() extractor function (see section on optional extractors in Learner).
  - `"oob_error"`: The learner supports extraction of estimated out of bag error, i.e. comes with a `oob_error()` extractor function (see section on optional extractors in Learner).

`data_formats (character())`
: Set of supported data formats which can be processed during $train() and $predict(), e.g. `"data.table"`.

`packages (character())`
: Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via `requireNamespace()`.

`man (character(1))`
: String in the format [pkg]::[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method `format()`**:** Helper for print outputs.

Usage:

```
Learner$format()
```

Method `print()`**:** Printer.

Usage:

```
Learner$print()
```

Arguments:

`...` (ignored).

Method `help()`**:** Opens the corresponding help page referenced by field $man.

Usage:

```
Learner$help()
```

Method `train()`**:** Train the learner on a set of observations of the provided `task`. Mutates the learner by reference, i.e. stores the model alongside other information in field $state.

Usage:

```
Learner$train(task, row_ids = NULL)
```

Arguments:

`task` (Task).

`row_ids (integer())`
: Vector of training indices.

Returns: Returns the object itself, but modified **by reference**. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method `predict()`**:** Uses the information stored during $train() in $state to create a new Prediction for a set of observations of the provided `task`.

Usage:

```
Learner$predict(task, row_ids = NULL)
```

Arguments:

`task` (Task).

`row_ids (integer())`
: Vector of test indices.

Returns: Prediction.

Method `predict_newdata()`: Uses the model fitted during $train() to create a new Prediction based on the new data in `newdata`. Object `task` is the task used during $train() and required for conversion of `newdata`. If the learner's $train() method has been called, there is a (size reduced) version of the training task stored in the learner. If the learner has been fitted via `resample()` or `benchmark()`, you need to pass the corresponding task stored in the ResampleResult or BenchmarkResult, respectively.

Usage:

```
Learner$predict_newdata(newdata, task = NULL)
```

Arguments:

`newdata` (`data.frame()`)
New data to predict on. Row ids are automatically created via auto-incrementing.

`task` (Task).

Returns: Prediction.

Method `reset()`: Reset the learner, i.e. un-train by resetting the `state`.

Usage:

```
Learner$reset()
```

Returns: Returns the object itself, but modified **by reference**. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method `clone()`: The objects of this class are cloneable with this method.

Usage:

```
Learner$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Other Learner: `LearnerClassif`, `LearnerRegr`, `mlr_learners_classif.debug`, `mlr_learners_classif.featureless`, `mlr_learners_classif.rpart`, `mlr_learners_regr.featureless`, `mlr_learners_regr.rpart`, `mlr_learners`

`LearnerClassif` *Classification Learner*

Description

This Learner specializes Learner for classification problems:

- `task_type` is set to `"classif"`.
- Creates Predictions of class PredictionClassif.
- Possible values for `predict_types` are:
  - `"response"`: Predicts a class label for each observation in the test set.

  - "prob": Predicts the posterior probability for each class for each observation in the test set.
- Additional learner properties include:
  - "twoclass": The learner works on binary classification problems.
  - "multiclass": The learner works on multiclass classification problems.

Predefined learners can be found in the dictionary mlr_learners. Essential classification learners can be found in this dictionary after loading **mlr3learners**.

Super class

`mlr3::Learner` -> `LearnerClassif`

Methods

Public methods:

- `LearnerClassif$new()`
- `LearnerClassif$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
LearnerClassif$new(
  id,
  param_set = ParamSet$new(),
  predict_types = "response",
  feature_types = character(),
  properties = character(),
  data_formats = "data.table",
  packages = character(),
  man = NA_character_
)
```

Arguments:

`id (character(1))`
: Identifier for the new instance.

`param_set (paradox::ParamSet)`
: Set of hyperparameters.

`predict_types (character())`
: Supported predict types. Must be a subset of `mlr_reflections$learner_predict_types`.

`feature_types (character())`
: Feature types the learner operates on. Must be a subset of `mlr_reflections$task_feature_types`.

`properties (character())`
: Set of properties of the Learner. Must be a subset of `mlr_reflections$learner_properties`.
The following properties are currently standardized and understood by learners in **mlr3**:
  - "missings": The learner can handle missing values in the data.
  - "weights": The learner supports observation weights.
  - "importance": The learner supports extraction of importance scores, i.e. comes with an $importance() extractor function (see section on optional extractors in Learner).

- "selected_features": The learner supports extraction of the set of selected features, i.e. comes with a $selected_features() extractor function (see section on optional extractors in Learner).
- "oob_error": The learner supports extraction of estimated out of bag error, i.e. comes with a oob_error() extractor function (see section on optional extractors in Learner).

data_formats (character())
: Set of supported data formats which can be processed during $train() and $predict(), e.g. "data.table".

packages (character())
: Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via requireNamespace().

man (character(1))
: String in the format [pkg]::[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method clone(): The objects of this class are cloneable with this method.

Usage:

```
LearnerClassif$clone(deep = FALSE)
```

Arguments:

deep Whether to make a deep clone.

See Also

Other Learner: LearnerRegr, Learner, mlr_learners_classif.debug, mlr_learners_classif.featureless, mlr_learners_classif.rpart, mlr_learners_regr.featureless, mlr_learners_regr.rpart, mlr_learners

Examples

```
# get all classification learners from mlr_learners:
lrns = mlr_learners$mget(mlr_learners$keys("^classif"))
names(lrns)

# get a specific learner from mlr_learners:
lrn = lrn("classif.rpart")
print(lrn)

# train the learner:
task = tsk("iris")
lrn$train(task, 1:120)

# predict on new observations:
lrn$predict(task, 121:150)$confusion
```

`LearnerRegr` *Regression Learner*

Description

This Learner specializes Learner for regression problems:

- `task_type` is set to `"regr"`.
- Creates Predictions of class PredictionRegr.
- Possible values for `predict_types` are:
  - `"response"`: Predicts a numeric response for each observation in the test set.
  - `"se"`: Predicts the standard error for each value of response for each observation in the test set.
  - `"distr"`: Probability distribution as distr6::VectorDistribution object (requires package **distr6**).

Predefined learners can be found in the dictionary mlr_learners. Essential regression learners can be found in this dictionary after loading **mlr3learners**.

Super class

`mlr3::Learner` -> `LearnerRegr`

Methods

Public methods:

- `LearnerRegr$new()`
- `LearnerRegr$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
LearnerRegr$new(
  id,
  param_set = ParamSet$new(),
  predict_types = "response",
  feature_types = character(),
  properties = character(),
  data_formats = "data.table",
  packages = character(),
  man = NA_character_
)
```

Arguments:

`id (character(1))`
Identifier for the new instance.

`param_set` (paradox::ParamSet)
Set of hyperparameters.

`predict_types` (`character()`)
Supported predict types. Must be a subset of `mlr_reflections$learner_predict_types`.

`feature_types` (`character()`)
Feature types the learner operates on. Must be a subset of `mlr_reflections$task_feature_types`.

`properties` (`character()`)
Set of properties of the Learner. Must be a subset of `mlr_reflections$learner_properties`.
The following properties are currently standardized and understood by learners in **mlr3**:

- `"missings"`: The learner can handle missing values in the data.
- `"weights"`: The learner supports observation weights.
- `"importance"`: The learner supports extraction of importance scores, i.e. comes with an $importance() extractor function (see section on optional extractors in Learner).
- `"selected_features"`: The learner supports extraction of the set of selected features, i.e. comes with a $selected_features() extractor function (see section on optional extractors in Learner).
- `"oob_error"`: The learner supports extraction of estimated out of bag error, i.e. comes with a `oob_error()` extractor function (see section on optional extractors in Learner).

`data_formats` (`character()`)
Set of supported data formats which can be processed during $train() and $predict(), e.g. `"data.table"`.

`packages` (`character()`)
Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via `requireNamespace()`.

`man` (`character(1)`)
String in the format [pkg]::[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
LearnerRegr$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Learner: `LearnerClassif`, `Learner`, `mlr_learners_classif.debug`, `mlr_learners_classif.featureless`, `mlr_learners_classif.rpart`, `mlr_learners_regr.featureless`, `mlr_learners_regr.rpart`, `mlr_learners`

Examples

```
# get all regression learners from mlr_learners:
lrns = mlr_learners$mget(mlr_learners$keys("^regr"))
names(lrns)

# get a specific learner from mlr_learners:
```

```
mlr_learners$get("regr.rpart")
lrn("classif.featureless")
```

`Measure` *Measure Class*

Description

This is the abstract base class for measures like MeasureClassif and MeasureRegr.

Measures are classes around tailored around two functions:

1. A function $score() which quantifies the performance by comparing true and predicted response.
2. A function $aggregator() which combines multiple performance scores returned by `calculate` to a single numeric value.

In addition to these two functions, meta-information about the performance measure is stored.

Predefined measures are stored in the dictionary mlr_measures, e.g. `classif.auc` or `time_train`. Many of the measures in **mlr3** are implemented in **mlr3measures** as ordinary functions.

A guide on how to extend **mlr3** with custom measures can be found in the mlr3book.

Public fields

`id (character(1))`
Identifier of the object. Used in tables, plot and text output.

`task_type (character(1))`
Task type, e.g. `"classif"` or `"regr"`.
For a complete list of possible task types (depending on the loaded packages), see `mlr_reflections$task_types$type`

`predict_type (character(1))`
Required predict type of the Learner.

`predict_sets (character())`
During `resample()`/`benchmark()`, a Learner can predict on multiple sets. Per default, a learner only predicts observations in the test set (`predict_sets == "test"`). To change this behaviour, set `predict_sets` to a non-empty subset of {"train", "test"}. Each set yields a separate Prediction object. Those be combined via getters in ResampleResult/BenchmarkResult, or Measures can be altered to operate on specific subsets of the calculated prediction sets.

`average (character(1))`
Method for aggregation:

- `"micro"`: All predictions from multiple resampling iterations are first combined into a single Prediction object. Next, the scoring function of the measure is applied on this combined object, yielding a single numeric score.
- `"macro"`: The scoring function is applied on the Prediction object of each resampling iterations, each yielding a single numeric score. Next, the scores are combined with the `aggregator` function to a single numerical score.

`aggregator` (function())
: Function to aggregate scores computed on different resampling iterations.

`task_properties` (character())
: Required properties of the Task.

`range` (numeric(2))
: Lower and upper bound of possible performance scores.

`properties` (character())
: Properties of this measure.

`minimize` (logical(1))
: If TRUE, good predictions correspond to small values of performance scores.

`packages` (character(1))
: Set of required packages. These packages are loaded, but not attached.

`man` (character(1))
: String in the format [pkg]::[topic] pointing to a manual page for this object. Defaults to NA, but can be set by child classes.

Active bindings

`hash` (character(1))
: Hash (unique identifier) for this object.

Methods

Public methods:

- `Measure$new()`
- `Measure$format()`
- `Measure$print()`
- `Measure$help()`
- `Measure$score()`
- `Measure$aggregate()`

Method `new()`**:** Creates a new instance of this R6 class.

Note that this object is typically constructed via a derived classes, e.g. MeasureClassif or MeasureRegr.

Usage:

```
Measure$new(
  id,
  task_type = NA,
  range = c(-Inf, Inf),
  minimize = NA,
  average = "macro",
  aggregator = NULL,
  properties = character(),
  predict_type = "response",
  predict_sets = "test",
  task_properties = character(),
```

```
  packages = character(),
  man = NA_character_
)
```

Arguments:

`id (character(1))`
: Identifier for the new instance.

`task_type (character(1))`
: Type of task, e.g. `"regr"` or `"classif"`. Must be an element of mlr_reflections$task_types$type.

`range (numeric(2))`
: Feasible range for this measure as `c(lower_bound, upper_bound)`. Both bounds may be infinite.

`minimize (logical(1))`
: Set to `TRUE` if good predictions correspond to small values, and to `FALSE` if good predictions correspond to large values. If set to `NA` (default), tuning this measure is not possible.

`average (character(1))`
: How to average multiple Predictions from a ResampleResult.
  The default, `"macro"`, calculates the individual performances scores for each Prediction and then uses the function defined in $aggregator to average them to a single number.
  If set to `"micro"`, the individual Prediction objects are first combined into a single new Prediction object which is then used to assess the performance. The function in $aggregator is not used in this case.

`aggregator (function(x))`
: Function to aggregate individual performance scores `x` where `x` is a numeric vector. If `NULL`, defaults to `mean()`.

`properties (character())`
: Properties of the measure. Must be a subset of mlr_reflections$measure_properties. Supported by `mlr3`:
  - `"requires_task"` (requires the complete Task),
  - `"requires_learner"` (requires the trained Learner),
  - `"requires_train_set"` (requires the training indices from the Resampling), and
  - `"na_score"` (the measure is expected to occasionally return `NA` or `NaN`).

`predict_type (character(1))`
: Required predict type of the Learner. Possible values are stored in mlr_reflections$learner_predict_types.

`predict_sets (character())`
: Prediction sets to operate on, used in `aggregate()` to extract the matching `predict_sets` from the ResampleResult. Multiple predict sets are calculated by the respective Learner during `resample()`/`benchmark()`. Must be a non-empty subset of {"train", "test"}. If multiple sets are provided, these are first combined to a single prediction object. Default is `"test"`.

`task_properties (character())`
: Required task properties, see Task.

`packages (character())`
: Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via `requireNamespace()`.

`man (character(1))`
: String in the format [pkg]::[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method `format()`**:** Helper for print outputs.

Usage:

```
Measure$format()
```

Method `print()`**:** Printer.

Usage:

```
Measure$print()
```

Arguments:

`...` (ignored).

Method `help()`**:** Opens the corresponding help page referenced by field $man.

Usage:

```
Measure$help()
```

Method `score()`**:** Takes a Prediction (or a list of Prediction objects named with valid `predict_sets`) and calculates a numeric score. If the measure if flagged with the properties `"requires_task"`, `"requires_learner"` or `"requires_train_set"`, you must additionally pass the respective Task, the trained Learner or the training set indices. This is handled internally during `resample()`/`benchmark()`.

Usage:

```
Measure$score(prediction, task = NULL, learner = NULL, train_set = NULL)
```

Arguments:

`prediction` (Prediction | named list of Prediction).

`task` (Task).

`learner` (Learner).

`train_set` (`integer()`).

Returns: `numeric(1)`.

Method `aggregate()`**:** Aggregates multiple performance scores into a single score using the `aggregator` function of the measure. Operates on the Predictions of ResampleResult with matching `predict_sets`.

Usage:

```
Measure$aggregate(rr)
```

Arguments:

`rr` ResampleResult.

Returns: `numeric(1)`.

Other Measure: `MeasureClassif`, `MeasureRegr`, `mlr_measures_classif.costs`, `mlr_measures_debug`, `mlr_measures_elapsed_time`, `mlr_measures_oob_error`, `mlr_measures_selected_features`, `mlr_measures`

MeasureClassif *Classification Measure*

Description

This measure specializes Measure for classification problems:

- task_type is set to "classif".
- Possible values for predict_type are "response" and "prob".

Predefined measures can be found in the dictionary mlr_measures.

Super class

mlr3::Measure -> MeasureClassif

Methods

Public methods:

- MeasureClassif$new()

Method new(): Creates a new instance of this R6 class.

Usage:

```
MeasureClassif$new(
  id,
  range,
  minimize = NA,
  average = "macro",
  aggregator = NULL,
  properties = character(),
  predict_type = "response",
  predict_sets = "test",
  task_properties = character(),
  packages = character(),
  man = NA_character_
)
```

Arguments:

id (character(1))
: Identifier for the new instance.

range (numeric(2))
: Feasible range for this measure as c(lower_bound,upper_bound). Both bounds may be infinite.

minimize (logical(1))
: Set to TRUE if good predictions correspond to small values, and to FALSE if good predictions correspond to large values. If set to NA (default), tuning this measure is not possible.

`average (character(1))`
: How to average multiple Predictions from a ResampleResult.
The default, `"macro"`, calculates the individual performances scores for each Prediction and then uses the function defined in $aggregator to average them to a single number.
If set to `"micro"`, the individual Prediction objects are first combined into a single new Prediction object which is then used to assess the performance. The function in $aggregator is not used in this case.

`aggregator (function(x))`
: Function to aggregate individual performance scores `x` where `x` is a numeric vector. If `NULL`, defaults to `mean()`.

`properties (character())`
: Properties of the measure. Must be a subset of mlr_reflections$measure_properties. Supported by `mlr3`:
- `"requires_task"` (requires the complete Task),
- `"requires_learner"` (requires the trained Learner),
- `"requires_train_set"` (requires the training indices from the Resampling), and
- `"na_score"` (the measure is expected to occasionally return `NA` or `NaN`).

`predict_type (character(1))`
: Required predict type of the Learner. Possible values are stored in mlr_reflections$learner_predict_types.

`predict_sets (character())`
: Prediction sets to operate on, used in `aggregate()` to extract the matching `predict_sets` from the ResampleResult. Multiple predict sets are calculated by the respective Learner during `resample()`/`benchmark()`. Must be a non-empty subset of {"train", "test"}. If multiple sets are provided, these are first combined to a single prediction object. Default is `"test"`.

`task_properties (character())`
: Required task properties, see Task.

`packages (character())`
: Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via `requireNamespace()`.

`man (character(1))`
: String in the format [pkg]::[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

See Also

Default classification measures: `classif.ce`

Other Measure: `MeasureRegr`, `Measure`, `mlr_measures_classif.costs`, `mlr_measures_debug`, `mlr_measures_elapsed_time`, `mlr_measures_oob_error`, `mlr_measures_selected_features`, `mlr_measures`

`MeasureRegr` *Regression Measure*

Description

This measure specializes Measure for regression problems:

- `task_type` is set to `"regr"`.
- Possible values for `predict_type` are `"response"`, `"se"` and `"distr"`.

Predefined measures can be found in the dictionary mlr_measures.

Super class

`mlr3::Measure` -> `MeasureRegr`

Methods

Public methods:

- `MeasureRegr$new()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
MeasureRegr$new(
  id,
  range,
  minimize = NA,
  average = "macro",
  aggregator = NULL,
  properties = character(),
  predict_type = "response",
  predict_sets = "test",
  task_properties = character(),
  packages = character(),
  man = NA_character_
)
```

Arguments:

`id (character(1))`
: Identifier for the new instance.

`range (numeric(2))`
: Feasible range for this measure as `c(lower_bound,upper_bound)`. Both bounds may be infinite.

`minimize (logical(1))`
: Set to `TRUE` if good predictions correspond to small values, and to `FALSE` if good predictions correspond to large values. If set to `NA` (default), tuning this measure is not possible.

`average (character(1))`
: How to average multiple Predictions from a ResampleResult.
The default, `"macro"`, calculates the individual performances scores for each Prediction and then uses the function defined in $aggregator to average them to a single number.
If set to `"micro"`, the individual Prediction objects are first combined into a single new Prediction object which is then used to assess the performance. The function in $aggregator is not used in this case.

`aggregator` (function(x))
: Function to aggregate individual performance scores `x` where `x` is a numeric vector. If `NULL`, defaults to `mean()`.

`properties` (`character()`)
: Properties of the measure. Must be a subset of mlr_reflections$measure_properties. Supported by `mlr3`:
  - `"requires_task"` (requires the complete Task),
  - `"requires_learner"` (requires the trained Learner),
  - `"requires_train_set"` (requires the training indices from the Resampling), and
  - `"na_score"` (the measure is expected to occasionally return `NA` or `NaN`).

`predict_type` (`character(1)`)
: Required predict type of the Learner. Possible values are stored in mlr_reflections$learner_predict_types.

`predict_sets` (`character()`)
: Prediction sets to operate on, used in `aggregate()` to extract the matching `predict_sets` from the ResampleResult. Multiple predict sets are calculated by the respective Learner during `resample()`/`benchmark()`. Must be a non-empty subset of {"train", "test"}. If multiple sets are provided, these are first combined to a single prediction object. Default is `"test"`.

`task_properties` (`character()`)
: Required task properties, see Task.

`packages` (`character()`)
: Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via `requireNamespace()`.

`man` (`character(1)`)
: String in the format [pkg]::[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

---

mlr_coercions *Object Coercion*

Description

S3 generics and methods to coerce to (lists of) Task, Learner, Resampling, and Measure.

Usage

```
as_task(x, clone = FALSE)

## S3 method for class 'Task'
as_task(x, clone = FALSE)

as_tasks(x, clone = FALSE)

## S3 method for class 'list'
as_tasks(x, clone = FALSE)

## S3 method for class 'Task'
as_tasks(x, clone = FALSE)

as_learner(x, clone = FALSE)

## S3 method for class 'Learner'
as_learner(x, clone = FALSE)

as_learners(x, clone = FALSE)

## S3 method for class 'list'
as_learners(x, clone = FALSE)

## S3 method for class 'Learner'
as_learners(x, clone = FALSE)

as_resampling(x, clone = FALSE)

## S3 method for class 'Resampling'
as_resampling(x, clone = FALSE)

as_resamplings(x, clone = FALSE)

## S3 method for class 'list'
as_resamplings(x, clone = FALSE)

## S3 method for class 'Resampling'
as_resamplings(x, clone = FALSE)

as_measure(x, task_type = NULL, clone = FALSE)

## S3 method for class '`NULL`'
as_measure(x, task_type = NULL, clone = FALSE)

## S3 method for class 'Measure'
as_measure(x, task_type = NULL, clone = FALSE)
```

```
as_measures(x, task_type = NULL, clone = FALSE)

## S3 method for class '`NULL`'
as_measures(x, task_type = NULL, clone = FALSE)

## S3 method for class 'list'
as_measures(x, task_type = NULL, clone = FALSE)

## S3 method for class 'Measure'
as_measures(x, task_type = NULL, clone = FALSE)
```

Arguments

x	(any) Object to coerce.
clone	(logical(1)) If TRUE, ensures that the returned object is not the same as the input x, e.g. by cloning it or constructing it from a dictionary such as mlr_learners.
task_type	(character(1)) Used if x is NULL to construct a default measure for the respective task type. The default measures are stored in mlr_reflections$default_measures.

Value

Coerced object. The default method will return the object as-is. Failed coercions have to be handled by on of the assertions in mlr_assertions.

Examples

```
# convert single measure to list of measures
measure = msr("classif.ce")
as_measures(measure)
```

---

mlr_learners *Dictionary of Learners*

Description

A simple mlr3misc::Dictionary storing objects of class Learner. Each learner has an associated help page, see mlr_learners_[id].

This dictionary can get populated with additional learners by add-on packages. For more classification and regression learners, load the **mlr3learners** package and https://github.com/mlr3learners.

For a more convenient way to retrieve and construct learners, see lrn()/lrns().

Format

R6::R6Class object inheriting from mlr3misc::Dictionary.

Methods

See mlr3misc::Dictionary.

S3 methods

- `as.data.table(dict)`
  mlr3misc::Dictionary -> `data.table::data.table()`
  Returns a `data.table::data.table()` with fields "key", "feature_types", "packages", "properties" and "predict_types" as columns.

See Also

Sugar functions: `lrn()`, `lrns()`

Extension Packages: **mlr3learners**

Other Dictionary: `mlr_measures`, `mlr_resamplings`, `mlr_task_generators`, `mlr_tasks`

Other Learner: `LearnerClassif`, `LearnerRegr`, `Learner`, `mlr_learners_classif.debug`, `mlr_learners_classif.featu`
`mlr_learners_classif.rpart`, `mlr_learners_regr.featureless`, `mlr_learners_regr.rpart`

Examples

```
as.data.table(mlr_learners)
mlr_learners$get("classif.featureless")
lrn("classif.rpart")
```

`mlr_learners_classif.debug`

Classification Learner for Debugging

Description

A simple LearnerClassif used primarily in the unit tests and for debugging purposes. If no hyperparameter is set, it simply constantly predicts a randomly selected label. The following hyperparameters trigger the following actions:

message_train: Probability to output a message during train.

message_predict: Probability to output a message during predict.

warning_train: Probability to signal a warning during train.

warning_predict: Probability to signal a warning during predict.

error_train: Probability to raises an exception during train.

error_predict: Probability to raise an exception during predict.

segfault_train: Probability to provokes a segfault during train.

segfault_predict: Probability to provokes a segfault during predict.

predict_missing Ratio of predictions which will be NA.

save_tasks: Saves input task in `model` slot during training and prediction.

x: Numeric tuning parameter. Has no effect.

Note that segfaults may not be triggered on your operating system. Also note that if they work, they will tear down your R session immediately!

Dictionary

This Learner can be instantiated via the dictionary mlr_learners or with the associated sugar function `lrn()`:

```
mlr_learners$get("classif.featureless")
lrn("classif.featureless")
```

Meta Information

- Task type: "classif"
- Predict Types: "response", "prob"
- Feature Types: "logical", "integer", "numeric", "character", "factor", "ordered"
- Required Packages: -

Parameters

Id	Type	Default	Range	Levels
message_train	numeric	0	$[0, 1]$	-
message_predict	numeric	0	$[0, 1]$	-
warning_train	numeric	0	$[0, 1]$	-
warning_predict	numeric	0	$[0, 1]$	-
error_train	numeric	0	$[0, 1]$	-
error_predict	numeric	0	$[0, 1]$	-
segfault_train	numeric	0	$[0, 1]$	-
segfault_predict	numeric	0	$[0, 1]$	-
predict_missing	numeric	0	$[0, 1]$	-
save_tasks	logical	FALSE	$(-\infty, \infty)$	TRUE, FALSE
x	numeric	-	$[0, 1]$	-

Super classes

`mlr3::Learner` -> `mlr3::LearnerClassif` -> `LearnerClassifDebug`

Methods

Public methods:

- `LearnerClassifDebug$new()`
- `LearnerClassifDebug$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
LearnerClassifDebug$new()
```

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
LearnerClassifDebug$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Dictionary of Learners: mlr_learners

`as.data.table(mlr_learners)` for a complete table of all (also dynamically created) Learner implementations.

Other Learner: `LearnerClassif`, `LearnerRegr`, `Learner`, `mlr_learners_classif.featureless`, `mlr_learners_classif.rpart`, `mlr_learners_regr.featureless`, `mlr_learners_regr.rpart`, `mlr_learners`

Examples

```
learner = lrn("classif.debug")
learner$param_set$values = list(message_train = 1, save_tasks = TRUE)

# this should signal a message
task = tsk("iris")
learner$train(task)
learner$predict(task)

# task_train and task_predict are the input tasks for train() and predict()
names(learner$model)
```

---

mlr_learners_classif.featureless

Featureless Classification Learner

Description

A simple LearnerClassif which only analyses the labels during train, ignoring all features. Hyperparameter `method` determines the mode of operation during prediction:

mode: Predicts the most frequent label. If there are two or more labels tied, randomly selects one per prediction.

sample: Randomly predict a label uniformly.

weighed.sample: Randomly predict a label, with probability estimated from the training distribution.

Dictionary

This Learner can be instantiated via the dictionary mlr_learners or with the associated sugar function `lrn()`:

```
mlr_learners$get("classif.featureless")
lrn("classif.featureless")
```

Meta Information

- Task type: "classif"
- Predict Types: "response", "prob"
- Feature Types: "logical", "integer", "numeric", "character", "factor", "ordered"
- Required Packages: -

Parameters

Id	Type	Default	Range	Levels
method	character	mode	$(-\infty, \infty)$	mode , sample , weighted.sample

Super classes

`mlr3::Learner` -> `mlr3::LearnerClassif` -> `LearnerClassifFeatureless`

Methods

Public methods:

- `LearnerClassifFeatureless$new()`
- `LearnerClassifFeatureless$importance()`
- `LearnerClassifFeatureless$selected_features()`
- `LearnerClassifFeatureless$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
LearnerClassifFeatureless$new()
```

Method `importance()`**:** All features have a score of `0` for this learner.

Usage:

```
LearnerClassifFeatureless$importance()
```

Returns: Named `numeric()`.

Method `selected_features()`**:** Selected features are always the empty set for this learner.

Usage:

```
LearnerClassifFeatureless$selected_features()
```

Returns: `character(0)`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
LearnerClassifFeatureless$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Dictionary of Learners: mlr_learners

`as.data.table(mlr_learners)` for a complete table of all (also dynamically created) Learner implementations.

Other Learner: `LearnerClassif`, `LearnerRegr`, `Learner`, `mlr_learners_classif.debug`, `mlr_learners_classif.rpar`
`mlr_learners_regr.featureless`, `mlr_learners_regr.rpart`, `mlr_learners`

`mlr_learners_classif.rpart`
Classification Tree Learner

Description

A LearnerClassif for a classification tree implemented in `rpart::rpart()` in package **rpart**. Parameter `xval` is set to 0 in order to save some computation time. Parameter `model` has been renamed to `keep_model`.

Dictionary

This Learner can be instantiated via the dictionary mlr_learners or with the associated sugar function `lrn()`:

```
mlr_learners$get("classif.rpart")
lrn("classif.rpart")
```

Meta Information

- Task type: "classif"
- Predict Types: "response", "prob"
- Feature Types: "logical", "integer", "numeric", "factor", "ordered"
- Required Packages: **rpart**

Parameters

Id	Type	Default	Range	Levels
minsplit	integer	20	$[1, \infty)$	-
minbucket	integer	-	$[1, \infty)$	-
cp	numeric	0.01	$[0, 1]$	-
maxcompete	integer	4	$[0, \infty)$	-
maxsurrogate	integer	5	$[0, \infty)$	-
maxdepth	integer	30	$[1, 30]$	-
usesurrogate	integer	2	$[0, 2]$	-
surrogatestyle	integer	0	$[0, 1]$	-
xval	integer	10	$[0, \infty)$	-
keep_model	logical	FALSE	$(-\infty, \infty)$	TRUE, FALSE

Super classes

`mlr3::Learner` -> `mlr3::LearnerClassif` -> `LearnerClassifRpart`

Methods

Public methods:

- `LearnerClassifRpart$new()`
- `LearnerClassifRpart$importance()`
- `LearnerClassifRpart$selected_features()`
- `LearnerClassifRpart$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
LearnerClassifRpart$new()
```

Method `importance()`**:** The importance scores are extracted from the model slot `variable.importance`.

Usage:

```
LearnerClassifRpart$importance()
```

Returns: Named `numeric()`.

Method `selected_features()`**:** Selected features are extracted from the model slot `frame$var`.

Usage:

```
LearnerClassifRpart$selected_features()
```

Returns: `character()`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
LearnerClassifRpart$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Dictionary of Learners: mlr_learners

`as.data.table(mlr_learners)` for a complete table of all (also dynamically created) Learner implementations.

Other Learner: `LearnerClassif`, `LearnerRegr`, `Learner`, `mlr_learners_classif.debug`, `mlr_learners_classif.featu`
`mlr_learners_regr.featureless`, `mlr_learners_regr.rpart`, `mlr_learners`

`mlr_learners_regr.featureless`

Featureless Regression Learner

Description

A simple LearnerRegr which only analyses the response during train, ignoring all features. If hyperparameter `robust` is `FALSE` (default), constantly predicts `mean(y)` as response and `sd(y)` as standard error. If `robust` is `TRUE`, `median()` and `mad()` are used instead of `mean()` and `sd()`, respectively.

Dictionary

This Learner can be instantiated via the dictionary mlr_learners or with the associated sugar function `lrn()`:

```
mlr_learners$get("regr.featureless")
lrn("regr.featureless")
```

Meta Information

- Task type: "regr"
- Predict Types: "response", "se"
- Feature Types: "logical", "integer", "numeric", "character", "factor", "ordered"
- Required Packages: 'stats'

Parameters

Id	Type	Default	Range	Levels
robust	logical	TRUE	$(-\infty, \infty)$	TRUE, FALSE

Super classes

mlr3::Learner -> mlr3::LearnerRegr -> LearnerRegrFeatureless

Methods

Public methods:

- LearnerRegrFeatureless$new()
- LearnerRegrFeatureless$importance()
- LearnerRegrFeatureless$selected_features()
- LearnerRegrFeatureless$clone()

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
LearnerRegrFeatureless$new()
```

Method `importance()`**:** All features have a score of `0` for this learner.

Usage:

```
LearnerRegrFeatureless$importance()
```

Returns: Named `numeric()`.

Method `selected_features()`**:** Selected features are always the empty set for this learner.

Usage:

```
LearnerRegrFeatureless$selected_features()
```

Returns: `character(0)`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
LearnerRegrFeatureless$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

`mlr_measures` *Dictionary of Performance Measures*

Description

A simple mlr3misc::Dictionary storing objects of class Measure. Each measure has an associated help page, see `mlr_measures_[id]`.

This dictionary can get populated with additional measures by add-on packages.

For a more convenient way to retrieve and construct measures, see `msr()`/`msrs()`.

Format

R6::R6Class object inheriting from mlr3misc::Dictionary.

Methods

See mlr3misc::Dictionary.

S3 methods

- `as.data.table(dict)`
  mlr3misc::Dictionary -> `data.table::data.table()`
  Returns a `data.table::data.table()` with fields "key", "task_type", "predict_type", and "packages" as columns.

See Also

Sugar functions: `msr()`, `msrs()`

Implementation of most measures: **mlr3measures**

Other Dictionary: `mlr_learners`, `mlr_resamplings`, `mlr_task_generators`, `mlr_tasks`

Other Measure: `MeasureClassif`, `MeasureRegr`, `Measure`, `mlr_measures_classif.costs`, `mlr_measures_debug`, `mlr_measures_elapsed_time`, `mlr_measures_oob_error`, `mlr_measures_selected_features`

Examples

```
as.data.table(mlr_measures)
mlr_measures$get("classif.ce")
msr("regr.mse")
```

`mlr_measures_classif.acc` *Classification Accuracy*

Description

Classification measure defined as

$$\frac{1}{n} \sum_{i=1}^{n} (t_i = r_i) .$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("acc")
msr("acc")
```

Meta Information

- Type: `"classif"`
- Range: $[0, 1]$
- Minimize: `FALSE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::acc()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

See Also

`mlr_measures_classif.costs`, `mlr_measures_classif.logloss`, `mlr_measures_classif.mbrier`

`mlr_measures_classif.auc` *Area Under the ROC Curve*

Description

Computes the area under the Receiver Operator Characteristic (ROC) curve. The AUC can be interpreted as the probability that a randomly chosen positive observation has a higher predicted probability than a randomly chosen negative observation.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("auc")
msr("auc")
```

Meta Information

- Type: `"binary"`
- Range: $[0, 1]$
- Minimize: `FALSE`
- Required prediction: `prob`

Note

The score function calls `mlr3measures::auc()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

`mlr_measures_classif.bacc`

Balanced Accuracy

Description

Computes the weighted balanced accuracy, suitable for imbalanced data sets. It is defined analogously to the definition in sklearn.

First, the sample weights w are normalized per class:

$$\hat{w}_i = \frac{w_i}{\sum_j 1(y_j = y_i) w_i}.$$

The balanced accuracy is calculated as

$$\frac{1}{\sum_i \hat{w}_i} \sum_i 1(r_i = t_i) \hat{w}_i.$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("bacc")
msr("bacc")
```

Meta Information

- Type: `"classif"`
- Range: $[0, 1]$
- Minimize: `FALSE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::bacc()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

`mlr_measures_classif.costs`, `mlr_measures_classif.logloss`, `mlr_measures_classif.mbrier`

`mlr_measures_classif.bbrier`

Binary Brier Score

Description

Brier score for binary classification problems defined as

$$\frac{1}{n}\sum_{i=1}^{n}(I_i - p_i)^2.$$

I_i is 1 if observation i belongs to the positive class, and 0 otherwise.

Note that this (more common) definition of the Brier score is equivalent to the original definition of the multi-class Brier score (see `mbrier()`) divided by 2.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("bbrier")
msr("bbrier")
```

Meta Information

- Type: `"binary"`
- Range: $[0, 1]$
- Minimize: `TRUE`
- Required prediction: `prob`

Note

The score function calls `mlr3measures::bbrier()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

mlr_measures_classif.ce

Classification Error

Description

Classification measure defined as

$$\frac{1}{n} \sum_{i=1}^{n} (t_i \neq r_i) .$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("ce")
msr("ce")
```

Meta Information

- Type: "classif"
- Range: $[0, 1]$
- Minimize: TRUE
- Required prediction: response

Note

The score function calls mlr3measures::ce() from package **mlr3measures**.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field na_value.

mlr_measures_classif.costs, mlr_measures_classif.logloss, mlr_measures_classif.mbrier

---

mlr_measures_classif.costs

Cost-sensitive Classification Measure

Description

Uses a cost matrix to create a classification measure. True labels must be arranged in columns, predicted labels must be arranged in rows. The cost matrix is stored as slot $costs.

For calculation of the score, the confusion matrix is multiplied element-wise with the cost matrix. The costs are then summed up (and potentially divided by the number of observations if normalize is set to TRUE).

This measure requires the Task during scoring to ensure that the rows and columns of the cost matrix are in the same order as in the confusion matrix.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("classif.costs")
msr("classif.costs")
```

Meta Information

- Type: `"classif"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: 'response'

Super classes

`mlr3::Measure` -> `mlr3::MeasureClassif` -> `MeasureClassifCosts`

Public fields

`normalize` (`logical(1)`)
Normalize the costs?

Active bindings

`costs` (numeric `matrix()`)
Matrix of costs (truth in columns, predicted response in rows).

Methods

Public methods:

- `MeasureClassifCosts$new()`
- `MeasureClassifCosts$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
MeasureClassifCosts$new()
```

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
MeasureClassifCosts$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Other multiclass classification measures: mlr_measures_classif.acc, mlr_measures_classif.bacc, mlr_measures_classif.ce, mlr_measures_classif.logloss, mlr_measures_classif.mbrier

Examples

```
# get a cost sensitive task
task = tsk("german_credit")

# cost matrix as given on the UCI page of the german credit data set
# https://archive.ics.uci.edu/ml/datasets/statlog+(german+credit+data)
costs = matrix(c(0, 5, 1, 0), nrow = 2)
dimnames(costs) = list(truth = task$class_names, predicted = task$class_names)
print(costs)

# mlr3 needs truth in columns, predictions in rows
costs = t(costs)

# create measure which calculates the absolute costs
m = msr("classif.costs", id = "german_credit_costs", costs = costs, normalize = FALSE)

# fit models and calculate costs
learner = lrn("classif.rpart")
rr = resample(task, learner, rsmp("cv", folds = 3))
rr$aggregate(m)
```

---

mlr_measures_classif.dor

Diagnostic Odds Ratio

Description

Binary classification measure defined as

$$\frac{\mathrm{TP}/\mathrm{FP}}{\mathrm{FN}/\mathrm{TN}}.$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("dor")
msr("dor")
```

Meta Information

- Type: `"binary"`
- Range: $[0, \infty)$
- Minimize: `FALSE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::dor()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

`mlr_measures_classif.fbeta` *F-beta Score*

Description

Binary classification measure defined with P as `precision()` and R as `recall()` as

$$(1 + \beta^2) \frac{P \cdot R}{(\beta^2 P) + R}.$$

It measures the effectiveness of retrieval with respect to a user who attaches β times as much importance to recall as precision. For $\beta = 1$, this measure is called "F1" score.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("fbeta")
msr("fbeta")
```

Meta Information

- Type: `"binary"`
- Range: $[0, 1]$
- Minimize: `FALSE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::fbeta()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

`mlr_measures_classif.fdr`

False Discovery Rate

Description

Binary classification measure defined as

$$\frac{\mathrm{FP}}{\mathrm{TP} + \mathrm{FP}}.$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("fdr")
msr("fdr")
```

Meta Information

- Type: `"binary"`
- Range: $[0, 1]$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::fdr()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

mlr_measures_classif.fn

False Negatives

Description

Classification measure counting the false negatives (type 2 error), i.e. the number of predictions indicating a negative class label while in fact it is positive. This is sometimes also called a "false alarm".

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("fn")
msr("fn")
```

Meta Information

- Type: `"binary"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::fn()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

`mlr_measures_classif.fnr`

False Negative Rate

Description

Binary classification measure defined as

$$\frac{\mathrm{FN}}{\mathrm{TP} + \mathrm{FN}}.$$

Also know as "miss rate".

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("fnr")
msr("fnr")
```

Meta Information

- Type: "binary"
- Range: $[0, 1]$
- Minimize: TRUE
- Required prediction: response

Note

The score function calls mlr3measures::fnr() from package **mlr3measures**.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field na_value.

mlr_measures_classif.fomr

False Omission Rate

Description

Binary classification measure defined as

$$\frac{\mathrm{FN}}{\mathrm{FN} + \mathrm{TN}}.$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("fomr")
msr("fomr")
```

Meta Information

- Type: `"binary"`
- Range: $[0, 1]$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::fomr()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

`mlr_measures_classif.fp` *False Positives*

Description

Classification measure counting the false positives (type 1 error), i.e. the number of predictions indicating a positive class label while in fact it is negative.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("fp")
msr("fp")
```

Meta Information

- Type: `"binary"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::fp()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

`mlr_measures_classif.fpr`

False Positive Rate

Description

Binary classification measure defined as

$$\frac{\mathrm{FP}}{\mathrm{FP} + \mathrm{TN}}.$$

Also know as fall out or probability of false alarm.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("fpr")
msr("fpr")
```

Meta Information

- Type: `"binary"`
- Range: $[0, 1]$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::fpr()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

`mlr_measures_classif.logloss`
Log Loss

Description

Classification measure defined as

$$-\frac{1}{n}\sum_{i=1}^{n}\log\left(p_i\right)$$

where p_i is the probability for the true class of observation i.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("logloss")
msr("logloss")
```

Meta Information

- Type: `"classif"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `prob`

Note

The score function calls `mlr3measures::logloss()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

mlr_measures_classif.mbrier

Multiclass Brier Score

Description

Brier score for multi-class classification problems with r labels defined as

$$\frac{1}{n}\sum_{i=1}^{n}\sum_{j=1}^{r}(I_{ij} - p_{ij})^2.$$

I_{ij} is 1 if observation i has true label j, and 0 otherwise.

Note that there also is the more common definition of the Brier score for binary classification problems in bbrier().

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```
mlr_measures$get("mbrier")
msr("mbrier")
```

Meta Information

- Type: "classif"
- Range: $[0, 2]$
- Minimize: TRUE
- Required prediction: prob

Note

The score function calls `mlr3measures::mbrier()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

Other multiclass classification measures: `mlr_measures_classif.acc`, `mlr_measures_classif.bacc`, `mlr_measures_classif.ce`, `mlr_measures_classif.costs`, `mlr_measures_classif.logloss`

`mlr_measures_classif.mcc`

Matthews Correlation Coefficient

Description

Binary classification measure defined as

$$\frac{\mathrm{TP} \cdot \mathrm{TN} - \mathrm{FP} \cdot \mathrm{FN}}{\sqrt{(\mathrm{TP} + \mathrm{FP})(\mathrm{TP} + \mathrm{FN})(\mathrm{TN} + \mathrm{FP})(\mathrm{TN} + \mathrm{FN})}}.$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("mcc")
msr("mcc")
```

Meta Information

- Type: `"binary"`
- Range: $[-1, 1]$
- Minimize: `FALSE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::mcc()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

mlr_measures_classif.sensitivity

True Positive Rate

Description

Binary classification measure defined as

$$\frac{\mathrm{TP}}{\mathrm{TP} + \mathrm{FN}}.$$

Also know as "recall" or "sensitivity".

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("sensitivity")
msr("sensitivity")
```

Meta Information

- Type: `"binary"`
- Range: $[0, 1]$
- Minimize: `FALSE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::sensitivity()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

`mlr_measures_classif.specificity`

True Negative Rate

Description

Binary classification measure defined as

$$\frac{\mathrm{TN}}{\mathrm{FP} + \mathrm{TN}}.$$

Also know as "specificity".

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("specificity")
msr("specificity")
```

Meta Information

- Type: `"binary"`
- Range: $[0, 1]$
- Minimize: `FALSE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::specificity()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

mlr_measures_classif.tn

True Negatives

Description

Classification measure counting the true negatives, i.e. the number of predictions correctly indicating a negative class label.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("tn")
msr("tn")
```

Meta Information

- Type: `"binary"`
- Range: $[0, \infty)$
- Minimize: `FALSE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::tn()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

`mlr_measures_classif.tnr` *True Negative Rate*

Description

Binary classification measure defined as

$$\frac{\mathrm{TN}}{\mathrm{FP} + \mathrm{TN}}.$$

Also know as "specificity".

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("tnr")
msr("tnr")
```

Meta Information

- Type: `"binary"`
- Range: $[0, 1]$
- Minimize: `FALSE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::tnr()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

`mlr_measures_classif.tp`

True Positives

Description

Binary classification measure counting the true positives, i.e. the number of predictions correctly indicating a positive class label.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("tp")
msr("tp")
```

Meta Information

- Type: `"binary"`
- Range: $[0, \infty)$
- Minimize: `FALSE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::tp()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

`mlr_measures_classif.tpr`

True Positive Rate

Description

Binary classification measure defined as

$$\frac{\mathrm{TP}}{\mathrm{TP} + \mathrm{FN}}.$$

Also know as "recall" or "sensitivity".

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("tpr")
msr("tpr")
```

Meta Information

- Type: `"binary"`
- Range: $[0, 1]$
- Minimize: `FALSE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::tpr()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

mlr_measures_debug *Debug Measure*

Description

This measure returns the number of observations in the Prediction object. Its main purpose is debugging.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```
mlr_measures$get("debug")
msr("debug")
```

Meta Information

- Type: NA
- Range: $[0, \infty)$
- Minimize: NA
- Required prediction: 'response'

Super class

mlr3::Measure -> MeasureDebug

Public fields

`na_ratio (numeric(1))`
Ratio of scores which randomly should be `NA`, between 0 (default) and 1. Default is 0.

Methods

Public methods:

- `MeasureDebug$new()`
- `MeasureDebug$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
MeasureDebug$new()
```

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
MeasureDebug$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Dictionary of Measures: mlr_measures

`as.data.table(mlr_measures)` for a complete table of all (also dynamically created) Measure implementations.

Other Measure: `MeasureClassif`, `MeasureRegr`, `Measure`, `mlr_measures_classif.costs`, `mlr_measures_elapsed_time`, `mlr_measures_oob_error`, `mlr_measures_selected_features`, `mlr_measures`

Examples

```
task = tsk("wine")
learner = lrn("classif.featureless")
measure = msr("debug")
rr = resample(task, learner, rsmp("cv", folds = 3))
rr$score(measure)
```

---

mlr_measures_elapsed_time

Elapsed Time Measure

Description

Measures the elapsed time during train ("time_train"), predict ("time_predict"), or both ("time_both").

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("time_train")
msr("time_train")
```

Meta Information

- Type: `NA`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: 'response'

Super class

`mlr3::Measure` -> `MeasureElapsedTime`

Public fields

`stages (character())`
Which stages of the learner to measure?

Methods

Public methods:

- `MeasureElapsedTime$new()`
- `MeasureElapsedTime$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
MeasureElapsedTime$new(id = "elapsed_time", stages)
```

Arguments:

`id (character(1))`
Identifier for the new instance.

`stages (character())`
Subset of ("train", "predict"). The runtime of provided stages will be summed.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
MeasureElapsedTime$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Dictionary of Measures: mlr_measures

`as.data.table(mlr_measures)` for a complete table of all (also dynamically created) Measure implementations.

Other Measure: `MeasureClassif`, `MeasureRegr`, `Measure`, `mlr_measures_classif.costs`, `mlr_measures_debug`, `mlr_measures_oob_error`, `mlr_measures_selected_features`, `mlr_measures`

`mlr_measures_oob_error`

Out-of-bag Error Measure

Description

Returns the out-of-bag error of the Learner for learners that support it (learners with property `"oob_error"`). Returns `NA` for unsupported learners.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("oob_error")
msr("oob_error")
```

Meta Information

- Type: `NA`
- Range: $(-\infty, \infty)$
- Minimize: `NA`
- Required prediction: 'response'

Super class

`mlr3::Measure` -> `MeasureOOBError`

Methods

Public methods:

- `MeasureOOBError$new()`
- `MeasureOOBError$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
MeasureOOBError$new()
```

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
MeasureOOBError$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

`as.data.table(mlr_measures)` for a complete table of all (also dynamically created) Measure implementations.

Other Measure: `MeasureClassif`, `MeasureRegr`, `Measure`, `mlr_measures_classif.costs`, `mlr_measures_debug`, `mlr_measures_elapsed_time`, `mlr_measures_selected_features`, `mlr_measures`

`mlr_measures_regr.bias`

Bias

Description

Regression measure defined as

$$\frac{1}{n} \sum_{i=1}^{n} (t_i - r_i) .$$

Good predictions score close to 0.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("bias")
msr("bias")
```

Meta Information

- Type: `"regr"`
- Range: $(-\infty, \infty)$
- Minimize: `NA`
- Required prediction: `response`

Note

The score function calls `mlr3measures::bias()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

mlr_measures_regr.ktau

Kendall's tau

Description

Regression measure defined as Kendall's rank correlation coefficient between truth and response. Calls `stats::cor()` with `method` set to `"kendall"`.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("ktau")
msr("ktau")
```

Meta Information

- Type: `"regr"`
- Range: $[-1, 1]$
- Minimize: `FALSE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::ktau()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

See Also

`mlr_measures_regr.mae` *Mean Absolute Errors*

Description

Regression measure defined as

$$\frac{1}{n} \sum_{i=1}^{n} |t_i - r_i| .$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("mae")
msr("mae")
```

Meta Information

- Type: `"regr"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::mae()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

See Also

`mlr_measures_regr.mape`

Mean Absolute Percent Error

Description

Regression measure defined as

$$\frac{1}{n} \sum_{i=1}^{n} \left| \frac{t_i - r_i}{t_i} \right|.$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("mape")
msr("mape")
```

Meta Information

- Type: `"regr"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::mape()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: mlr_measures

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

---

mlr_measures_regr.maxae

Max Absolute Error

Description

Regression measure defined as

$$\max\left(|t_i - r_i|\right).$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```
mlr_measures$get("maxae")
msr("maxae")
```

Meta Information

- Type: "regr"
- Range: $[0, \infty)$
- Minimize: TRUE
- Required prediction: response

Note

The score function calls mlr3measures::maxae() from package **mlr3measures**.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field na_value.

See Also

Other regression measures: `mlr_measures_regr.bias`, `mlr_measures_regr.ktau`, `mlr_measures_regr.mae`, `mlr_measures_regr.mape`, `mlr_measures_regr.medae`, `mlr_measures_regr.medse`, `mlr_measures_regr.mse`, `mlr_measures_regr.msle`, `mlr_measures_regr.pbias`, `mlr_measures_regr.rae`, `mlr_measures_regr.rmse`, `mlr_measures_regr.rmsle`, `mlr_measures_regr.rrse`, `mlr_measures_regr.rse`, `mlr_measures_regr.rsq`, `mlr_measures_regr.sae`, `mlr_measures_regr.smape`, `mlr_measures_regr.srho`, `mlr_measures_regr.sse`

`mlr_measures_regr.medae`

Median Absolute Errors

Description

Regression measure defined as

$$\underset{i}{\text{median}} \left| t_i - r_i \right| .$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("medae")
msr("medae")
```

Meta Information

- Type: `"regr"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::medae()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

`mlr_measures_regr.medse`

Median Squared Error

Description

Regression measure defined as

$$\underset{i}{\text{median}} \left[(t_i - r_i)^2 \right].$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("medse")
msr("medse")
```

Meta Information

- Type: `"regr"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::medse()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

`mlr_measures_regr.mse` *Mean Squared Error*

Description

Regression measure defined as

$$\frac{1}{n} \sum_{i=1}^{n} (t_i - r_i)^2 .$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("mse")
msr("mse")
```

Meta Information

- Type: `"regr"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::mse()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

mlr_measures_regr.msle

Mean Squared Log Error

Description

Regression measure defined as

$$\frac{1}{n}\sum_{i=1}^{n}\left(\ln(1+t_i)-\ln(1+r_i)\right)^2.$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("msle")
msr("msle")
```

Meta Information

- Type: `"regr"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::msle()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

See Also

`mlr_measures_regr.pbias`

Percent Bias

Description

Regression measure defined as

$$\frac{1}{n}\sum_{i=1}^{n}\frac{(t_i - r_i)}{|t_i|}.$$

Good predictions score close to 0.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("pbias")
msr("pbias")
```

Meta Information

- Type: `"regr"`
- Range: $(-\infty, \infty)$
- Minimize: `NA`
- Required prediction: `response`

Note

The score function calls `mlr3measures::pbias()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

See Also

---

mlr_measures_regr.rae *Relative Absolute Error*

Description

Regression measure defined as

$$\frac{\sum_{i=1}^{n} |t_i - r_i|}{\sum_{i=1}^{n} |t_i - \bar{t}|}.$$

Can be interpreted as absolute error of the predictions relative to a naive model predicting the mean.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("rae")
msr("rae")
```

Meta Information

- Type: `"regr"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::rae()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

`mlr_measures_regr.rmse`

Root Mean Squared Error

Description

Regression measure defined as

$$\sqrt{\frac{1}{n}\sum_{i=1}^{n}(t_i - r_i)^2}.$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("rmse")
msr("rmse")
```

Meta Information

- Type: `"regr"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::rmse()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

mlr_measures_regr.rmsle

Root Mean Squared Log Error

Description

Regression measure defined as

$$\sqrt{\frac{1}{n}\sum_{i=1}^{n}(\ln(1+t_i) - \ln(1+r_i))^2}.$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("rmsle")
msr("rmsle")
```

Meta Information

- Type: `"regr"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::rmsle()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

See Also

`mlr_measures_regr.rrse`

Root Relative Squared Error

Description

Regression measure defined as

$$\sqrt{\frac{\sum_{i=1}^{n}(t_i - r_i)^2}{\sum_{i=1}^{n}(t_i - \bar{t})^2}}.$$

Can be interpreted as root of the squared error of the predictions relative to a naive model predicting the mean.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("rrse")
msr("rrse")
```

Meta Information

- Type: `"regr"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::rrse()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

`mlr_measures_regr.rse` *Relative Squared Error*

Description

Regression measure defined as

$$\frac{\sum_{i=1}^{n} (t_i - r_i)^2}{\sum_{i=1}^{n} (t_i - \bar{t})^2}.$$

Can be interpreted as squared error of the predictions relative to a naive model predicting the mean.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("rse")
msr("rse")
```

Meta Information

- Type: `"regr"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::rse()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: mlr_measures

---

mlr_measures_regr.rsq *R Squared*

Description

Regression measure defined as

$$1 - \frac{\sum_{i=1}^{n} (t_i - r_i)^2}{\sum_{i=1}^{n} (t_i - \bar{t})^2}.$$

Also known as coefficient of determination or explained variation. Substracts the `rse()` from 1, hence it compares the squared error of the predictions relative to a naive model predicting the mean.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("rsq")
msr("rsq")
```

Meta Information

- Type: `"regr"`
- Range: $(-\infty, 1]$
- Minimize: `FALSE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::rsq()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: mlr_measures

`as.data.table(mlr_measures)` for a complete table of all (also dynamically created) Measure implementations.

Other regression measures: `mlr_measures_regr.bias`, `mlr_measures_regr.ktau`, `mlr_measures_regr.mae`, `mlr_measures_regr.mape`, `mlr_measures_regr.maxae`, `mlr_measures_regr.medae`, `mlr_measures_regr.medse`, `mlr_measures_regr.mse`, `mlr_measures_regr.msle`, `mlr_measures_regr.pbias`, `mlr_measures_regr.rae`, `mlr_measures_regr.rmse`, `mlr_measures_regr.rmsle`, `mlr_measures_regr.rrse`, `mlr_measures_regr.rse`, `mlr_measures_regr.sae`, `mlr_measures_regr.smape`, `mlr_measures_regr.srho`, `mlr_measures_regr.sse`

`mlr_measures_regr.sae` *Sum of Absolute Errors*

Description

Regression measure defined as

$$\sum_{i=1}^{n} |t_i - r_i| \,.$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("sae")
msr("sae")
```

Meta Information

- Type: `"regr"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::sae()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

See Also

`mlr_measures_regr.smape`

Symmetric Mean Absolute Percent Error

Description

Regression measure defined as

$$\frac{2}{n} \sum_{i=1}^{n} \frac{|t_i - r_i|}{|t_i| + |r_i|}.$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("smape")
msr("smape")
```

Meta Information

- Type: `"regr"`
- Range: $[0, 2]$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::smape()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

See Also

---

mlr_measures_regr.srho

Spearman's rho

Description

Regression measures defined as Spearman's rank correlation coefficient between truth and response. Calls stats::cor() with method set to "spearman".

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```
mlr_measures$get("srho")
msr("srho")
```

Meta Information

- Type: "regr"
- Range: $[-1, 1]$
- Minimize: FALSE
- Required prediction: response

Note

The score function calls mlr3measures::srho() from package **mlr3measures**.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field na_value.

See Also

`mlr_measures_regr.sse` *Sum of Squared Errors*

Description

Regression measure defined as

$$\sum_{i=1}^{n} (t_i - r_i)^2 .$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("sse")
msr("sse")
```

Meta Information

- Type: `"regr"`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: `response`

Note

The score function calls `mlr3measures::sse()` from package **mlr3measures**.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

---

mlr_measures_selected_features

Selected Features Measure

Description

Measures the number of selected features by extracting it from learners with property `"selected_features"`. If the learner does not support this, `NA` is returned.

This measure requires the Task and the Learner for scoring.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function `msr()`:

```
mlr_measures$get("selected_features")
msr("selected_features")
```

Meta Information

- Type: `NA`
- Range: $[0, \infty)$
- Minimize: `TRUE`
- Required prediction: 'response'

Super class

`mlr3::Measure` -> `MeasureSelectedFeatures`

Public fields

`normalize (logical(1))`
: If set to `TRUE`, divides the number of features by the total number of features.

Methods

Public methods:

- `MeasureSelectedFeatures$new()`
- `MeasureSelectedFeatures$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
MeasureSelectedFeatures$new(normalize = FALSE)
```

Arguments:

`normalize (logical(1))`
If set to `TRUE`, divides the number of features by the total number of features.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
MeasureSelectedFeatures$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

`mlr_resamplings` *Dictionary of Resampling Strategies*

Description

A simple mlr3misc::Dictionary storing objects of class Resampling. Each resampling has an associated help page, see `mlr_resamplings_[id]`.

This dictionary can get populated with additional resampling strategies by add-on packages.

For a more convenient way to retrieve and construct resampling strategies, see `rsmp()`/`rsmps()`.

Format

R6::R6Class object inheriting from mlr3misc::Dictionary.

Methods

See mlr3misc::Dictionary.

S3 methods

- as.data.table(dict)
  mlr3misc::Dictionary -> data.table::data.table()
  Returns a data.table::data.table() with columns "key", "params", and "iters".

See Also

Sugar functions: rsmp(), rsmps()

Other Dictionary: mlr_learners, mlr_measures, mlr_task_generators, mlr_tasks

Other Resampling: Resampling, mlr_resamplings_bootstrap, mlr_resamplings_custom, mlr_resamplings_cv, mlr_resamplings_holdout, mlr_resamplings_insample, mlr_resamplings_loo, mlr_resamplings_repeated_cv, mlr_resamplings_subsampling

Examples

```
as.data.table(mlr_resamplings)
mlr_resamplings$get("cv")
rsmp("subsampling")
```

---

mlr_resamplings_bootstrap

Bootstrap Resampling

Description

Splits data into bootstrap samples (sampling with replacement). Hyperparameters are the number of bootstrap iterations (repeats, default: 30) and the ratio of observations to draw per iteration (ratio, default: 1) for the training set.

Dictionary

This Resampling can be instantiated via the dictionary mlr_resamplings or with the associated sugar function rsmp():

```
mlr_resamplings$get("bootstrap")
rsmp("bootstrap")
```

Parameters

- repeats (integer(1))
  Number of repetitions.
- ratio (numeric(1))
  Ratio of observations to put into the training set.

Super class

mlr3::Resampling -> ResamplingBootstrap

Active bindings

`iters (integer(1))`
Returns the number of resampling iterations, depending on the values stored in the `param_set`.

Methods

Public methods:

- `ResamplingBootstrap$new()`
- `ResamplingBootstrap$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ResamplingBootstrap$new()
```

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ResamplingBootstrap$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Dictionary of Resamplings: mlr_resamplings

`as.data.table(mlr_resamplings)` for a complete table of all (also dynamically created) Resampling implementations.

Other Resampling: `Resampling`, `mlr_resamplings_custom`, `mlr_resamplings_cv`, `mlr_resamplings_holdout`, `mlr_resamplings_insample`, `mlr_resamplings_loo`, `mlr_resamplings_repeated_cv`, `mlr_resamplings_subsampling`, `mlr_resamplings`

Examples

```
# Create a task with 10 observations
task = tsk("iris")
task$filter(1:10)

# Instantiate Resampling
rb = rsmp("bootstrap", repeats = 2, ratio = 1)
rb$instantiate(task)

# Individual sets:
rb$train_set(1)
```

```
rb$test_set(1)
intersect(rb$train_set(1), rb$test_set(1))

# Internal storage:
rb$instance$M # Matrix of counts
```

`mlr_resamplings_custom` *Custom Resampling*

Description

Splits data into training and test sets using manually provided indices.

Dictionary

This Resampling can be instantiated via the dictionary mlr_resamplings or with the associated sugar function `rsmp()`:

```
mlr_resamplings$get("custom")
rsmp("custom")
```

Super class

`mlr3::Resampling` -> `ResamplingCustom`

Active bindings

`iters` (`integer(1)`)
: Returns the number of resampling iterations, depending on the values stored in the `param_set`.

`hash` (`character(1)`)
: Hash (unique identifier) for this object.

Methods

Public methods:

- `ResamplingCustom$new()`
- `ResamplingCustom$instantiate()`
- `ResamplingCustom$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ResamplingCustom$new()
```

Method `instantiate()`**:** Instantiate this Resampling with custom splits into training and test set.

Usage:

```
ResamplingCustom$instantiate(task, train_sets, test_sets)
```

Arguments:

`task` Task
: Mainly used to check if `train_sets` and `test_sets` are feasible.

`train_sets` (list of `integer()`)
: List with row ids for training, one list element per iteration. Must have the same length as `test_sets`.

`test_sets` (list of `integer()`)
: List with row ids for testing, one list element per iteration. Must have the same length as `train_sets`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ResamplingCustom$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Dictionary of Resamplings: mlr_resamplings

`as.data.table(mlr_resamplings)` for a complete table of all (also dynamically created) Resampling implementations.

Other Resampling: `Resampling`, `mlr_resamplings_bootstrap`, `mlr_resamplings_cv`, `mlr_resamplings_holdout`, `mlr_resamplings_insample`, `mlr_resamplings_loo`, `mlr_resamplings_repeated_cv`, `mlr_resamplings_subsampling`, `mlr_resamplings`

Examples

```
# Create a task with 10 observations
task = tsk("iris")
task$filter(1:10)

# Instantiate Resampling
rc = rsmp("custom")
train_sets = list(1:5, 5:10)
test_sets = list(5:10, 1:5)
rc$instantiate(task, train_sets, test_sets)

rc$train_set(1)
rc$test_set(1)
```

`mlr_resamplings_cv` *Cross Validation Resampling*

Description

Splits data using a `folds`-folds (default: 10 folds) cross-validation.

Dictionary

This Resampling can be instantiated via the dictionary mlr_resamplings or with the associated sugar function `rsmp()`:

```
mlr_resamplings$get("cv")
rsmp("cv")
```

Parameters

- `folds` (`integer(1)`)
  Number of folds.

Super class

`mlr3::Resampling` -> `ResamplingCV`

Active bindings

`iters` (`integer(1)`)
Returns the number of resampling iterations, depending on the values stored in the `param_set`.

Methods

Public methods:

- `ResamplingCV$new()`
- `ResamplingCV$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ResamplingCV$new()
```

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ResamplingCV$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Examples

```
# Create a task with 10 observations
task = tsk("iris")
task$filter(1:10)

# Instantiate Resampling
rcv = rsmp("cv", folds = 3)
rcv$instantiate(task)

# Individual sets:
rcv$train_set(1)
rcv$test_set(1)
intersect(rcv$train_set(1), rcv$test_set(1))

# Internal storage:
rcv$instance # table
```

---

mlr_resamplings_holdout

Holdout Resampling

Description

Splits data into a training set and a test set. Parameter `ratio` determines the ratio of observation going into the training set (default: 2/3).

Dictionary

This Resampling can be instantiated via the dictionary mlr_resamplings or with the associated sugar function `rsmp()`:

```
mlr_resamplings$get("holdout")
rsmp("holdout")
```

Parameters

- `ratio` (`numeric(1)`)
  Ratio of observations to put into the training set.

Super class

`mlr3::Resampling` -> `ResamplingHoldout`

Public fields

`iters` (`integer(1)`)
Returns the number of resampling iterations, depending on the values stored in the `param_set`.

Methods

Public methods:

- `ResamplingHoldout$new()`
- `ResamplingHoldout$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ResamplingHoldout$new()
```

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ResamplingHoldout$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

References

Bischl B, Mersmann O, Trautmann H, Weihs C (2012). "Resampling Methods for Meta-Model Validation with Recommendations for Evolutionary Computation." *Evolutionary Computation*, **20**(2), 249–275. doi: 10.1162/evco_a_00069.

`mlr_resamplings`

Examples

```
# Create a task with 10 observations
task = tsk("iris")
task$filter(1:10)

# Instantiate Resampling
rho = rsmp("holdout", ratio = 0.5)
rho$instantiate(task)

# Individual sets:
rho$train_set(1)
rho$test_set(1)
intersect(rho$train_set(1), rho$test_set(1))

# Internal storage:
rho$instance # simple list
```

---

mlr_resamplings_insample

Insample Resampling

Description

Uses all observations as training and as test set.

Dictionary

This Resampling can be instantiated via the dictionary mlr_resamplings or with the associated sugar function `rsmp()`:

```
mlr_resamplings$get("insample")
rsmp("insample")
```

Super class

`mlr3::Resampling` -> `ResamplingInsample`

Public fields

`iters (integer(1))`
Returns the number of resampling iterations, depending on the values stored in the `param_set`.

Methods

Public methods:

- `ResamplingInsample$new()`
- `ResamplingInsample$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ResamplingInsample$new()
```

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ResamplingInsample$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Examples

```
# Create a task with 10 observations
task = tsk("iris")
task$filter(1:10)

# Instantiate Resampling
rins = rsmp("insample")
rins$instantiate(task)

rins$train_set(1)
rins$test_set(1)

# Internal storage:
rins$instance # just row ids
```

---

mlr_resamplings_loo *Leave-One-Out Cross Validation*

Description

Splits data using leave-one-observation-out. This is identical to cross validation with the number of folds set to the number of observations.

Dictionary

This Resampling can be instantiated via the dictionary mlr_resamplings or with the associated sugar function `rsmp()`:

```
mlr_resamplings$get("loo")
rsmp("loo")
```

Super class

`mlr3::Resampling` -> `ResamplingLOO`

Active bindings

`iters (integer(1))`
: Returns the number of resampling iterations which is the number of rows of the task provided to instantiate. Is `NA` if the resampling has not been instantiated.

Methods

Public methods:

- `ResamplingLOO$new()`
- `ResamplingLOO$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ResamplingLOO$new()
```

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ResamplingLOO$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

References

Bischl B, Mersmann O, Trautmann H, Weihs C (2012). "Resampling Methods for Meta-Model Validation with Recommendations for Evolutionary Computation." *Evolutionary Computation*, **20**(2), 249–275. doi: 10.1162/evco_a_00069.

Other Resampling: `Resampling`, `mlr_resamplings_bootstrap`, `mlr_resamplings_custom`, `mlr_resamplings_cv`, `mlr_resamplings_holdout`, `mlr_resamplings_insample`, `mlr_resamplings_repeated_cv`, `mlr_resamplings_subsamp`
`mlr_resamplings`

Examples

```
# Create a task with 10 observations
task = tsk("iris")
task$filter(1:10)

# Instantiate Resampling
rcv = rsmp("loo")
rcv$instantiate(task)

# Individual sets:
rcv$train_set(1)
rcv$test_set(1)
intersect(rcv$train_set(1), rcv$test_set(1))

# Internal storage:
rcv$instance # vector
```

`mlr_resamplings_repeated_cv`

Repeated Cross Validation Resampling

Description

Splits data `repeats` (default: 10) times using a `folds`-fold (default: 10) cross-validation.

The iteration counter translates to `repeats` blocks of `folds` cross-validations, i.e., the first `folds` iterations belong to a single cross-validation.

Iteration numbers can be translated into folds or repeats with provided methods.

Dictionary

This Resampling can be instantiated via the dictionary mlr_resamplings or with the associated sugar function `rsmp()`:

```
mlr_resamplings$get("holdout")
rsmp("holdout")
```

Parameters

- `repeats` (`integer(1)`)
  Number of repetitions.
- `folds` (`integer(1)`)
  Number of folds.

Super class

`mlr3::Resampling` -> `ResamplingRepeatedCV`

Active bindings

`iters (integer(1))`
Returns the number of resampling iterations, depending on the values stored in the `param_set`.

Methods

Public methods:

- `ResamplingRepeatedCV$new()`
- `ResamplingRepeatedCV$folds()`
- `ResamplingRepeatedCV$repeats()`
- `ResamplingRepeatedCV$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ResamplingRepeatedCV$new()
```

Method `folds()`**:** Translates iteration numbers to fold numbers.

Usage:

```
ResamplingRepeatedCV$folds(iters)
```

Arguments:

`iters (integer())`
Iteration number.

Returns: `integer()` of fold numbers.

Method `repeats()`**:** Translates iteration numbers to repetition numbers.

Usage:

```
ResamplingRepeatedCV$repeats(iters)
```

Arguments:

`iters (integer())`
Iteration number.

Returns: `integer()` of repetition numbers.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ResamplingRepeatedCV$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Examples

```
# Create a task with 10 observations
task = tsk("iris")
task$filter(1:10)

# Instantiate Resampling
rrcv = rsmp("repeated_cv", repeats = 2, folds = 3)
rrcv$instantiate(task)
rrcv$iters
rrcv$folds(1:6)
rrcv$repeats(1:6)

# Individual sets:
rrcv$train_set(1)
rrcv$test_set(1)
intersect(rrcv$train_set(1), rrcv$test_set(1))

# Internal storage:
rrcv$instance # table
```

---

mlr_resamplings_subsampling

Subsampling Resampling

Description

Splits data repeats (default: 30) times into training and test set with a ratio of ratio (default: 2/3) observations going into the training set.

Dictionary

This Resampling can be instantiated via the dictionary mlr_resamplings or with the associated sugar function rsmp():

```
mlr_resamplings$get("holdout")
rsmp("holdout")
```

Parameters

- `repeats` (`integer(1)`)
  Number of repetitions.
- `ratio` (`numeric(1)`)
  Ratio of observations to put into the training set.

Super class

`mlr3::Resampling` -> `ResamplingSubsampling`

Active bindings

`iters` (`integer(1)`)
Returns the number of resampling iterations, depending on the values stored in the `param_set`.

Methods

Public methods:

- `ResamplingSubsampling$new()`
- `ResamplingSubsampling$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ResamplingSubsampling$new()
```

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ResamplingSubsampling$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

intersect(rss$train_set(1), rss$test_set(1))

# Internal storage:
rss$instance$train # list of index vectors
```

`mlr_sugar` *Syntactic Sugar for Object Construction*

Description

Functions to retrieve objects, set hyperparameters and assign to fields in one go. Relies on `mlr3misc::dictionary_sugar_g` to extract objects from the respective mlr3misc::Dictionary:

- `tsk()` for a Task from mlr_tasks.
- `tsks()` for a list of Tasks from mlr_tasks.
- `tgen()` for a TaskGenerator from mlr_task_generators.
- `tgens()` for a list of TaskGenerators from mlr_task_generators.
- `lrn()` for a Learner from mlr_learners.
- `lrns()` for a list of Learners from mlr_learners.
- `rsmp()` for a Resampling from mlr_resamplings.
- `rsmps()` for a list of Resamplings from mlr_resamplings.
- `msr()` for a Measure from mlr_measures.
- `msrs()` for a list of Measures from mlr_measures.

Usage

```
tsk(.key, ...)

tsks(.keys, ...)

tgen(.key, ...)

tgens(.keys, ...)
```

```
lrn(.key, ...)

lrns(.keys, ...)

rsmp(.key, ...)

rsmps(.keys, ...)

msr(.key, ...)

msrs(.keys, ...)
```

Arguments

`.key`	(`character(1)`) Key passed to the respective dictionary to retrieve the object.
`...`	(named `list()`) Named arguments passed to the constructor, to be set as parameters in the paradox::ParamSet, or to be set as public field. See `mlr3misc::dictionary_sugar_get()` for more details.
`.keys`	(`character()`) Keys passed to the respective dictionary to retrieve multiple objects.

Value

R6::R6Class object of the respective type, or a list of R6::R6Class objects for the plural versions.

Examples

```
# iris task with new id
tsk("iris", id = "iris2")

# classification tree with different hyperparameters
# and predict type set to predict probabilities
lrn("classif.rpart", cp = 0.1, predict_type = "prob")

# multiple learners with predict type 'prob'
lapply(c("classif.featureless", "classif.rpart"), lrn, predict_type = "prob")
```

---

mlr_tasks *Dictionary of Tasks*

Description

A simple mlr3misc::Dictionary storing objects of class Task. Each task has an associated help page, see `mlr_tasks_[id]`.

This dictionary can get populated with additional tasks by add-on packages, e.g. **mlr3data**.

For a more convenient way to retrieve and construct tasks, see `tsk()`/`tsks()`.

Format

R6::R6Class object inheriting from mlr3misc::Dictionary.

Methods

See mlr3misc::Dictionary.

S3 methods

- `as.data.table(dict)`
  mlr3misc::Dictionary -> `data.table::data.table()`
  Returns a `data.table::data.table()` with columns `"key"`, `"task_type"`, `"measures"`, `"nrow"`, `"ncol"` and the number of features of type `"lgl"`, `"int"`, `"dbl"`, `"chr"`, `"fct"` and `"ord"` as columns.

See Also

Sugar functions: `tsk()`, `tsks()`

Extension Packages: **mlr3data**

Other Dictionary: `mlr_learners`, `mlr_measures`, `mlr_resamplings`, `mlr_task_generators`

Other Task: `TaskClassif`, `TaskRegr`, `TaskSupervised`, `TaskUnsupervised`, `Task`, `mlr_tasks_boston_housing`, `mlr_tasks_breast_cancer`, `mlr_tasks_german_credit`, `mlr_tasks_iris`, `mlr_tasks_mtcars`, `mlr_tasks_pima`, `mlr_tasks_sonar`, `mlr_tasks_spam`, `mlr_tasks_wine`, `mlr_tasks_zoo`

Examples

```
as.data.table(mlr_tasks)
task = mlr_tasks$get("iris") # same as tsk("iris")
head(task$data())

# Add a new task, based on a subset of iris:
data = iris
data$Species = factor(ifelse(data$Species == "setosa", "1", "0"))
task = TaskClassif$new("iris.binary", data, target = "Species", positive = "1")

# add to dictionary
mlr_tasks$add("iris.binary", task)

# list available tasks
mlr_tasks$keys()

# retrieve from dictionary
mlr_tasks$get("iris.binary")

# remove task again
mlr_tasks$remove("iris.binary")
```

`mlr_tasks_boston_housing` *Boston Housing Regression Task*

Description

A regression task for the mlbench::BostonHousing2 data set.

Format

R6::R6Class inheriting from TaskRegr.

Construction

```
mlr_tasks$get("boston_housing")
tsk("boston_housing")
```

Meta Information

- Task type: "regr"
- Dimensions: 506x19
- Properties: -
- Has Missings: `FALSE`
- Target: "medv"
- Features: "age", "b", "chas", "cmedv", "crim", "dis", "indus", "lat", "lon", "lstat", "nox", "ptratio", "rad", "rm", "tax", "town", "tract", "zn"

See Also

Dictionary of Tasks: mlr_tasks

`as.data.table(mlr_tasks)` for a complete table of all (also dynamically created) Tasks.

Other Task: `TaskClassif`, `TaskRegr`, `TaskSupervised`, `TaskUnsupervised`, `Task`, `mlr_tasks_breast_cancer`, `mlr_tasks_german_credit`, `mlr_tasks_iris`, `mlr_tasks_mtcars`, `mlr_tasks_pima`, `mlr_tasks_sonar`, `mlr_tasks_spam`, `mlr_tasks_wine`, `mlr_tasks_zoo`, `mlr_tasks`

`mlr_tasks_breast_cancer`

Wisconsin Breast Cancer Classification Task

Description

A classification task for the mlbench::BreastCancer data set.

- Column `"Id"` has been removed.
- Column names have been converted to `snake_case`.
- Positive class is set to `"malignant"`.
- 16 incomplete cases have been removed from the data set.

Format

R6::R6Class inheriting from TaskClassif.

Construction

```
mlr_tasks$get("breast_cancer")
tsk("breast_cancer")
```

Meta Information

- Task type: "classif"
- Dimensions: 683x10
- Properties: "twoclass"
- Has Missings: `FALSE`
- Target: "class"
- Features: "bare_nuclei", "bl_cromatin", "cell_shape", "cell_size", "cl_thickness", "epith_c_size", "marg_adhesion", "mitoses", "normal_nucleoli"

See Also

Dictionary of Tasks: mlr_tasks

`as.data.table(mlr_tasks)` for a complete table of all (also dynamically created) Tasks.

Other Task: `TaskClassif`, `TaskRegr`, `TaskSupervised`, `TaskUnsupervised`, `Task`, `mlr_tasks_boston_housing`, `mlr_tasks_german_credit`, `mlr_tasks_iris`, `mlr_tasks_mtcars`, `mlr_tasks_pima`, `mlr_tasks_sonar`, `mlr_tasks_spam`, `mlr_tasks_wine`, `mlr_tasks_zoo`, `mlr_tasks`

`mlr_tasks_german_credit`

German Credit Classification Task

Description

A classification task for the German credit data set. The aim is to predict creditworthiness, labeled as "good" and "bad". Positive class is set to label "good".

See example for the creation of a MeasureClassifCosts as described misclassification costs.

Format

R6::R6Class inheriting from TaskClassif.

Construction

```
mlr_tasks$get("german_credit")
tsk("german_credit")
```

Meta Information

- Task type: "classif"
- Dimensions: 1000x21
- Properties: "twoclass"
- Has Missings: `FALSE`
- Target: "credit_risk"
- Features: "age", "amount", "credit_history", "duration", "employment_duration", "foreign_worker", "housing", "installment_rate", "job", "number_credits", "other_debtors", "other_installment_plans", "people_liable", "personal_status_sex", "present_residence", "property", "purpose", "savings", "status", "telephone"

Source

Data set originally published on UCI. This is the preprocessed version taken from package **rchallenge** with factors instead of dummy variables, and corrected as proposed by Ulrike Grömping.

measure = msr("classif.costs", id = "german_credit_costs", costs = costs)
print(measure)
```

---

mlr_tasks_iris *Iris Classification Task*

Description

A classification task for the popular datasets::iris data set.

Format

R6::R6Class inheriting from TaskClassif.

Construction

```
mlr_tasks$get("iris")
tsk("iris")
```

Meta Information

- Task type: "classif"
- Dimensions: 150x5
- Properties: "multiclass"
- Has Missings: `FALSE`
- Target: "Species"
- Features: "Petal.Length", "Petal.Width", "Sepal.Length", "Sepal.Width"

Dictionary of Tasks: mlr_tasks

`as.data.table(mlr_tasks)` for a complete table of all (also dynamically created) Tasks.

Other Task: `TaskClassif`, `TaskRegr`, `TaskSupervised`, `TaskUnsupervised`, `Task`, `mlr_tasks_boston_housing`, `mlr_tasks_breast_cancer`, `mlr_tasks_german_credit`, `mlr_tasks_mtcars`, `mlr_tasks_pima`, `mlr_tasks_sonar`, `mlr_tasks_spam`, `mlr_tasks_wine`, `mlr_tasks_zoo`, `mlr_tasks`

---

mlr_tasks_mtcars *Motor Trend Regression Task*

Description

A regression task for the datasets::mtcars data set. Target variable is `mpg` (Miles/(US) gallon). Rownames are stored as variable "..rownames with column role `"model"`.

Format

R6::R6Class inheriting from TaskRegr.

Construction

```
mlr_tasks$get("mtcars")
tsk("mtcars")
```

Meta Information

- Task type: “regr”
- Dimensions: 32x11
- Properties: -
- Has Missings: `FALSE`
- Target: “mpg”
- Features: “am”, “carb”, “cyl”, “disp”, “drat”, “gear”, “hp”, “qsec”, “vs”, “wt”

mlr_tasks_pima *Pima Indian Diabetes Classification Task*

Description

A classification task for the mlbench::PimaIndiansDiabetes2 data set. Positive class is set to "pos".

Format

R6::R6Class inheriting from TaskClassif.

Construction

```
mlr_tasks$get("pima")
tsk("pima")
```

Meta Information

- Task type: "classif"
- Dimensions: 768x9
- Properties: "twoclass"
- Has Missings: TRUE
- Target: "diabetes"
- Features: "age", "glucose", "insulin", "mass", "pedigree", "pregnant", "pressure", "triceps"

See Also

Dictionary of Tasks: mlr_tasks

as.data.table(mlr_tasks) for a complete table of all (also dynamically created) Tasks.

Other Task: TaskClassif, TaskRegr, TaskSupervised, TaskUnsupervised, Task, mlr_tasks_boston_housing, mlr_tasks_breast_cancer, mlr_tasks_german_credit, mlr_tasks_iris, mlr_tasks_mtcars, mlr_tasks_sonar, mlr_tasks_spam, mlr_tasks_wine, mlr_tasks_zoo, mlr_tasks

mlr_tasks_sonar *Sonar Classification Task*

Description

A classification task for the mlbench::Sonar data set. Positive class is set to "M" (Mine).

Format

R6::R6Class inheriting from TaskClassif.

Construction

```
mlr_tasks$get("sonar")
tsk("sonar")
```

Meta Information

- Task type: "classif"
- Dimensions: 208x61
- Properties: "twoclass"
- Has Missings: FALSE
- Target: "Class"
- Features: "V1", "V10", "V11", "V12", "V13", "V14", "V15", "V16", "V17", "V18", "V19", "V2", "V20", "V21", "V22", "V23", "V24", "V25", "V26", "V27", "V28", "V29", "V3", "V30", "V31", "V32", "V33", "V34", "V35", "V36", "V37", "V38", "V39", "V4", "V40", "V41", "V42", "V43", "V44", "V45", "V46", "V47", "V48", "V49", "V5", "V50", "V51", "V52", "V53", "V54", "V55", "V56", "V57", "V58", "V59", "V6", "V60", "V7", "V8", "V9"

---

mlr_tasks_spam *Spam Classification Task*

Description

Spam data set from the UCI machine learning repository (http://archive.ics.uci.edu/ml/datasets/spambase). Data set collected at Hewlett-Packard Labs to classify emails as spam or non-spam. 57 variables indicate the frequency of certain words and characters in the e-mail. The positive class is set to "spam".

Format

R6::R6Class inheriting from TaskClassif.

Construction

```
mlr_tasks$get("spam")
tsk("spam")
```

Meta Information

- Task type: "classif"
- Dimensions: 4601x58
- Properties: "twoclass"
- Has Missings: FALSE
- Target: "type"
- Features: "address", "addresses", "all", "business", "capitalAve", "capitalLong", "capitalTotal", "charDollar", "charExclamation", "charHash", "charRoundbracket", "charSemicolon", "charSquarebracket", "conference", "credit", "cs", "data", "direct", "edu", "email", "font", "free", "george", "hp", "hpl", "internet", "lab", "labs", "mail", "make", "meeting", "money", "num000", "num1999", "num3d", "num415", "num650", "num85", "num857", "order", "original", "our", "over", "parts", "people", "pm", "project", "re", "receive", "remove", "report", "table", "technology", "telnet", "will", "you", "your"

---

mlr_tasks_wine *Wine Classification Task*

Description

Wine data set from the UCI machine learning repository (https://archive.ics.uci.edu/ml/datasets/wine). Results of a chemical analysis of three types of wines grown in the same region in Italy but derived from three different cultivars.

Format

R6::R6Class inheriting from TaskClassif.

Construction

```
mlr_tasks$get("wine")
tsk("wine")
```

Meta Information

- Task type: "classif"
- Dimensions: 178x14
- Properties: "multiclass"
- Has Missings: FALSE
- Target: "type"
- Features: "alcalinity", "alcohol", "ash", "color", "dilution", "flavanoids", "hue", "magnesium", "malic", "nonflavanoids", "phenols", "proanthocyanins", "proline"

`mlr_task_generators` *Dictionary of Task Generators*

Description

A simple mlr3misc::Dictionary storing objects of class TaskGenerator. Each task generator has an associated help page, see `mlr_task_generators_[id]`.

This dictionary can get populated with additional task generators by add-on packages.

For a more convenient way to retrieve and construct task generators, see `tgen()`/`tgens()`.

Format

R6::R6Class object inheriting from mlr3misc::Dictionary.

Methods

See mlr3misc::Dictionary.

S3 methods

- `as.data.table(dict)`
  mlr3misc::Dictionary -> `data.table::data.table()`
  Returns a `data.table::data.table()` with fields `"key"` and `"packages"` as columns.

See Also

Sugar functions: tgen(), tgens()

Other Dictionary: mlr_learners, mlr_measures, mlr_resamplings, mlr_tasks

Other TaskGenerator: TaskGenerator, mlr_task_generators_2dnormals, mlr_task_generators_cassini, mlr_task_generators_circle, mlr_task_generators_friedman1, mlr_task_generators_moons, mlr_task_generators_simplex, mlr_task_generators_smiley, mlr_task_generators_spirals, mlr_task_generators_xor

Examples

```
mlr_task_generators$get("smiley")
tgen("2dnormals")
```

---

mlr_task_generators_2dnormals

2D Normals Classification Task Generator

Description

A TaskGenerator for the 2d normals task in mlbench::mlbench.2dnormals().

Dictionary

This TaskGenerator can be instantiated via the dictionary mlr_task_generators or with the associated sugar function tgen():

```
mlr_task_generators$get("2dnormals")
tgen("2dnormals")
```

Super class

mlr3::TaskGenerator -> TaskGenerator2DNormals

Methods

Public methods:

- TaskGenerator2DNormals$new()
- TaskGenerator2DNormals$plot()
- TaskGenerator2DNormals$clone()

Method new(): Creates a new instance of this R6 class.

Usage:

```
TaskGenerator2DNormals$new()
```

Method plot(): Creates a simple plot of generated data.

Usage:

```
TaskGenerator2DNormals$plot(n = 200, pch = 19L, ...)
```

Arguments:

`n (integer(1))`
: Number of samples to draw for the plot. Default is 200.

`pch (integer(1))`
: Point char. Passed to `plot()`.

`... (any)`
: Additional arguments passed to `plot()`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
TaskGenerator2DNormals$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Dictionary of TaskGenerators: mlr_task_generators

`as.data.table(mlr_resamplings)` for a complete table of all (also dynamically created) TaskGenerator implementations.

Other TaskGenerator: `TaskGenerator`, `mlr_task_generators_cassini`, `mlr_task_generators_circle`, `mlr_task_generators_friedman1`, `mlr_task_generators_moons`, `mlr_task_generators_simplex`, `mlr_task_generators_smiley`, `mlr_task_generators_spirals`, `mlr_task_generators_xor`, `mlr_task_generators`

Examples

```
generator = tgen("2dnormals")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())
```

---

mlr_task_generators_cassini

Cassini Classification Task Generator

Description

A TaskGenerator for the cassini task in `mlbench::mlbench.cassini()`.

Dictionary

This TaskGenerator can be instantiated via the dictionary mlr_task_generators or with the associated sugar function `tgen()`:

```
mlr_task_generators$get("cassini")
tgen("cassini")
```

Super class

`mlr3::TaskGenerator` -> `TaskGeneratorCassini`

Methods

Public methods:

- `TaskGeneratorCassini$new()`
- `TaskGeneratorCassini$plot()`
- `TaskGeneratorCassini$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
TaskGeneratorCassini$new()
```

Method `plot()`**:** Creates a simple plot of generated data.

Usage:

```
TaskGeneratorCassini$plot(n = 200, pch = 19L, ...)
```

Arguments:

`n` (`integer(1)`)
Number of samples to draw for the plot. Default is 200.

`pch` (`integer(1)`)
Point char. Passed to `plot()`.

`...` (any)
Additional arguments passed to `plot()`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
TaskGeneratorCassini$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

`as.data.table(mlr_resamplings)` for a complete table of all (also dynamically created) TaskGenerator implementations.

Other TaskGenerator: `TaskGenerator`, `mlr_task_generators_2dnormals`, `mlr_task_generators_circle`, `mlr_task_generators_friedman1`, `mlr_task_generators_moons`, `mlr_task_generators_simplex`, `mlr_task_generators_smiley`, `mlr_task_generators_spirals`, `mlr_task_generators_xor`, `mlr_task_generators`

Examples

```
generator = tgen("cassini")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())
```

`mlr_task_generators_circle` *Circle Classification Task Generator*

Description

A TaskGenerator for the circle binary classification task in `mlbench::mlbench.circle()`. Creates a large circle containing a smaller circle.

Dictionary

This TaskGenerator can be instantiated via the dictionary mlr_task_generators or with the associated sugar function `tgen()`:

```
mlr_task_generators$get("circle")
tgen("circle")
```

Super class

`mlr3::TaskGenerator` -> `TaskGeneratorCircle`

Methods

Public methods:

- `TaskGeneratorCircle$new()`
- `TaskGeneratorCircle$plot()`
- `TaskGeneratorCircle$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
TaskGeneratorCircle$new()
```

Method `plot()`**:** Creates a simple plot of generated data.

Usage:

```
TaskGeneratorCircle$plot(n = 200, pch = 19L, ...)
```

Arguments:

`n (integer(1))`
Number of samples to draw for the plot. Default is 200.

`pch (integer(1))`
Point char. Passed to `plot()`.

`...` (any)
Additional arguments passed to `plot()`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
TaskGeneratorCircle$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Examples

```
generator = tgen("circle")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())
```

---

mlr_task_generators_friedman1

Friedman1 Regression Task Generator

Description

A TaskGenerator for the friedman1 task in `mlbench::mlbench.friedman1()`.

Dictionary

This TaskGenerator can be instantiated via the dictionary mlr_task_generators or with the associated sugar function `tgen()`:

```
mlr_task_generators$get("friedman1")
tgen("friedman1")
```

Super class

`mlr3::TaskGenerator` -> `TaskGeneratorFriedman1`

Methods

Public methods:

- `TaskGeneratorFriedman1$new()`
- `TaskGeneratorFriedman1$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
TaskGeneratorFriedman1$new()
```

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
TaskGeneratorFriedman1$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Examples

```
generator = tgen("friedman1")
task = generator$generate(200)
str(task$data())
```

---

mlr_task_generators_moons

Moons Classification Task Generator

Description

A TaskGenerator creating two interleaving half circles ("moons") as binary classification problem.

Dictionary

This TaskGenerator can be instantiated via the dictionary mlr_task_generators or with the associated sugar function `tgen()`:

```
mlr_task_generators$get("moons")
tgen("moons")
```

Super class

`mlr3::TaskGenerator` -> `TaskGeneratorMoons`

Methods

Public methods:

- `TaskGeneratorMoons$new()`
- `TaskGeneratorMoons$plot()`
- `TaskGeneratorMoons$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
TaskGeneratorMoons$new()
```

Method `plot()`**:** Creates a simple plot of generated data.

Usage:

```
TaskGeneratorMoons$plot(n = 200, pch = 19L, ...)
```

Arguments:

`n (integer(1))`
Number of samples to draw for the plot. Default is 200.

`pch (integer(1))`
Point char. Passed to `plot()`.

`...` (any)
Additional arguments passed to `plot()`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
TaskGeneratorMoons$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Other TaskGenerator: `TaskGenerator`, `mlr_task_generators_2dnormals`, `mlr_task_generators_cassini`, `mlr_task_generators_circle`, `mlr_task_generators_friedman1`, `mlr_task_generators_simplex`, `mlr_task_generators_smiley`, `mlr_task_generators_spirals`, `mlr_task_generators_xor`, `mlr_task_generators`

Examples

```
generator = tgen("moons")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())
```

`mlr_task_generators_simplex` *Simplex Classification Task Generator*

Description

A TaskGenerator for the simplex task in `mlbench::mlbench.simplex()`.

Note that the generator implemented in **mlbench** returns fewer samples than requested.

Dictionary

This TaskGenerator can be instantiated via the dictionary mlr_task_generators or with the associated sugar function `tgen()`:

```
mlr_task_generators$get("simplex")
tgen("simplex")
```

Super class

`mlr3::TaskGenerator` -> `TaskGeneratorSimplex`

Methods

Public methods:

- `TaskGeneratorSimplex$new()`
- `TaskGeneratorSimplex$plot()`
- `TaskGeneratorSimplex$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
TaskGeneratorSimplex$new()
```

Method `plot()`**:** Creates a simple plot of generated data.

Usage:

```
TaskGeneratorSimplex$plot(n = 200, pch = 19L, ...)
```

Arguments:

`n (integer(1))`
Number of samples to draw for the plot. Default is 200.

`pch (integer(1))`
Point char. Passed to `plot()`.

`...` (any)
Additional arguments passed to `plot()`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
TaskGeneratorSimplex$clone(deep = FALSE)
```

Arguments:

deep Whether to make a deep clone.

See Also

Other TaskGenerator: `TaskGenerator`, `mlr_task_generators_2dnormals`, `mlr_task_generators_cassini`, `mlr_task_generators_circle`, `mlr_task_generators_friedman1`, `mlr_task_generators_moons`, `mlr_task_generators_smiley`, `mlr_task_generators_spirals`, `mlr_task_generators_xor`, `mlr_task_generators`

Examples

```
generator = tgen("simplex")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())
```

---

mlr_task_generators_smiley

Smiley Classification Task Generator

Description

A TaskGenerator for the smiley task in `mlbench::mlbench.smiley()`.

Dictionary

This TaskGenerator can be instantiated via the dictionary mlr_task_generators or with the associated sugar function `tgen()`:

```
mlr_task_generators$get("smiley")
tgen("smiley")
```

Super class

`mlr3::TaskGenerator` -> `TaskGeneratorSmiley`

Methods

Public methods:

- `TaskGeneratorSmiley$new()`
- `TaskGeneratorSmiley$plot()`
- `TaskGeneratorSmiley$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
TaskGeneratorSmiley$new()
```

Method `plot()`**:** Creates a simple plot of generated data.

Usage:

```
TaskGeneratorSmiley$plot(n = 200, pch = 19L, ...)
```

Arguments:

`n (integer(1))`
Number of samples to draw for the plot. Default is 200.

`pch (integer(1))`
Point char. Passed to `plot()`.

`...` (any)
Additional arguments passed to `plot()`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
TaskGeneratorSmiley$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Dictionary of TaskGenerators: mlr_task_generators

Examples

```
generator = tgen("smiley")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())
```

`mlr_task_generators_spirals` *Spiral Classification Task Generator*

Description

A TaskGenerator for the spirals task in `mlbench::mlbench.spirals()`.

Dictionary

This TaskGenerator can be instantiated via the dictionary mlr_task_generators or with the associated sugar function `tgen()`:

```
mlr_task_generators$get("spirals")
tgen("spirals")
```

Super class

`mlr3::TaskGenerator` -> `TaskGeneratorSpirals`

Methods

Public methods:

- `TaskGeneratorSpirals$new()`
- `TaskGeneratorSpirals$plot()`
- `TaskGeneratorSpirals$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
TaskGeneratorSpirals$new()
```

Method `plot()`**:** Creates a simple plot of generated data.

Usage:

```
TaskGeneratorSpirals$plot(n = 200, pch = 19L, ...)
```

Arguments:

`n (integer(1))`
: Number of samples to draw for the plot. Default is 200.

`pch (integer(1))`
: Point char. Passed to `plot()`.

`...` (any)
: Additional arguments passed to `plot()`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
TaskGeneratorSpirals$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Examples

```
generator = tgen("spirals")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())
```

---

mlr_task_generators_xor

XOR Classification Task Generator

Description

A TaskGenerator for the xor task in `mlbench::mlbench.xor()`.

Dictionary

This TaskGenerator can be instantiated via the dictionary mlr_task_generators or with the associated sugar function `tgen()`:

```
mlr_task_generators$get("xor")
tgen("xor")
```

Super class

`mlr3::TaskGenerator` -> `TaskGeneratorXor`

Methods

Public methods:

- `TaskGeneratorXor$new()`
- `TaskGeneratorXor$plot()`
- `TaskGeneratorXor$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
TaskGeneratorXor$new()
```

Method `plot()`**:** Creates a simple plot of generated data.

Usage:

```
TaskGeneratorXor$plot(n = 200, pch = 19L, ...)
```

Arguments:

`n (integer(1))`
Number of samples to draw for the plot. Default is 200.

`pch (integer(1))`
Point char. Passed to `plot()`.

`...` (any)
Additional arguments passed to `plot()`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
TaskGeneratorXor$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Dictionary of TaskGenerators: mlr_task_generators

`as.data.table(mlr_resamplings)` for a complete table of all (also dynamically created) TaskGenerator implementations.

Other TaskGenerator: `TaskGenerator`, `mlr_task_generators_2dnormals`, `mlr_task_generators_cassini`, `mlr_task_generators_circle`, `mlr_task_generators_friedman1`, `mlr_task_generators_moons`, `mlr_task_generators_simplex`, `mlr_task_generators_smiley`, `mlr_task_generators_spirals`, `mlr_task_generators`

Examples

```
generator = tgen("xor")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())
```

`predict.Learner` *Predict Method for Learners*

Description

Extends the generic `stats::predict()` with a method for Learner. Note that this function is intended as glue code to be used in third party packages. We recommend to work with the Learner directly, i.e. calling `learner$predict()` or `learner$predict_newdata()` directly.

Performs the following steps:

- Sets additional hyperparameters passed to this function.
- Creates a Prediction object by calling `learner$predict_newdata()`.
- Returns (subset of) Prediction.

Usage

```
## S3 method for class 'Learner'
predict(object, newdata, predict_type = NULL, ...)
```

Arguments

`object`	(Learner) Any Learner.
`newdata`	(`data.frame()`) New data to predict on.
`predict_type`	(`character(1)`) The predict type to return. Set to <Prediction> to retrieve the complete Prediction object. If set to `NULL` (default), the first predict type for the respective class of the Learner as stored in mlr_reflections is used.
`...`	(any) Hyperparameters to pass down to the Learner.

Examples

```
task = tsk("spam")

learner = lrn("classif.rpart", predict_type = "prob")
learner$train(task)
predict(learner, task$data(1:3), predict_type = "response")
predict(learner, task$data(1:3), predict_type = "prob")
predict(learner, task$data(1:3), predict_type = "<Prediction>")
```

`Prediction` *Abstract Prediction Object*

Description

This is the abstract base class for task objects like PredictionClassif or PredictionRegr.

Prediction objects store the following information:

1. The row ids of the test set
2. The corresponding true (observed) response.
3. The corresponding predicted response.
4. Additional predictions based on the class and `predict_type`. E.g., the class probabilities for classification or the estimated standard error for regression.

Note that this object is usually constructed via a derived classes, e.g. PredictionClassif or PredictionRegr.

S3 Methods

- `as.data.table(rr)`
  Prediction -> `data.table::data.table()`
  Converts the data to a `data.table::data.table()`.
- `c(...,keep_duplicates = TRUE)`
  (Prediction, Prediction, ...) -> Prediction
  Combines multiple `Predictions` to a single `Prediction`. If `keep_duplicates` is `FALSE` and there are duplicated row ids, the data of the former passed objects get overwritten by the data of the later passed objects.

Public fields

`data` (named `list()`)
Internal data structure.

`task_type` (`character(1)`)
Required type of the Task.

`task_properties` (`character()`)
Required properties of the Task.

`predict_types` (`character()`)
Set of predict types this object stores.

`man` (`character(1)`)
String in the format [pkg]::[topic] pointing to a manual page for this object. Defaults to `NA`, but can be set by child classes.

Active bindings

`row_ids` (`integer()`)
Vector of row ids for which predictions are stored.

`truth` (`any`)
True (observed) outcome.

`missing` (`integer()`)
Returns `row_ids` for which the predictions are missing or incomplete.

Methods

Public methods:

- `Prediction$format()`
- `Prediction$print()`
- `Prediction$help()`
- `Prediction$score()`
- `Prediction$clone()`

Method `format()`**:** Helper for print outputs.

Usage:

```
Prediction$format()
```

Method `print()`**:** Printer.

Usage:

```
Prediction$print(...)
```

Arguments:

`...` (ignored).

Method `help()`**:** Opens the corresponding help page referenced by field $man.

Usage:

```
Prediction$help()
```

Method `score()`**:** Calculates the performance for all provided measures Task and Learner may be `NULL` for most measures, but some measures need to extract information from these objects.

Usage:

```
Prediction$score(
  measures = NULL,
  task = NULL,
  learner = NULL,
  train_set = NULL
)
```

Arguments:

`measures` (Measure | list of Measure)
Measure(s) to calculate.

`task` (Task).

`learner` (Learner).

`train_set` (`integer()`).

Returns: Prediction.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Prediction$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Prediction: PredictionClassif, PredictionRegr

`PredictionClassif` *Prediction Object for Classification*

Description

This object wraps the predictions returned by a learner of class LearnerClassif, i.e. the predicted response and class probabilities.

If the response is not provided during construction, but class probabilities are, the response is calculated from the probabilities: the class label with the highest probability is chosen. In case of ties, a label is selected randomly.

Thresholding

If probabilities are stored, it is possible to change the threshold which determines the predicted class label. Usually, the label of the class with the highest predicted probability is selected. For binary classification problems, such an threshold defaults to 0.5. For cost-sensitive or imbalanced classification problems, manually adjusting the threshold can increase the predictive performance.

- For binary problems only a single threshold value can be set. If the probability exceeds the threshold, the positive class is predicted. If the probability equals the threshold, the label is selected randomly.
- For binary and multi-class problems, a named numeric vector of thresholds can be set. The length and names must correspond to the number of classes and class names, respectively. To determine the class label, the probabilities are divided by the threshold. This results in a ratio > 1 if the probability exceeds the threshold, and a ratio < 1 otherwise. Note that it is possible that either none or multiple ratios are greater than 1 at the same time. Anyway, the class label with maximum ratio is selected. In case of ties in the ratio, one of the tied class labels is selected randomly.

  Note that there are the following edge cases for threshold equal to `0` which are handled specially:

  1. With threshold 0 the resulting ratio gets `Inf` and thus gets always selected. If there are multiple ratios with value `Inf`, one is selected according to `ties_method` (randomly per default).
  2. If additionally the predicted probability is also 0, the ratio `0/0` results in `NaN` values. These are simply replaced by `0` and thus will never get selected.

Super class

`mlr3::Prediction` -> `PredictionClassif`

Active bindings

`response (factor())`
: Access to the stored predicted class labels.

`prob (matrix())`
: Access to the stored probabilities.

`confusion (matrix())`
: Confusion matrix, as resulting from the comparison of truth and response. Truth is in columns, predicted response is in rows.

`missing (integer())`
: Returns `row_ids` for which the predictions are missing or incomplete.

Methods

Public methods:

- `PredictionClassif$new()`
- `PredictionClassif$set_threshold()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
PredictionClassif$new(
  task = NULL,
  row_ids = task$row_ids,
  truth = task$truth(),
  response = NULL,
  prob = NULL
)
```

Arguments:

`task` (TaskClassif)
: Task, used to extract defaults for `row_ids` and `truth`.

`row_ids (integer())`
: Row ids of the predicted observations, i.e. the row ids of the test set.

`truth (factor())`
: True (observed) labels. See the note on manual construction.

`response (character() | factor())`
: Vector of predicted class labels. One element for each observation in the test set. Character vectors are automatically converted to factors. See the note on manual construction.

`prob (matrix())`
: Numeric matrix of posterior class probabilities with one column for each class and one row for each observation in the test set. Columns must be named with class labels, row names are automatically removed. If `prob` is provided, but `response` is not, the class labels are calculated from the probabilities using `max.col()` with `ties.method` set to `"random"`.

Method `set_threshold()`**:** Sets the prediction response based on the provided threshold. See the section on thresholding for more information.

Usage:

`PredictionClassif$set_threshold(threshold, ties_method = "random")`

Arguments:

`threshold` (`numeric()`).

`ties_method` (`character(1)`)
One of `"random"`, `"first"` or `"last"` (c.f. `max.col()`) to determine how to deal with tied probabilities.

Returns: Returns the object itself, but modified **by reference**. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Note

If this object is constructed manually, make sure that the factor levels for `truth` have the same levels as the task, in the same order. In case of binary classification tasks, the positive class label must be the first level.

See Also

Other Prediction: `PredictionRegr`, `Prediction`

Examples

```
task = tsk("iris")
learner = lrn("classif.rpart", predict_type = "prob")
learner$train(task)
p = learner$predict(task)
p$predict_types
head(as.data.table(p))

# confusion matrix
p$confusion

# change threshold
th = c(0.05, 0.9, 0.05)
names(th) = task$class_names

# new predictions
p$set_threshold(th)$response
p$score(measures = msr("classif.ce"))
```

PredictionRegr *Prediction Object for Regression*

Description

This object wraps the predictions returned by a learner of class LearnerRegr, i.e. the predicted response and standard error. Additionally, probability distributions implemented in **distr6** are supported.

Super class

`mlr3::Prediction` -> `PredictionRegr`

Active bindings

`response` (`numeric()`)
Access the stored predicted response.

`se` (`numeric()`)
Access the stored standard error.

`distr` (distr6::VectorDistribution)
Access the stored vector distribution. Requires package **distr6**.

`missing` (`integer()`)
Returns `row_ids` for which the predictions are missing or incomplete.

Methods

Public methods:

- `PredictionRegr$new()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
PredictionRegr$new(
  task = NULL,
  row_ids = task$row_ids,
  truth = task$truth(),
  response = NULL,
  se = NULL,
  distr = NULL
)
```

Arguments:

`task` (TaskRegr)
Task, used to extract defaults for `row_ids` and `truth`.

`row_ids` (`integer()`)
Row ids of the predicted observations, i.e. the row ids of the test set.

`truth` (`numeric()`)
True (observed) response.

`response` (`numeric()`)
Vector of numeric response values. One element for each observation in the test set.

`se` (`numeric()`)
Numeric vector of predicted standard errors. One element for each observation in the test set.

`distr` (distr6::VectorDistribution)
VectorDistribution from **distr6**. Each individual distribution in the vector represents the random variable 'survival time' for an individual observation.

See Also

Other Prediction: PredictionClassif, Prediction

Examples

```
task = tsk("boston_housing")
learner = lrn("regr.featureless", predict_type = "se")
p = learner$train(task)$predict(task)
p$predict_types
head(as.data.table(p))
```

---

resample *Resample a Learner on a Task*

Description

Runs a resampling (possibly in parallel): Repeatedly apply Learner `learner` on a training set of Task `task` to train a model, then use the trained model to predict observations of a test set. Training and test sets are defined by the Resampling `resampling`.

Usage

```
resample(task, learner, resampling, store_models = FALSE)
```

Arguments

`task`	(Task).
`learner`	(Learner).
`resampling`	(Resampling).
`store_models`	(`logical(1)`) Keep the fitted model after the test set has been predicted? Set to `TRUE` if you want to further analyse the models or want to extract information like variable importance.

Value

ResampleResult.

Parallelization

This function can be parallelized with the **future** package. One job is one resampling iteration, and all jobs are send to an apply function from **future.apply** in a single batch. To select a parallel backend, use `future::plan()`.

Progress Bars

This function supports progress bars via the package **progressr**. Simply wrap the function in `progressr::with_progress()` to enable them. We recommend to use package **progress** as backend; enable with `progressr::handlers("progress")`.

Logging

The **mlr3** uses the **lgr** package for logging. **lgr** supports multiple log levels which can be queried with `getOption("lgr.log_levels")`.

To suppress output and reduce verbosity, you can lower the log from the default level `"info"` to `"warn"`:

```
lgr::get_logger("mlr3")$set_threshold("warn")
```

To get additional log output for debugging, increase the log level to `"debug"` or `"trace"`:

```
lgr::get_logger("mlr3")$set_threshold("debug")
```

To log to a file or a data base, see the documentation of lgr::lgr-package.

Note

The fitted models are discarded after the predictions have been computed in order to reduce memory consumption. If you need access to the models for later analysis, set `store_models` to `TRUE`.

Examples

```
task = tsk("iris")
learner = lrn("classif.rpart")
resampling = rsmp("cv")

# Explicitly instantiate the resampling for this task for reproduciblity
set.seed(123)
resampling$instantiate(task)

rr = resample(task, learner, resampling)
print(rr)

# Retrieve performance
rr$score(msr("classif.ce"))
rr$aggregate(msr("classif.ce"))

# merged prediction objects of all resampling iterations
pred = rr$prediction()
pred$confusion

# Repeat resampling with featureless learner
rr_featureless = resample(task, lrn("classif.featureless"), resampling)

# Convert results to BenchmarkResult, then combine them
```

```
bmr1 = as_benchmark_result(rr)
bmr2 = as_benchmark_result(rr_featureless)
print(bmr1$combine(bmr2))
```

`ResampleResult` *Container for Results of* `resample()`

Description

This is the result container object returned by `resample()`.

Note that all stored objects are accessed by reference. Do not modify any object without cloning it first.

S3 Methods

- `as.data.table(rr)`
  ResampleResult -> `data.table::data.table()`
  Returns a copy of the internal data.
- `c(...)`
  (ResampleResult, ...) -> BenchmarkResult
  Combines multiple objects convertible to BenchmarkResult into a new BenchmarkResult.

Public fields

`data` (`data.table::data.table()`)
: Internal data storage. We discourage users to directly work with this field.

Active bindings

`task` (Task)
: The task `resample()` operated on.

`learners` (list of Learner)
: List of trained learners, sorted by resampling iteration.

`resampling` (Resampling)
: Instantiated Resampling object which stores the splits into training and test.

`uhash` (`character(1)`)
: Unique hash for this object.

`warnings` (`data.table::data.table()`)
: A table with all warning messages. Column names are `"iteration"` and `"msg"`. Note that there can be multiple rows per resampling iteration if multiple warnings have been recorded.

`errors` (`data.table::data.table()`)
: A table with all error messages. Column names are `"iteration"` and `"msg"`. Note that there can be multiple rows per resampling iteration if multiple errors have been recorded.

Methods

Public methods:

- ResampleResult$new()
- ResampleResult$format()
- ResampleResult$print()
- ResampleResult$help()
- ResampleResult$prediction()
- ResampleResult$predictions()
- ResampleResult$score()
- ResampleResult$aggregate()
- ResampleResult$filter()
- ResampleResult$clone()

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
ResampleResult$new(data, uhash = NULL)
```

Arguments:

`data` (`data.table::data.table()`)
: Table with data for one resampling iteration per row: Task, Learner, Resampling, iteration (`integer(1)`), and Prediction.

`uhash` (`character(1)`)
: Unique hash for this `ResampleResult`. If `NULL`, a new unique hash is generated. This unique hash is primarily needed to group information in BenchmarkResults.

Method `format()`**:** Helper for print outputs.

Usage:

```
ResampleResult$format()
```

Method `print()`**:** Printer.

Usage:

```
ResampleResult$print()
```

Arguments:

`...` (ignored).

Method `help()`**:** Opens the corresponding help page referenced by field $man.

Usage:

```
ResampleResult$help()
```

Method `prediction()`**:** Combined Prediction of all individual resampling iterations, and all provided predict sets. Note that performance measures do not operate on this object, but instead on each prediction object separately and then combine the performance scores with the aggregate function of the respective Measure.

Usage:

```
ResampleResult$prediction(predict_sets = "test")
```

Arguments:

`predict_sets (character())`
Subset of {"train", "test"}.

Returns: Prediction.

Method `predictions()`**:** List of prediction objects, sorted by resampling iteration. If multiple sets are given, these are combined to a single one for each iteration.

Usage:

```
ResampleResult$predictions(predict_sets = "test")
```

Arguments:

`predict_sets (character())`
Subset of {"train", "test"}.

Returns: List of Prediction objects, one per element in `predict_sets`.

Method `score()`**:** Returns a table with one row for each resampling iteration, including all involved objects: Task, Learner, Resampling, iteration number (`integer(1)`), and Prediction. Additionally, a column with the individual (per resampling iteration) performance is added for each Measure in `measures`, named with the id of the respective measure id. If `measures` is `NULL`, `measures` defaults to the return value of `default_measures()`.

Usage:

```
ResampleResult$score(measures = NULL, ids = TRUE)
```

Arguments:

`measures` (Measure | list of Measure)
Measure(s) to calculate.

`ids (logical(1))`
If `ids` is `TRUE`, extra columns with the ids of objects (`"task_id"`, `"learner_id"`, `"resampling_id"`) are added to the returned table. These allow to subset more conveniently.

Returns: `data.table::data.table()`.

Method `aggregate()`**:** Calculates and aggregates performance values for all provided measures, according to the respective aggregation function in Measure. If `measures` is `NULL`, `measures` defaults to the return value of `default_measures()`.

Usage:

```
ResampleResult$aggregate(measures = NULL)
```

Arguments:

`measures` (Measure | list of Measure)
Measure(s) to calculate.

Returns: Named `numeric()`.

Method `filter()`**:** Subsets the ResampleResult, reducing it to only keep the iterations specified in `iters`.

Usage:

```
ResampleResult$filter(iters)
```

Arguments:

`iters (integer())`
Resampling iterations to keep.

Returns: Returns the object itself, but modified **by reference**. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
ResampleResult$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Examples

```
task = tsk("iris")
learner = lrn("classif.rpart")
resampling = rsmp("cv", folds = 3)
rr = resample(task, learner, resampling)
print(rr)

rr$aggregate(msr("classif.acc"))
rr$prediction()
rr$prediction()$confusion
rr$warnings
rr$errors
```

`Resampling` *Resampling Class*

Description

This is the abstract base class for resampling objects like ResamplingCV and ResamplingBootstrap.

The objects of this class define how a task is partitioned for resampling (e.g., in `resample()` or `benchmark()`), using a set of hyperparameters such as the number of folds in cross-validation.

Resampling objects can be instantiated on a Task, which applies the strategy on the task and manifests in a fixed partition of `row_ids` of the Task.

Predefined resamplings are stored in the dictionary mlr_resamplings, e.g. `cv` or `bootstrap`.

Stratification

All derived classes support stratified sampling. The stratification variables are assumed to be discrete and must be stored in the Task with column role `"stratum"`. In case of multiple stratification variables, each combination of the values of the stratification variables forms a strata.

First, the observations are divided into subpopulations based one or multiple stratification variables (assumed to be discrete), c.f. `task$strata`.

Second, the sampling is performed in each of the k subpopulations separately. Each subgroup is divided into iter training sets and iter test sets by the derived Resampling. These sets are merged based on their iteration number: all training sets from all subpopulations with iteration 1 are combined, then all training sets with iteration 2, and so on. Same is done for all test sets. The merged sets can be accessed via $train_set(i) and $test_set(i), respectively.

Grouping / Blocking

All derived classes support grouping of observations. The grouping variable is assumed to be discrete and must be stored in the Task with column role "group".

Observations in the same group are treated like a "block" of observations which must be kept together. These observations either all go together into the training set or together into the test set.

The sampling is performed by the derived Resampling on the grouping variable. Next, the grouping information is replaced with the respective row ids to generate training and test sets. The sets can be accessed via $train_set(i) and $test_set(i), respectively.

Public fields

`id (character(1))`
: Identifier of the object. Used in tables, plot and text output.

`param_set (paradox::ParamSet)`
: Set of hyperparameters.

`instance (any)`
: During `instantiate()`, the instance is stored in this slot in an arbitrary format. Note that if a grouping variable is present in the Task, a Resampling may operate on the group ids internally instead of the row ids (which may lead to confusion).

  It is advised to not work directly with the `instance`, but instead only use the getters $train_set() and $test_set().

`task_hash (character(1))`
: The hash of the Task which was passed to `r$instantiate()`.

`task_nrow (integer(1))`
: The number of observations of the Task which was passed to `r$instantiate()`.

`duplicated_ids (logical(1))`
: If TRUE, duplicated rows can occur within a single training set or within a single test set. E.g., this is TRUE for Bootstrap, and FALSE for cross validation. Only used internally.

`man (character(1))`
: String in the format [pkg]::[topic] pointing to a manual page for this object. Defaults to NA, but can be set by child classes.

Active bindings

`is_instantiated (logical(1))`
: Is TRUE if the resampling has been instantiated.

`hash (character(1))`
: Hash (unique identifier) for this object.

Methods

Public methods:

- `Resampling$new()`
- `Resampling$format()`
- `Resampling$print()`
- `Resampling$help()`
- `Resampling$instantiate()`
- `Resampling$train_set()`
- `Resampling$test_set()`
- `Resampling$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
Resampling$new(
  id,
  param_set = ParamSet$new(),
  duplicated_ids = FALSE,
  man = NA_character_
)
```

Arguments:

`id` (`character(1)`)
: Identifier for the new instance.

`param_set` (paradox::ParamSet)
: Set of hyperparameters.

`duplicated_ids` (`logical(1)`)
: Set to `TRUE` if this resampling strategy may have duplicated row ids in a single training set or test set.
Note that this object is typically constructed via a derived classes, e.g. ResamplingCV or ResamplingHoldout.

`man` (`character(1)`)
: String in the format [pkg]::[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method `format()`**:** Helper for print outputs.

Usage:

```
Resampling$format()
```

Method `print()`**:** Printer.

Usage:

```
Resampling$print(...)
```

Arguments:

`...` (ignored).

Method `help()`**:** Opens the corresponding help page referenced by field $man.

Usage:

```
Resampling$help()
```

Method `instantiate()`**:** Materializes fixed training and test splits for a given task and stores them in `r$instance` in an arbitrary format.

Usage:

```
Resampling$instantiate(task)
```

Arguments:

`task` (Task)
Task used for instantiation.

Returns: Returns the object itself, but modified **by reference**. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method `train_set()`**:** Returns the row ids of the i-th training set.

Usage:

```
Resampling$train_set(i)
```

Arguments:

`i (integer(1))`
Iteration.

Returns: `(integer())` of row ids.

Method `test_set()`**:** Returns the row ids of the i-th test set.

Usage:

```
Resampling$test_set(i)
```

Arguments:

`i (integer(1))`
Iteration.

Returns: `(integer())` of row ids.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Resampling$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

r$param_set$values

# Do only 3 repeats on 10% of the data
r$param_set$values = list(ratio = 0.1, repeats = 3)
r$param_set$values

# Instantiate on iris task
task = tsk("iris")
r$instantiate(task)

# Extract train/test sets
train_set = r$train_set(1)
print(train_set)
intersect(train_set, r$test_set(1))

# Another example: 10-fold CV
r = rsmp("cv")$instantiate(task)
r$train_set(1)

# Stratification
task = tsk("pima")
prop.table(table(task$truth())) # moderately unbalanced
task$col_roles$stratum = task$target_names

r = rsmp("subsampling")
r$instantiate(task)
prop.table(table(task$truth(r$train_set(1)))) # roughly same proportion
```

`Task` *Task Class*

Description

This is the abstract base class for task objects like TaskClassif and TaskRegr.

Tasks serve two purposes:

1. Tasks wrap a DataBackend, an object to transparently interface different data storage types.
2. Tasks store meta-information, such as the role of the individual columns in the DataBackend. For example, for a classification task a single column must be marked as target column, and others as features.

Predefined (toy) tasks are stored in the dictionary mlr_tasks, e.g. `iris` or `boston_housing`.

S3 methods

- `as.data.table(t)`
  Task -> `data.table::data.table()`
  Returns the complete data as `data.table::data.table()`.

Task mutators

The following methods change the task in-place:

- Any modification to $col_roles and $row_roles. This provides a different "view" on the data without altering the data itself.
- $filter() and $select() subset the set of active rows or features in $row_roles or $col_roles, respectively. This provides a different "view" on the data without altering the data itself.
- `rbind()` and `cbind()` change the task in-place by binding rows or columns to the data, but without modifying the original DataBackend. Instead, the methods first create a new DataBackendDataTable from the provided new data, and then merge both backends into an abstract DataBackend which merges the results on-demand.
- `rename()` wraps the DataBackend of the Task in an additional DataBackend which deals with the renaming. Also updates $col_roles and $col_info.

Public fields

`id (character(1))`
Identifier of the object. Used in tables, plot and text output.

`task_type (character(1))`
Task type, e.g. `"classif"` or `"regr"`.
For a complete list of possible task types (depending on the loaded packages), see `mlr_reflections$task_types$type`

`backend (DataBackend)`
Abstract interface to the data of the task.

`col_info (data.table::data.table())`
Table with with 3 columns:

- `"id"` (`character()`) stores the name of the column.
- `"type"` (`character()`) holds the storage type of the variable, e.g. `integer`, `numeric` or `character`. See mlr_reflections$task_feature_types for a complete list of allowed types.
- `"levels"` stores a vector of distinct values (levels) for ordered and unordered factor variables.

`man (character(1))`
String in the format [pkg]::[topic] pointing to a manual page for this object. Defaults to `NA`, but can be set by child classes.

Active bindings

`hash (character(1))`
Hash (unique identifier) for this object.

`row_ids (integer())`
Returns the row ids of the DataBackend for observations with role "use".

`row_names` (`data.table::data.table()`)
Returns a table with two columns:

- `"row_id"` (`integer()`), and
- `"row_name"` (`character()`).

`feature_names` (`character()`)
Returns all column names with `role == "feature"`.

Note that this vector determines the default order of columns for `task$data(cols = NULL, ...)`. However, it is recommended to **not** rely on the order of columns, but instead always address columns by their name. The default order is not well defined after some operations, e.g. after `task$cbind()` or after processing via **mlr3pipelines**.

`target_names` (`character()`)
Returns all column names with role "target".

`properties` (`character()`)
Set of task properties. Possible properties are are stored in mlr_reflections$task_properties. The following properties are currently standardized and understood by tasks in **mlr3**:

- `"strata"`: The task is resampled using one or more stratification variables (role `"stratum"`).
- `"groups"`: The task comes with grouping/blocking information (role `"group"`).
- `"weights"`: The task comes with observation weights (role `"weight"`).

Note that above listed properties are calculated from the $col_roles and may not be set explicitly.

`row_roles` (named `list()`)
Each row (observation) can have an arbitrary number of roles in the learning task:

- `"use"`: Use in train / predict / resampling.
- `"validation"`: Hold the observations back unless explicitly requested. Validation sets are not yet completely integrated into the package.

`row_roles` keeps track of the roles with a named list, elements are named by row role and each element is a `integer()` vector of row ids. To alter the roles, just modify the list, e.g. with R's set functions (`intersect()`, `setdiff()`, `union()`, ...).

`col_roles` (named `list()`)
Each column (feature) can have an arbitrary number of the following roles:

- `"feature"`: Regular feature used in the model fitting process.
- `"target"`: Target variable.
- `"name"`: Row names / observation labels. To be used in plots. Can be queried with $row_names.
- `"order"`: Data returned by $data() is ordered by this column (or these columns).
- `"group"`: During resampling, observations with the same value of the variable with role "group" are marked as "belonging together". They will be exclusively assigned to be either in the training set or in the test set for each resampling iteration. Only up to one column may have this role.
- `"stratum"`: Stratification variables. Multiple discrete columns may have this role.
- `"weight"`: Observation weights. Only up to one column (assumed to be discrete) may have this role.

`col_roles` keeps track of the roles with a named list, the elements are named by column role and each element is a character vector of column names. To alter the roles, just modify the list, e.g. with R's set functions (`intersect()`, `setdiff()`, `union()`, ...).

`nrow` (`integer(1)`)
Returns the total number of rows with role "use".

`ncol` (`integer(1)`)
Returns the total number of columns with role "target" or "feature".

`feature_types` (`data.table::data.table()`)
Returns a table with columns `id` and `type` where `id` are the column names of "active" features of the task and `type` is the storage type.

`data_formats` `character()`
Vector of supported data output formats. A specific format can be chosen in the $data() method.

`strata` (`data.table::data.table()`)
If the task has columns designated with role `"stratum"`, returns a table with one subpopulation per row and two columns:

- `N` (`integer()`) with the number of observations in the subpopulation, and
- `row_id` (list of `integer()`) as list column with the row ids in the respective subpopulation. Returns `NULL` if there are is no stratification variable. See Resampling for more information on stratification.

`groups` (`data.table::data.table()`)
If the task has a column with designated role `"group"`, a table with two columns:

- `row_id` (`integer()`), and
- grouping variable `group` (`vector()`).

Returns `NULL` if there are is no grouping column. See Resampling for more information on grouping.

`order` (`data.table::data.table()`)
If the task has at least one column with designated role `"order"`, a table with two columns:

- `row_id` (`integer()`), and
- ordering vector `order` (`integer()`).

Returns `NULL` if there are is no order column.

`weights` (`data.table::data.table()`)
If the task has a column with designated role `"weight"`, a table with two columns:

- `row_id` (`integer()`), and
- observation weights `weight` (`numeric()`).

Returns `NULL` if there are is no weight column.

Methods

Public methods:

- `Task$new()`
- `Task$help()`
- `Task$format()`

- Task$print()
- Task$data()
- Task$formula()
- Task$head()
- Task$levels()
- Task$missings()
- Task$filter()
- Task$select()
- Task$rbind()
- Task$cbind()
- Task$rename()
- Task$set_row_role()
- Task$set_col_role()
- Task$droplevels()
- Task$clone()

Method `new()`**:** Creates a new instance of this R6 class.
Note that this object is typically constructed via a derived classes, e.g. TaskClassif or TaskRegr.

Usage:

```
Task$new(id, task_type, backend)
```

Arguments:

`id` (`character(1)`)
Identifier for the new instance.

`task_type` (`character(1)`)
Type of task, e.g. `"regr"` or `"classif"`. Must be an element of mlr_reflections$task_types$type.

`backend` (DataBackend)
Either a DataBackend, or any object which is convertible to a DataBackend with `as_data_backend()`. E.g., a `data.frame()` will be converted to a DataBackendDataTable.

Method `help()`**:** Opens the corresponding help page referenced by field $man.

Usage:

```
Task$help()
```

Method `format()`**:** Helper for print outputs.

Usage:

```
Task$format()
```

Method `print()`**:** Printer.

Usage:

```
Task$print(...)
```

Arguments:

`...` (ignored).

Method `data()`: Returns a slice of the data from the DataBackend in the data format specified by `data_format`. Rows are additionally subsetted to only contain observations with role `"use"`, and columns are filtered to only contain features with roles `"target"` and `"feature"`. If invalid `rows` or `cols` are specified, an exception is raised.

Rows and columns are returned in the order specified via the arguments `rows` and `cols`. If `rows` is `NULL`, rows are returned in the order of `task$row_ids`. If `cols` is `NULL`, the column order defaults to `c(task$target_names, task$feature_names)`. Note that it is recommended to **not** rely on the order of columns, and instead always address columns with their respective column name.

Usage:

```
Task$data(rows = NULL, cols = NULL, data_format = "data.table", ordered = TRUE)
```

Arguments:

`rows integer()`
: Row indices.

`cols character()`
: Column names.

`data_format (character(1))`
: Desired data format, e.g. `"data.table"` or `"Matrix"`.

`ordered (logical(1))`
: If `TRUE` (default), data is ordered according to the columns with column role `"order"`.

Returns: Depending on the DataBackend, but usually a `data.table::data.table()`.

Method `formula()`: Constructs a `formula()`, e.g. [target] ~ [feature_1] + [feature_2] + ... + [feature_k], using the features provided in argument `rhs` (defaults to all columns with role `"feature"`, symbolized by `"."`).

Usage:

```
Task$formula(rhs = ".")
```

Arguments:

`rhs (character(1))`
: Right hand side of the formula. Defaults to `"."` (all features of the task).

Returns: `formula()`.

Method `head()`: Get the first `n` observations with role `"use"` of all columns with role `"target"` or `"feature"`.

Usage:

```
Task$head(n = 6L)
```

Arguments:

`n (integer(1))`.

Returns: `data.table::data.table()` with `n` rows.

Method `levels()`: Returns the distinct values for columns referenced in `cols` with storage type "factor" or "ordered". Argument `cols` defaults to all such columns with role `"target"` or `"feature"`.

Note that this function ignores the row roles, it returns all levels available in the DataBackend. To update the stored level information, e.g. after subsetting a task with $filter(), call $droplevels().

Usage:

```
Task$levels(cols = NULL)
```

Arguments:

`cols` `character()`
Column names.

Returns: named `list()`.

Method `missings()`**:** Returns the number of missing observations for columns referenced in `cols`. Considers only active rows with row role `"use"`. Argument `cols` defaults to all columns with role "target" or "feature".

Usage:

```
Task$missings(cols = NULL)
```

Arguments:

`cols` `character()`
Column names.

Returns: Named `integer()`.

Method `filter()`**:** Subsets the task, keeping only the rows specified via row ids `rows`.
This operation mutates the task in-place. See the section on task mutators for more information.

Usage:

```
Task$filter(rows)
```

Arguments:

`rows` `integer()`
Row indices.

Returns: Returns the object itself, but modified **by reference**. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method `select()`**:** Subsets the task, keeping only the features specified via column names `cols`. Note that you cannot deselect the target column, for obvious reasons.
This operation mutates the task in-place. See the section on task mutators for more information.

Usage:

```
Task$select(cols)
```

Arguments:

`cols` `character()`
Column names.

Returns: Returns the object itself, but modified **by reference**. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method `rbind()`**:** Adds additional rows to the DataBackend stored in $backend. New row ids are automatically created, unless `data` has a column whose name matches the primary key of the DataBackend (`task$backend$primary_key`). In case of name clashes of row ids, rows in `data` have higher precedence and virtually overwrite the rows in the DataBackend.
All columns with the roles `"target"`, `"feature"`, `"weight"`, `"group"`, `"stratum"`, and `"order"` must be present in `data`. Columns only present in `data` but not in the DataBackend of `task` will be discarded.
This operation mutates the task in-place. See the section on task mutators for more information.

Usage:

```
Task$rbind(data)
```

Arguments:

`data (data.frame())`.

Returns: Returns the object itself, but modified **by reference**. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method `cbind()`**:** Adds additional columns to the DataBackend stored in $backend.

The row ids must be provided as column in `data` (with column name matching the primary key name of the DataBackend). If this column is missing, it is assumed that the rows are exactly in the order of $row_ids. In case of name clashes of column names in `data` and DataBackend, columns in `data` have higher precedence and virtually overwrite the columns in the DataBackend.

This operation mutates the task in-place. See the section on task mutators for more information.

Usage:

```
Task$cbind(data)
```

Arguments:

`data (data.frame())`.

Method `rename()`**:** Renames columns by mapping column names in `old` to new column names in `new` (element-wise).

This operation mutates the task in-place. See the section on task mutators for more information.

Usage:

```
Task$rename(old, new)
```

Arguments:

`old (character())`
: Old names.

`new (character())`
: New names.

Returns: Returns the object itself, but modified **by reference**. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method `set_row_role()`**:** Adds the roles `new_roles` to rows referred to by row ids `rows`. If `exclusive` is `TRUE`, the referenced rows will be removed from all other roles.

This function is deprecated and will be removed in the next version in favor of directly modifying $row_roles.

Usage:

```
Task$set_row_role(rows, new_roles, exclusive = TRUE)
```

Arguments:

`rows integer()`
: Row indices.

`new_roles (character())`.

`exclusive (logical(1))`.

Returns: Returns the object itself, but modified **by reference**. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method `set_col_role()`**:** Adds the roles `new_roles` to columns referred to by column names `cols`. If `exclusive` is `TRUE`, the referenced columns will be removed from all other roles.
This function is deprecated and will be removed in the next version in favor of directly modifying $col_roles.

Usage:

```
Task$set_col_role(cols, new_roles, exclusive = TRUE)
```

Arguments:

`cols` `character()`
Column names.

`new_roles` (`character()`).

`exclusive` (`logical(1)`).

Returns: Returns the object itself, but modified **by reference**. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method `droplevels()`**:** Updates the cache of stored factor levels, removing all levels not present in the current set of active rows. `cols` defaults to all columns with storage type "factor" or "ordered".

Usage:

```
Task$droplevels(cols = NULL)
```

Arguments:

`cols` `character()`
Column names.

Returns: Modified `self`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Task$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Task: `TaskClassif`, `TaskRegr`, `TaskSupervised`, `TaskUnsupervised`, `mlr_tasks_boston_housing`, `mlr_tasks_breast_cancer`, `mlr_tasks_german_credit`, `mlr_tasks_iris`, `mlr_tasks_mtcars`, `mlr_tasks_pima`, `mlr_tasks_sonar`, `mlr_tasks_spam`, `mlr_tasks_wine`, `mlr_tasks_zoo`, `mlr_tasks`

Examples

```
# we use the inherited class TaskClassif here,
# Class Task is not intended for direct use
task = TaskClassif$new("iris", iris, target = "Species")
```

```
task$nrow
task$ncol
task$feature_names
task$formula()

# de-select "Petal.Width"
task$select(setdiff(task$feature_names, "Petal.Width"))

task$feature_names

# Add new column "foo"
task$cbind(data.frame(foo = 1:150))
task$head()
```

`TaskClassif` *Classification Task*

Description

This task specializes Task and TaskSupervised for classification problems. The target column is assumed to be a factor. The `task_type` is set to `"classif"`.

Additional task properties include:

- `"twoclass"`: The task is a binary classification problem.
- `"multiclass"`: The task is a multiclass classification problem.

Predefined tasks are stored in the dictionary mlr_tasks.

Super classes

`mlr3::Task` -> `mlr3::TaskSupervised` -> `TaskClassif`

Active bindings

`class_names` (`character()`)
: Returns all class labels of the target column.

`positive` (`character(1)`)
: Stores the positive class for binary classification tasks, and `NA` for multiclass tasks. To switch the positive class, assign a level to this field.

`negative` (`character(1)`)
: Stores the negative class for binary classification tasks, and `NA` for multiclass tasks.

Methods

Public methods:

- `TaskClassif$new()`
- `TaskClassif$data()`

- TaskClassif$truth()
- TaskClassif$droplevels()
- TaskClassif$clone()

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
TaskClassif$new(id, backend, target, positive = NULL)
```

Arguments:

`id` (`character(1)`)
: Identifier for the new instance.

`backend` (DataBackend)
: Either a DataBackend, or any object which is convertible to a DataBackend with `as_data_backend()`. E.g., a `data.frame()` will be converted to a DataBackendDataTable.

`target` (`character(1)`)
: Name of the target column.

`positive` (`character(1)`)
: Only for binary classification: Name of the positive class. The levels of the target columns are reordered accordingly, so that the first element of $class_names is the positive class, and the second element is the negative class.

Method `data()`**:** Calls $data from parent class Task and ensures that levels of the target column are in the right order.

Usage:

```
TaskClassif$data(
  rows = NULL,
  cols = NULL,
  data_format = "data.table",
  ordered = TRUE
)
```

Arguments:

`rows` `integer()`
: Row indices.

`cols` `character()`
: Column names.

`data_format` (`character(1)`)
: Desired data format, e.g. `"data.table"` or `"Matrix"`.

`ordered` (`logical(1)`)
: If `TRUE` (default), data is ordered according to the columns with column role `"order"`.

Returns: Depending on the DataBackend, but usually a `data.table::data.table()`.

Method `truth()`**:** True response for specified `row_ids`. Format depends on the task type. Defaults to all rows with role `"use"`.

Usage:

```
TaskClassif$truth(rows = NULL)
```

Arguments:

`rows integer()`
Row indices.

Returns: `factor()`.

Method `droplevels()`**:** Updates the cache of stored factor levels, removing all levels not present in the current set of active rows. `cols` defaults to all columns with storage type "factor" or "ordered". Also updates the task property `"twoclass"`/`"multiclass"`.

Usage:

```
TaskClassif$droplevels(cols = NULL)
```

Arguments:

`cols character()`
Column names.

Returns: Modified `self`.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
TaskClassif$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other Task: `TaskRegr`, `TaskSupervised`, `TaskUnsupervised`, `Task`, `mlr_tasks_boston_housing`, `mlr_tasks_breast_cancer`, `mlr_tasks_german_credit`, `mlr_tasks_iris`, `mlr_tasks_mtcars`, `mlr_tasks_pima`, `mlr_tasks_sonar`, `mlr_tasks_spam`, `mlr_tasks_wine`, `mlr_tasks_zoo`, `mlr_tasks`

Examples

```
data("Sonar", package = "mlbench")
task = TaskClassif$new("sonar", backend = Sonar, target = "Class", positive = "M")

task$task_type
task$formula()
task$truth()
task$class_names
task$positive

# possible properties:
mlr_reflections$task_properties$classif
```

TaskGenerator *TaskGenerator Class*

Description

Creates a Task of arbitrary size. Predefined task generators are stored in the dictionary mlr_task_generators, e.g. xor.

Public fields

`id (character(1))`
Identifier of the object. Used in tables, plot and text output.

`task_type (character(1))`
Task type, e.g. "classif" or "regr".
For a complete list of possible task types (depending on the loaded packages), see `mlr_reflections$task_types$type`

`param_set (paradox::ParamSet)`
Set of hyperparameters.

`packages (character(1))`
Set of required packages. These packages are loaded, but not attached.

`man (character(1))`
String in the format [pkg]::[topic] pointing to a manual page for this object. Defaults to NA, but can be set by child classes.

Methods

Public methods:

- `TaskGenerator$new()`
- `TaskGenerator$format()`
- `TaskGenerator$print()`
- `TaskGenerator$generate()`
- `TaskGenerator$clone()`

Method `new()`**:** Creates a new instance of this R6 class.

Usage:

```
TaskGenerator$new(
  id,
  task_type,
  packages = character(),
  param_set = ParamSet$new(),
  man = NA_character_
)
```

Arguments:

`id (character(1))`
Identifier for the new instance.

`task_type` (`character(1)`)
Type of task, e.g. `"regr"` or `"classif"`. Must be an element of mlr_reflections$task_types$type.

`packages` (`character()`)
Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via `requireNamespace()`.

`param_set` (paradox::ParamSet)
Set of hyperparameters.

`man` (`character(1)`)
String in the format [pkg]::[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method `format()`**:** Helper for print outputs.

Usage:

```
TaskGenerator$format()
```

Method `print()`**:** Printer.

Usage:

```
TaskGenerator$print(...)
```

Arguments:

`...` (ignored).

Method `generate()`**:** Creates a task of type `task_type` with `n` observations, possibly using additional settings stored in `param_set`.

Usage:

```
TaskGenerator$generate(n)
```

Arguments:

`n` (`integer(1)`)
Number of rows to generate.

Returns: Task.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
TaskGenerator$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

See Also

Other TaskGenerator: `mlr_task_generators_2dnormals`, `mlr_task_generators_cassini`, `mlr_task_generators_circ`
`mlr_task_generators_friedman1`, `mlr_task_generators_moons`, `mlr_task_generators_simplex`,
`mlr_task_generators_smiley`, `mlr_task_generators_spirals`, `mlr_task_generators_xor`,
`mlr_task_generators`

TaskRegr *Regression Task*

Description

This task specializes Task and TaskSupervised for regression problems. The target column is assumed to be numeric. The task_type is set to "regr".

Predefined tasks are stored in the dictionary mlr_tasks.

Super classes

mlr3::Task -> mlr3::TaskSupervised -> TaskRegr

Methods

Public methods:

- TaskRegr$new()
- TaskRegr$truth()
- TaskRegr$clone()

Method new(): Creates a new instance of this R6 class.

Usage:

```
TaskRegr$new(id, backend, target)
```

Arguments:

id (character(1))
: Identifier for the new instance.

backend (DataBackend)
: Either a DataBackend, or any object which is convertible to a DataBackend with as_data_backend(). E.g., a data.frame() will be converted to a DataBackendDataTable.

target (character(1))
: Name of the target column.

Method truth(): True response for specified row_ids. Format depends on the task type. Defaults to all rows with role "use".

Usage:

```
TaskRegr$truth(rows = NULL)
```

Arguments:

rows integer()
: Row indices.

Returns: numeric().

Method clone(): The objects of this class are cloneable with this method.

Usage:

```
TaskRegr$clone(deep = FALSE)
```

Arguments:

deep Whether to make a deep clone.

See Also

Other Task: TaskClassif, TaskSupervised, TaskUnsupervised, Task, mlr_tasks_boston_housing, mlr_tasks_breast_cancer, mlr_tasks_german_credit, mlr_tasks_iris, mlr_tasks_mtcars, mlr_tasks_pima, mlr_tasks_sonar, mlr_tasks_spam, mlr_tasks_wine, mlr_tasks_zoo, mlr_tasks

Examples

```
task = TaskRegr$new("iris", backend = iris, target = "Sepal.Length")
task$task_type
task$formula()
task$truth()

# possible properties:
mlr_reflections$task_properties$regr
```

Index
