Package 'incidence2'

May 29, 2021

Type Package

Title Compute, Handle and Plot Incidence of Dated Events

Version 1.1

Description Provides functions and classes to compute, handle and visualise incidence from dated events for a defined time interval. Dates can be provided in various standard formats. The class 'incidence2' is used to store computed incidence and can be easily manipulated, subsetted, and plotted. This package is part of the RECON (<https://www.repidemicsconsortium.org/>) toolkit for outbreak analysis (<https://www.reconverse.org>).

`accessors` *Access various elements of an incidence object*

Description

Access various elements of an incidence object

Usage

```
get_counts(x, ...)

## Default S3 method:
get_counts(x, ...)

## S3 method for class 'incidence2'
get_counts(x, ...)

get_count_names(x, ...)

## Default S3 method:
get_count_names(x, ...)

## S3 method for class 'incidence2'
get_count_names(x, ...)

get_date_index(x, ...)

## Default S3 method:
get_date_index(x, ...)

## S3 method for class 'incidence2'
```

```
get_date_index(x, ...)

get_dates(x, ...)

get_dates_name(x, ...)

## Default S3 method:
get_dates_name(x, ...)

## S3 method for class 'incidence2'
get_dates_name(x, ...)

get_group_names(x, ...)

## Default S3 method:
get_group_names(x, ...)

## S3 method for class 'incidence2'
get_group_names(x, ...)

get_timespan(x, ...)

## Default S3 method:
get_timespan(x, ...)

## S3 method for class 'incidence2'
get_timespan(x, ...)

get_n(x)

## Default S3 method:
get_n(x)

## S3 method for class 'incidence2'
get_n(x)

get_interval(x, ...)

## Default S3 method:
get_interval(x, ...)

## S3 method for class 'incidence2'
get_interval(x, ...)
```

Arguments

x	An `incidence()` object.
...	Not used.

Value

- `get_counts`: The count vector from x.
- `get_count_names()`: The name of the count variable of x.
- `get_date_index()`: The date_index vector from x.
- `get_dates()`: Same as `get_date_index()`.
- `get_dates_name()`: The name of the date_index variable of x.
- `get_group_names()`: a character vector of the group variables of x or NULL if none are present.
- `get_timespan()`: an `integer` denoting the timespan in days represented by the incidence object.
- `get_n()` The total number of cases stored in the object
- `get_interval()`: if `integer = TRUE`, an integer vector, otherwise the character value of the `interval`

Examples

```
if (requireNamespace("outbreaks", quietly = TRUE)) {
  withAutoprint({
    data(ebola_sim_clean, package = "outbreaks")
    dat <- ebola_sim_clean$linelist
    i <- incidence(dat,
                   date_index = date_of_onset,
                   groups = c(gender, hospital))

    get_counts(i)
    get_count_names(i)

    get_group_names(i)

    get_date_index(i)
    get_dates_name(i)

    get_interval(i)

    get_n(i)

    get_timespan(i)
  })
}
```

as.data.frame.incidence2 *Convert incident object to dataframe*

Description

Convert incident object to dataframe

Usage

```
## S3 method for class 'incidence2'
as.data.frame(x, ...)
```

Arguments

x	An incidence() object.
...	Not used.

Examples

```
dat <- data.frame(dates = Sys.Date() + 1:100,
                  names = rep(c("Jo", "John"), 5))

dat <- incidence(dat, date_index = dates, groups = names)
as.data.frame(dat)
```

as_tibble *Convert incident2 object to a tibble*

Description

Convert incident2 object to a tibble

Usage

```
## S3 method for class 'incidence2'
as_tibble(x, ...)
```

Arguments

x	An incidence() object.
...	Not used.

Examples

```
dat <- data.frame(dates = Sys.Date() + 1:100,
                  names = rep(c("Jo", "John"), 5))

dat <- incidence(dat, date_index = dates, groups = names)
as_tibble(dat)
```

`complete_counts` *Complete counts for all date and group combinations*

Description

This function ensures that an incidence object has the same range of dates for each grouping. By default missing counts will be filled with `NA` but you can optionally specify a value to replace these by.

Usage

```
complete_counts(x, fill = NA)
```

Arguments

`x`	An `incidence()` object.
`fill`	The value to replace missing counts by. Defaults to `NA`.

Examples

```
dat <- data.frame(
  dates = Sys.Date() + 1:4,
  groups = rep(c("grp1","grp2"), 2),
  counts = 1:4
)

i <- incidence(dat, date_index = dates, groups = groups, counts = counts)
complete_counts(i, fill = 0)
```

`cumulate` *Compute cumulative 'incidence'*

Description

`cumulate` is an S3 generic to compute cumulative numbers, with methods for different types of objects:

- default method is a wrapper for `cumsum`
- `incidence` objects: computes cumulative incidence over time

Usage

```
cumulate(x)

## Default S3 method:
cumulate(x)

## S3 method for class 'incidence2'
cumulate(x)
```

Arguments

`x`	An incidence object.

Examples

```
dat <- data.frame(
  dates = as.integer(c(0,1,2,2,3,5,7)),
  groups = factor(c(1, 2, 3, 3, 3, 3, 1))
)

i <- incidence(dat, date_index = dates, groups = groups)
i

cumulative_i <- cumulate(i)
cumulative_i
```

`incidence` *Compute the incidence of events*

Description

Compute the incidence of events

Usage

```
incidence(
  x,
  date_index,
  groups = NULL,
  interval = 1L,
  na_as_group = TRUE,
  counts = NULL,
  firstdate = NULL
)
```

Arguments

x	A data frame representing a linelist (or potentially a pre-aggregated dataset).
date_index	The time index(es) of the given data. This should be the name(s) corresponding to the desired date column(s) in x of class: integer, numeric, Date, POSIXct, POSIXlt, and character. (See Note about `numeric` and `character` formats). Multiple inputs only make sense when x is a linelist, and in this situation, to avoid ambiguity, the vector must be named. These names will be used for the resultant count columns.
groups	An optional vector giving the names of the groups of observations for which incidence should be grouped.

interval	An integer or character indicating the (fixed) size of the time interval used for computing the incidence; defaults to 1 day. This can also be a text string that corresponds to a valid date interval, e.g.
	`* (x) day(s)`
	`* (x) weeks(s)`
	`* (x) epiweeks(s)`
	`* (x) isoweeks(s)`
	`* (x) months(s)`
	`* (x) quarter(s)`
	`* (x) years(s)`
	More details can be found in the "Interval specification" and "Week intervals" sections below.

na_as_group	A logical value indicating if missing group values (NA) should treated as a separate category (`TRUE`) or removed from consideration (`FALSE`). Defaults to `TRUE`.
counts	The count variables of the given data. If NULL (default) the data is taken to be a linelist of individual observations.
firstdate	When the interval is numeric or in days/months and has a numeric prefix greater than 1, then you can optionally specify the date that you wish to anchor your intervals to begin from. If NULL (default) then the intervals will start at the minimum value contained in the `date_index` column. Note that the class of `firstdate` must be `Date` if the `date_index` column is Date, POSIXct, POSIXlt, or character and integer otherwise.

Value

An incidence2 object. This is a subclass of tibble that represents and aggregated count of observations grouped according to the specified interval and, optionally, the given groups. By default it will contain the following columns:

- **date / date_index**: If the default interval of 1 day is used then this will be the dates of the given observations and given the name "date", otherwise, this will be values obtained from the specified date grouping with column name "date_index" (See Interval specification below).
- **groups**: If specified, column(s) containing the categories of the given groups.
- **count** (or name of count variables): The aggregated observation counts.

Note

Input data (`date_index`):

- **Decimal (numeric) dates**: will be truncated.
- **Character dates** should be in the unambiguous `yyyy-mm-dd` (ISO 8601) format. Any other format will trigger an error.

Interval specification (`interval`): `incidence2` uses the `grates` package to generate date groupings. The grouping used depends on the value of `interval`. This can be specified as either an integer value or a more standard specification such as "day", "week", "month", "quarter" or "year". The format in this situation is similar to that used by `seq.Date()` where these values can optionally be preceded by a (positive or negative) integer and a space, or followed by "s". When no prefix is given:

- "week" : uses the "grates_yearweek" class (see `grates::as_yearweek()`).
- "month" : uses the "grates_month" class (see `grates::as_month()`).
- "quarter" : uses the "grates_quarter" class (see `grates::as_quarter()`).
- "year" : uses the "grates_year" class (see `grates::as_year()`).

When a prefix is provided (e.g. 2 weeks) the output is an object of class "period" (see `as_period()`). Note that for the values "month", "quarter" and "year" intervals are always chosen to start at the beginning of the calendar equivalent. If the input is an integer value the input is treated as if it was specified in days (i.e. 2 and 2 days) produce the same output.

The only interval values that do not produce these grouped classes are 1, 1L, "day" or "days" (both without prefix) are used. In this situation the returned object is of the standard "Date" class.

Week intervals:

It is possible to construct incidence objects standardized to any day of the week. The default state is to use ISO 8601 definition of weeks, which start on Monday. You can specify the day of the week an incidence object should be standardised to by using the pattern "n W weeks" where "W" represents the weekday in an English or current locale and "n" represents the duration, but this can be ommitted. Below are examples of specifying weeks starting on different days assuming we had data that started on 2016-09-05, which is ISO week 36 of 2016:

- interval = "2 monday weeks" (Monday 2016-09-05)
- interval = "1 tue week" (Tuesday 2016-08-30)
- interval = "1 Wed week" (Wednesday 2016-08-31)
- interval = "1 Thursday week" (Thursday 2016-09-01)

- interval = "1 F week" (Friday 2016-09-02)
- interval = "1 Saturday week" (Saturday 2016-09-03)
- interval = "Sunday week" (Sunday 2016-09-04)

It's also possible to use something like "3 weeks: Saturday"; In addition, there are keywords reserved for specific days of the week:

- interval = "week", (Default, Monday)
- interval = "ISOweek" (Monday)
- interval = "EPIweek" (Sunday)
- interval = "MMWRweek" (Sunday)

Examples

```
if (requireNamespace("outbreaks", quietly = TRUE)) {
  withAutoprint({
    data(ebola_sim_clean, package = "outbreaks")
    dat <- ebola_sim_clean$linelist

    # daily incidence
    incidence(dat, date_of_onset)

    # weekly incidence
    incidence(dat, date_of_onset, interval = "week")

    # starting on a Monday
    incidence(dat, date_of_onset, interval = "isoweek")

    # starting on a Sunday
    incidence(dat, date_of_onset, interval = "epiweek")

    # group by gender
    incidence(dat, date_of_onset, interval = 7, groups = gender)

    # group by gender and hospital
    incidence(dat, date_of_onset, interval = "2 weeks", groups = c(gender, hospital))
  })
}

# use of first_date
dat <- data.frame(dates = Sys.Date() + sample(-3:10, 10, replace = TRUE))
incidence(dat, dates, interval = "week", firstdate = Sys.Date() + 1)
```

---

keep *Keep first and last occurences*

Description

`keep_first()` (`keep_last`) keeps the first (last) `n` entries to occur by date ordering.

Usage

```
keep_first(x, n, ...)

## Default S3 method:
keep_first(x, n, ...)

## S3 method for class 'incidence2'
keep_first(x, n, ...)

## S3 method for class 'grates_yearweek'
keep_first(x, n, ...)

## S3 method for class 'grates_month'
keep_first(x, n, ...)

## S3 method for class 'grates_quarter'
keep_first(x, n, ...)

## S3 method for class 'grates_year'
keep_first(x, n, ...)

## S3 method for class 'grates_period'
keep_first(x, n, ...)

keep_last(x, n, ...)

## Default S3 method:
keep_last(x, n, ...)

## S3 method for class 'incidence2'
keep_last(x, n, ...)

## S3 method for class 'grates_yearweek'
keep_last(x, n, ...)

## S3 method for class 'grates_month'
keep_last(x, n, ...)

## S3 method for class 'grates_quarter'
keep_last(x, n, ...)

## S3 method for class 'grates_year'
keep_last(x, n, ...)

## S3 method for class 'grates_period'
keep_last(x, n, ...)
```

Arguments

x	Object to filter.
n	Number of entries to keep.
...	Not currently used.

Value

The objected with the chosen entries.

`plot.incidence2` *Plotting functions*

Description

incidence2 includes two plotting functions to simplify graph creation.

Usage

```
## S3 method for class 'incidence2'
plot(
  x,
  count = NULL,
  fill = NULL,
  centre_dates = TRUE,
  date_format = "%Y-%m-%d",
  stack = TRUE,
  title = NULL,
  col_pal = vibrant,
  alpha = 0.7,
  color = NA,
  xlab = "",
  ylab = NULL,
  n.breaks = 6,
  width = 1,
  show_cases = FALSE,
  border = "white",
  na_color = "grey",
  legend = c("right", "left", "bottom", "top", "none"),
  angle = 0,
  size = NULL,
  ...
)

facet_plot(x, ...)

## S3 method for class 'incidence2'
```

```
facet_plot(
  x,
  count = NULL,
  facets = NULL,
  centre_dates = TRUE,
  date_format = "%Y-%m-%d",
  stack = TRUE,
  fill = NULL,
  title = NULL,
  col_pal = vibrant,
  alpha = 0.7,
  color = NA,
  xlab = "",
  ylab = NULL,
  n.breaks = 3,
  width = 1,
  show_cases = FALSE,
  border = "white",
  na_color = "grey",
  legend = c("bottom", "top", "left", "right", "none"),
  angle = 0,
  size = NULL,
  nrow = NULL,
  ...
)
```

Arguments

x	An incidence() object.
count	Which count variable to have on the y-axis. If NULL (default) the first entry returned from get_count_names(x) is used.
fill	Which variable to color plots by. If NULL no distinction if made for plot colors.
centre_dates	If the interval is one of a single week, month, quarter or year the x_axis labels are centred with custom category labels. Set this option to FALSE to use date labels at the breaks.
date_format	Format to use if "Date" scales are required. The value is used by format.Date() and can be any input acceptable by that function (defaults to "%Y-%m-%d).
stack	A logical indicating if bars of multiple groups should be stacked, or displayed side-by-side. Only used if fill is not NULL.
title	Optional title for the graph.
col_pal	col_pal The color palette to be used for the groups; defaults to vibrant (see ?palettes).
alpha	The alpha level for color transparency, with 1 being fully opaque and 0 fully transparent; defaults to 0.7.
color	The color to be used for the borders of the bars; NA for invisible borders; defaults to NA.

xlab	The label to be used for the x-axis; empty by default.
ylab	The label to be used for the y-axis; by default, a label will be generated automatically according to the time interval used in incidence computation.
n.breaks	Approximate number of breaks calculated using scales::breaks_pretty (default 6).
width	Value between 0 and 1 indicating the relative size of the bars to the interval. Default 1.
show_cases	if TRUE (default: FALSE), then each observation will be colored by a border. The border defaults to a white border unless specified otherwise. This is normally used outbreaks with a small number of cases. Note: this can only be used if stack = TRUE
border	If show_cases is TRUE this represents the color used for the borders of the individual squares plotted (defaults to "white").
na_color	The colour to plot NA values in graphs (default: grey).
legend	Position of legend in plot.
angle	Rotation angle for text.
size	text size in pts.
...	other arguments to pass to ggplot2::scale_x_continuous().
facets	Which variable to facet plots by. If NULL will use all group_labels of the incidence object.
nrow	Number of rows.

Details

- plot creates a one-pane graph of an incidence object.
- facet_plot creates a multi-facet graph of a grouped incidence object. If the object has no groups it returns the same output as a call to plot().
- If the incidence() object has a rolling average column then that average will be overlaid on top.

Value

- facet_plot() and plot() generate a ggplot2::ggplot() object.

Examples

```
if (requireNamespace("outbreaks", quietly = TRUE) && requireNamespace("ggplot2", quietly = TRUE)) {
  withAutoprint({
    data(ebola_sim_clean, package = "outbreaks")
    dat <- ebola_sim_clean$linelist

    inci <- incidence(dat,
                      date_index = date_of_onset,
                      interval = 7,
                      groups = hospital)
```

```
    inci2 <- incidence(dat,
                       date_index = date_of_onset,
                       interval = 7,
                       groups = c(hospital, gender))

    plot(inci)
    plot(inci, fill = hospital)
    plot(inci, fill = hospital, stack = FALSE)

    facet_plot(inci)
    facet_plot(inci2)
    facet_plot(inci2, facets = gender)
    facet_plot(inci2, facets = hospital, fill = gender)
  })
}
```

`print.incidence2` *Print an incidence object.*

Description

Print an incidence object.

Usage

```
## S3 method for class 'incidence2'
print(x, ...)
```

Arguments

`x`	An 'incidence2' object.
`...`	Not used.

`regroup` *Regroup 'incidence' objects*

Description

This function regroups an `incidence()` object across the specified groups. The resulting `incidence()` object will contains counts summed over the groups present in the input.

Usage

```
regroup(x, groups = NULL)
```

Arguments

x	An incidence() object.
groups	The groups to sum over. If NULL (default) then the function ignores all groups.

Examples

```
if (requireNamespace("outbreaks", quietly = TRUE)) {
  withAutoprint({
    data(ebola_sim_clean, package = "outbreaks")
    dat <- ebola_sim_clean$linelist
    i <- incidence(dat,
                   date_index = date_of_onset,
                   groups = c(gender, hospital))

    regroup(i)

    regroup(i, hospital)
  })
}
```

---

summary.incidence2 *Summary of a given incidence object*

Description

Summary of a given incidence object

Usage

```
## S3 method for class 'incidence2'
summary(object, ...)
```

Arguments

object	An 'incidence' object.
...	Not used.

Value

object (invisibly).

`vibrant` *Color palettes used in incidence*

Description

These functions are color palettes used in incidence. The palettes come from https://personal.sron.nl/~pault/#sec:qualitative and exclude `grey`, which is reserved for missing data.

Usage

```
vibrant(n)

muted(n)
```

Arguments

`n`	a number of colors

Examples

```
vibrant(5)
muted(10)
```
